Two days ago Roger Cohen wrote the following in the New York Times: The magnetism of Silicon Valley may suggest that the United States, a young nation still, is Rome at the height of its power. American soft power is alive and well. America's capacity for reinvention, its looming self-sufficiency in energy, its good demographics and, not least, its hold on the world's imagination, all suggest vigor. Cohen goes on to fret about the waning of U.S. geopolitical power, but let's stay on the soft power side of things. The events in Ferguson, Mo., have given rise to a new wave of "whataboutism," a term coined by the Economist to describe Russia's tendency to respond to criticisms of its policies with tu quoque replies of "what about Iraq?" or "what about race relations in America?" Events in Ferguson have caused whataboutism to go global. As Robin Wright notes in the Wall Street Journal a whole bunch o' authoritarian states have seized on Ferguson to criticize the United States: The U.S. investment of billions of American dollars to promote democratic values around the world has been undermined by the racial unrest in Ferguson. "US can't tell other countries to improve their records on policing and peaceful assembly if it won't clear up its own human rights record," Amnesty International tweeted this week. Several countries that have faced severe criticism in the State Department's annual Human Rights Report are now boldly engaging in a kind of diplomatic touché-to-you in their condemnation of the U.S. Some may be expected from autocratic regimes. But the crisis in Ferguson undermines the moral high-ground that the U.S. has long claimed. Robert Mackey provides even more detail in the New York Times: While the unrest has also shocked American observers and foreign correspondents from other Western democracies — including British and German reporters who have been struck by the "sounds of battle" and endured arrest — some of the most strident criticism of the police violence in Ferguson has come from authoritarian nations where the police are often venerated and dissent is scarcely tolerated. Coverage that echoes the broadcasts from Moscow has also appeared on Iran's state-run Press TV, in reports about the use of force "to suppress protests in Ferguson," that also make no mention of how demonstrations are dispersed in Iran.... Not to be outdone, a spokesman for Egypt's foreign ministry, Badr Abdel-Atti, told the official news agency MENA on Tuesday that his country was "closely following" the protests in Ferguson. According to the state-owned Ahram Online, Egypt "called on U.S. authorities to exercise restraint and deal with the protests in accordance with U.S. and international standards." The statement came just days after the first anniversary of the massacre of hundreds of peaceful protesters by the same military-backed government. So how big if a deal is this for American foreign policy and the promotion of American democratic values? Is Ferguson yet another blow to America's waning hypocritical power? There are some reasons for real concern. It was The New Republic's indispensable Julia Ioffe who first observed the application of whataboutism to Ferguson — and she found it very sobering: Watching the riots in Ferguson, Missouri, it's hard not to wince... at our foolish idea of our country. Russian police arrested journalists at protests, not American cops. And, even if the chances are higher

that heads will roll here for something like this than in Russia, it's hard not to notice one thing: Even at the height of the race riots in Moscow, at the height of the crackdown on the opposition, even the Russian police did not use rubber bullets. And, like it or not, this is what the world is seeing, the world to which we strive to be an example. Another issue is that that Amnesty International has "sent delegates to support and observe a community in the middle of a crisis" in the United States for the first time. Given that the Ferguson PD has conducted itself in a manner that makes the Hazzard County police look like comparative beacons of professionalism, I fear that both Amnesty and the global media will continue to have plenty of fodder for further reporting. But there are three important caveats to this. The first is that this kind of tu quoque doesn't necessarily last all that long when it comes to foreign affairs. If I had told you a decade ago that the United States would be conducting airstrikes in Iraq with the approval of just about every NATO and Middle East ally, and that Germany was considering supplying arms to the Kurds in Iraq, you would have laughed pretty hard. As I have argued elsewhere, even gigantic policy clusterf**** don't dent American influence all that much. The second is that the basic feature of whataboutism is that even if Ferguson hadn't gone global — which it has — authoritarian leaders would have seized on some other flaw in the United States to hype. I mean, when Foreign Affairs produces this cover, it's easy to remember that Ferguson is just the latest blemish on a country that has plenty of political blemishes: The final and most important point is that, as bad as things have been in Ferguson over the past week, they can get better. Indeed, they were getting better at the end of last week until the Ferguson PD played the "How Can We Release Information In The Most Inflammatory Manner Possible?" game. The comparative advantage of countries that have democracy and the rule of law is their resiliency to negative political shocks like what happened in Ferguson. If the legal system does its job and adjudicates exactly what happened to Michael Brown, if the political system nudges some alterations of police tactics, and if civil society groups manage to filter out anarchists from peaceful protestors, then the political narrative will look much better six months from now.

Soft Power Low – Torture

CIA torture undercuts US credibility

Lord, 14 (Kristin Lord, President and CEO of IREX, a global education and development NGO, 12-23-2014, "Soft Power Outage", Foreign Policy, <http://foreignpolicy.com/2014/12/23/soft-power-outage/#ER>, DA: 7-7-2015)

The release of a long-awaited report by the U.S. Senate Select Committee on Intelligence on the CIA's secret detention and interrogation program dealt yet another blow to the United States' moral authority and its credibility as a defender of human rights around the globe. It also begs the question: How much damage must the United States suffer before it learns to take soft power more seriously and, finally, learn to use it more proactively? To understand the immediate damage done to U.S. influence, look no further than the commentary surrounding the report's release. According to the Washington Post, the state-run Chinese news service Xinhua editorialized that "America is neither a suitable role model nor a qualified judge on human rights issues in other countries," while a pro-government television commentator in Egypt observed, "The United States cannot demand human rights reports from other countries since this [document] proves they know nothing about human rights." The Islamic State and other extremists joined the propaganda gold rush. One tweet, quoted in a report from the SITE Intelligence Group, pointed to the audacity of the United States lecturing Muslims about brutality, adding, "Getting beheaded is 100 times more humane, more dignified than what these filthy scumbags do to Muslims." Such reactions are galling and they do real harm to U.S. credibility. But the fault lies not with those who released the report, as some critics argue, but with those who permitted and perpetrated acts of torture, those who lied about it to America's elected representatives, and those who willfully kept the president and senior members of the Bush administration in the dark. Their actions undermined not only American values, but also American influence and national security interests. In the words of a former prisoner of war, Sen. John McCain (R-Ariz.), the actions laid out in the Senate report "stained our national honor" and "did much harm and little practical good."

Soft Power Low – Values

Lack of value influence undermines US influence

Lagon, 11 (Mark P. Lagon, International Relations and Security Chair at Georgetown University's Master of Science in Foreign Service Program and adjunct senior fellow at the Council on Foreign Relations. He is the former US Ambassador-at-Large to Combat Trafficking in Persons at the US Department of State, Sept/Oct 2011, "The Value of Values: Soft Power Under Obama", World Affairs Journal, <http://www.worldaffairsjournal.org/article/value-values-soft-power-under-obama#ER>, DA: 7-7-2015)

One irony of the Obama presidency is how much it relies on hard power. The president came into office proposing a dramatic shift from George W. Bush's perceived unilateralism, and most of his predecessor's hard-edged counterterrorism tactics and massive deployments in wars abroad. Yet after three years, Obama has escalated forces in Afghanistan, embraced the widespread use of unmanned drones to kill terrorists at the risk of civilian casualties, kept Guantánamo open, and killed Osama bin Laden in Pakistan in a thoroughly unilateral fashion. What he hasn't accomplished to any great degree is what most observers assumed would be the hallmark of his approach to foreign affairs—a full assertion of the soft power that makes hard power more effective. His 2008 campaign centered on a critique of President Bush's overreliance on hard power. Obama suggested he would rehabilitate the damaged image of America created by these excesses and show that the United States was not a cowboy nation. Upon taking office, he made fresh-start statements, such as his June 2009 remarks in Cairo, and embraced political means like dialogue, respectful multilateralism, and the use of new media, suggesting that he felt the soft power to change minds, build legitimacy, and advance interests was the key element missing from the recent US approach to the world—and that he would quickly remedy that defect. Yet President Obama's conception of soft power has curiously lacked the very quality that has made it most efficacious in the past—the values dimension. This may seem odd for a leader who is seen worldwide as an icon of morality, known for the motto "the audacity of hope" and his deployment of soaring rhetoric. Yet his governance has virtually ignored the values dimension of soft power, which goes beyond the tradecraft of diplomacy and multilateral consultation to aggressively assert the ideals of freedom in practical initiatives. The excision of this values dimension renders soft power a hollow concept. The Obama presidency has regularly avoided asserting meaningful soft power, particularly in its relations with three countries—Iran, Russia, and Egypt—where it might have made a difference not only for those countries but for American interests as well. His reaction to the challenges these countries have posed to the US suggest that it is not soft power itself that Obama doubts, but America's moral standing to project it.

Soft Power Low – Foreign Policy

So Po Low – incoherent Obama foreign policy (Ukraine, SCS, Syria, Iran, Israel, Climate change), low econ, simultaneous hard power decline

Robbins 5/29

{James S, syndicated foreign affairs columnist, Senior Fellow in National Security Affairs at the American Foreign Policy Council, former special assistant in the Office of the Secretary of Defense, Ph.D. Fletcher School of Law and Diplomacy, Professor at National Defense University and Marine Corps University, "Obama's West Point Speech Exposes his Foreign-Policy Failures," Washington Examiner, 2014, <http://washingtonexaminer.com/obamas-west-point-speech-exposes-his-foreign-policy-failures/article/2549082#THUR>}

President Obama promised a powerful speech on national-security policy on Wednesday to the graduates of the United States Military Academy. Instead, the chief executive reinforced the notion that in an increasingly dangerous world, he is in over his head. Obama's principal argument was that U.S. national security must not be based solely on military power, and that America cannot go it alone in the world. But this was no grand revelation; every recent president has believed the same thing. Even George W. Bush, falsely criticized for unilateralism, assembled a larger international coalition than any Obama has put together. Sign Up for the Politics Today newsletter! At West Point this week, the president claimed he was responding to unnamed "critics who think military intervention is the only way for America to avoid looking weak." However, our real challenge is not the appearance of weakness, but the reality of fading U.S. global power and leadership. Obama said that "by most measures, America has rarely been stronger relative to the rest of the world." But what measures did he have in mind? The U.S. share of global gross domestic product is declining, as is America's share of global defense spending. The Army is cutting troops and the Navy sheds ships. Obama is unilaterally dismantling America's nuclear arsenal as other nuclear powers modernize. The intelligence community suffered the worst counterintelligence failure in history, thanks to Edward Snowden. Adversary states no longer fear the United States, and friendly states no longer trust us. And, while 15 years ago, the U.S. confidently projected an era of space dominance, we are now reduced to begging Moscow for rockets. America's adversaries understand the nature of this decline far better than the president. When "masked men occupy a building in Ukraine," Obama intoned, "it is America that the world looks to for help." But why did these Russian-backed thugs think they could get away with it in the first place? And can the people of occupied Crimea still expect Obama to come to their rescue with more than a hashtag? The president also mentioned China's aggressive moves in the South China Sea, but rather than chastising Beijing he chose to blame Congress for not acting faster on the Law of the Sea Convention. He maintains with "every fiber of [his] being" that America is an exceptional nation, but only to the extent that the U.S. conforms to the norms imposed by other countries. Obama wants the United States to focus more on soft power, but his diplomatic efforts leave much to be desired. He claimed success in ongoing negotiations regarding the Iranian nuclear program, even as Iran's supreme leader, Ayatollah Ali Khamenei, said that those who support continuing the negotiations are traitors and jihad will continue until the U.S. is destroyed. He said the United States would

increase support for rebels in Syria but skipped over the chemical weapons “red line” debacle that ruined his credibility. In his speech, Obama didn't even bother to mention the Israeli-Palestinian train wreck that has humbled both his secretaries of State. The president brought up his pet cause of global climate change, another issue on which he has failed to build international consensus. And he reiterated his intention to close the detainee facility at Guantanamo Bay, which he promised to do his first day in office. At this rate, Gitmo will close when the remaining detainees die of old age. Ironically, Obama can point to more success through using force rather than diplomacy. His most noteworthy achievements - killing Osama bin Laden and dismantling the core al Qaeda network through drone strikes - were kinetic and mostly unilateral. Few would argue that, as American global military clout declines, it makes sense to shift emphasis to other elements of national power. But Obama has yet to demonstrate that he is capable of managing a complex, multifaceted global strategy. He has no strong track record of success even by his own metrics. Maybe he should stick to drones.

Saudi Soft Power High

Saudi Arabia has tons of soft power – oil, cultural influence, and regional partnerships

Gallarotti and Al-Filali, 12 (Giulio Gallarotti, Professor of Government and Tutor in the College of Social Studies at Wesleyan University, AND Isam Yahia Al-Filali, General Director of Alryadah, a Jeddah-based consultation firm, specializing in strategic planning and different aspects of knowledge economics, "Saudi Arabia's Soft Power", *International Studies* 49(3&4) 233–261, <http://isq.sagepub.com/content/49/3-4/233.abstract#ER>, DA: 7/8/2015)

When people are asked the question what is the source of Saudi Arabia's power, who would cite factors other than oil? This equation of Saudi power exclusively with its oil wealth is mistaken. Historically, a principal and the most consistent source of Saudi power at the domestic, regional and global levels has not been revenues from oil, but the cultural power that inheres in a Kingdom that is both the capital of the Muslim and Arab worlds. This soft power accounts for as much, if not more, of Saudi influence than even oil itself. To a large extent, this power explains why Saudi Arabia has remained stout in the face of the shock waves of the Arab Spring. This soft power also accounts for much of the leverage that the Kingdom enjoys in its region and the world at large. Ultimately, of course, Saudi Arabian power is grounded in both the hard power of its oil wealth and the soft power of its cultural importance. Hence, the Kingdom is endowed with extensive smart or cosmopolitan power (that is, the synthesis of soft and hard power). Events in the Middle East and North Africa have confronted Saudi Arabia with some of its greatest challenges as a nation due to its strong ties with the countries in the region and the Saudi's special eminence among the people of those countries. The political landscape has been transformed by popular movements calling for freedom, social justice and economic opportunities. The serious economic and political turbulence that confronts the region does not promise to abate anytime soon because of relentless resistance from the old regimes and the fledgling nature of the new political orders that continue to establish themselves. Saudi Arabia, given its special place among these nations, is at the centre of this regional transformation. In the greater sphere of global relations, Saudi Arabia faces a critical and uncertain future with the limitations of an oil economy, the US re-engaging from Iraq, and the controversy over a nuclear Iran. On the domestic front, Saudi Arabia too has to continue to modernize and prosper in the face of myriad political, economic and social challenges. Never has the need for a resolute continuation of the use of its hard and soft power been more pronounced in order for Saudi Arabia to effectively confront its domestic and international challenges. But while much has been said about its hard power, far too little attention has been paid to the role of Saudi soft power. This article is an attempt to analytically balance the power ledger. It assesses the modern day international, regional and domestic challenges facing Saudi Arabia and analyzes how the nation's soft power can be employed to effectively deal with those challenges. Section I identifies the general theoretical foundations of soft power. Section II takes an inventory of Saudi Arabia's principal sources of international and domestic soft power. Section III analyzes the potential of this soft power as a means of confronting the Kingdom's most pressing challenges and problems. Section IV offers brief concluding remarks.

China Soft Power High / US Soft Power Low

Chinese soft power high and rising RELATIVE to the US – all metrics and ability to spin events

Leitch 14

{Simon, Lecturer in IR specializing in East Asian politics and Chinese cultural influence (Griffith University), Ph.D. in IR, "China's Growing Influence: The Role of its Soft Power," Alochonaa, 2/3, <http://alochonaa.com/2014/02/03/chinas-growing-influence-the-role-of-its-soft-power/#THUR>}

The rise of China has become one of the most discussed features of international politics in the 21st century, and policymakers and media pundits around the world are involved in an unending debate about the near-term and long-term significance of China's return to great power status. Analysts are captivated by China's growing military potential, its cyber-weapons, its space program, its assertive nationalism and its growing economic leverage over its neighbors and trading partners. These are all interesting issues to be sure, but an underrated element of China's rise has been its rising "soft power" assets. For most academics to have soft power means having the ability to persuade others to want what you want, or to attract them to your cause through the strength of your argument or legitimacy of your actions. Of course, bribes and threats are a form of power often used in international politics (and often used by China) but threats and bribes are sometimes clumsy weapons to use. By crafting and advertising policies in such a way as they appear legitimate to outsiders, and by cultivating a positive national image, a state can operate with fewer barriers, less resistance and less resentment. Chinese soft power has grown rapidly in recent years. Thirty years ago China's only friends in the West were those seeking to use China as a counterweight to Soviet ambitions in Asia, or those members of the radical left who were duped into believing that communism was liberation. Today the story is different. Global public opinion surveys continue to show that China is perceived fairly favorably by large swathes of the world's populace, from the Asia-Pacific to Africa and Europe. China has garnered cooperation from a diverse group of states in areas such as trade, tourism, education and infrastructure development, and Chinese statesmen are sure to be given a warm welcome in almost any foreign capital. These developments are both causes and effects of Chinese soft power. Beijing has been working on enhancing its soft power for many years and is equipped with increasingly well-oiled soft power machinery. By opening China to tourism, foreign students and journalists whilst at the same time restricting foreign access to "approved" places the PRC has been able to present its best face to the world. With a tightly controlled state media and highly disciplined and knowledgeable spokespersons, the information flow out of China is carefully monitored, filtered and disseminated with the aim of projecting a positive image of China and the ruling regime. Foreign journalists and academics who propagate negative images of China are denied access for the future, and though such Chinese policies may themselves blur the lines between hard and soft power they do, in the end, contribute enormously to soft power assets by altering how it is permissible to discuss China in international society. Whereas Western politicians and journalists seem perfectly happy to label Kim Jong-un or various Iranian leaders as dictators, the government in Beijing has acquired a measure of legitimacy unheard of for a nominally communist state. The coming of the digital age, marked by greater

computerization and the mass utilization of the internet, has had important consequences for the exercise of soft power. Although Beijing has been adept at digital censorship it is important to note how Beijing has embraced the internet and new media to promote its message. Through translated press releases and dedicated foreign language broadcasts the PRC has challenged negative interpretations of its policies, advertised the positives of China's development, reached out to foreign constituents and argued its position in international disputes. Beijing now employs professional lobbyists in foreign capitals and it has been effective in promoting its self-serving version of history (to both foreign and domestic audiences) in a way few other major states can. China paints itself as a victim of foreign aggression, and has helped perpetuate an influential discourse about China's traditional culture and foreign policy which provide a convenient justification for its lack of democratization and territorial claims alike. As China has grown more powerful and the United States has staggered under the weight of financial and political stagnation, the PRC has begun to offer itself as an alternative model of government for others to emulate, and as an alternative to the United States as a great power partner. China's veto powers in the UN and its growing importance as both market and supplier make it a valuable ally, and it is unsurprising that many states, particularly authoritarian regimes, see a partnership with China as a way of loosening the grip of liberal-democratic powers over the international system. If China wants the United States and its allies to loosen their grip on the international system, so too do many others. By presenting its foreign policy as a quest for sovereignty, non-interference, anti-hegemonism and economic development, whilst at the same time giving legitimacy to corrupt, authoritarian regimes, Beijing has made others realize that they want what Beijing wants.

China's rise huge – trades off with Western soft power – via economic strength and deception over human rights

Debono 13

{James, chief planning reporter for MaltaToday, syndicated foreign affairs columnist, "[ANALYSIS] The Rise of China's Soft Power," MaltaToday, 9/17, <http://www.maltatoday.com.mt/news/national/29948/the-rise-of-china-s-soft-power-20130917#.U5E1xvldXT9#THUR>}

"By buying companies, exploiting natural resources, building infrastructure and giving loans all over the world, China is pursuing a soft but unstoppable form of economic domination." This is the sombre picture painted by Spanish journalists Juan Pablo Cardenal and Heriberto Araujo, authors of *The Silent Chinese Conquest*. They warn that Beijing's unlimited financial resources will enable China to erode the competitive edge of Western firms, kill jobs in Europe and America and blunt criticism of human rights abuses in China. Now Malta is welcoming a state-owned Chinese company to invest a considerable sum of cash in the ailing state utility, Enemalta. Given its €800 million in debt, much of it guaranteed by the government and piling onto its enormous national debt bill, the Maltese business community has welcomed the news with open arms. The Greens claim the company, whose subsidiary is a renewable energy firm, is

looking for a foothold in the EU to undercut the solar panel market. Nationalist leader Simon Busuttil has echoed these concerns and tried to pooh-pooh Labour's embrace of privatisation. But should China's rise from the ashes of Maoist revolution into global domination preoccupy the Maltese? As analysts Kevin Yao and Alan Wheatley point out, while China's flood of keenly priced manufactured goods has hollowed out jobs in advanced and emerging nations alike, this has also helped cap inflation, making an array of consumer goods affordable for tens of millions of people for the first time. One case in point is solar panels, which became more accessible thanks to cheap Chinese labour. But it is this unfair competition which risks eroding workers' rights in Europe, thanks to the low cost alternative from China. Chinese investment has been crucial in offering emerging nations and their cash-starved economies new opportunities for growth, and a greater independence from the United States and European multinationals. To a certain extent, China has changed the rules of the game, but on the other hand the rise of its own middle class offers an opportunity for Western countries to enter the market for luxury and high-tech goods.

Even if we lose Chinese soft power is low, HUGE squo push – That momentum means US decline inevitable

Xinhua 14

{“China to Promote Cultural Soft Power,” Via China Daily, 1/1,
http://www.chinadaily.com.cn/china/2014-01/01/content_17208354.htm#THUR}

BEIJING -- President Xi Jinping has vowed to promote China's cultural soft power by disseminating modern Chinese values and showing the charm of Chinese culture to the world. Efforts are needed to build China's national image, Xi said when delivering a speech at a group study session of members of the Political Bureau of the Communist Party of China Central Committee on Monday. China should be portrayed as a civilized country featuring rich history, ethnic unity and cultural diversity, and as an oriental power with good government, developed economy, cultural prosperity, national unity and beautiful mountains and rivers, Xi said. China should also be marked as a responsible country that advocates peaceful and common development, safeguards international justice, and makes contributions to humanity, and as a socialist country which is open, amicable, promising and vibrant. At the session, Xi called for efforts to promote advanced socialist culture, deepen reform in the cultural system, and enhance people's cultural creativity, moves that he believed will raise China's overall cultural strength and competitiveness. In order to build a solid foundation for the nation's cultural soft power, China needs to deepen the reform in its cultural system, promote socialist core values and push forward the cultural industry. He stressed more publicity for modern Chinese values, or socialist values with Chinese characteristics. The publicity and interpretation of the Chinese Dream should be integrated with such values, Xi noted. The Chinese Dream means the Chinese people's recognition and pursuit of values, the building of China into a well-off society in an all-round way and the great rejuvenation of the Chinese nation, he said. The Chinese Dream also means that every Chinese will realize his own dream in fulfilling the Chinese Dream, the highest

common factor for the unity of the Chinese nation, and the sincere aspirations of the Chinese nation to contribute to the mankind's peace and development, Xi added. To show charm of the Chinese culture to the world, Xi said it was important to accommodate Chinese cultural inheritance with contemporary culture and a modern society. Mass media, groups and individuals should play their roles in displaying the charm to the world, he added. To strengthen China's soft power, the country needs to build its capacity in international communication, construct a communication system, better use the new media and increase the creativity, appeal and credibility of China's publicity, Xi said. "The stories of China should be well told, voices of China well spread, and characteristics of China well explained," the President said.

China Soft Power High – A2 Impossible BC Regime

Democracy and human rights perception irrelevant to Chinese Soft Power

Leitch 14

{Simon, Lecturer in IR specializing in East Asian politics and Chinese cultural influence (Griffith University), Ph.D. in IR, "China's Growing Influence: The Role of its Soft Power," Alochoanaa, 2/3, <http://alochonaa.com/2014/02/03/chinas-growing-influence-the-role-of-its-soft-power/#THUR>}

Most analyses of Chinese soft power believe that China's regime is a liability to its soft power, and insinuate that democracy is a key element of soft power. Similarly, it is often thought that Chinese soft power is undermined by Beijing's relations with dictators and human rights abusers. This is wrongheaded for a number of reasons. First, China's soft power is often directed towards undemocratic regimes or states that have greater concerns than Chinese suffrage, and it has successfully attracted them. Second, China's government appears to have built legitimacy perfectly well to international audiences irrespective of its lack of democracy or high levels of corruption. Which of the following figures was last able to meet President Obama in the Oval Office; the Dalai Lama or the President of the PRC? If that is not extending legitimacy then the concept is too vague to quibble about it further.

China Soft Power Low

Chinese soft power is nonexistent – polling data, influence isn't political, slowing growth, territorial claims, corruption, IPR concerns, social issues – best studies show

Schmitt, 14 (Gary J. Schmitt, co-director of the Marilyn Ware Center for Security Studies at AEI and the director of AEI's Program on American Citizenship, executive director of the President's Foreign Intelligence Advisory Board during President Ronald Reagan's second term, 6-19-2014, "A hard look at soft power in East Asia", AEI, <http://www.aei.org/publication/a-hard-look-at-soft-power-in-east-asia/#ER>, DA: 7-6-2015)

China. China, the other East Asian great power, is no less interested in soft power.[7] In recent years, there has been a virtual explosion of articles in Chinese journals discussing the utility of soft power. For example, in 1994, there were only a handful of pieces written on the topic; in 2008, there were more than 600. Nor was this interest only academic. Chinese President Hu Jintao made a very public pronouncement in 2007 about China's need to enhance its soft-power efforts. China's soft-power campaign has a number of elements to it. Among the most prominent is the establishment of Confucius Institutes on university and secondary-school campuses around the world. The underlying assumption behind the program is that China will become more appealing if more people come to understand the country's culture and can read and speak Chinese. Between 2004 and 2007, a new institute was opening every four days. With more than 300 institutes already, the goal is to have 1,000 operating by the decade's end. Other parts of China's program include having a relatively open door for foreign students to study in China, hosting world fairs and the Olympics, setting up English-speaking China Central Television bureaus around the world, flooding major newspapers with China Daily inserts, and, perhaps most importantly, providing a national development model, the Beijing Consensus, as an alternative to the Washington Consensus, which was put forward by American and European-created entities like the World Bank and International Monetary Fund. "Former Chinese president Hu Jintao made a very public pronouncement in 2007 about China's need to enhance its soft-power efforts." In spite of these efforts, China, too, has seen only marginal improvement in its image globally. Analyzing a variety of polling data over the past decade, American sinologist David Shambaugh concludes that "China's global image remains mixed and the majority of the world is very ambivalent about China's rise." [8] In a Pew Research Center poll released in mid-2013, for instance, China was still clearly seen in a less favorable light than the United States. [9] Only in the Middle East was that not the case. And among the major states of East Asia, the difference in favorability between the United States and China remained substantial. Why the gap between China's efforts at soft power and the results? First, although there is much to admire in Chinese civilization, this does not necessarily mean one is attracted to Chinese government or policies. [10] The fact that one might admire Greece as the birthplace of democracy and philosophy hardly means one would look to the Greek government today as a model of governance. Second, Chinese foreign aid predominantly takes the form of loans or assistance that require the recipient country to use Chinese companies and labor to carry out a specific project. The nations on the receiving end are happy to get the assistance, but they are under no illusions about Chinese intentions. As one Pew polling director noted: "[G]lobal publics believe China also wields its power in a self-interested manner. These views feed the perception

that the People's Republic has yet to become, in the words of former US diplomat and World Bank President Robert Zoellick, a 'responsible stakeholder' in the international system." [11]

Third, both inside and outside of China, there is a sense that China's continued progress depends on significant changes to its existing development model. China's economic growth appears to be slowing as it hits the middle-income trap, and it suffers from substantial problems in the areas of demographics, the environment, and social cohesion and corruption. As a result, optimism that China's leaders had discovered a unique formula for how a nation might rapidly rise, and that they continue to do so without increased liberalization, has waned considerably. Moreover, the attractiveness of "the China market" has diminished as problems with intellectual property rights, rising labor costs, and domestic protectionist measures continue to plague foreign investors. As the World Bank's China 2030 report succinctly notes, "After more than 30 years of rapid growth, China has reached another turning point in its development path when a second strategic, and no less fundamental, shift is called for." [12]

The fact that, according to several reports, a favored reading of senior Politburo members in late 2012 was Alexis de Tocqueville's *L'Ancien Régime et la Révolution*—a book that details the disaster that befell the French government as the population's "rising expectations," among other things, were not met—suggests doubts even among Chinese elite over how sustainable the Chinese model is. [13]

And, finally, China's more assertive behavior toward its neighbors—in the South China and East China Seas and along the Indian-Chinese border—and its continuing military buildup have undercut its "peaceful rise" narrative with countries in the region and with the United States. Former paramount leader Deng Xiaoping's admonition to his countrymen that China should "maintain a low profile" and "hide our capacities and bide our time" has been replaced, it seems, with the China Dream. [14]

Combined with the strategic uncertainties that arise from China's system of closed decision making, Beijing's hard power policies have created a dynamic in which its soft-power efforts have been less effective than they might otherwise have been.

Russia Soft Power Low

Russian soft power low and swamped by alt causes

Nye 13

{Joseph, Harvard Professor, "What China and Russia Don't Get about Soft Power," FP, April, http://www.foreignpolicy.com/articles/2013/04/29/what_china_and_russia_don_t_get_about_soft_power#THUR}

When Foreign Policy first published my essay "Soft Power" in 1990, who would have expected that someday the term would be used by the likes of Hu Jintao or Vladimir Putin? Yet Hu told the Chinese Communist Party in 2007 that China needed to increase its soft power, and Putin recently urged Russian diplomats to apply soft power more extensively. Neither leader, however, seems to have understood how to accomplish his goals. Power is the ability to affect others to get the outcomes one wants, and that can be accomplished in three main ways -- by coercion, payment, or attraction. If you can add the soft power of attraction to your toolkit, you can economize on carrots and sticks. For a rising power like China whose growing economic and military might frightens its neighbors into counter-balancing coalitions, a smart strategy includes soft power to make China look less frightening and the balancing coalitions less effective. For a declining power like Russia (or Britain before it), a residual soft power helps to cushion the fall. The soft power of a country rests primarily on three resources: its culture (in places where it is attractive to others), its political values (when it lives up to them at home and abroad), and its foreign policies (when they are seen as legitimate and having moral authority). But combining these resources is not always easy. Establishing, say, a Confucius Institute in Manila to teach Chinese culture might help produce soft power, but it is less likely to do so in a context where China has just bullied the Philippines over possession of Scarborough Reef. Similarly, Putin has told his diplomats that "the priority has been shifting to the literate use of soft power, strengthening positions of the Russian language," but as Russian scholar Sergei Karaganov noted in the aftermath of the dispute with Georgia, Russia has to use "hard power, including military force, because it lives in a much more dangerous world ... and because it has little soft power -- that is, social, cultural, political and economic attractiveness."

NSA Hurts Soft Power

Public surveillance erodes soft power – undercuts diplomacy and destroys influence with key nations

Johnson, 14 (Joe Johnson, teaches strategic planning for public diplomacy at the National Foreign Affairs Training Center, consults on government communication and technology after a career in the United States Foreign Service, 1/21/2014, "Soft Power and Nosey Uncle Sam", Public Diplomacy Council, <http://www.publicdiplomacycouncil.org/commentaries/01-21-14/soft-power-and-nosey-uncle-sam#ER>, DA: 7-6-2015)

Last year's revelations about United States electronic surveillance delivered a body blow to America's soft power, with no detectable public reaction from America's diplomats. After President Obama's speech, the United States can begin a more robust dialogue on the subject – if public diplomacy leaders take action. The President's remarks last Friday at the Justice Department were directed to his fellow citizens, but they acknowledged the interest of foreigners in this subject – an element that has been missing up to now in our national debate. The propriety of U.S. signals intelligence gathering was hardly on the radar screen when I was active in PD. But now, what foreign publics and their leaders think about it matters. · In Europe at least, details about NSA collection programs as described in documents purloined and publicized by former NSA contractor Edward Snowden have eroded public trust in the U.S. as a defender of freedom. · Such a basic problem of perception makes it more difficult for U.S. diplomats to advance on a range of issues, from promoting democracy to advancing trade negotiations. · Germany's Angela Merkel, Brazil's Dilma Rousseff and others were forced to react to revelations that their phones had been tapped, personalizing and sensationalizing the issue and awakening an ever-present anti-Americanism worldwide. · The witting and unwitting involvement of American information technology firms damaged their reputations and it may be eroding their global market share. Google and its kin have been a key positive element of the United States' image and soft power, not to mention its balance of trade. · Challenges to the current governance of the Internet, conducted by the U.S.-based ICANN and founded on open access to information, spread beyond Russia and China to include nations like Brazil. This will come up at the International Telecommunications Union conference next October in Korea, where nations are already challenging U.S. control of the Internet. Trust, an anti-American narrative, and concrete national interests. This would seem to call for active involvement by public diplomacy. In the heat of Snowden's first revelations last spring and summer, public diplomacy officers had no talking points beyond defensive press guidance. The issue was too hot, and might easily leak into Washington's hyper-politicized environment.

NSA Hurts Influence/Alliances

NSA surveillance tanks hard and soft power, alliances – makes diplomacy ineffective

Quinn, 13 (Adam Quinn, Senior Lecturer in International Politics at University of Birmingham, 10-28-2013, "Obama's soft power a hard sell after NSA revelations", Conversation, <http://theconversation.com/obamas-soft-power-a-hard-sell-after-nsa-revelations-19572#ER>, DA: 7-6-2015)

For presidents, like sports team managers, the tough weeks tend to outnumber the jubilant. But even by the standards of an unforgiving job, Barack Obama could be forgiven for feeling unusually buffeted of late. Many of the blows have come on the domestic front, with the all-consuming stand off of the government shutdown segueing into frantic efforts to defend and repair the roll-out of Obamacare amid charges of fatal technological incompetence. But if he were tempted to seek solace in the autonomy of foreign policy – as modern presidents have been wont to do – there has been little consolatory triumph to be found. In August and September, he was caught in a mighty tangle over Syria, threatening military strikes over its chemical weapons use before being hamstrung first by Britain's refusal to join the charge and then by the reluctance of his own Congress. The legacy of that mess continues to work itself out in unpredictable ways, such as increasingly public tensions between the US and Saudi Arabia, hitherto one of its more solid allies. Though the eventual Russian-orchestrated deal to remove Syria's chemical weapons was a respectable one given the circumstances, the episode as a whole spoke of an America straining to translate its power into influence, or to maintain a united front among its friends. Now the rolling scandal over National Security Agency surveillance, triggered by the mass leak of secrets by Edward Snowden, has entered another phase of intensity, this time centred on Europe. Revelations that the US tapped the phone of German Chancellor Angela Merkel, operated numerous "listening posts" on European soil, and sucked up vast quantities of communications data from millions of citizens across Europe have broken in the press. Public expressions of displeasure have been forthcoming, including a European Union statement. Taken together, these vignettes of public dissention will be enough to make many ask the question: is the US losing its influence even over its allies? Is this just a tricky moment for a particular president, or harbinger of a broader trend? Global shift First, the necessary caveats: enduring alliance relationships resemble long marriages, in that the mere presence of moments of strain, or even audible arguments, cannot be taken as evidence of imminent separation. Looking back over the longer-term history of America's relations with its allies, episodes such as the Vietnam War, the "Euromissile" crisis of the 1980s, and the controversial interventions in the former Yugoslavia in the 1990s, demonstrate that sharp differences of opinion and conflicting priorities are no radical new state of affairs. And however unhappy they may be with their recent treatment, it is not obvious that countries such as Germany, France or Saudi Arabia have anywhere to go if they did decide the time had come to tout for alternative alliance partners. It is not entirely clear how European annoyance might manifest in ways that have practical importance. It is true they have it in their power to threaten progress on the Transatlantic Trade and Investment Partnership process, but it is not clear that such an action would harm the US more than Europe itself. In short, even if they are disgruntled, necessity may ultimately prove a sufficient force to help them get over it. The reason present

friction between the US and its allies carries greater weight, however, is that it arises in the context of a global shift in power away from the US and its established allies and towards new powers. The prospect of “American decline” in terms of relative international power is the focus of a great deal of debate over both substance and semantics. But the central fact is that even the part of the US’s own intelligence apparatus charged with long-term foresight regards it as established that within 20 years the world will have transitioned from the “unipolar” American dominance of the first post-Cold War decades to a world in which multiple centres of power must coexist. The centre of economic gravity has already shifted markedly towards Asia during the last decade. This certainly does not mean any single new power is about to rise to replace the US as a hegemonic force. Nor does it mean the US will be going anywhere: the scale of its existing advantages across a range of fronts – military, economic, institutional – is sufficiently great that it is assured a prominent place at the table of whatever order may come. What it does mean is that Americans must presently be engaged in thinking carefully about how best to leverage their advantages to retain the maximum possible influence into the future. If they cannot continue to be first among equals in managing the world order, they will wish at least to ensure that order is one that runs in line with their own established preferences. Soft power

Many of those who are optimistic about the ability of the US to pull off this project of declining power without declining influence place emphasis on two things: the extent to which the US has soft power due to widespread admiration for its political and cultural values, and the extent to which it has locked in influence through the extent of its existing networks of friends and allies. Even if these advantages cannot arrest America’s decline on harder metrics, if played properly they can mitigate its consequences and secure an acceptable future. Shoring up support from like-minded countries such as those of Europe ought to be the low-hanging fruit of such an effort. So the current problems do harm on both fronts. It will be difficult to maintain the allure of soft power if global opinion settles on the view that American political discord has rendered its democracy dysfunctional at home, or that its surveillance practices have given rein to the mores of a police state. And it will be harder to preserve American status through the force of its alliances if its politicians’ economic irresponsibility (for example, publicly contemplating a default on American national debt) or scandals over surveillance or drone strikes alienate their public or cause their leaders to question the extent to which they really are on the same side as the US. Obama’s day-to-day foreign policy struggles should not be simplistically taken as signs of collapsing American influence. But if the long-term plan is to carefully manage relative decline so as to preserve maximum influence, episodes such as those his country has faced since August do nothing to boost the prospects of success.

A2 Surveillance Hurts Soft Power

US soft power is high despite surveillance – it's irrelevant to overall opinion – direct polling data vis-à-vis China

Pew, 2014 (Pew Research Center, U.S., JULY 14, 2014, "Global Opposition to U.S. Surveillance and Drones, but Limited Harm to America's Image", Pew Research Center's Global Attitudes Project, <http://www.pewglobal.org/2014/07/14/global-opposition-to-u-s-surveillance-and-drones-but-limited-harm-to-americas-image/#ER>, DA: 7-10-2015)

Revelations about the scope of American electronic surveillance efforts have generated headlines around the world over the past year. And a new Pew Research Center survey finds widespread global opposition to U.S. eavesdropping and a decline in the view that the U.S. respects the personal freedoms of its people. But in most countries there is little evidence this opposition has severely harmed America's overall image. In nearly all countries polled, majorities oppose monitoring by the U.S. government of emails and phone calls of foreign leaders or their citizens. In contrast, Americans tilt toward the view that eavesdropping on foreign leaders is an acceptable practice, and they are divided over using this technique on average people in other countries. However, the majority of Americans and others around the world agree that it is acceptable to spy on suspected terrorists, and that it is unacceptable to spy on American citizens. Another high-profile aspect of America's recent national security strategy is also widely unpopular: drones. In 39 of 44 countries surveyed, majorities or pluralities oppose U.S. drone strikes targeting extremists in countries such as Pakistan, Yemen and Somalia. Moreover, opposition to drone attacks has increased in many nations since last year. Israel, Kenya and the U.S. are the only nations polled where at least half of the public supports drone strikes. Despite these misgivings about signature American policies, across 43 nations, a median of 65% express a positive opinion about the U.S. And these overall ratings for the U.S. are little changed from 2013. Moreover, President Obama is still largely popular internationally – across 44 nations, a median of 56% say they have confidence in him to do the right thing in world affairs. And, while Obama no longer has the same high levels of popularity that he enjoyed immediately after his election in 2008, there has been very little change in his appeal over the past year. The biggest declines in his ratings since last year are found in two nations where the U.S. has listened to the private phone conversations of national leaders: Germany (from 88% confident in 2013 to 71% confident now) and Brazil (69% in 2013, 52% now). Obama's favorability is also down considerably in Russia, reflecting recent tensions over the crisis in Ukraine. Only 15% of Russians currently express confidence in the American president, down from an already low 29% in 2013. U.S. favorability has also declined dramatically – just 23% of Russians say they have a favorable opinion of the U.S., less than half of the 51% registered in last year's survey. In spite of the unpopularity of U.S. spying and its use of drones, America also remains more popular globally than China, its principal rival in world affairs. A median of 49% of the publics surveyed hold a positive view of China. And the U.S. is still considered the world's top economic power, although this is less true today than it was before the Great Recession. However, looking to the future, a median of 50% of those surveyed in both 2013 and 2014, up from 41% last year, see China eventually supplanting America as the dominant world superpower. But China's rising power also generates its own anxieties, especially in its immediate neighborhood. In particular, there are strong concerns in Asia that territorial

disputes between China and its neighbors will lead to military conflict. More than seven-in-ten in the Philippines, Japan, Vietnam, South Korea and India say this is a concern. And two-thirds of Americans agree, as do 62% in China itself. These are among the major findings of a new survey by the Pew Research Center, conducted in 44 countries among 48,643 respondents from March 17 to June 5, 2014. The survey also finds that in most nations, young people are more favorable than their elders toward both the U.S. and China. The Snowden Effect Disclosures by former National Security Administration (NSA) contractor Edward Snowden about NSA spying revealed the U.S. government's vast capacity to intercept communications around the world. The Snowden revelations appear to have damaged one major element of America's global image: its reputation for protecting individual liberties. In 22 of 36 countries surveyed in both 2013 and 2014, people are significantly less likely to believe the U.S. government respects the personal freedoms of its citizens. In six nations, the decline was 20 percentage points or more. Still, the U.S. has a relatively strong reputation for respecting personal freedoms compared with the other major nations tested on the survey. A median of 58% believe the American government respects individual liberties, while 56% say this about France, 36% about China, and only 28% say it about the Russian government.¹ And while the Snowden revelations have harmed aspects of America's image, overall ratings for the U.S. remain mostly positive. Globally, the U.S. has a higher favorability rating than China. This is especially true in Europe – across the seven European Union nations surveyed, a median of 66% express a favorable opinion of the U.S., while just 39% feel this way about China. The U.S. is also considerably more popular in Latin America, while both countries receive mostly high marks in Asia and Africa. The Middle East is the clear exception. China's favorability in the region is not especially high, but is higher than that for the U.S. Anti-Americanism has been common in many Middle Eastern nations throughout the Obama presidency, as was the case during the George W. Bush era. And again this year some of the lowest ratings for the U.S. are found in the region. Only 19% of Turks and 12% of Jordanians offer a favorable opinion of the U.S., and at 10% Egypt gives the U.S. its lowest rating in the survey.

Soft Power Good (SPG)

SPG – Laundry Lists

Leveraging effective US soft power is key to prevent a laundry list of existential scenarios, including terrorism, disease, proliferation, alliances and genocide

Lagon, 11 (Mark P. Lagon, International Relations and Security Chair at Georgetown University's Master of Science in Foreign Service Program and adjunct senior fellow at the Council on Foreign Relations. He is the former US Ambassador-at-Large to Combat Trafficking in Persons at the US Department of State, Sept/Oct 2011, "The Value of Values: Soft Power Under Obama", World Affairs Journal, <http://www.worldaffairsjournal.org/article/value-values-soft-power-under-obama#ER>, DA: 7-7-2015)

Despite large economic challenges, two protracted military expeditions, and the rise of China, India, Brazil, and other new players on the international scene, the United States still has an unrivaled ability to confront terrorism, nuclear proliferation, financial instability, pandemic disease, mass atrocity, or tyranny. Although far from omnipotent, the United States is still, as former Secretary of State Madeleine Albright called it, "the indispensable nation." Soft power is crucial to sustaining and best leveraging this role as catalyst. That President Obama should have excluded it from his vision of America's foreign policy assets—particularly in the key cases of Iran, Russia, and Egypt—suggests that he feels the country has so declined, not only in real power but in the power of example, that it lacks the moral authority to project soft power. In the 1970s, many also considered the US in decline as it grappled with counterinsurgency in faraway lands, a crisis due to economic stagnation, and reliance on foreign oil. Like Obama, Henry Kissinger tried to manage decline in what he saw as a multipolar world, dressing up prescriptions for policy as descriptions of immutable reality. In the 1980s, however, soft power played a crucial part in a turnaround for US foreign policy. Applying it, President Reagan sought to transcend a nuclear balance of terror with defensive technologies, pushed allies in the Cold War (e.g., El Salvador, Chile, Taiwan, South Korea, and the Philippines) to liberalize for their own good, backed labor movements opposed to Communists in Poland and Central America, and called for the Berlin Wall to be torn down—over Foggy Bottom objections. This symbolism not only boosted the perception and the reality of US influence, but also hastened the demise of the USSR and the Warsaw Pact. For Barack Obama, this was the path not taken. Even the Arab Spring has not cured his acute allergy to soft power. His May 20, 2011, speech on the Middle East and Northern Africa came four months after the Jasmine Revolution emerged. His emphasis on 1967 borders as the basis for Israeli-Palestinian peace managed to eclipse even his broad words (vice deeds) on democracy in the Middle East. Further, those words failed to explain his deeds in continuing to support some Arab autocracies (e.g., Bahrain's, backed by Saudi forces) even as he gives tardy rhetorical support for popular forces casting aside other ones. To use soft power without hard power is to be Sweden. To use hard power without soft power is to be China. Even France, with its long commitment to realpolitik, has overtaken the United States as proponent and implementer of humanitarian intervention in Libya and Ivory Coast. When the American president has no problem with France combining hard and soft power better than the United States, something is seriously amiss.

Soft power is key to international cooperation – that solves disease, terrorism, and warming

Nye 08 (Joseph S. Nye Jr., created the theory of “soft power,” distinguished service professor and former dean of Harvard’s Kennedy School of Government, PhD in Political Science from Harvard, 3/7/08, <http://abs.sagepub.com/cgi/content/abstract/51/9/1351>)

Etzioni is correct that a successful policy of security first will require the combination of hard and soft power. Combining the two instruments so that they reinforce rather than undercut each other is crucial to success. Power is the ability to get the outcomes one wants. In the past, it was assumed that military power dominated most issues, but in today’s world, the contexts of power differ greatly on military, economic, and transnational issues. These latter problems, including everything from climate change to pandemics to transnational terrorism, pose some of the greatest challenges we face today, and yet few are susceptible to purely military solutions. The only way to grapple with these problems is through cooperation with others, and that requires smart power—a strategy that combines the soft power of attraction with the hard power of coercion. For example, American and British intelligence agencies report that our use of hard power in Iraq without sufficient attention to soft power has increased rather than reduced the number of Islamist terrorists throughout the past 5 years. The soft power of attraction will not win over the hard core terrorists but it is essential in winning the hearts and minds of mainstream Muslims, without whose support success will be impossible in the long term. Yet all the polling evidence suggests that American soft power has declined dramatically in the Muslim world. There is no simple military solution that will produce the outcomes we want. Etzioni is clear on this and highly critical of the failure to develop a smart power strategy in Iraq. One wishes, however, that he had spent a few more pages developing one for Iran.

SPG – Heg

Soft power & perception is key to effective leadership – builds alliances, checks counter-balancing, maintains domestic support

Jervis 09 (professor of international politics at Columbia University. (Robert, Unipolarity: A Structural Perspective, World Politics Volume 61, Number 1, January 2009)

To say that the system is unipolar is not to argue that the unipole can get everything it wants or that it has no need for others. American power is very great, but it is still subject to two familiar limitations: it is harder to build than to destroy, and success usually depends on others' decisions. This is particularly true of the current system because of what the U.S. wants. If Hitler had won World War II, he might have been able to maintain his system for some period of time with little cooperation from others because "all" he wanted was to establish the supremacy of the Aryan race. The U.S. wants not only to prevent the rise of a peer competitor but also to stamp out terrorism, maintain an open international economic system, spread democracy throughout the world, and establish a high degree of cooperation among countries that remain juridically equal. Even in the military arena, the U.S. cannot act completely alone. Bases and overflight rights are always needed, and support from allies, especially Great Britain, is important to validate military action in the eyes of the American public. When one matches American forces, not against those of an adversary but against the tasks at hand, they often fall short. Against terrorism, force is ineffective without excellent intelligence. Given the international nature of the threat and the difficulties of gaining information about it, international cooperation is the only route to success. The maintenance of international prosperity also requires joint efforts, even leaving aside the danger that other countries could trigger a run on the dollar by cashing in their holdings. Despite its lack of political unity, Europe is in many respects an economic unit, and one with a greater gdp than that of the U.S. Especially because of the growing Chinese economy, economic power is spread around the world much more equally than is military power, and the open economic system could easily disintegrate despite continued unipolarity. In parallel, on a whole host of problems such as aids, poverty, and international crime (even leaving aside climate change), the unipole can lead and exert pressure but cannot dictate. Joint actions may be necessary to apply sanctions to various unpleasant and recalcitrant regimes; proliferation can be stopped only if all the major states (and many minor ones) work to this end; unipolarity did not automatically enable the U.S. to maintain the coalition against Iraq after the first Gulf War; close ties within the West are needed to reduce the ability of China, Russia, and other states to play one Western country off against the others. But in comparison with the cold war era, there are fewer incentives today for allies to cooperate with the U.S. During the earlier period unity and close coordination not only permitted military efficiencies but, more importantly, gave credibility to the American nuclear umbrella that protected the allies. Serious splits were dangerous because they entailed the risk that the Soviet Union would be emboldened. This reason for avoiding squabbles disappeared along with the USSR, and the point is likely to generalize to other unipolar systems if they involve a decrease of threats that call for maintaining good relations with the superpower. This does not mean that even in this particular unipolar system the superpower is like Gulliver tied down by the Lilliputians. In some areas opposition can be self-defeating. Thus for any country to undermine American leadership of the international economy would be to put its own economy at risk,

even if the U.S. did not retaliate, and for a country to sell a large proportion of its dollar holding would be to depress the value of the dollar, thereby diminishing the worth of the country's remaining stock of this currency. Furthermore, cooperation often follows strong and essentially unilateral action. Without the war in Iraq it is not likely that we would have seen the degree of cooperation that the U.S. obtained from Europe in combating the Iranian nuclear program and from Japan and the PRC in containing North Korea. Nevertheless, many of the American goals depend on persuading others, not coercing them. Although incentives and even force are not irrelevant to spreading democracy and the free market, at bottom this requires people to embrace a set of institutions and values. Building the world that the U.S. seeks is a political, social, and even psychological task for which unilateral measures are likely to be unsuited and for which American military and economic strength can at best play a supporting role. Success requires that others share the American vision and believe that its leadership is benign.

SPG – Terrorism

Soft power is critical to eliminating terrorism – it's key to coalition building, legal institutions, and stemming recruitment

CSR, 14 (this text is a paraphrased transcript of a roundtable seminar of security experts by the CSR; these security experts include Fatma Ceren Yazgan, Deputy Director General for Security and Intelligence Affairs at the Turkish Ministry of Foreign Affairs; Heidi Meyer, Political Advisor to the Commander of NATO Allied Land Command; and David Blose, political analyst at LANDCOM. "The Role of Diplomacy and Soft Power in Combatting Terrorism: Concepts, Fighting Methods and Case Studies", Center for Strategic Research Workshop Report, http://www.coedat.nato.int/publication/workshop_reports/04-Diplomacy_Soft_Power_Report.pdf#ER, p. 5-7, date is not given but the pdf was published 9/4/2014, DA: 7/9/2015)

Mrs. Fatma Ceren Yazgan, Deputy Director General for Security and Intelligence Affairs at the Turkish Ministry of Foreign Affairs, expressed that diplomacy and the criminal justice system have key roles in combatting terrorism. The United Nations Charter and the Council of Europe agreements which set the international legal framework for combatting terrorism have been drawn up through negotiations carried out between various countries through diplomatic channels. As every country has a different set of regulations, diplomacy is the most fundamental instrument to ensure convergence between these regulations and develop a common understanding in the fight against terrorism. Mrs. Yazgan pointed out that although there is no definition for terrorism provided by the United Nations, there are decisions in this direction. She said that even though States lack confidence in each other, they tend to cooperate as they perceive threats. Such a process occurred after 2001. Turkey could not obtain sufficient support in the fight against terrorism from the international community before that date. Additionally, PKK terrorism was often considered as a matter of human rights in multilateral platforms. Although Turkey might have had past deficiencies in its legal framework for criminal justice, this does not change the fact that PKK is a terrorist organization. Turkey also adopted soft power elements as fundamental political instruments to fight against the PKK without alienating its Kurdish citizens in any way. For example expressions like "Kurdish terrorism" have never been used. She also stated that the European Union listed the PKK as a terrorist organization in 2002 as a result of the post- 2001 threat perceptions. Underlining the importance of international cooperation and experience-sharing in the fight against terrorism, Yazgan reminded that the Global Counterterrorism Forum, co-chaired by Turkey and the United States, was established with the participation of 29 countries and the European Union in 2011. The main objectives of the forum are to strengthen the fight against terrorism by sharing experiences and reinforcing the criminal justice approach. Educational and collaborative projects are planned to be carried out through the "Fund" established under the Forum. Radicalization continues to exist in Western Europe despite all countermeasures. Terrorist organizations in Syria have strengthened also taking advantage from the current economic crisis environment. Although al-Qaeda lost its power in Afghanistan, the ideology influenced by this organization has gained ground in the Middle East. In this context, Turkey will continue to share its experiences through both NATO and its individual initiatives. Organizational Structure of the United States Department of State in use of Soft Power Heidi Meyer, Political Advisor to the Commander of NATO Allied Land

Command (LANDCOM), pointed out that the U.S. Department of State has been trying to organize in the field of soft power since 2010 and taken serious decisions to that end; U.S. President Barack Obama instructed to mainly employ soft power elements instead of armed forces in the fight against terrorism, thus a document titled “the Quadrennial Diplomacy and Development Review” was produced as the first institutional step in this direction in 2010. This document draws a framework on how to shape foreign policy on soft power and aims to create a consistent capacity for civilians against terrorist threats. Accordingly, different units at the Department of State with the same purpose gathered under the so-called “J Bureau”. She expressed that the “J Bureau” has been created since threats are multifaceted today, thus strategies could be developed in a coordinated way; bilateral and multilateral diplomacy could be conducted and efforts and practices could be carried out to increase the capacity of resident partners in different regions of the world. Stating that “J Bureau” allows to create a versatile, robust and integrated fighting system, Meyer expressed that the aim is to develop cooperation between all the institutions and agencies within the state and collaborative work culture between diplomats and other government employees and to fight against terrorism in an integrated structure. She also added that efforts aimed at maintaining civil security and reducing poverty and unemployment are being exerted via USAID and similar organizations with a view to narrowing social grounds where terrorist organizations could gain footholds, taking into account that ideological and military presence of terrorist organizations is not limited to a single country. Brain Washing Activities of the Terrorist Organisations towards the Youth and Possible Measures to be Taken David Blose, political analyst at LANDCOM, stated that defining the fight against terrorism should have priority. Otherwise the instruments used in combatting terrorism cannot achieve their goals. It is necessary to have good command of the cultures of the societies providing a base for the terrorist organizations and in this way local actors can be incorporated into the efforts. Pointing out to the fact that terrorist organizations have developed their sphere of influence and activity areas at a great pace, Blose expressed that these organizations deployed in different regions of the world spread their ideology thanks to the educational programs developed especially towards the youth. Soft power instruments used by states in combatting terrorism are implemented more effectively by terrorist organizations like Al-Qaeda; schools and madrasas in countries such as Pakistan and Syria are put to use to brainwash the youngsters and these threats exist also in Saudi Arabia and Indonesia. While the process of the Arab Spring is expected to be an opportunity to promote the values such as democracy, human rights and the rule of law, terrorist organizations like Al-Qaeda expanded their bases by spreading the belief that they are protectors and securers of justice. Sabotage the educational programs of the respective states; the main activities of terrorist organizations to be emphasized and fought against, which could be seen as an iceberg, are the educational programs they provide for the children and young people in order to spread their ideology.

Soft power key to stop terrorism

Nye, 03 (Joseph S. Nye Jr., Dean of Harvard’s Kennedy School of Government, Foreign Affairs, July/August 2003)

THE WILLINGNESS of other countries to cooperate in dealing with transnational issues such as terrorism depends in part on their own self-interest, but also on the attractiveness of American positions. Soft power lies in the ability to attract and

persuade rather than coerce. It means that others want what the United States wants, and there is less need to use carrots and sticks. Hard power, the ability to coerce, grows out of a country's military and economic might. Soft power arises from the attractiveness of a country's culture, political ideals, and policies. When U.S. policies appear legitimate in the eyes of others, American soft power is enhanced. Hard power will always remain crucial in a world of nation-states guarding their independence, but soft power will become increasingly important in dealing with the transnational issues that require multilateral cooperation for their solution.

SPG – India Relations

US soft power is key to US-India relations – influence makes the partnership resilient and effective

Pande, 12 (Aparna Pande, Director, Initiative on the Future of India and South Asia, 5-17-2012, "U.S.-India: A Soft Power Tie That Binds", Hudson Institute, <http://www.hudson.org/research/8941-u-s-india-a-soft-power-tie-that-binds#ER>, DA: 7-9-2015)

While the Atlantic partnership will always remain important for the United States, it is the United States' ties with India that will be the "defining partnership" of the twenty-first century. Ties with India are the result of more than two decades of efforts by Indian and American leaders, and they will remain steady despite ups and downs because they rest on an underpinning not only of hard power but of soft power. India is one of the fastest growing economies in the world today, and American companies aim to benefit from the Indian economic boom. Bilateral trade today stands at over \$50 billion and American foreign investment in India is approximately \$16 billion. The potential for collaboration in the fields of science and technology between the U.S. and India has grown exponentially. The removal of Indian defense and space organizations from the "entity list" will help forge partnerships between companies in both countries. The security dimension of the U.S.-India partnership is equally critical with deepening military-to-military ties, counter-terrorism cooperation, defense sales and a common desire to defend the domains of cyber and outer space. American policymakers tend to view their ties with India not just in the bilateral context but in the broader global context. India and the U.S. are both status quo powers that seek inclusive security architecture not only for Asia, but beyond. During their visits to India, both President Barack Obama and Secretary Hillary Rodham Clinton have repeatedly emphasized their desire that India build deeper strategic and economic ties with its East and South East Asian neighbors. The two countries share a similar outlook with respect to Afghanistan and Pakistan. Indian discussions of the U.S.-led war in Afghanistan have helped crystallize a certain school of Indian thinking which views robust U.S. engagement in the region as conducive to Indian security. Also, while skeptical of American support for Pakistan, most Indian strategists agree that American absence from Afghanistan and Pakistan is harmful to Indian interests. While hard power is critical in international relations, it is soft power that ensures relationships between countries withstand the vagaries of politics and crises. During the Cold War, India had a hard power-based relationship with the Soviet Union. While there will always be a hard power component to India's relationship with the U.S., it is the strengthening of the soft power relationship that is critical. In a recent book titled *China's Nightmare, America's Dream: India as the Next Global Power*, a former American diplomat, William Avery, argues that like the United Kingdom, the United States and India too share the ideals of democracy, human rights, rule of law and free markets. To this we should add pluralism and an open society. That the United States seeks a long-term, people-to-people relationship is demonstrated in the way high-level visits are structured. Secretary Clinton's trips have included visits to non-governmental organizations as well as interactive media appearances. President Obama held a town hall meeting with students during his 2010 visit to India. During the 1950s and 60s, when American leaders and policymakers visited India, the focus of attention was India's first Prime Minister Jawaharlal Nehru and his cabinet colleagues; the opposition parties were rarely paid much attention. With

the rise of coalition politics during the 1990s and the importance of political parties, including those in opposition, American officials and leaders made it a point to broaden their interaction. Not only does this reflect a desire to reach out to the larger population, but it reflects an understanding of internal media dynamics. There has been an attempt to go beyond the federal government with the rise in power and importance of regional players in Indian politics. In each of her last three trips to India, Secretary Clinton has made it a point to visit a key regional capital in addition to New Delhi—Mumbai, Chennai and Kolkata. The visit to Mumbai was important not only because the city is India's financial capital, but also to express solidarity with the residents of the city who have suffered repeatedly at the hands of terrorists. The United States consulate in Chennai has the distinction of issuing the largest numbers of American visas of all the consulates in India. Both Chennai and Kolkata are important for domestic politics: the parties in power in these states are mercurial allies of the Congress party—and for foreign policy—politics in Tamil Nadu and West Bengal affects India's ties to Sri Lanka and Bangladesh. There is a similar regionalization on the American side—an increasing number of American states are building independent economic ties with their counterparts in India. A consistently favorable rating of the other country in polling data demonstrates that there is a genuine desire in both countries for better ties. According to the Gallup American Favorability Toward Countries poll, India has had a consistently high ranking—72 percent (2011) and 75 percent (2012)—which places it just below allies like Canada, Australia, the United Kingdom, France, Japan and Germany. According to Pew Global Attitudes Project 2011, the number of Indians (41 percent) and Americans (49 percent) who have a favorable view of the other country is very similar. Also, 10 percent of Indians and 14 percent of Americans have an unfavorable view of the other. The two countries seem to have come a long way from the Cold War era and the days of President Nixon. In early May 2012, Secretary Clinton went on what is most likely her last trip to India as secretary of state. In her four years as secretary, Ms. Clinton has traveled to India almost every year. The last three American presidents have also made it a point to visit India once during the course of their presidency. While there is still a long way to go, the relationship between the United States and India has the potential of becoming another Entente Cordiale, a special relationship.

Defense

A2 War – General

Soft power doesn't solve war – Ukraine and previous Russian examples prove, realism/hard power dominate foreign affairs, only civil society (not government) can leverage it, terrible track record, Obama doesn't know how to operationalize

Cecire 14

{Michael, Black Sea regional analyst and an associate scholar at the Foreign Policy Research Institute's Project on Democratic Transitions, former visiting scholar Columbia University's Harriman Institute, MPA (Penn), bachelors in cultural anthropology (VCU), "The Limits of Soft Power," 4/1, <http://nationalinterest.org/commentary/the-limits-soft-power-10163?page=2#THUR>}

The Russian invasion of Ukraine has already punctured much of the prevailing foreign-policy thinking that had become pro forma in Washington and Europe. In particular, the notion that Western unilateral disarmament can somehow be balanced or compensated for with less tangible forms of influence—soft power—has much to answer for in this ongoing crisis. By now, it is clear that Moscow's actions in Crimea strongly demonstrate the sharp limits of soft power, especially one that appears to have been decoupled from hard power, the traditional final arbiter of interstate relations. Ukraine is not merely a geopolitical setback, but a symptom of a misplaced faith in the potency of postmodern soft power as foreign policy plan A through Z. Ukraine's rapid transformation from homo Sovieticus-ruled kleptocracy to inspiring popular revolution to the latest victim of Russian imperialism has been astonishing. In the span of mere weeks, Ukraine's political cleavages have been magnified as the faultline of a tense geopolitical contest between the Euro-Atlantic community and a revanchist, increasingly militant Russia. In the Western scramble to come to terms with the new threat landscape—let alone formulating an effective, unified response—Crimea has almost certainly already been lost. Meanwhile, Russia seems poised to expand its writ into other areas of eastern Ukraine just as it aggressively probes Euro-Atlantic readiness in the Baltic, Turkey, and the Caucasus. In Washington, defense and administration officials appear resigned—if only unofficially—to Russian control over Crimea (if not eastern Ukraine) and are digging in for the long haul. How did we get here? Among the ideologues, the answer lies in the foreign policies of the current or previous administrations. On the right, President Obama's "reset" and subordination of foreign policy to domestic issues is the obvious cause. And on the left, President Bush's wars have given the Kremlin the perfect moral justification. But the reality, like many things, is hardly one sided. Partisans decrying President Obama's "weakness" appear to ignore that the administration's response to Russia's occupation of Crimea is already far more muscular than President Bush's reaction to the Russian invasion of Georgia 2008. And conversely, some of the left's bizarre use of a war they supposedly opposed to equivocate on the invasion of a sovereign state by corrupt autocracy is as self-contradictory as it is troubling. The likelier culprit is not so intimately tethered to the tribalisms of American politics, though ideology inevitably has played a role. Instead, the Western political class has become intoxicated with the notion that soft power, now the highly fashionable foreign-policy instrument of first resort, can compensate for—or in some ways replace altogether—diminished hard power. If the late 1990s was the heyday for

liberal internationalism by airpower, the late 2000s saw an analogous consensus congregate around soft power. Soft power is supposed to describe the latent factors—values, economy, culture and the like—of a state, entity or idea to persuade or attract. This contrasts with its more recognizable counterpart, hard power, which is based on the more traditional principle of coercion. There is little doubt that soft power is a real and fundamentally important phenomenon in the conduct of international relations. Contributions from scholars like Joseph Nye and Giulio Gallarotti have made a compelling case that soft power is a powerful geopolitical signifier; but what began as a keen observation had morphed into a cottage industry looking to leverage soft power into a foreign-policy panacea. In an illuminating 2011 paper published by the Strategic Studies Institute at the U.S. Army War College, University of Reading (U.K.) political scientist Colin S. Gray rightly acknowledges the merits of the soft-power thesis while articulating its practical limitations, particularly in the policy arena. “While it is sensible to seek influence abroad as cost-effectively as possible, it is only prudent to be modest in one’s expectations of the soft power to be secured by cultural influence,” cautions Gray. Indeed, soft power’s attraction and subsequent embrace by the foreign policy elite had as much to do with its usefulness as a substitute for “hard power” as its salience as an idea. But while hard and soft power can be complementary, Gray observes that soft power can in no way compensate for military power. “Sad to say,” laments Gray, “there is no convincing evidence suggesting an absence of demand for the threat and use of military force.” Sad, indeed. However, events in Ukraine have exposed the stark limits of soft power in a way that no analysis ever could. There is no small irony in the fact that Russia’s forceful military intervention into Ukraine was preceded by a grinding, if superficially velveted, tug of war between Moscow and the West over Ukraine’s integration with two competing soft-power “vehicles”—the EU and the Moscow-led Customs Union-cum-Eurasian Union. It was Yanukovich’s abandonment of Ukraine’s pledge to sign an Association Agreement with the EU—following intense Russian coercion—that protests began again in earnest. Yanukovich’s turn to brutality eventually precipitated his toppling, Russia’s military intervention, and now Crimea’s annexation. The idea of soft power as operational policy should be buried. While there is some government role in propagating and wielding soft power—public affairs, policy making, and, yes, sometimes psychological operations—the real business of soft power exists well outside of the domain of the state. In reality, the track record of operationalizing soft power has been, to date, abysmal. Russia is a case in point. Moscow repeatedly sought to revise the post-Cold War order through a variety of projects that might normally be filed as soft-power initiatives: then president Dmitry Medvedev’s repeated attempts to reorient the European security architecture; the Kremlin obsession with making the ruble an international reserve currency; the formation of the Russia-led Customs Union in 2010; and the (now likely stillborn) plans to establish the Eurasian Union. And yet, in the end, Crimea was forcibly seized by men with guns. Indeed, the truer currency of power remains the ability to coerce. Fatigue from disastrous wars in Iraq and Afghanistan elevated expectations that soft power could supplant a beleaguered and overstretched U.S. military. Why, indeed, would the U.S. opt for coercion when civilizational persuasion could do the trick? Pro-West people power in Eurasia seemed to bolster the case for operationalized soft power after the “color revolutions” in Georgia, Ukraine and Kyrgyzstan. Yet the longer-term results were unpredictable at best and disastrous at worst. Over time, it has become increasingly apparent that soft power is perhaps less an instrument to wield than a favorable wind at our backs. The crisis with Russia

has laid bare the limits of soft power as well as the continued relevance of hard power—even in “postmodern” Europe. While the Obama administration should be credited with being among the few Western governments to offer a relatively serious response to the Ukraine crisis, the White House overall still seems uncomfortable with the difficult but very real role that hard power necessarily plays in establishing and policing a U.S.-led, liberal normative order. This must change with the new circumstances established by Russian revanchism. Western values can only be propagated and upheld with the ultimate guarantee of hard power. And if the West is not prepared to enforce its values with tangible consequences, then perhaps we should abandon the pretense of a rules-based international system and cease the cruel practice of giving hope where there is none to be had. Soft power is here to stay, but its moment as a diplomatic instrument has long since gone. Because, in reality, it was never really much more than an illusion of what we wished the world to be rather than the one that exists.

A2 War / A2 Terrorism

Soft power fails – can't prevent conflict or convince hostile actors

Shah, 14 (Ritula Shah, 11-19-2014, "Is US monopoly on the use of soft power at an end?", BBC News, <http://www.bbc.com/news/world-29536648#ER>, DA: 7-8-2015)

But **the limits of soft power are** also **apparent everywhere**. If you look back across the period since the end of the Cold War, the US has actually deployed rather a lot of "hard power" around the world; two wars **in Iraq, Bosnia, Kosovo** and **Afghanistan** and the current airstrikes in **Iraq** and **Syria**, to name a few and not to mention the use of drones. In all these cases, **soft power wasn't enough to avert** a **conflict** or military intervention. Also, as Prof **Nye concedes, soft power can only work when people are receptive to the messages** it's peddling. So the movies may help to spread a US vision of what a free, democratic life might look like, but only if the people watching, recognise the importance of those values to them. **It seems unlikely** that the **violent jihadists** of Islamic State **will** be persuaded to **abandon their anti-Western vision**.

***Re-tag and re-highlight this card based on whatever you're trying to use it for – this ev can be used to answer Iran, North Korea, human rights abuses, genocide, proliferation, Russian expansion, and China rise

states aren't deterred from ((human rights abuse)) by soft power alone – empirics show

Holmes, 09 (Kim R. Holmes, Ph.D., Distinguished Fellow at The Heritage Foundation, assistant secretary of state under Bush, 6-1-2009, "Sustaining American Leadership with Military Power", Heritage Foundation, <http://www.heritage.org/research/reports/2009/06/sustaining-american-leadership-with-military-power#ER>, DA: 7-9-2015)

The Limits of Soft Power To witness the consequences when policymakers and politicians believe that hard and soft power are disconnected, one need look no further than Europe. The Europeans--many of whom believe that the peace that has broken out on their continent is the model for a post-sovereign world order--have become convinced that the anarchic order of the Westphalian system of nation-states can be breached through the exercise of soft power alone. In their view, bridging the often hardened differences between states and shaping their decisions requires only negotiation and common understanding. Many liberals are now pressing the U.S. government to adopt this vision, but the futility of this approach can be seen everywhere, from the failure of negotiations to deter both Iran and North Korea from their nuclear programs over the past five years--a period in which their efforts have only matured--to the lackluster response to Russia's invasion of Georgian territory. Whether it is states like Iran and North Korea that believe a nuclear weapons program is central to regime survival, or human-rights abusers like Sudan, Burma, and Zimbabwe, or rising powers like China, which continues to use its military to emphasize its sovereignty in the South China Sea, diplomacy alone has not been enough to bring about change in a direction that is favorable to America's interests. At times, America and its leaders have also been guilty of this type of strategic myopia. After applying pressure on North Korea so diligently in 2006, the Bush Administration relaxed its posture in early 2007, and North Korea concluded that it was again free to backslide on its commitments. Two years later, this weak diplomatic approach, which the Obama Administration continued even after North Korea's April 5 missile test, has only brought North Korea to believe that it can get away with more missile tests and nuclear weapons detonations. And so far, it has.

A2 Russia

US soft power fails in Russia-too much reliance on Hard Power

Seib, 09 (Director of the USC Center on Public Diplomacy, Philip Seib is a Professor of Journalism and Public Diplomacy and Professor of International Relations, "Toward a New Public Diplomacy", pg. 72-73)

American soft power has lost its influence in Russia for two principal reasons. First, since the early 1990s Russia has been neglected by the U.S. government. Second, Russia, after addressing tremendous challenges and transformations in its post-Soviet development, since 2003 has tried to diminish any U.S. impact on Russia's internal politics to avoid destabilizing effects in Russian society. Why did once mighty U.S. public diplomacy fail to influence Russia? Given that hard power dominates in U.S.-Russia relations today, can we regard American public diplomacy as a failure? Seeking reasons for the ineffectiveness of U.S. public diplomacy efforts, many researchers considered the successful U.S. soft power experience during the cold war. However, the cold war model of public diplomacy cannot be implemented today. In the bipolar world the United States had one ideological "enemy," so it aimed the mightiest informational weapon and hard power resources at one target. What about today? America needs to spread public diplomacy activities around the world, because strategically important regions are elsewhere: Iraq, Iran, Afghanistan, China, the European Union.... The list is long. This post-cold war world, "engaged in a vast remapping of the relationship of the state to images, messages, and information within its boundaries," demands new methods and principles of fulfilling state policies, including public diplomacy. Global net society made world leaders, policy makers, media, and nonofficial actors develop sophisticated strategies to create spheres of influence and markets for loyalties in the highly competitive information space. In the "global village," without information boundaries and strong ideological barriers, the implementation of effective public diplomacy is increasingly difficult. The Internet and new media have complicated public diplomacy because they require special skills to define and find target audiences in a very fragmented communication field. Further, failures in strategic communication between nations occur because of transformations in geopolitics and increasing rivalry of great powers. In a fast-changing multicivilizational world or, as the Economist said, a "neo-polar world, in which old alliances and rivalries are bumping up against each other in new ways," public diplomacy's ability to influence a target state is difficult. It makes sense to analyze U.S. public diplomacy through the prism of U.S.—Russian relations since the crucial historical point—the dissolution of the Soviet Union. The euphoria at the end the 1980s stimulated by freedom and convergence with the West has evaporated. Russia has entered a new decade that had been one of the most painful and desperate periods in its history. When Vladimir Putin called the collapse of the Soviet Union the greatest geopolitical catastrophe of the twentieth century, he did not mean he was nostalgic for the Soviet Empire, as many Westerners interpreted this statement. As Stephen F. Cohen noted, "No one in authority anywhere had ever foreseen that one of the twentieth century's two superpowers would plunge, along with its arsenals of destruction, into such catastrophic circumstances."¹¹ Ideological and economic decay after the end of the Soviet Union deprived Russia of its status and identity; people felt themselves disoriented and humiliated, many of them, including among the Russian intelligentsia, suffered from poverty. Western ideas promoted by United States and other Western public diplomats seemed elusive

for the majority of disappointed Russians, who “experienced a collective inferiority complex.”² It was the time of the next turn in the Russian mass consciousness, which shaped Russia’s skeptical attitude toward Western ideas and democracy. Instead of a wealthy Western society, the nation, recently a superpower, plunged into severe depression and ideological turmoil. Nevertheless, in 1991—1993, a majority of Russians (approximately 70 percent) held positive views about the United States.³ That was the appropriate moment for U.S. soft power to help Russia to recover from the post-Soviet fever.

A2 Democracy/Human Rights

Soft power doesn't solve human rights or democracy – many examples.

Krauthammer, Pulitzer-Prize winning syndicated columnist, 2008 (Charles, National Review, July 11, Lexis Academic)

This in foreign policy establishment circles is called "hard power." In the Bush years, hard power is terribly out of fashion, seen as a mere obsession of cowboys and neocons. Both in Europe and America, the sophisticates worship at the altar of "soft power" -- the use of diplomatic and moral resources to achieve one's ends. Europe luxuriates in soft power, nowhere more than in l'affaire Betancourt in which Europe's repeated gestures of solidarity hovered somewhere between the fatuous and the destructive. Europe had been pressing the Colombian government to negotiate for the hostages. Venezuela's Hugo Chavez offered to mediate. Of course, we know from documents captured in a daring Colombian army raid into Ecuador in March -- your standard hard-power operation duly denounced by that perfect repository of soft power, the Organization of American States -- that Chavez had been secretly funding and pulling the strings of the FARC. These negotiations would have been Chavez's opportunity to gain recognition and legitimacy for his terrorist client. Colombia's President Alvaro Uribe, a conservative and close ally of President Bush, went instead for the hard stuff. He has for years. As a result, he has brought to its knees the longest-running and once-strongest guerrilla force on the continent by means of "an intense military campaign (that) weakened the FARC, killing seasoned commanders and prompting 1,500 fighters and urban operatives to desert" (Washington Post). In the end, it was that campaign -- and its agent, the Colombian military -- that freed Betancourt. She was, however, only one of the high-minded West's many causes. Solemn condemnations have been issued from every forum of soft-power fecklessness -- the EU, the U.N., the G-8 foreign ministers -- demanding that Robert Mugabe of Zimbabwe stop butchering his opponents and step down. Before that, the cause du jour was Burma, where a vicious dictatorship allowed thousands of cyclone victims to die by denying them independently delivered foreign aid, lest it weaken the junta's grip on power. And then there is Darfur, a perennial for which myriad diplomats and foreign-policy experts have devoted uncountable hours at the finest five-star hotels to deplore the genocide and urgently urge relief. What is done to free these people? Nothing. Everyone knows it will take the hardest of hard power to remove the oppressors in Zimbabwe, Burma, Sudan, and other godforsaken places where the bad guys have the guns and use them. Indeed, as the Zimbabwean opposition leader suggested (before quickly retracting) from his hideout in the Dutch embassy -- Europe specializes in providing haven for those fleeing the evil that Europe does nothing about -- the only solution is foreign intervention.

A2 Terrorism

Can't solve terrorism – can't win the hearts and minds

Kroenig et al '9 (Matthew, assistant professor in the Department of Government at Georgetown University and a research affiliate with The Project on Managing the Atom at Harvard University, Melissa McAdam, Ph.D. student in the UC Berkeley Political Science Department, Steven Weber, Professor of political science @UC Berk, "Taking Soft Power Seriously," 39-46 AM)

The United States has also sought to apply soft power to counter ideological support for terrorism. Again, despite a concerted effort by the United States, global support for terrorist ideology shows no sign of abating and, according to some measures, may be increasing. The inability of the United States to counter ideological support for terrorism can be attributed to an environment hostile to the application of soft power. The societies to which the United States has targeted its message lack a functioning marketplace of ideas and the U.S. message is not credible to the target audience. For these reasons, the application of soft power has been an ineffective tool for countering ideological support for terrorism, despite the importance of individual attitudes as a driver of terrorist behavior. In the 2005 National Defense Strategy, the United States presented a threepronged strategy for winning the War on Terror.⁷⁷ The first two elements of the strategy, attacking terrorist networks and defending the homeland, were definitively in the realm of hard power. The third and, according to many Pentagon officials, the most important element of the strategy, however, was "countering ideological support for terrorism."⁷⁸ As part of this soft power strategy, the United States declared its intent to "Support models of moderation in the Muslim world by helping change Muslim misperceptions of the United States and the West."⁷⁹ Furthermore, the United States vowed to "delegitimize terrorism and extremists by e.g., eliminating state and private support for extremism."⁸⁰ The 2006 National Strategy for Combating Terrorism continued the theme of ideological combat stating that "from the beginning, [the War on Terror] has been both a battle of arms and a battle of ideas. Not only do we fight our terrorist enemies on the battlefield, we promote freedom and human dignity as alternatives to the terrorists' perverse vision of oppression and totalitarian rule."⁸¹ According to the strategy, "winning the War on Terror means winning the battle of ideas." The United States also singled out state sponsors of terror for its soft power campaign and declared that it desired "to make clear that all acts of terrorism are illegitimate so that terrorism will be viewed in the same light as slavery, piracy, or genocide: behavior that no respectable government can condone or support and all must oppose."⁸² These were serious statements of policy objectives. To isolate state-sponsors of terrorism, President Bush encouraged states to choose a position "either with us or against us in the fight against terror."⁸³ A special task force on "strategic communications" was set up at the Defense Science Board that argued that "the United States is engaged in a generational and global struggle about ideas." ⁸⁴ The Board concluded that, "policies will not succeed unless they are communicated to global and domestic audiences in ways that are credible and allow them to make informed, independent judgments."⁸⁵ To show the level of commitment the Bush administration made to the task of public diplomacy, President Bush appointed his trusted public relations manager, Karen Hughes, as Undersecretary of State for Public Diplomacy. ⁸⁶ Under Hughes's leadership, the State Department established regional media hubs offering U.S. spokespeople with language capabilities to speak on America's behalf in media outlets throughout the Middle East.⁸⁷ The

United States Government also increased the budget for the United States Agency for International Development (USAID), the U.S. agency responsible for dispensing foreign aid, by 60%, from 5 billion in 1998 to 8 billion in 2003.⁸⁸ The United States funded a variety of pro-American media in the Muslim world including H1 magazine, Radio Sawa, and the Al Hurra television station. ⁸⁹ Furthermore, the United States established reeducation facilities, such as the “House of Wisdom” in Iraq, to teach moderate Muslim theology to detainees captured in the War on Terror.⁹⁰ Despite this widespread effort to communicate throughout the Muslim world, the United States, to date, has largely failed in its effort to apply soft power to its advantage in the War on Terror. The War on Terror will probably be a “generational struggle,” but it is nevertheless troubling that after a sustained multi-year effort to counter ideological support for terrorism, the United States has made real progress on very few of its stated objectives. The United States has, since 9/11, avoided a major terrorist attack, and while the causes of this can be debated, it is not likely the result of a waning of terrorist ideology globally as is evidenced by the string of attacks in other parts of the world. In recent years, terrorists have carried out attacks in: Algeria, Great Britain, Israel, Iraq, Jordan, Russia, Spain, and other countries.⁹¹ Despite heavy pressure from the United States in the form of hard and soft power, states still support terrorism and Al Qaeda has even reconstituted terrorist training camps in South Asia. ⁹² Terrorist ideology continues to flourish globally with the help of the Internet.⁹³ The low public opinion of the United States in the Muslim world, often thought to be one of the factors contributing to terrorism against the United States, has not improved in recent years. In fact, a recent study found that people’s “attitudes toward U.S. foreign policy actually worsened slightly since they started listening to Radio Sawa and Al Hurra.”⁹⁴ Few observers believe that U.S. efforts to combat Al Qaeda have been effective. In a recent worldwide poll, survey respondents in 22 out of 23 countries reported that the U.S.-led war on terror has not weakened Al Qaeda.⁹⁵ The U.S. failure to use soft power effectively in the War on Terror is even more pronounced in some of the most important countries. In Egypt and Pakistan, for example, 60% and 41% of the respective publics possess either positive or mixed views of Al Qaeda.⁹⁶ According to Doug Miller, chairman of the international polling firm Globescan, “The fact that so many people in Egypt and Pakistan have mixed or even positive views of al Qaeda is yet another indicator that the US war on terror is not winning hearts and minds.”⁹⁷ Why has the United States failed in its effort to use soft power to counter ideological support for terrorism? Part of the reason is that the United States has not been able to compete in a functioning marketplace of ideas in most of the societies where a threat of jihadi terrorism exists. In the 2006 National Strategy for Combating Terrorism, the United States acknowledges that “terrorists recruit more effectively from populations whose information about the world is contaminated by falsehoods and corrupted by conspiracy theories. The distortions keep alive grievances and filter out facts that would challenge popular prejudices and self-serving propaganda.”⁹⁸ In other words, many countries of the Middle East and the broader Muslim world lack a functioning marketplace of ideas. They are disproportionately authoritarian. ⁹⁹ These governments often take measures, generally for the purposes of domestic stability, that have the effect of preventing meaningful competition in their domestic marketplace of ideas. Foreign media content containing ideas about democracy and freedom are filtered.¹⁰⁰ Domestic political opponents are prevented from expressing views that challenge the government.¹⁰¹ Radical religious groups, extremist parties, and fundamentalist madrassas are supported to shore up the legitimacy of secular

regimes.¹⁰² Domestic problems are externalized and blamed on an “imperial” United States.¹⁰³ The lack of a functioning marketplace of ideas in this region contributes to the pervasiveness of conspiracy theories in the region from private households to the highest levels of government.¹⁰⁴ Due in part to these phenomena, public opinion of U.S. foreign policy is lower in the Middle East than in any other world region.¹⁰⁵ The inability of the United States to communicate in this region is aptly described by Norman Patizz, an American media entrepreneur, who notes that “there is a media war going on [in the Muslim world] with incitement, hate broadcasting, disinformation, government censorship, self-censorship, and America is not in the race.”¹⁰⁶ Another limiting factor on the United States effort to counter ideological support for terrorism is the logic of persuasion. U.S. efforts to communicate directly with the Muslim world have been thwarted by a lack of credibility. Expert messengers are more persuasive than non-experts, but U.S. government officials are hardly qualified to discuss the intricacies of Muslim theology and the consistency, or lack thereof, of terrorism with the teachings of the Koran. U.S. strategists have recognized this and sought to adjust strategy appropriately, aiming to communicate through surrogates whenever possible.¹⁰⁷ Attempts to channel a message through third parties face a number of challenges however. The audiences that the United States targets in the Middle East generally know which media outlets receive U.S. support and, accordingly, discount the messages that they receive from those sources. In a recent study on the effectiveness of U.S. supported media in the Middle East, a Jordanian student wrote that “Radio Sawa serves US interests and helps it spread its control over the world and to serve Zionist interests.”¹⁰⁸ A student from Palestine wrote that the United States “[spreads] lies and fabricates news” through Television Al Hurra.¹⁰⁹ According to Al-Ahram Weekly, an Egyptian newspaper, Arab youth listen to Radio Sawa, but “they take the U.S. sound and discard the U.S. agenda.”¹¹⁰ The United States efforts at persuasion may have also failed because they fail to speak to the intended audience at an emotional level. Shibley Telhami has described Al Hurra as adopting a style of “detached objectivity” to its coverage of highly controversial political issues. Telhami went on to criticize the futility of a mismatched approach that aims “to be precisely dispassionate while facing a passionate audience.”¹¹¹ As difficult as it may be for the United States to accept, the United States with all of its hard and soft power is not well-equipped to persuade international audiences about the legitimacy of terrorism as a tactic. There are undoubtedly other factors that helped to discredit the U.S. message on issues of terrorism. The U.S. military intervention in Iraq and the related prisoner abuse scandal at Abu Ghraib, for example, alienated many in the broader Middle East.¹¹² But, these factors only further weakened U.S. credibility; the United States was never in a position to be a persuasive messenger on the subject of terrorism in the Muslim world. In the War on Terror, however, individual attitudes have had an important, though mixed, effect on international political outcomes. Ideas have a critical (but by no means exclusive) impact on individual decisions to join terrorist organization, but attitudes are less important determinants of the state sponsorship of terrorism. Exposure to radical ideology is an important component leading an individual to become a terrorist. While containing an undeniable ideological component, however, many of the factors that convince people to turn to terrorism are material in origin, not ideational, and, thus, cannot be addressed with soft power tools. Social science research suggests that many factors may contribute to the production of a terrorist. Few opportunities for political participation, low levels of social integration, personal loss, and foreign occupation are among

the variables that have been linked to a higher risk of terrorism. 113 The United States can combat some of these risk factors through the application or withdrawal of hard power, but few of them can be addressed through the application of soft power alone. Despite America's soft power campaign, the state sponsorship of terrorism also appears to be alive and well and driven by states' core material interests. Pakistan continues to walk the fine line of allowing terrorists to operate in the tribal regions while making occasional raids against terrorist hideouts to placate the United States.¹¹⁴ And states that can gain through the active support of terrorism as an extension of their national power, such as Iran and Syria, continue to do so.¹¹⁵ The United States has been unsuccessful, so far, in its attempt to use soft power to counter global ideological support for terror. This failure is due, at least in part, to the absence of the conditions necessary for an effective soft power strategy. Attitudes may be influential in determining the strength of the international terrorist movement, but the United States was unable to participate in debates in key regions in which terrorist ideology flourishes and a lack of credibility further hindered U.S. efforts to change attitudes on important terrorism-related issues.

Soft vs Hard Power

A2 Tradeoff

no tradeoff – hard and soft power are mutually reinforcing

Holmes, 09 (Kim R. Holmes, Ph.D., Distinguished Fellow at The Heritage Foundation, assistant secretary of state under Bush, 6-1-2009, "Sustaining American Leadership with Military Power", Heritage Foundation, <http://www.heritage.org/research/reports/2009/06/sustaining-american-leadership-with-military-power#ER>, DA: 7-9-2015)

Contrary to what many politicians and talking heads tell Americans, a false choice exists between what are often referred to as hard and soft power. A country's military resources (its hard power) and the diplomatic tools it uses to persuade others without resorting to coercion (its soft power) operate most efficiently in tandem. As Teddy Roosevelt famously observed, a nation must "speak softly" with diplomacy while also wielding a "big stick." Just as no country can be expected to provide security and pursue its interests solely through the use of military power, no country can expect to be taken seriously during high-stakes negotiations without the potential threat of military force to back up its word. The two approaches are not separate tools but mutually reinforcing mechanisms.

Hard Power k2 Soft Power

Hard power's key to soft power – provides the legitimacy to back up diplomatic commitments

Holmes, 09 (Kim R. Holmes, Ph.D., Distinguished Fellow at The Heritage Foundation, assistant secretary of state under Bush, 6-1-2009, "Sustaining American Leadership with Military Power", Heritage Foundation, <http://www.heritage.org/research/reports/2009/06/sustaining-american-leadership-with-military-power#ER>, DA: 7-9-2015)

The Importance of Sustaining Military Power The consequences of hard-power atrophy will be a direct deterioration of America's diplomatic clout. This is already on display in the western Pacific Ocean, where America's ability to hedge against the growing ambitions of a rising China is being called into question by some of our key Asian allies. Recently, Australia released a defense White Paper that is concerned primarily with the potential decline of U.S. military primacy and the implications that this decline would have for Australian security and stability in the Asia-Pacific. These developments are anything but reassuring. The ability of the United States to reassure friends, deter competitors, coerce belligerent states, and defeat enemies does not rest on the strength of our political leaders' commitment to diplomacy; it rests on the foundation of a powerful military. Only by retaining a "big stick" can the United States succeed in advancing its diplomatic priorities. Only by building a full-spectrum military force can America reassure its many friends and allies and count on their future support.

Soft Power k2 Hard Power

Soft power key to hard power

Nye, 03 (Joseph S. Nye Jr., Dean of Harvard's Kennedy School of Government, Foreign Affairs, July/August 2003)

One of Rumsfeld's "rules" is that "weakness is provocative." In this, he is correct. As Osama bin Laden observed, it is best to bet on the strong horse. The effective demonstration of military power in the second Gulf War, as in the first, might have a deterrent as well as a transformative effect in the Middle East. But the first Gulf War, which led to the Oslo peace process, was widely regarded as legitimate, whereas the legitimacy of the more recent war was contested. Unable to balance American military power, France, Germany, Russia, and China created a coalition to balance American soft power by depriving the United States of the legitimacy that might have been bestowed by a second UN resolution. Although such balancing did not avert the war in Iraq, it did significantly raise its price. When Turkish parliamentarians regarded U.S. policy as illegitimate, they refused Pentagon requests to allow the Fourth Infantry Division to enter Iraq from the north. Inadequate attention to soft power was detrimental to the hard power the United States could bring to bear in the early days of the war. Hard and soft power may sometimes conflict, but they can also reinforce each other. And when the Jacksonians mistake soft power for weakness, they do so at their own risk.

Loss of soft power erodes overall leadership

Blinken, 02 (Antony Blinken, senior fellow at CSIS and former member of the National Security Council, Washington Quarterly, Spring, 2002)

U.S. success in Afghanistan will count for little if the United States loses the global war of ideas. That has produced a growing gap between much of the world's perception of the United States and the U.S. perception of itself. If this gap persists, U.S. influence abroad will erode, and the partners the United States needs to advance its interests will stand down. The few real enemies the United States faces will find it easier both to avoid sanction and to recruit others to their cause. The United States remains powerfully attractive. Most people around the world hold a favorable view of the United States, considering it a land of opportunity and democratic ideals while admiring the country's technological and scientific achievements. Millions of the world's citizens desire to move to, become educated in, do business with, or visit the United States. When people vote with their feet, the United States wins in a landslide. Yet, the United States tends to disregard an increasingly potent mix of criticism and resentment that is diluting its attraction: anti-Americanism.

Soft power is the only way to make leadership effective

Hanna, O2 (Julia Hanna, Kennedy School Bulletin, "Going It Alone," Spring, 2002, <http://www.ksg.harvard.edu/ksgpress/bulletin/spring2002/features/alone.html>)

It's more than a matter of staying one step ahead of our enemies in a technological game of cat and mouse, he continues. "When the Pan Am flight exploded over Lockerbie, Scotland, the cause was a bomb in unaccompanied luggage. "So now the airline employees ask if we packed our bag ourselves. A Mohammed Atta would say, 'Yes, I packed my bag myself,' so we've created new security procedures. Unfortunately, each time you find a solution, someone will be looking for a chink in your armor. That dynamic is bound to continue." Military power is an essential part of the response, but an equally productive focusing point, Nye continues, would be the cultivation of what he calls "soft power," or the ability to advance one's agenda through attraction rather than coercion. "Soft power arises from our culture, values, and policies," he states. Given its proper weight, soft power can serve as a much-needed balance to our economic and military might, two examples of "hard power" that can overwhelm and alienate other countries. The thousands of international students who come to study at U.S. institutions are an example of this country's soft power. Our government's democratic values and promotion of peace and human rights influence how other countries perceive us. For better or worse, so does the latest Bruce Willis action flick. America's use of capital punishment and relatively permissive gun control laws undercut its soft power in European countries. While its intangible quality makes soft power much more difficult to use and control, observes Nye, that fact does not diminish its importance. "American pre-eminence will last well into this century, but our attitudes and policies will need to encompass a very different means of meeting challenges and achieving our goals," he says. While a strong military presence will continue to be essential to maintaining global stability, it proves less adequate when confronting issues such as global climate change, the spread of infectious diseases, and international financial stability. "We must not let the illusion of empire blind us to the increasing importance of soft power," Nye cautions. "A unilateralist approach to foreign policy fails to produce the right results, and its accompanying arrogance erodes the soft power that is often part of the solution."

Hard Power Key – A2 SoPo is the Future

Hard power is key – history shows it's the most successful tool – you should prefer empiricism because the future is nonlinear and probabilistic

Gray, 11 (Dr. Colin S. Gray, Professor of International Politics and Strategic Studies at the University of Reading, England, April 2011, "Hard Power and Soft Power: The Utility of Military Force as an Instrument of Policy in the 21st Century", Strategic Studies Institute, p. 1-2, <http://www.strategicstudiesinstitute.army.mil/pubs/download.cfm?q=1059#ER>, DA: 7-9-2015)

The main purpose of this analysis is to consider the relevance of military power today as well as for tomorrow. This is a subject that should give one pause before claiming a confident understanding of it. Major trends seem clear enough, but will they continue? The frequency with which history shows a liking for irony suggests that the future context for military power may be unlike that of today, in good part because the contemporary situation contains features that will be repudiated in the future in some mixture of thought, word, and deed. The course of history assuredly reveals that events must advance from what preceded them, which is why defense analysis, especially if it seeks to peer into the future, must honor chronology. But the chronology of historical narrative may obscure the traps of nonlinearity. What we know for certain about the 21st century is that we know little of detail with total assurance. Moreover, even broad trends that appear to have unstoppable momentum are not to be trusted to deliver on their obvious promise. History must be our guide, if only because nothing else is accessible. Unfortunately, the past as it is interpreted in the history written by historians provides anything but a reliable compass. Argument either by historical analogy, or at the least with illustration by historical anecdote claimed to be pertinent, is the rule, not the exception, in political discourse.⁴ This is scarcely surprising, since today is by definition both brief and unstable, while the future by definition is blank. All that is available as an evidential base for our political and strategic guidance is a past that cannot be recovered faithfully, even by those who seek honestly to do so, with the result that the past is mediated by historians. Since many facts do not speak with total clarity for themselves, they have to be interpreted by historians, amateur and professional.⁵ A factually reliable chronicle of an obviously major episode in the recent past, World War II say, or the Cold War, is easier to assemble than is a theory, or rather an explanation, which makes thoroughly persuasive sense of the subject at issue.

Solvency/Effectiveness

Soft Power Fails – Ideological Polarity

We can't use soft power – everyone has already made up their minds

Gray, 11 (Dr. Colin S. Gray, Professor of International Politics and Strategic Studies at the University of Reading, England, April 2011, "Hard Power and Soft Power: The Utility of Military Force as an Instrument of Policy in the 21st Century", Strategic Studies Institute, p. 36-39, <http://www.strategicstudiesinstitute.army.mil/pubs/download.cfm?q=1059#ER>, DA: 7-9-2015)

9. The domain for the policy utility of soft power typically is either structurally permissive of easy success, or is unduly resistant to such influence. The third fundamental question about soft power in need of answer can best be posed in only two words, "So what?" The combined fallacies of misnaming and over-simplification that threaten the integrity and utility of the concept of soft power are more than merely an academic itch that can be scratched into oblivion. The soft power concept is sufficiently valid intellectually that its contestable evidential base in history and thus its true fragility are easily missed. To explain its logic: soft power resides in the ability to co-opt the willing rather than to coerce or compel the reluctant; American soft power attracts non-Americans because it represents or advances values, ideas, practices, and arrangements that they judge to be in their interest, or at least to which they feel some bond of affinity. Therefore, the soft power of the American hegemon is some conflation of perceived interests with ideological association (by and large more tacit than explicit). Full-blown, the argument holds, first, that America (for example) gains useful political clout if and when foreigners who matter highly to U.S. national security share important American understandings, values, and preferences. The thesis proceeds in its second step to package this thus far commonsense proposition under the banner of "soft power"; it is now dangerously objectified, as if giving something a name causes it to exist. Next, the third and most problematic step in the argument is the logical leap that holds that American soft power, as existing reality—what it is, and its effects— can be approached and treated usefully as an instrument of national policy. This is an attractive proposition: it is unfortunate that its promise is thoroughly unreliable. The problem lies in the extensive middle region that lies between a near harmony of values and perceived interests and, at the opposite end of the spectrum, a close to complete antagonism between those values and interests. Historical evidence as well as reason suggest that the effective domain of soft power is modest. The scope and opportunity for co-option by soft power are even less. People and polities have not usually been moved far by argument, enticement, and attractiveness. There will be some attraction to, and imitation of, a great power's ideas and practical example, but this fact has little consequence for the utility of military force. Indeed, one suspects that on many occasions what might be claimed as a triumph for soft power is in reality no such thing. Societies and their political leaders may be genuinely attracted to some features of American ideology and practice, but the clinching reason for their agreement to sign on to an American position or initiative will be that the United States looks convincing as a guardian state and coalition leader. It is not difficult to identify reasons why military force seems to be less useful as a source of security than it once was. But it is less evident that soft power can fill the space thus vacated by the military and economic tools of grand strategy. Soft power should become more potent, courtesy of the electronic revolution that enables a networked global community. The ideological, political, and strategic consequences of such globalization, however, are not quite as benign as one might have

predicted. It transpires that Francis Fukuyama was wrong; the age of ideologically fueled hostility has not passed after all.⁴⁷ Also, it is not obvious that the future belongs to a distinctively Western civilization.⁴⁸ It is well not to forget that the Internet is content-blind, and it advertises, promotes, and helps enable bloody antagonism in addition to the harmony of worldview that many optimists have anticipated. It does not follow from all this that the hard power of military force retains, let alone increases, its utility as an instrument of policy. But assuredly it does follow that the historical motives behind defense preparation are not greatly diminished. Thus, there is some noteworthy disharmony between the need for hard power and its availability, beset as it increasingly is by liberal global attitudes that heavily favor restraint.

Soft Power Fails – Laundry List

Soft power is useless in practice – doesn't translate to other countries, we can't change it, and hard power is key

*Really good line: "9. Soft power tends to be either so easy to exercise that it is probably in little need of a policy push, being essentially preexistent, or too difficult to achieve because local interests, or culture, or both, deny it political traction."

Gray, 11 (Dr. Colin S. Gray, Professor of International Politics and Strategic Studies at the University of Reading, England, April 2011, "Hard Power and Soft Power: The Utility of Military Force as an Instrument of Policy in the 21st Century", Strategic Studies Institute, <http://www.strategicstudiesinstitute.army.mil/pubs/summary.cfm?q=1059#ER>, DA: 7-9-2015)
***modified for potentially objectionable language

Unfortunately, although the concept of American soft power is true gold in theory, in practice it is not so valuable. Ironically, the empirical truth behind the attractive concept is just sufficient to mislead policymakers and grand strategists. Not only do Americans want to believe that the soft power of their civilization and culture is truly potent, we are all but programmed by our enculturation to assume that the American story and its values do and should have what amounts to missionary merit that ought to be universal. American culture is so powerful a programmer that it can be difficult for Americans to empathize with, or even understand, the somewhat different values and their implications held deeply abroad. The idea is popular, even possibly authoritative, among Americans that ours is not just an "ordinary country," but instead is a country both exceptionally blessed (by divine intent) and, as a consequence, exceptionally obliged to lead Mankind [humanity]. When national exceptionalism is not merely a proposition, but is more akin to an iconic item of faith, it is difficult for usually balanced American minds to consider the potential of their soft power without rose-tinted spectacles. And the problem is that they are somewhat correct. American values, broadly speaking "the American way," to hazard a large project in reductionism, are indeed attractive beyond America's frontiers and have some utility for U.S. policy. But there are serious limitations to the worth of the concept of soft power, especially as it might be thought of as an instrument of policy. To date, the idea of soft power has not been subjected to a sufficiently critical forensic examination. In particular, the relation of the soft power of attraction and persuasion to the hard power of coercion urgently requires more rigorous examination than it has received thus far. When considered closely, the subject of soft power and its implications for the hard power of military force reveals a number of plausible working propositions that have noteworthy meaning for U.S. policy and strategy. 1. Hard military threat and use are more difficult to employ today than was the case in the past, in part because of the relatively recent growth in popular respect for universal humanitarian values. However, this greater difficulty does not mean that military force has lost its distinctive ability to secure some political decisions. The quality of justification required for the use of force has risen, which means that the policy domain for military relevance has diminished, but has by no means disappeared. 2. The political and other contexts for the use of force today do not offer authoritative guidance for the future. History is not reliably linear. To know the 2000s is not necessarily to know the 2010s. 3. The utility of military force is not a fixed metric value, either universally or for the United States. The utility of force

varies with culture and circumstance, inter alia. It is not some free-floating objective calculable truth. 4. For both good and for ill, ethical codes are adapted and applied under the pressure of more or less stressful circumstances, and tend to be significantly situational in practice. This is simply the way things are and have always been. What a state licenses or tolerates by way of military behavior effected in its name depends to a degree on how desperate and determined are its policymakers and strategists. 5. War involves warfare, which means military force, which means violence that causes damage, injury, and death. Some of the debate on military force and its control fails to come to grips with the bloody reality, chaos, and friction that is in the very nature of warfare. Worthy and important efforts to limit conduct in warfare cannot avoid accepting the inherent nastiness of the subject. War may be necessary and it should be restrained in its conduct, but withal it is by definition illiberally violent behavior. 6. By and large, soft power should not be thought of as an instrument of policy. America is what it is, and the ability of Washington to project its favored “narrative(s)” is heavily constrained. Cultural diplomacy and the like are hugely mortgaged by foreigners’ own assessments of their interests. And a notable dimension of culture is local, which means that efforts to project American ways risk fueling “blow-back.” 7. Soft power cannot sensibly be regarded as a substantial alternative to hard military power. Familiarity with the concept alone encourages the fallacy that hard and soft power have roughly equivalent weight and utility. An illusion of broad policy choice is thus fostered, when in fact effective choices are severely constrained. 8. An important inherent weakness of soft power as an instrument of policy is that it utterly depends upon the uncoerced choices of foreigners. Sometimes their preferences will be compatible with ours, but scarcely less often they will not be. Interests and cultures do differ. 9. Soft power tends to be either so easy to exercise that it is probably in little need of a policy push, being essentially preexistent, or too difficult to achieve because local interests, or culture, or both, deny it political traction. 10. Hard and soft power should be complementary, though often they are not entirely so. U.S. national style, reflecting the full array of American values as a hegemonic power, has been known to give some cultural and hence political offense abroad, even among objective allies and other friends. Whereas competent strategy enables hard military power to be all, or most of what it can be, soft power does not lend itself readily to strategic direction. 11. Provided the different natures of hard and soft power are understood—the critical distinguishing factor being coercion versus attraction—it is appropriate to regard the two kinds of power as mutual enablers. However, theirs is an unequal relationship. The greater attractiveness of soft power is more than offset in political utility by its inherent unsuitability for policy direction and control. From all the factors above, it follows that military force will long remain an essential instrument of policy. That said, popular enthusiasm in Western societies for the placing of serious restraints on the use of force can threaten the policy utility of the military. The ill consequences of America’s much-manifested difficulty in thinking and behaving strategically are augmented perilously when unwarranted faith is placed upon soft power that inherently is resistant to strategic direction. Although it is highly appropriate to be skeptical of the policy utility of soft power, such skepticism must not be interpreted as implicit advice to threaten or resort to military force with scant reference to moral standards. Not only is it right in an absolute sense, it is also expedient to seek, seize, and hold the moral high ground. There can be significant strategic advantage in moral advantage—to risk sounding cynical. Finally, it is essential to recognize that soft power tends to work well when America scarcely has need of it, but the

more challenging contexts for national security require the mailed fist, even if it is cushioned, but not concealed, by a glove of political and ethical restraint.

Soft Power Fails – Hard Power

US soft power is inevitable but fails – countries always default to hard power – empirics

Burnett, 15 (Alistair Burnett, editor of The World Tonight, a BBC News program, 1-8-2015, "China, Russia and the US Juggle Soft and Hard Power", Yale Global Online, <http://yaleglobal.yale.edu/content/china-russia-and-us-juggle-soft-and-hard-power#ER>, DA: 7-8-2015)

LONDON: This year has seen marked resurgence in the use of hard power by states in pursuit of national interests. The US return to military action in Iraq and direct intervention in Syria, Russia's annexation of Crimea and destabilization of eastern Ukraine and China's assertion of its territorial claims in the East and South China seas are just three examples of major powers turning to force and coercion to achieve strategic aims. Yet, not so long ago, talk in diplomatic, academic and journalistic circles focused on the growing importance of soft power in international relations. In recent years, governments consider how to boost soft power, investing heavily in tools like international broadcasting and cultural institutes to win friends abroad. China has spent billions expanding China Central TV's broadcasts in English and other languages and opening 450 Confucius Institutes around the world teaching Chinese language and culture. It has even invested in trying to create global pop star Jia Ruhan. Russia has expanded its international TV news station, RT. The US continues to fund international broadcasting started during the Cold War. These are all efforts to influence the views of people in other countries, winning them over to a way of thinking so they will pressure their governments – even in authoritarian states – to fall into line with new policies. The US is considered the world leader in soft and hard power, and there's no doubt American culture is attractive to many around the world – consider the numbers wanting to migrate there and who wear baseball caps, eat American-style fast food, listen to American music and watch Hollywood movies. Much of the global attractiveness of the US has little to do with its government, and photographs of anti-American protesters in the Middle East in jeans and T-shirts demonstrate how it's possible to like American culture and dislike Washington's policies. But while the US has accumulated a lot of this soft power without having to spend a cent, relying instead on the sheer attractiveness of American society, the government still takes steps to manipulate attitudes. One little publicized effort is how the Pentagon influences its on-screen image through its film liaison office which can save Hollywood producers millions in special effects by providing hardware and personnel on approved scripts. But do events of the past year suggest that in a world where the global balance of power is shifting and countries really want their own way, they turn to old-fashioned hard power? Harvard Professor Joe Nye who coined the term "soft power" argues it is not a binary choice. He developed on his original definition of power by identifying a third way states could convince others to do what they wanted – with "smart power" – basically wielding a mix of hard and soft power. Looking at how the United States, Russia and China have conducted themselves through this lens shows all three are trying – with varying levels of success – to use smart power. Before using military force in Iraq and Syria against Islamic State, the Obama administration utilized soft power to maximize impact of the use of its hard power. Washington was keen that its intervention was not seen as unilateral action by aggressive Christian states against Muslims, so it portrayed IS as an enemy of fellow

Muslims. Washington also emphasizes it intervenes in Iraq at the invitation of Baghdad and has been successful in building a coalition including leading Sunni Arab states to carry out airstrikes in Syria. So far the campaign has slowed IS down. In Ukraine, Russia's campaign to take Crimea and destabilize the eastern part of the country has been called hybrid warfare because of its mix of diplomacy, TV and social media propaganda about the threat to Russian speakers from Ukrainian nationalists, and use of irregular and disguised forces designed for ambiguity long enough to achieve Russian objectives. In the case of Crimea, annexed with little fighting, acute observers of Russian policy see this as an effective use of smart power. Stalemate in eastern Ukraine suggests it may be less effective there. Beijing's attempt to use smart power has met with mixed results. In the South China Sea, China claims waters also claimed by the Philippines, Vietnam, Malaysia, Brunei and Taiwan. It has spent recent years reassuring neighbors it's not a threat despite its growing economic and military strength. But, earlier this year, China sent an oil exploration vessel into an area Vietnam also claims leading to clashes between Chinese and Vietnamese ships. Tensions with the Philippines emerged after Chinese ships tried to block Filipino efforts to resupply a garrison of marines on a disputed atoll. The result was anti-Chinese riots in Vietnam, diplomatic protests by the Philippines, and both countries establishing closer military ties with the United States. The long-term effectiveness of the return to hard power is probably more dependent on the military and economic strength of the United States, Russia and China than their international image. Russia will probably hang on to Crimea because Ukraine is the weaker state and shows no real appetite to get it back. China's economic preponderance in the South China Sea region means its neighbors, while not rolling over, will probably meet it more than halfway in the resolving the maritime disputes. The US battle with what's now called IS really goes back to the 2003 Iraq invasion which allowed jihadis to get a foothold in the country by presenting themselves as the resistance to infidel invaders. The extremists extended their power to western Iraq and Syria after 2011 when the Syrian civil war broke out and US troops left Iraq. Ultimately, defeating IS depends on a political solution in Syria and an Iraqi government truly inclusive of Sunnis as well as Shias and Kurds. In all these cases though, soft power is being deployed in subtle ways to attract support by trying to "shape the narrative" by portraying rivals and enemies as acting outside shared global norms and values. The United States claims to defend Muslims from the Islamic extremism; Russia says it defends Russian-speakers from Ukrainian nationalists; and China describes itself as a rising, but peace-loving nation. The success of these attempts depends not just on the language and imagery used by officials, but also on whether the media and other opinion-formers adopt similar language and imagery. Wielding soft and smart power is also complicated because one country's attractiveness to another is a result of a complex interplay of what a country has to offer and how the offer is perceived. For instance, the United States has appeal in a country like Burma, because many people there want democratic elections and free speech after decades of repression, while many Pakistanis dislike the United States, regarding it as a country that doesn't respect their sovereignty while also killing many of citizens in its anti-terror operations. The increasing use of hard power is partly a result of the changing global balance as other countries take advantage of the relative decline of the United States to assert their interests. But the difficulties and uncertainties surrounding how to best wield soft power and measure its effectiveness also explain why leaders are still attracted to using familiar hard-power methods, be they airstrikes or economic sanctions.

Internal Link D – Not Govt

US soft power is inevitable and decided by culture – government policies are irrelevant

Bev, 12 (Jennie S. Bev, regular columnist to Forbes Indonesia, The Jakarta Post, and Strategic Review, Associate Partner of Fortune PR Indonesia and based in Northern California, 5-23-2012, "The Power of American "Soft Power"", Forbes, <http://www.forbes.com/sites/85broads/2012/05/23/the-power-of-american-soft-power/#ER>, DA: 7-7-2015)

Almost four years since the beginning of the Great Recession, signified by the implosion of the financial industry and the fall of Lehman Brothers in September 2008, the United States is recovering. In fact, some sectors have grown to new heights. Thus, a “declining USA” is no more than a myth. This myth is likely to continue for a while despite the recession officially ending in June 2009 as the high unemployment and on-going foreclosure crisis have cloaked significant economic improvements. In the last four years, declinism and declinists have been spreading paralyzing dystopian analyses. Combine this with Nouriel “Dr. Doom” Roubini’s “the perfect storm” forecast in 2013 and you probably would become even more paralyzed. Daniel Gross’ best-selling book *Better, Stronger, Faster* released in May 2012 is an exception. It is probably one of the first books that presents encouraging facts in this recovery period rather than discouraging views of America’s future. The mammoth has gotten back up, but it is always the memory of one’s fall that lingers in mind. We all remember that one fateful day when we attended the 341(a) bankruptcy hearing to meet creditors and not the thousands of days of financial stability. Just like we all remember vividly the day our loved one was buried six-feet under when he died and not the beautiful decades he shared his life with us. Failure and losing hurt, thus they are recorded for eternity in our long-term memory. It is just how our brain works, thanks to millions of years of evolution. The world was so shocked with the fall of USA, that its gradual rise hasn’t yet created a lasting mental image. Good news, American “soft power” is more powerful than any fiscal policy and political maneuver. Joseph Nye of Harvard University Kennedy School of Government says “soft power” refers to the ability to get through attraction rather than coercion or payments. By “to get” it means to receive favorable treatments based upon attractiveness of a country’s culture, ideals, and policies. For instance, inspired by TV series about medical doctors, some children in Taiwan aspire to study medicine at an American university. Infatuated by the idea of a fair trial, an Indonesian dissident aspires to become a lawyer. “Soft power” can be hardcore power. And the American brand is still the best out there. Also, thanks to low US dollar value, a record 62 million foreign tourists visited USA in 2011. In 2010, some 1.04 million immigrants applied for permanent residency, following 1.13 million in the previous year, which reflects the world’s insatiable faith in the US brand. The people of the world still believe that the USA is the place to visit, to reside, and to prosper. US brands, such as automobile giants Buick, GM, and Ford, continue to grow outside of the USA. US brands continue to influence socio-political-economic wellbeing of people of the world: Facebook, Twitter, and Youtube are vital in demonstrations and social unrests. US brands continue to serve people’s mobility and communication: Apple, Microsoft, CISCO, Oracle, and Boeing. People of the world is a market of seven-billion, and most of them have occasionally consumed black soda drinks called Coca-Cola and Pepsi. The US government has lost its

geopolitical epicenter, yet American brands keep the legend alive. And the shift has occurred from public power to private power, from political power to economic power, from hard power to soft power, with the end of the Cold War as the turning point.

US unrivaled – government alt causes irrelevant because SoPo NOT from them and hard power backs it up

Nye 13

{Joseph, Harvard Professor, “What China and Russia Don’t Get about Soft Power,” FP, April, http://www.foreignpolicy.com/articles/2013/04/29/what_china_and_russia_don_t_get_about_soft_power#THUR}

Much of America's soft power is produced by civil society -- everything from universities and foundations to Hollywood and pop culture -- not from the government. Sometimes the United States is able to preserve a degree of soft power because of its critical and uncensored civil society even when government actions -- like the invasion of Iraq -- are otherwise undermining it. But in a smart power strategy, hard and soft reinforce each other. In his new book, *China Goes Global*, George Washington University's David Shambaugh shows how China has spent billions of dollars on a charm offensive to increase its soft power. Chinese aid programs to Africa and Latin America are not limited by the institutional or human rights concerns that constrain Western aid. The Chinese style emphasizes high-profile gestures. But for all its efforts, China has earned a limited return on its investment. Polls show that opinions of China's influence are positive in much of Africa and Latin America, but predominantly negative in the United States, Europe, as well as India, Japan and South Korea.

A2 Soft Power Solvency

Soft power is non-governmental – attempts to increase it through policies fail and backfire

Ellwood, 14 (David Ellwood, Senior Adjunct Professor of European Studies at Johns Hopkins University School of Advanced International Studies, Bologna Center, 1-9-2014, "'Soft power' and the politics of influence", OUP Blog, <http://blog.oup.com/2014/01/soft-power-and-the-politics-of-influence/#ER>, DA: 7-8-2015)

Leaving aside its glibness and air of casuistry, the 'soft power' concept is fundamentally flawed at just the point where Nye insists on its usefulness: as a tool of foreign policy. The more states attempt consciously to project the force of example they see in their nations and its ways, the more the rest will see manipulation and propaganda. Two US analysts who commented on the prospects for British foreign policy in a new book (*Influencing Tomorrow: Future Challenges for British Foreign Policy*, 2013) were happy to say that 'the BBC may be a more effective tool of British foreign policy than the Royal Navy or the British Army'. But they also warned against the temptations and risks of leverage: 'when you reach for the tool of soft power, you find it evaporates in your hand'. In the American case in particular, the temptation seems to be to try to mobilise the charismatic nature of so many successful American inventions and people as though they are resources at the disposal of the state. But they are not; they are the values and products of that society in the most diffuse sense, and its creative industries in particular, with all their talent for absorbing and re-configuring the inventions of the world then re-launching them for a global market. Today the experts know that the sources of power in the world are multiplying, and that force is only one of them. Diffused through so many channels today, soft power is best seen as the influence of culture in all its forms. Nothing like culture adds value – and values – to power. The key cultural power is the one which most successfully defines the content, direction and pace of change for the rest, and so presents itself as the leading model of modernity in any given era. This was the challenge of America to the world in the 20th century. Now others have understood this lesson, and are trying to join the competition. Hopefully it's a contest for diversity, and not for supremacy.

We Can't Use It

Soft power fails – it's unpredictable and we can't leverage it effectively

Kalathil, O5 (Shanthi Kalathil, Georgetown University, adviser, consultant and speaker on development, democratization and the role of technology in international affairs, was previously a senior Democracy Fellow at the U.S. Agency for International Development, a non-resident Associate at Georgetown's Institute for the Study of Diplomacy, and a regular consultant for the World Bank, the Aspen Institute and others, published 2006, "Soft Power, Hard Issues", Reports of the 2005 Aspen Institute Roundtable on Public Diplomacy and the Middle East and the Forum on Communications and Society, The Aspen Institute, <https://www.aspeninstitute.org/sites/default/files/content/docs/cands/C%26SSOFTPOWER.PDF> #ER, p. 15, DA: 7/9/2015)

Recognizing that soft power rests on a variety of sources is a first step in understanding the issues surrounding public diplomacy, Nye pointed out at the Forum. If one understands that soft power—and public diplomacy as a component of it—is about attraction, then public diplomacy must involve more than broadcasting a message. For instance, Nye cautioned, public diplomacy cannot simply be about selling: "If the policy is terrible, advertising won't work," he observed. Moreover, as Nye put it, soft power can be much harder to wield than hard power, with less predictable results. The United States is not alone in trying to understand and augment its soft power. In a preceding discussion on China, many participants concurred that China has successfully boosted its soft power capabilities in recent years. It has done so not through advanced messaging techniques but through strategic engagement on key foreign policy issues of interest to its target countries. In this sense, one can understand that the scope of soft power goes far beyond the techniques and practices of public diplomacy—and has the potential to be far more influential.

A2 Smart Power

This term means nothing

Schmitt, 14 (Gary J. Schmitt, co-director of the Marilyn Ware Center for Security Studies at AEI and the director of AEI's Program on American Citizenship, executive director of the President's Foreign Intelligence Advisory Board during President Ronald Reagan's second term, 6-19-2014, "A hard look at soft power in East Asia", AEI, <http://www.aei.org/publication/a-hard-look-at-soft-power-in-east-asia/#ER>, DA: 7-6-2015)

The Problem of Definition To start, "smart power" is not an especially helpful term.[1] It is not smart, some say, to depend solely or overly on hard power. It is much wiser to match soft and hard power as appropriate to the problem at hand and do so in such a way that they reinforce each other's effectiveness. However, as much sense as this axiom superficially made, the concept itself is really just a new way of talking about what was traditionally and most broadly referred to as "grand strategy." And it is not at all clear that much is gained by avoiding the more traditional terminology. Indeed, something might be lost. Strategy immediately brings to mind the "means-ends" nexus, whereas in the case of smart power, the focus is often more about the mix of means and less about what is to be accomplished. Moreover, by calling a policymaker's mix of hard and soft power "smart," one is actually prejudging that mix as being sound. And, the truth is, one rarely knows if a strategy is smart—that is, whether it is effective in accomplishing its ends—for years to come. In short, a complex mix of hard and soft power might on its face look prudent and effective, but in the final analysis is not. "By calling a policymaker's mix of hard and soft power "smart," one is actually prejudging that mix as being sound." Although there should be some hesitancy in employing the phrase "smart power," there should probably be less when it comes to using "soft power." For one thing, it is a term of art that has had staying power and, as such, has obviously captured an element of power that analysts and policymakers find useful.

Terrorism -DDI

*****1NC*****

Terror risk is high- maintaining current surveillance is key

Inserra, 6-8-2015

David Inserra is a Research Associate for Homeland Security and Cyber Security in the Douglas and Sarah Allison Center for Foreign and National Security Policy of the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, at The Heritage Foundation, 6-8-2015, "69th Islamist Terrorist Plot: Ongoing Spike in Terrorism Should Force Congress to Finally Confront the Terrorist Threat," Heritage Foundation, <http://www.heritage.org/research/reports/2015/06/69th-islamist-terrorist-plot-ongoing-spike-in-terrorism-should-force-congress-to-finally-confront-the-terrorist-threat>

On June 2 in Boston, Usaamah Abdullah Rahim drew a knife and attacked police officers and FBI agents, who then shot and killed him. Rahim was being watched by Boston's Joint Terrorism Task Force as he had been plotting to behead police officers as part of violent jihad. A conspirator, David Wright or Dawud Sharif Abdul Khaliq, was arrested shortly thereafter for helping Rahim to plan this attack. This plot marks the 69th publicly known Islamist terrorist plot or attack against the U.S. homeland since 9/11, and is part of a recent spike in terrorist activity. The U.S. must redouble its efforts to stop terrorists before they strike, through the use of properly applied intelligence tools. The Plot According to the criminal complaint filed against Wright, Rahim had originally planned to behead an individual outside the state of Massachusetts,[1] which, according to news reports citing anonymous government officials, was Pamela Geller, the organizer of the "draw Mohammed" cartoon contest in Garland, Texas.[2] To this end, Rahim had purchased multiple knives, each over 1 foot long, from Amazon.com. The FBI was listening in on the calls between Rahim and Wright and recorded multiple conversations regarding how these weapons would be used to behead someone. Rahim then changed his plan early on the morning of June 2. He planned to go "on vacation right here in Massachusetts.... I'm just going to, ah, go after them, those boys in blue. Cause, ah, it's the easiest target." [3] Rahim and Wright had used the phrase "going on vacation" repeatedly in their conversations as a euphemism for violent jihad. During this conversation, Rahim told Wright that he planned to attack a police officer on June 2 or June 3. Wright then offered advice on preparing a will and destroying any incriminating evidence. Based on this threat, Boston police officers and FBI agents approached Rahim to question him, which prompted him to pull out one of his knives. After being told to drop his weapon, Rahim responded with "you drop yours" and moved toward the officers, who then shot and killed him. While Rahim's brother, Ibrahim, initially claimed that Rahim was shot in the back, video surveillance was shown to community leaders and civil rights groups, who have confirmed that Rahim was not shot in the back.[4] Terrorism Not Going Away This 69th Islamist plot is also the seventh in this calendar year. Details on how exactly Rahim was radicalized are still forthcoming, but according to anonymous officials, online propaganda from ISIS and other radical Islamist groups are the source.[5] That would make this attack the 58th homegrown terrorist plot and continue the recent trend of ISIS playing an

important role in radicalizing individuals in the United States. It is also the sixth plot or attack targeting law enforcement in the U.S., with a recent uptick in plots aimed at police. While the debate over the PATRIOT Act and the USA FREEDOM Act is taking a break, the terrorists are not. The result of the debate has been the reduction of U.S. intelligence and counterterrorism capabilities, meaning that the U.S. has to do even more with less when it comes to connecting the dots on terrorist plots.[6] Other legitimate intelligence tools and capabilities must be leaned on now even more. Protecting the Homeland To keep the U.S. safe, Congress must take a hard look at the U.S. counterterrorism enterprise and determine other measures that are needed to improve it. Congress should: Emphasize community outreach. Federal grant funds should be used to create robust community-outreach capabilities in higher-risk urban areas. These funds must not be used for political pork, or so broadly that they no longer target those communities at greatest risk. Such capabilities are key to building trust within these communities, and if the United States is to thwart lone-wolf terrorist attacks, it must place effective community outreach operations at the tip of the spear. Prioritize local cyber capabilities. Building cyber-investigation capabilities in the higher-risk urban areas must become a primary focus of Department of Homeland Security grants. With so much terrorism-related activity occurring on the Internet, local law enforcement must have the constitutional ability to monitor and track violent extremist activity on the Web when reasonable suspicion exists to do so. Push the FBI toward being more effectively driven by intelligence. While the FBI has made high-level changes to its mission and organizational structure, the bureau is still working on integrating intelligence and law enforcement activities. Full integration will require overcoming inter-agency cultural barriers and providing FBI intelligence personnel with resources, opportunities, and the stature they need to become a more effective and integral part of the FBI. Maintain essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well. Clear-Eyed Vigilance The recent spike in terrorist plots and attacks should finally awaken policymakers—all Americans, for that matter—to the seriousness of the terrorist threat. Neither fearmongering nor willful blindness serves the United States. Congress must recognize and acknowledge the nature and the scope of the Islamist terrorist threat, and take the appropriate action to confront it.

Surveillance is critical to stopping terror threats

Lewis 14 [James Andrew Lewis, Director and Senior Fellow of the Technology and Public Policy Program at the CSIS, December 2014, "Underestimating Risk in the Surveillance Debate", Center for Strategic and International Studies, http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf pg 10-11 jf]

Assertions that a collection program contributes nothing because it has not singlehandedly prevented an attack reflect an ill-informed understanding of how the United States conducts collection and analysis to prevent harmful acts against itself and its allies. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success (nor is technology consistently infallible). Intelligence is a team sport. Perfect knowledge does not exist and success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. Analysts assemble this mosaic from many different sources and based on experience and intuition. Luck is still more important than anyone would like and the alternative to luck is acquiring more information. This ability to blend different sources of intelligence has improved U.S. intelligence capabilities and gives us an advantage over some opponents. Portrayals of spying in popular culture focus on a central narrative, essential for storytelling but deeply misleading. In practice, there can be many possible narratives that analysts must explore simultaneously. An analyst might decide, for example, to see if there is additional confirming information that points to which explanation deserves further investigation. Often, the contribution from collection programs comes not from what they tell us, but what they let us reject as false. In the case of the 215 program, its utility was in being able to provide information that allowed analysts to rule out some theories and suspects. This allows analysts to focus on other, more likely, scenarios. In one instance, an attack is detected and stopped before it could be executed. U.S. forces operating in Iraq discover a bomb-making factory. Biometric data found in this factory is correlated with data from other bombings to provide partial identification for several individuals who may be bomb-makers, none of whom are present in Iraq. In looking for these individuals, the United States receives information from another intelligence service that one of the bombers might be living in a neighboring Middle Eastern country. Using communications intercepts, the United States determines that the individual is working on a powerful new weapon. The United States is able to combine the communications intercept from the known bomb maker with information from other sources—battlefield data, information obtained by U.S. agents, collateral information from other nations' intelligence services—and use this to identify others in the bomber's network, understand the plans for bombing, and identify the bomber's target, a major city in the United States. This effort takes place over months and involves multiple intelligence, law enforcement, and military agencies, with more than a dozen individuals from these agencies collaborating to build up a picture of the bomb-maker and his planned attack. When the bomb-maker leaves the Middle East to carry out his attack, he is prevented from entering the United States. An analogy for how this works would be to take a 1,000-piece jigsaw puzzle, randomly select 200 pieces, and provide them to a team of analysts who, using incomplete data, must guess what the entire picture looks like. The likelihood of their success is determined by how much information they receive, how much time they have, and by experience and luck. Their guess can be tested by using a range of collection programs, including communications surveillance programs like the 215 metadata program. What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before

an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects. This makes the critique of the 215 program like a critique of airbags in a car—you own a car for years, the airbags never deploy, so therefore they are useless and can be removed. The weakness in this argument is that discarding airbags would increase risk. How much risk would increase and whether other considerations outweigh this increased risk are fundamental problems for assessing surveillance programs. With the Section 215 program, Americans gave up a portion of their privacy in exchange for decreased risk. Eliminating 215 collection is like subtracting a few of the random pieces of the jigsaw puzzle. It decreases the chances that the analysts will be able to deduce what is actually going on and may increase the time it takes to do this. That means there is an increase in the risk of a successful attack. How much of an increase in risk is difficult to determine.

Terrorists will use bioweapons- guarantees extinction

Cooper 13

(Joshua, 1/23/13, University of South Carolina, "Bioterrorism and the Fermi Paradox," <http://people.math.sc.edu/cooper/fermi.pdf>, 7/15/15, SM)

We may conclude that, when a civilization reaches its space-faring age, it will more or less at the same moment (1) contain many individuals who seek to cause large-scale destruction, and (2) acquire the capacity to tinker with its own genetic chemistry. This is a perfect recipe for bioterrorism, and, given the many very natural pathways for its development and the overwhelming evidence that precisely this course has been taken by humanity, it is hard to see how bioterrorism does not provide a neat, if profoundly unsettling, solution to Fermi's paradox. One might object that, if omnicidal individuals are successful in releasing highly virulent and deadly genetic malware into the wild, they are still unlikely to succeed in killing everyone. However, even if every such mass death event results only in a high (i.e., not total) kill rate and there is a large gap between each such event (so that individuals can build up the requisite scientific infrastructure again), extinction would be inevitable regardless. Some of the engineered bioweapons will be more successful than others; the inter-apocalyptic eras will vary in length; and post-apocalyptic environments may be so war-torn, disease-stricken, and impoverished of genetic variation that they may culminate in true extinction events even if the initial cataclysm 'only' results in 90% death rates, since they may cause the effective population size to dip below the so-called "minimum viable population." This author ran a Monte Carlo simulation using as (admittedly very crude and poorly informed, though arguably conservative) estimates the following Earth-like parameters: bioterrorism event mean death rate 50% and standard deviation 25% (beta distribution), initial population 10¹⁰, minimum viable population 4000, individual omnicidal act probability 10⁻⁷ per annum, and population growth rate 2% per annum. One thousand trials yielded an average post-space-age time until extinction of less than 8000 years. This is essentially instantaneous on a cosmological scale, and varying the parameters by quite a bit does nothing to make the survival period comparable with the age of the universe.

*****Neg Uniqueness*****

Yes ISIS attack

Isis is mobilizing now and ready to take action.

Randy DeSoto May 7, 2015

<http://www.westernjournalism.com/isis-claims-to-have-71-trained-soldiers-in-targeted-u-s-states/> (Randy DeSoto is a writer for Western Journalism, which consistently ranks in the top 5 most popular conservative online news outlets in the country)

Purported ISIS jihadists issued threats against the United States Tuesday, indicating the group has trained soldiers positioned throughout the country, ready to attack “any target we desire.” The online post singles out controversial blogger Pamela Geller, one of the organizers of the “Draw the Prophet” Muhammad cartoon contest in Garland, Texas, calling for her death to “heal the hearts of our brothers and disperse the ones behind her.” ISIS also claimed responsibility for the shooting, which marked the first time the terror group claimed responsibility for an attack on U.S. soil, according to the New York Daily News. “The attack by the Islamic State in America is only the beginning of our efforts to establish a wiliyah [authority or governance] in the heart of our enemy,” the ISIS post reads. As for Geller, the jihadists state: “To those who protect her: this will be your only warning of housing this woman and her circus show. Everyone who houses her events, gives her a platform to spill her filth are legitimate targets. We have been watching closely who was present at this event and the shooter of our brothers.” ISIS further claims to have known that the Muhammad cartoon contest venue would be heavily guarded, but conducted the attack to demonstrate the willingness of its followers to die for the “Sake of Allah.” The FBI and the Department of Homeland Security, in fact, issued a bulletin on April 20 indicating the event would be a likely terror target. ISIS drew its message to a close with an ominous threat: We have 71 trained soldiers in 15 different states ready at our word to attack any target we desire. Out of the 71 trained soldiers 23 have signed up for missions like Sunday, We are increasing in number bithnillah [if God wills]. Of the 15 states, 5 we will name... Virginia, Maryland, Illinois, California, and Michigan...The next six months will be interesting. Fox News reports that “the U.S. intelligence community was assessing the threat and trying to determine if the source is directly related to ISIS leadership or an opportunist such as a low-level militant seeking to further capitalize on the Garland incident.” Former Navy Seal Rob O’Neill told Fox News he believes the ISIS threat is credible, and the U.S. must be prepared. He added that the incident in Garland “is a prime example of the difference between a gun free zone and Texas. They showed up at Charlie Hebdo, and it was a massacre. If these two guys had gotten into that building it would have been Charlie Hebdo times ten. But these two guys showed up because they were offended by something protected by the First Amendment, and were quickly introduced to the Second Amendment.” Geller issued a statement regarding the ISIS posting: “This threat illustrates the savagery and barbarism of the Islamic State. They want me dead for violating Sharia blasphemy laws. What remains to be seen is whether the free world will finally wake up and stand for the freedom of speech, or instead kowtow to this evil and continue to denounce me.”

Isis threat level at military bases increasing

Starr, Barbara 5/8/15 (cnn pentagon correspondent) "ISIS activity prompts threat level increase at bases" <http://www.cnn.com/2015/05/08/politics/isis-activity-prompts-threat-level-increase-at-bases/>

On Thursday, FBI Director James Comey told reporters that there are thousands of ISIS, also known as ISIL, followers online in the U.S. "We have a general concern, obviously, that ISIL is focusing on the uniformed military and law enforcement," Comey told reporters Thursday. The order to upgrade the threat level was signed by Admiral William Gortney, head of the U.S. Northern Command, which oversees all U.S. military installations in the continental U.S. The security order affects 3,200 sites, including bases, National Guard facilities, recruiting stations and health clinics, a Pentagon official said. "We have the same concern about the potential threat posed by violent homegrown extremists," said Captain Jeff Davis, spokesman for the U.S. Northern Command, or NORTHCOM. Davis declined to specify the new security measures. But the change in threat level status could mean more checks of vehicles entering bases, and more thorough identity checks of all personnel. Davis emphasized that "this is the new normal, that we are going to have increased vigilance and force protection. We seek to be unpredictable." A U.S. military official said the order to raise the force protection level to Bravo also applies to all National Guard installations, recruiting stations, and ROTC detachments, though practically speaking, the official acknowledges it will be difficult for the ROTC detachments to do much more than security awareness. In addition, security was raised recently at Wright-Patterson Air Force Base near Dayton, Ohio, in response to a perceived threat to the base security, another U.S. military official said. The threat was never deemed credible, but it came after another security concern at a base in Delaware used by Vice President Joe Biden when he flies home. On Friday, Wright-Patterson announced that the Air Force museum, which is part of the base, was canceling a planned Friday night concert and was stopping tours that were regularly offered until further notice. The base said this was "due to elevated security measures." Since NORTHCOM was established in October 2002, the threat level has reached Bravo on four occasions: Feb. 9, 2003, amid concerns al Qaeda was planning attacks on American targets; Dec. 21, 2003, when officials were concerned about attacks during the holiday season; May 1, 2011, in the aftermath of the raid that killed Osama bin Laden; and the 10th anniversary of the Sept. 11 attacks.

ISIS will emerge as a serious threat to the US

Morell 15 , Michael Morell is the former deputy director of the CIA and has twice served as acting director. He is the author of *The Great War of Our Time: The CIA's Fight Against Terrorism — From al Qa'ida to ISIS*. May 14, 2015 Time Magazine *ISIS Is a Danger on U.S. Soil* <http://time.com/3858354/isis-is-a-danger-on-u-s-soil/>

The terrorist group poses a gathering threat. In the aftermath of the attempted terrorist attack on May 4 in Garland, Texas—for which ISIS claimed responsibility—we find ourselves again considering the question of whether or not ISIS is a real threat. The answer is yes. A very serious one. Extremists inspired by Osama bin Laden's ideology consider themselves to be at war with the U.S.; they want to attack us. It is important to never forget that—no matter how long it has been since 9/11. ISIS is just the latest manifestation of bin Laden's design. The group has grown

faster than any terrorist group we can remember, and the threat it poses to us is as wide-ranging as any we have seen. What ISIS has that al-Qaeda doesn't is a Madison Avenue level of sophisticated messaging and social media. ISIS has a multilingual propaganda arm known as al-Hayat, which uses GoPros and cameras mounted on drones to make videos that appeal to its followers. And ISIS uses just about every tool in the platform box—from Twitter to YouTube to Instagram—to great effect, attracting fighters and funding. Digital media are one of the group's most significant strengths; they have helped ISIS become an organization that poses four significant threats to the U.S. First, it is a threat to the stability of the entire Middle East. ISIS is putting the territorial integrity of both Iraq and Syria at risk. And a further collapse of either or both of these states could easily spread throughout the region, bringing with it sectarian and religious strife, humanitarian crises and the violent redrawing of borders, all in a part of the world that remains critical to U.S. national interests. ISIS now controls more territory—in Iraq and Syria—than any other terrorist group anywhere in the world. When al-Qaeda in Iraq joined the fight in Syria, the group changed its name to ISIS. ISIS added Syrians and foreign fighters to its ranks, built its supply of arms and money and gained significant battlefield experience fighting Bashar Assad's regime. Together with the security vacuum in Iraq and Nouri al-Maliki's alienation of the Sunnis, this culminated in ISIS's successful blitzkrieg across western Iraq in the spring and summer of 2014, when it seized large amounts of territory. ISIS is not the first extremist group to take and hold territory. Al-Shabab in Somalia did so a number of years ago and still holds territory there, al-Qaeda in the Islamic Maghreb did so in Mali in 2012, and al-Qaeda in Yemen did so there at roughly the same time. I fully expect extremist groups to attempt to take—and sometimes be successful in taking—territory in the years ahead. But no other group has taken so much territory so quickly as ISIS has. Second, ISIS is attracting young men and women to travel to Syria and Iraq to join its cause. At this writing, at least 20,000 foreign nationals from roughly 90 countries have gone to Syria and Iraq to join the fight. Most have joined ISIS. This flow of foreigners has outstripped the flow of such fighters into Iraq during the war there a decade ago. And there are more foreign fighters in Syria and Iraq today than there were in Afghanistan in the 1980s working to drive the Soviet Union out of that country. These foreign nationals are getting experience on the battlefield, and they are becoming increasingly radicalized to ISIS's cause. There is a particular subset of these fighters to worry about. Somewhere between 3,500 and 5,000 jihadist wannabes have traveled to Syria and Iraq from Western Europe, Canada, Australia and the U.S. They all have easy access to the U.S. homeland, which presents two major concerns: that these fighters will leave the Middle East and either conduct an attack on their own or conduct an attack at the direction of the ISIS leadership. The former has already happened in Europe. It has not happened yet in the U.S.—but it will. In spring 2014, Mehdi Nemmouche, a young Frenchman who went to fight in Syria, returned to Europe and shot three people at the Jewish Museum of Belgium in Brussels. The third threat is that ISIS is building a following among other extremist groups around the world. The allied exaltation is happening at a faster pace than al-Qaeda ever enjoyed. It has occurred in Algeria, Libya, Egypt and Afghanistan. More will follow. These groups, which are already dangerous, will become even more so. They will increasingly target ISIS's enemies (including us), and they will increasingly take on ISIS's brutality. We saw the targeting play out in early 2015 when an ISIS-associated group in Libya killed an American in an attack on a hotel in Tripoli frequented by diplomats and international businesspeople. And we saw the extreme violence

play out just a few weeks after that when another ISIS-affiliated group in Libya beheaded 21 Egyptian Coptic Christians. And fourth, perhaps most insidiously, ISIS's message is radicalizing young men and women around the globe who have never traveled to Syria or Iraq but who want to commit an attack to demonstrate their solidarity with ISIS. These are the so-called lone wolves. Even before May 4, such an ISIS-inspired attack had already occurred in the U.S.: an individual with sympathies for ISIS attacked two New York City police officers with a hatchet. Al-Qaeda has inspired such U.S. attacks—the Fort Hood shootings in late 2009 that killed 13 and the Boston Marathon bombing in spring 2013 that killed five and injured nearly 300. The attempted attack in Texas is just the latest of these. We can expect more of these kinds of attacks in the U. S. Attacks by ISIS-inspired individuals are occurring at a rapid pace around the world—roughly 10 since ISIS took control of so much territory. Two such attacks have occurred in Canada, including the October 2014 attack on the Parliament building. And another occurred in Sydney, in December 2014. Many planning such attacks—in Australia, Western Europe and the U.S.—have been arrested before they could carry out their terrorist plans. Today an ISIS-directed attack in the U. S. would be relatively unsophisticated (small-scale), but over time ISIS's capabilities will grow. This is what a long-term safe haven in Iraq and Syria would give ISIS, and it is exactly what the group is planning to do. They have announced their intentions—just like bin Laden did in the years prior to 9/11.

ISIS will attack – three reasons – its capabilities are growing, an attack would be good propaganda, and it basically hates all things America

Rogan 15 (Tom, panelist on The McLaughlin Group and holds the Tony Blankley Chair at the Steamboat Institute, "Why ISIS Will Attack America," National Review, 3-24-15, [//MJ](http://www.nationalreview.com/article/415866/why-isis-will-attack-america-tom-rogan)

There is no good in you if they are secure and happy while you have a pulsing vein. Erupt volcanoes of jihad everywhere. Light the earth with fire upon all the [apostate rulers], their soldiers and supporters. — ISIS leader Abu Bakr al-Baghdadi, November 2014. Those words weren't idle. The Islamic State (ISIS) is still advancing, across continents and cultures. It's attacking Shia Muslims in Yemen, gunning down Western tourists in Tunisia, beheading Christians in Libya, and murdering or enslaving all who do not yield in Iraq and Syria. Its black banner seen as undaunted by the international coalition against it, new recruits still flock to its service. The Islamic State's rise is, in other words, not over, and it is likely to end up involving an attack on America. Three reasons why such an attempt is inevitable: ISIS'S STRATEGY PRACTICALLY DEMANDS IT Imbued with existential hatred against the United States, the group doesn't just oppose American power, it opposes America's identity. Where the United States is a secular democracy that binds law to individual freedom, the Islamic State is a totalitarian empire determined to sweep freedom from the earth. As an ideological and physical necessity, ISIS must ultimately conquer America. Incidentally, this kind of total-war strategy explains why counterterrorism experts are rightly concerned about nuclear proliferation. The Islamic State's strategy is also energized by its desire to replace al-Qaeda as Salafi jihadism's global figurehead. While al-Qaeda in the Arabian Peninsula (AQAP) and ISIS had a short flirtation last year, ISIS has now signaled its intent to usurp al-Qaeda's power in its home territory. Attacks by ISIS last week

against Shia mosques in the Yemeni capital of Sana'a were, at least in part, designed to suck recruits, financial donors, and prestige away from AQAP. But to truly displace al-Qaeda, ISIS knows it must furnish a new 9/11. ITS CAPABILITIES ARE GROWING Today, ISIS has thousands of European citizens in its ranks. Educated at the online University of Edward Snowden, ISIS operations officers have cut back intelligence services' ability to monitor and disrupt their communications. With EU intelligence services stretched beyond breaking point, ISIS has the means and confidence to attempt attacks against the West. EU passports are powerful weapons: ISIS could attack — as al-Qaeda has repeatedly — U.S. targets around the world. AN ATTACK ON THE U.S. IS PRICELESS PROPAGANDA For transnational Salafi jihadists like al-Qaeda and ISIS, a successful blow against the U.S. allows them to claim the mantle of a global force and strengthens the narrative that they're on a holy mission. Holiness is especially important: ISIS knows that to recruit new fanatics and deter its enemies, it must offer an abiding narrative of strength and divine purpose. With the group's leaders styling themselves as Mohammed's heirs, Allah's chosen warriors on earth, attacking the infidel United States would reinforce ISIS's narrative. Of course, attacking America wouldn't actually serve the Islamic State's long-term objectives. Quite the opposite: Any atrocity would fuel a popular American resolve to crush the group with expediency. (Make no mistake, it would be crushed.) The problem, however, is that, until then, America is in the bull's eye.

Terrorism threat high

Terror threat high now—encryption and radicalization

Investor's Business Daily, 6-23-2015, "Despite Obama's Claim, Our Terror Threat Level Is High," <http://news.investors.com/ibd-editorials/062315-758709-diminishing-us-power-has-elevated-our-terror-threat-level.htm>

Homeland Security: The president repeatedly claims we're safer than ever. The chairman of the House Intelligence Committee just warned of the opposite. Apparently we have difficulty tracking U.S.-based terrorist cells. The attitude of the Obama administration toward terrorism is summed up by the National Terrorism Advisory System page on the Homeland Security website. "There are no current alerts," it reports. And "there are no expired alerts." Nearby is the question, "Was this page helpful?" The answer is no. The five post-9/11 color-coded terrorism alert levels, abandoned in 2011, were lampooned by comedians for being vague and based on hidden criteria. With the threat level never dropping below "elevated" (yellow), down to "guarded" (blue) or "low" (green), the public was ignoring it, it was said. But now, in its place, is a National Terrorism Advisory System that never issues alerts. In fact, over nearly six and a half years, President Obama has not once, under either the old or new system, issued an alert. Last August he promised "things are much less dangerous now than they were 20 years ago, 25 years ago, or 30 years ago." That contradicted his own Joint Chiefs chairman, secretary of defense, and even his then-Attorney General Eric Holder, who called potential undetectable explosives smuggled in from Syria the most frightening thing he had seen while in office. Enter House Intelligence Committee Chairman Devin Nunes, R-Calif., who told CBS' "Face the Nation" on Sunday that "we face the highest threat level we have ever faced in this country today . . . including after 9/11." Because of obstacles such as encrypted Internet chat rooms, "we are having a tough time tracking terrorist cells," according to Nunes. And "the flow of fighters" from Western nations who have been radicalized into the Islamic State, but "who have now come out" and may seek to commit terrorist attacks back home, is another reason the threat is greater than ever. Nunes noted that the FBI has "cases open in 50 states." Then there is civil war in Yemen, with the AQAP branch of al-Qaida "everywhere," according to Nunes. Last September, outlining his noncombat approach against the Islamic State, Obama cited his Yemen policy as the model. Eleven days later, Iranian-backed Houthi rebels toppled the U.S.-backed government. Obama is poised to make a nuclear deal with those same Iranians, lifting sanctions and handing Tehran tens of billions in cash to terrorize even more and gain regional dominance — all before getting nuclear weapons, which will launch an atomic arms race in the Mideast. Russia's new aggressiveness counters Obama's claims that the Cold War is ancient history. Iran, the Islamic State and other terrorists are actually, while lacking Moscow's massive nuclear arsenal, a greater threat because of the theocratic-based, self-destructive irrationality and instability underlying their motivations. The Soviets, after all, never murdered thousands of Americans on their own soil. Far less powerful Islamist fanatics did. Under the old color-coded system, today's level of alert would be "severe" (red).

Terror threat high now—Al Qaeda initiatives prove

Mail Online, 7-15-2015, "Terror alert remains high," <http://www.dailymail.co.uk/news/article-181751/Terror-alert-remains-high.html>

Britain and the US remained on terror alert today, following a call from Osama bin Laden's deputy for Muslims to attack the "missions" of the two countries. An audio tape said to have come from Ayman al-Zawahri was played on Arabic television station al-Jazeera, urging "brothers" to follow the example of the September 11 hijackers. "Consider your 19 brothers who attacked America in Washington and New York with their planes as an example," said the voice, identified as al-Zawahri by al-Jazeera, which did not say how it got the tape. "Attack the missions of the United States, the UK, Australia and Norway and their interests, companies and employees. Turn the ground beneath their feet into an inferno and kick them out of your countries," said the tape. "Know that you are not alone in this battle. Your mujahadeen brothers are following the enemies as well and are lying in wait for them." Al-Zawahri, who has not been seen since the war in Afghanistan, lashed out at Arab leaders for offering "airports and the facilities" to the Allied troops, in an apparent reference to the war on Iraq. His call to arms came as British and US embassies in the Saudi capital Riyadh remained shut amid fears they could be targeted in "imminent" terrorist attacks, and America upped its homeland terror alert status. Hijack plot foiled And details emerged of a possible al Qaida plot to hijack a civilian airliner in the Saudi town of Jeddah and crash it into a bank. According to reports, three armed Moroccans arrested in Jeddah's airport on Monday had planned the suicide hijack and hoped to crash the plane into the headquarters of Saudi's National Commercial Bank. It was not clear if they were linked to last week's triple suicide bombings of foreign residential compounds in Riyadh which killed 34, including two Britons, or similar bombings in Morocco on Friday. Security boosted Security officials warned that al Qaida appeared to be entering an "active" phase of attacks, aimed at showing it was still operational despite the so-called "war on terror". The British, German and Italian embassies in the Saudi capital Riyadh closed to the public yesterday following intelligence reports that terrorist attacks were being planned. The British consulate in Jeddah and trade office in al Khobar were also closed from yesterday. It is expected the offices will reopen on Saturday, although the situation will be kept under review. The US closed its embassy and consulates in the Middle Eastern kingdom on Tuesday, a week after the series of suicide bomb attacks in Riyadh. The Bush administration raised America's terror alert level to orange, its second highest level, amid fears that the wave of terrorist attacks in Saudi, Morocco and Israel will spread to the US.

Homegrown terrorism on the rise—74 plots discovered

Carrie Blackmore, 1-17-2015, "Number of homegrown terrorists is rising," USA TODAY, <http://www.usatoday.com/story/news/nation/2015/01/17/number-of-homegrown-terrorists-is-rising/21940159/>

CINCINNATI — We are far from knowing the outcome of the case against Christopher Cornell, the young local man accused of plotting an attack on the U.S. Capitol, but if he is convicted, he would be added to a growing list of homegrown jihadist terrorists. From Sept. 11, 2001, to January 2014, there were 74 known terrorist plots perpetrated by Americans, lawful U.S. residents or visitors largely radicalized here in the United States, according to the most recent data reported by the Congressional Research Service. Five of those plots were carried out before law enforcement was able to intervene. Fifty-three of the cases – almost 72 percent – happened after April 2009. That's a 152 percent increase over that time period – and constitutes a spike, according to the report by the service, an agency that works exclusively for the U.S. Congress,

providing policy and legal analysis to committees and members of the House and Senate. "It may be too early to tell how sustained this uptick is," the report reads. "Regardless, the apparent spike in such activity after April 2009 suggests that ideologies supporting violent jihad continue to influence some Americans – even if a tiny minority." A review of the 74 cases shows that just seven were initiated by someone working independently, a lone wolf. Forty-five of the 74 planned to attack a domestic target.

The likelihood of a lone wolf attack is growing

Zenko 5/19/15 (Micah, Council on Foreign Relations, "Is US Foreign Policy Ignoring Homegrown Terrorists?")

On February 12, National Counterterrorism Center Director Nicholas Rasmussen told the Senate Select Committee on Intelligence: ¶ "We face a much greater, more frequent, recurring threat from lone offenders and probably loose networks of individuals. Measured in terms of frequency and numbers, it is attacks from those sources that are increasingly the most noteworthy..." ¶ On February 26, during the annual worldwide threats hearing, Director of National Intelligence James Clapper warned: ¶ "Home-grown violent extremists continue to pose the most likely threat to the homeland." ¶ Last Friday, Secretary of Homeland Security Jeh Johnson stated on MSNBC: ¶ "We're in a new phase...in the global terrorist threat where, because of effective use of social media, the Internet, by ISIL, al-Qaeda, we have to be concerned about the independent actor who is here in the homeland who may strike with little or no warning..." ¶ Finally, yesterday, former CIA deputy director Michael Morell described the messaging efforts of jihadist groups generally and the self-declared Islamic State (IS) more specifically: ¶ "Their narrative is pretty powerful: The West, the United States, the modern world, is a significant threat to their religion. Their answer to that is to establish a caliphate. And they are being attacked by the U.S. and other Western nations, and by these apostate regimes in the region. Because they are being attacked they need support in two ways; people coming to fight for them, and people coming to stand up and attack coalition nations in their home." ¶ In summary, the most likely—though not most lethal—terror threats to Americans come from individuals living within the United States who are partially motivated to undertake self-directed attacks based upon their perception that the United States and the West are at war with the Muslim world.

Surveillance increasing

US surveillance is increasing to deal with new terrorist threats

Bennett 5/18/15 (Brian, Washington based reporter for the LA Times, "White House Steps Up Warning About Terrorism on US Soil")

Alarmed about the growing threat from Islamic State, the Obama administration has dramatically stepped up warnings of potential terrorist attacks on American soil after several years of relative calm. ¶ Behind the scenes, U.S. authorities have raised defenses at U.S. military bases, put local police forces on alert and increased surveillance at the nation's airports, railroads, shopping malls, energy plants and other potential targets. ¶ Driving the unease are FBI arrests of at least 30 Americans on terrorism-related charges this year in an array of "lone wolf" plots, none successful, but nearly all purportedly inspired by Islamic State propaganda or appeals. ¶ The group's leader, Abu Bakr Baghdadi, drove home the danger in a 34-minute audio recording released online Thursday. He urged Muslims everywhere to "migrate to the Islamic State or fight in his land, wherever that may be." ¶ It is pretty easy for [Islamic State] to reach out to a very large number of people using a very robust social media presence. I suspect we should see more plots going forward. ¶ - J.M. Berger, a nonresident fellow at the Brookings Institution ¶ The audio was released with translations in English, French, German, Russian and Turkish, signaling the militants' increasingly ambitious attempts to draw new recruits — and to spark violence — around the world. ¶ U.S. officials estimate the Sunni Muslim group has drawn 22,000 foreign fighters to Syria and Iraq, including about 3,700 from Western nations. About 180 Americans have gone, or tried to go. ¶ U.S. counter-terrorism officials initially viewed Islamic State as primarily a regional security threat, focused on expanding and protecting its self-proclaimed Islamist caliphate in Syria and Iraq, rather than launching attacks abroad. ¶ But the analysis has shifted sharply as gunmen inspired by the group, but not controlled or assisted by them, opened fire at the Parliament in Ottawa; at a cafe in Sydney, Australia; at a kosher grocery in Paris; and, on May 3, in Garland, Texas. ¶ In the Texas case, two would-be terrorists apparently prompted by Islamic State social media messages tried to shoot their way into a provocative contest for caricatures of the prophet Muhammad. Both gunmen were shot to death, and no one else was killed. Islamic State later claimed responsibility for the assault, the first time it has done so for an attack on U.S. soil. ¶ James B. Comey, the FBI director, warned this month that "hundreds, maybe thousands" of Americans are seeing recruitment pitches from Islamic State on Facebook, Twitter and other social media, as well as messages sent to smartphones of "disturbed people" who could be pushed to attack U.S. targets. ¶ "It's like the devil sitting on their shoulders saying, 'Kill, kill, kill,'" Comey told reporters. ¶ The United States has entered a "new phase, in my view, in the global terrorist threat," Jeh Johnson, director of Homeland Security, said Friday on MSNBC. ¶ "We have to be concerned about the independent actor, and the independent actor who is here in the homeland who may strike with little or no warning," he said. "The nature of the global terrorist threat has evolved." ¶ That poses a special challenge for U.S. intelligence and law enforcement agencies, which spent years desperately trying to penetrate and understand Al Qaeda's rigid hierarchy and top-down approach to terrorism. ¶ Now they are struggling to detect and prevent lethal attacks by individuals — such as the April 2013 bombing of the Boston Marathon by two Russian-born brothers — with little

or no outside communication or support.¶ The administration has sought to stiffen homeland defenses, and intelligence gathering, in response.

Surveillance Key

Mass surveillance has thwarted many attacks – more transparency of the programs makes attacks very likely

Nakashima 13 [Ellen Nakashima, national security reporter for The Washington Post. She focuses on issues relating to intelligence, technology and civil liberties. “Officials: Surveillance programs foiled more than 50 terrorist plots”, https://www.washingtonpost.com/world/national-security/officials-surveillance-programs-foiled-more-than-50-terrorist-plots/2013/06/18/d657cb56-d83e-11e2-9df4-895344c13c30_story.html, June 18th, 2013//Rahul]

The U.S. government’s sweeping surveillance programs have disrupted more than 50 terrorist plots in the United States and abroad, including a plan to bomb the New York Stock Exchange, senior government officials testified Tuesday. The officials, appearing before a largely friendly House committee, defended the collection of telephone and Internet data by the National Security Agency as central to protecting the United States and its allies against terrorist attacks. And they said that recent disclosures about the surveillance operations have caused serious damage. “We are now faced with a situation that, because this information has been made public, we run the risk of losing these collection capabilities,” said Robert S. Litt, general counsel of the Office of the Director of National Intelligence. “We’re not going to know for many months whether these leaks in fact have caused us to lose these capabilities, but if they do have that effect, there is no doubt that they will cause our national security to be affected.” The hearing before the House Intelligence Committee was the third congressional session examining the leaks of classified material about two top-secret surveillance programs by Edward Snowden, 29, a former NSA contractor and onetime CIA employee. Articles based on the material in The Washington Post and Britain’s Guardian newspaper have raised concerns about intrusions on civil liberties and forced the Obama administration to mount an aggressive defense of the effectiveness and privacy protections of the operations. Gen. Keith B. Alexander, the head of the NSA, told the committee that the programs had helped prevent “potential terrorist events over 50 times since 9/11.” He said at least 10 of the disrupted plots involved terrorism suspects or targets in the United States. Alexander said officials do not plan to release additional information publicly, to avoid revealing sources and methods of operation, but he said the House and Senate intelligence committees will receive classified details of the thwarted plots. Newly revealed plots In testimony last week, Alexander said the surveillance programs had helped prevent an attack on the subway system in New York City and the bombing of a Danish newspaper. Sean Joyce, deputy director of the FBI, described two additional plots Tuesday that he said were stopped through the surveillance — a plan by a Kansas City, Mo., man to bomb the New York Stock Exchange and efforts by a San Diego man to send money to terrorists in Somalia. The officials said repeatedly that the operations were authorized by Congress and subject to oversight through internal mechanisms and the Foreign Intelligence Surveillance Court, whose proceedings are secret. Alexander said that more than 90 percent of the information on the foiled plots came from a program targeting the communications of foreigners, known as PRISM. The program was authorized under Section 702 of a 2008 law that amended the Foreign Intelligence Surveillance Act (FISA). The law authorizes the NSA to collect e-mails and other Internet communications to and from foreign targets overseas who are

thought to be involved in terrorism or nuclear proliferation or who might provide critical foreign intelligence. No American in the country or abroad can be targeted without a warrant, and no person inside the United States can be targeted without a warrant. A second program collects all call records from U.S. phone companies. It is authorized under Section 215 of the USA Patriot Act. The records do not include the content of calls, location data, or a subscriber's name or address. That law, passed in 2001 and renewed twice since then, also amended FISA. Snowden, a high school dropout who worked at an NSA operations center in Hawaii for 15 months as a contractor, released highly classified information on both programs, claiming they represent government overreach. He has been in hiding since publicly acknowledging on June 9 that he leaked the material. Several lawmakers pressed for answers on how Snowden, a low-level systems administrator, could have had access to highly classified material such as a court order for phone records. "We need to seal this crack in the system," said Rep. C.A. Dutch Ruppersberger (Md.), the ranking Democrat on the intelligence panel. Alexander said he is working with intelligence officials to come up with a "two-person" rule to ensure that the agency can block unauthorized people from removing information from the system. But Alexander and the other witnesses focused more heavily on justifying the programs and arguing that they operate under legal guidelines. "As Americans, we value our privacy and our civil liberties," Alexander said. "As Americans, we also value our security and our safety. In the 12 years since the attacks on September 11th, we have lived in relative safety and security as a nation. That security is a direct result of the intelligence community's quiet efforts to better connect the dots and learn from the mistakes that permitted those attacks to occur on 9/11."

Mass surveillance key to prevent terrorist attacks—ISIS is recruiting from the US

Rory Carroll, 4-1-2015, "NSA surveillance needed to prevent Isis attack, claims former intelligence chair," Guardian, <http://www.theguardian.com/us-news/2015/apr/22/mass-surveillance-needed-isis-attack-mike-rogers>

Mass surveillance should be retained because of the prospect of Islamic State attacks within the United States, a key Republican ally of the National Security Agency has claimed. Mike Rogers, the former chairman of the House intelligence committee, said the NSA needed to preserve its wide powers in case Isis used its bases in Syria and Iraq to unleash atrocities on the US homeland. "Now you have a very real face on what the threat is," Rogers told the Guardian on Tuesday. "Somebody calling back from Syria to Minnesota, either recruiting somebody or giving the operational OK to do something. That's real and it's serious. Before it seemed all hypothetical. Now you can see it." He added: "Think about how many people are in Syria with western passports or even American passports. I want to know if they pick up the phone. If they're calling back to the States, I don't know about you, but I want to know who they're talking to and what they're talking about."

UQ- Risk of major terror attack is high; continued data surveillance is key to continue to prevent attacks

Lewis, senior fellow and program director at the Center for Strategic and International Studies, December 2014 (James, Center for Strategic and International Studies, "Underestimating Risk in

the Surveillance Debate”

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf; accessed 7/14/15 JH @ DDI)

Americans are reluctant to accept terrorism is part of their daily lives, but attacks have been planned or attempted against American targets (usually airliners or urban areas) almost every year since 9/11. Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq. The threat of attack is easy to exaggerate, but that does not mean it is nonexistent. Australia’s then-attorney general said in August 2013 that communications surveillance had stopped four “mass casualty events” since 2008. The constant planning and preparation for attack by terrorist groups is not apparent to the public. The dilemma in assessing risk is that it is discontinuous. There can be long periods with no noticeable activity, only to have the apparent calm explode. The debate over how to reform communications surveillance has discounted this risk. Communications surveillance is an essential law enforcement and intelligence tool. There is no replacement for it. Some suggestions for alternative approaches to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm.

UQ- Empirics arguments don’t matter terrorism can happen at anytime

Lewis 14 [James Andrew Lewis, Director and Senior Fellow of the Technology and Public Policy Program at the CSIS, December 2014, "Underestimating Risk in the Surveillance Debate", Center for Strategic and International Studies, http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf pg 19-20 jf]

The phrase “terrorism” is overused, and the threat of terrorist attack is easily exaggerated, but that does not mean this threat it is nonexistent. Groups and individuals still plan to attack American citizens and the citizens of allied countries. The dilemma in assessing risk is that it is discontinuous. There can be long periods where no activity is apparent, only to have the apparent calm explode in an attack. The constant, low-level activity in planning and preparation in Western countries is not apparent to the public, nor is it easy to identify the moment that discontent turns into action.

There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences.

A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia.

Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces.

The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems, nationally and in cooperation with others, including the United States, to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new “front” for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets. 27

The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational difficulties. These attacks are the threat that mass surveillance was created to prevent. The needed reduction in public anti-terror measures without increasing the chances of successful attack is contingent upon maintaining the capability provided by communications surveillance to detect, predict, and prevent attacks. Our opponents have not given up; neither should we.

Yes nuclear capabilities

Terrorist groups have the financial and nuclear capabilities to attack the US—transporting weapons into the US is a simple task—empirics prove

Mac Slavo, 5-26-2015, "Report: Terrorist Nuke Attack May Be Carried Out Inside the United States in Next 12 Months," Infowars, <http://www.infowars.com/report-terrorist-nuke-attack-may-be-carried-out-inside-the-united-states-in-next-12-months/>

With nuclear material having been stolen on multiple occasions in Mexico, and close terrorist ties to intelligence organizations in the middle east, it appears that if an organization was committed to acquiring nuclear material they could do so. Finding the scientists to build such a weapon, whether dirty or actual, wouldn't be all that difficult. Moreover, smuggling such a device into the U.S. is possible, as evidenced by a 2011 report which confirms that at least one nuclear weapon of mass destruction was seized as it entered the United States. According to a report from Zero Hedge, such a plan may be in the works over the next twelve months, as the Islamic State claims it may be actively pursuing a nuclear weapon intended for detonation on American soil. Three weeks after the first supposed attack by Islamic State supporters in the US, in which two ISIS "soldiers" wounded a security guard before they were killed in Garland, Texas, the time has come to raise the fear stakes. In an article posted in the terrorist group's English-language online magazine Dabiq (which as can be see below seems to have gotten its design cues straight from Madison Avenue and is just missing glossy pages filled with 'scratch and sniff' perfume ads) ISIS claimed that it has enough money to buy a nuclear weapon from Pakistan and "carry out an attack inside the United States next year." In the article, the ISIS columnist said the weapon could be smuggled into the United States via its southern border with Mexico. Curiously, the author of the piece is John Cantlie, a British photojournalist who was abducted by ISIS in 2012 and has been held hostage by the organization ever since; he has appeared in several videos since his kidnapping and criticized Western powers. As the Telegraph notes, "Mr Cantlie, whose fellow journalist hostages have all either been released or beheaded, has appeared in the group's propaganda videos and written previous pieces. In his latest work, presumed to be written under pressure but in his hall-mark style combining hyperbole, metaphor and sarcasm, he says that President Obama's policies for containing Isil have demonstrably failed and increased the risk to America." Cantlie describes the following "hypothetical" scenario in Dabiq : Let me throw a hypothetical operation onto the table. The Islamic State has billions of dollars in the bank, so they call on their wilayah in Pakistan to purchase a nuclear device through weapons dealers with links to corrupt officials in the region. The weapon is then transported overland until it makes it to Libya, where the muj?hid?n move it south to Nigeria. Drug shipments from Columbia bound for Europe pass through West Africa, so moving other types of contraband from East to West is just as possible. The nuke and accompanying mujahadin arrive on the shorelines of South America and are transported through the porous borders of Central America before arriving in Mexico and up to the border with the United States. From there it's just a quick hop through a smuggling tunnel and hey presto, they're mingling with another 12 million "illegal" aliens in America with a nuclear bomb in the trunk of their car. Cantlie continues: Perhaps such a scenario is far-fetched but it's the sum of all fears for Western intelligence agencies and it's infinitely more possible today than it was just one year ago. And if not a nuke, what about a few thousand tons of ammonium nitrate

explosive? That's easy enough to make. The Islamic State make no secret of the fact they have every intention of attacking America on its home soil and they're not going to mince about with two mujahidin taking down a dozen casualties if it originates from the Caliphate. They'll be looking to do something big, something that would make any past operation look like a squirrel shoot, and the more groups that pledge allegiance the more possible it becomes to pull off something truly epic. Remember, all of this has happened in less than a year. How more dangerous will be the lines of communication and supply a year on from today? If the West completely failed to spot the emergence of the Islamic State and then the allies who so quickly pledged allegiance to it from around the world, what else of massive significance are they going to miss next?

ISIS has the ability to acquire a nuclear weapon and explosives—al Qaeda proves

Fox News, 7-16-2015, "ISIS Magazine: Terror Army Could Buy Nuclear Weapon From Pakistan," Fox News Insider, <http://insider.foxnews.com/2015/05/26/isis-magazine-terror-army-could-buy-nuclear-weapon-pakistanxc>

An article in the official magazine of ISIS claims that the terror army has the financial wherewithal to purchase a nuclear weapon, possibly from corrupt officials in Pakistan. The article in Dabiq was written last week under the name of British photojournalist John Cantlie, who's been held by ISIS for the last two years. If a nuclear weapon cannot be obtained, the article suggests ISIS look into procuring a few thousand tons of ammonium nitrate explosives. Meantime, new photos show the terror army's rapidly growing arsenal of guns, ammo and explosives, seized when Iraqi forces fled Ramadi. Brian Kilmeade discussed these troubling developments with Lt. Col. Tony Shaffer, senior fellow at the London Center for Policy Research. Shaffer said the nuclear threat from ISIS is "very real," adding that al Qaeda went down this path years ago. Shaffer said al Qaeda was only one-tenth as smart as ISIS and about one one-hundredth as well financed. He argued that if Iran obtains a nuclear weapon, it's going to cause proliferation throughout the Middle East, increasing the chance that ISIS can get a nuclear device. "They're available. Last time I checked on the black market, these things run about 400 million dollars per warhead. So, ya know, it's there," said Shaffer.

ISIS is on track to gaining nuclear capabilities—US recruits and financial resources increase probability of a nuclear attack or a dirty bomb

Joseph Cirincione, 9-30-2014, "ISIS will get nukes if allowed to consolidate: expert," NY Daily News, <http://www.nydailynews.com/news/world/isis-nukes-allowed-consolidate-expert-article-1.1958855>

The risk of a terrorist attack using nuclear or chemical weapons has just gone up. ISIS is willing to kill large numbers of innocents, and it has added three capabilities that catapult the threat beyond anything seen before: control of large, urban territories, huge amounts of cash, and a global network of recruits. British Home Secretary Theresa May warned that if ISIS consolidates its control over the land it occupies, "We will see the world's first truly terrorist state" with "the space to plot attacks against us." Its seizure of banks and oil fields gave it more than \$2 billion in assets. If ISIS could make the right connection to corrupt officials in Russia or Pakistan, the group

might be able to buy enough highly enriched uranium (about 50 pounds) and the technical help to build a crude nuclear device. Militants recruited from Europe or America could help smuggle it into their home nations. Or ISIS could try to build a “dirty bomb,” conventional explosives like dynamite laced with highly radioactive materials. The blast would not kill many directly, but it would force the evacuation of tens of square blocks contaminated with radioactive particles. The terror and economic consequences of a bomb detonated in the financial districts of London or New York would be enormous. ISIS could also try to get chemical weapons, such as deadly nerve gases or mustard gas. Fortunately, the most likely source of these terror weapons was just eliminated.

Terrorist organizations have nuclear capabilities—ISIS has access to nuclear materials and are planning an attack

Lora Moftah, 6-30-2014, "Does ISIS Have A Nuclear Weapon? Islamic State Supporter Claims Militants Have Dirty Bomb," International Business Times, <http://www.ibtimes.com/does-isis-have-nuclear-weapon-islamic-state-supporter-claims-militants-have-dirty-1731890>

Islamic State group has reportedly developed a nuclear weapon made from radioactive material stolen from an Iraqi university, according to a militant who claims insider knowledge. Hamayun Tariq, a British ISIS member now based in Syria, claimed on social media that the group obtained the uranium from Mosul University and now possesses a “dirty bomb” that it is now considering detonating in a public area. If true, this would confirm fears voiced by Iraq’s United Nations ambassador back in July following the seizure of 40 kilograms of uranium compounds from Mosul University. In a letter to U.N. Secretary-General Ban Ki-moon dated July 8, ambassador Mohamed Ali Alhakim warned that these materials “can be used in manufacturing weapons of mass destruction,” according to Reuters. “These nuclear materials, despite the limited amounts mentioned, can enable terrorist groups, with the availability of the required expertise, to use it separate or in combination with other materials in its terrorist acts,” said Alhakim.

Mass Surv Links

Mass surveillance has thwarted many attacks – more transparency of the programs makes attacks very likely

Nakashima 13 [Ellen Nakashima, national security reporter for The Washington Post. She focuses on issues relating to intelligence, technology and civil liberties. “Officials: Surveillance programs foiled more than 50 terrorist plots”, https://www.washingtonpost.com/world/national-security/officials-surveillance-programs-foiled-more-than-50-terrorist-plots/2013/06/18/d657cb56-d83e-11e2-9df4-895344c13c30_story.html, June 18th, 2013//Rahul]

The U.S. government’s sweeping surveillance programs have disrupted more than 50 terrorist plots in the United States and abroad, including a plan to bomb the New York Stock Exchange, senior government officials testified Tuesday. The officials, appearing before a largely friendly House committee, defended the collection of telephone and Internet data by the National Security Agency as central to protecting the United States and its allies against terrorist attacks. And they said that recent disclosures about the surveillance operations have caused serious damage. “We are now faced with a situation that, because this information has been made public, we run the risk of losing these collection capabilities,” said Robert S. Litt, general counsel of the Office of the Director of National Intelligence. “We’re not going to know for many months whether these leaks in fact have caused us to lose these capabilities, but if they do have that effect, there is no doubt that they will cause our national security to be affected.” The hearing before the House Intelligence Committee was the third congressional session examining the leaks of classified material about two top-secret surveillance programs by Edward Snowden, 29, a former NSA contractor and onetime CIA employee. Articles based on the material in The Washington Post and Britain’s Guardian newspaper have raised concerns about intrusions on civil liberties and forced the Obama administration to mount an aggressive defense of the effectiveness and privacy protections of the operations. Gen. Keith B. Alexander, the head of the NSA, told the committee that the programs had helped prevent “potential terrorist events over 50 times since 9/11.” He said at least 10 of the disrupted plots involved terrorism suspects or targets in the United States. Alexander said officials do not plan to release additional information publicly, to avoid revealing sources and methods of operation, but he said the House and Senate intelligence committees will receive classified details of the thwarted plots. Newly revealed plots In testimony last week, Alexander said the surveillance programs had helped prevent an attack on the subway system in New York City and the bombing of a Danish newspaper. Sean Joyce, deputy director of the FBI, described two additional plots Tuesday that he said were stopped through the surveillance — a plan by a Kansas City, Mo., man to bomb the New York Stock Exchange and efforts by a San Diego man to send money to terrorists in Somalia. The officials said repeatedly that the operations were authorized by Congress and subject to oversight through internal mechanisms and the Foreign Intelligence Surveillance Court, whose proceedings are secret. Alexander said that more than 90 percent of the information on the foiled plots came from a program targeting the communications of foreigners, known as PRISM. The program was authorized under Section 702 of a 2008 law that amended the Foreign Intelligence Surveillance Act (FISA). The law authorizes the NSA to collect

e-mails and other Internet communications to and from foreign targets overseas who are thought to be involved in terrorism or nuclear proliferation or who might provide critical foreign intelligence. No American in the country or abroad can be targeted without a warrant, and no person inside the United States can be targeted without a warrant. A second program collects all call records from U.S. phone companies. It is authorized under Section 215 of the USA Patriot Act. The records do not include the content of calls, location data, or a subscriber's name or address. That law, passed in 2001 and renewed twice since then, also amended FISA. Snowden, a high school dropout who worked at an NSA operations center in Hawaii for 15 months as a contractor, released highly classified information on both programs, claiming they represent government overreach. He has been in hiding since publicly acknowledging on June 9 that he leaked the material. Several lawmakers pressed for answers on how Snowden, a low-level systems administrator, could have had access to highly classified material such as a court order for phone records. "We need to seal this crack in the system," said Rep. C.A. Dutch Ruppersberger (Md.), the ranking Democrat on the intelligence panel. Alexander said he is working with intelligence officials to come up with a "two-person" rule to ensure that the agency can block unauthorized people from removing information from the system. But Alexander and the other witnesses focused more heavily on justifying the programs and arguing that they operate under legal guidelines. "As Americans, we value our privacy and our civil liberties," Alexander said. "As Americans, we also value our security and our safety. In the 12 years since the attacks on September 11th, we have lived in relative safety and security as a nation. That security is a direct result of the intelligence community's quiet efforts to better connect the dots and learn from the mistakes that permitted those attacks to occur on 9/11."

Bulk surveillance is crucial to detect and act on threats – many examples prove

Hines 13 [Pierre Hines is a defense council member of the Truman National Security Project, "Here's how metadata on billions of phone calls predicts terrorist attacks" <http://qz.com/95719/heres-how-metadata-on-billions-of-phone-calls-predicts-terrorist-attacks>, June 19th, 2013//Rahul]

Yesterday, when NSA Director General Keith Alexander testified before the House Committee on Intelligence, he declared that the NSA's surveillance programs have provided "critical leads to help prevent over 50 potential terrorist events." FBI Deputy Director Sean Boyce elaborated by describing four instances when the NSA's surveillance programs have had an impact: (1) when an intercepted email from a terrorist in Pakistan led to foiling a plan to bomb of the New York subway system; (2) when NSA's programs helped prevent a plot to bomb the New York Stock Exchange; (3) when intelligence led to the arrest of a U.S. citizen who planned to bomb the Danish Newspaper office that published cartoon depictions of the Prophet Muhammad; and (4) when the NSA's programs triggered reopening the 9/11 investigation. So what are the practical applications of internet and phone records gathered from two NSA programs? And how can "metadata" actually prevent terrorist attacks? Metadata does not give the NSA and intelligence community access to the content of internet and phone communications. Instead, metadata is more like the transactional information cell phone customers would normally see on their billing statements—metadata can indicate when a call, email, or online chat began and how long the communication lasted. Section 215 of the Patriot Act provides the legal authority to obtain

“business records” from phone companies. Meanwhile, the NSA uses Section 702 of the Foreign Intelligence Surveillance Act to authorize its PRISM program. According to the figures provided by Gen. Alexander, intelligence gathered based on Section 702 authority contributed in over 90% of the 50 cases. One of the major benefits of metadata is that it provides hindsight—it gives intelligence analysts a retrospective view of a sequence of events. As Deputy Director Boyce discussed, the ability to analyze previous communications allowed the FBI to reopen the 9/11 investigation and determine who was linked to that attack. It is important to recognize that terrorist attacks are not orchestrated overnight; they take months or years to plan. Therefore, if the intelligence community only catches wind of an attack halfway into the terrorists’ planning cycle, or even after a terrorist attack has taken place, metadata might be the only source of information that captures the sequence of events leading up to an attack. Once a terrorist suspect has been identified or once an attack has taken place, intelligence analysts can use powerful software to sift through metadata to determine which numbers, IP addresses, or individuals are associated with the suspect. Moreover, phone numbers and IP addresses sometimes serve as a proxy for the general location of where the planning has taken place. This ability to narrow down the location of terrorists can help determine whether the intelligence community is dealing with a domestic or international threat. Even more useful than hindsight is a crystal ball that gives the intelligence community a look into the future. Simply knowing how many individuals are in a chat room, how many individuals have contacted a particular phone user, or how many individuals are on an email chain could serve as an indicator of how many terrorists are involved in a plot. Furthermore, knowing when a suspect communicates can help identify his patterns of behavior. For instance, metadata can help establish whether a suspect communicates sporadically or on a set pattern (e.g., making a call every Saturday at 2 p.m.). Any deviation from that pattern could indicate that the plan changed at a certain point; any phone number or email address used consistently and then not at all could indicate that a suspect has stopped communicating with an associate. Additionally, a rapid increase in communication could indicate that an attack is about to happen. Metadata can provide all of this information without ever exposing the content of a phone call or email. If the metadata reveals the suspect is engaged in terrorist activities, then obtaining a warrant would allow intelligence officials to actually monitor the content of the suspect’s communication. In Gen. Alexander’s words, “These programs have protected our country and allies . . . [t]hese programs have been approved by the administration, Congress, and the courts.” Now, Americans will have to decide whether they agree.

Surveillance is necessary and has very little negative consequences on civil liberty

Boot 13 [Max Boot, Max Boot is an American author, consultant, editorialist, lecturer, and military historian, “Stay calm and let the NSA carry on”, <http://articles.latimes.com/2013/jun/09/opinion/la-oe-boot-nsa-surveillance-20130609>, June 9th, 2015//Rahul]

After 9/11, there was a widespread expectation of many more terrorist attacks on the United States. So far that hasn't happened. We haven't escaped entirely unscathed (see Boston Marathon, bombing of), but on the whole we have been a lot safer than most security experts,

including me, expected. In light of the current controversy over the National Security Agency's monitoring of telephone calls and emails, it is worthwhile to ask: Why is that? It is certainly not due to any change of heart among our enemies. Radical Islamists still want to kill American infidels. But the vast majority of the time, they fail. The Heritage Foundation estimated last year that 50 terrorist attacks on the American homeland had been foiled since 2001. Some, admittedly, failed through sheer incompetence on the part of the would-be terrorists. For instance, Faisal Shahzad, a Pakistani American jihadist, planted a car bomb in Times Square in 2010 that started smoking before exploding, thereby alerting two New Yorkers who in turn called police, who were able to defuse it. But it would be naive to adduce all of our security success to pure serendipity. Surely more attacks would have succeeded absent the ramped-up counter-terrorism efforts undertaken by the U.S. intelligence community, the military and law enforcement. And a large element of the intelligence community's success lies in its use of special intelligence — that is, communications intercepts. The CIA is notoriously deficient in human intelligence — infiltrating spies into terrorist organizations is hard to do, especially when we have so few spooks who speak Urdu, Arabic, Persian and other relevant languages. But the NSA is the best in the world at intercepting communications. That is the most important technical advantage we have in the battle against fanatical foes who will not hesitate to sacrifice their lives to take ours. Which brings us to the current kerfuffle over two NSA monitoring programs that have been exposed by the Guardian and the Washington Post. One program apparently collects metadata on all telephone calls made in the United States. Another program provides access to all the emails, videos and other data found on the servers of major Internet firms such as Google, Apple and Microsoft. At first blush these intelligence-gathering activities raise the specter of Big Brother snooping on ordinary American citizens who might be cheating on their spouses or bad-mouthing the president. In fact, there are considerable safeguards built into both programs to ensure that doesn't happen. The phone-monitoring program does not allow the NSA to listen in on conversations without a court order. All that it can do is to collect information on the time, date and destination of phone calls. It should go without saying that it would be pretty useful to know if someone in the U.S. is calling a number in Pakistan or Yemen that is used by a terrorist organizer. As for the Internet-monitoring program, reportedly known as PRISM, it is apparently limited to "non-U.S. persons" who are abroad and thereby enjoy no constitutional protections. These are hardly rogue operations. Both programs were initiated by President George W. Bush and continued by President Obama with the full knowledge and support of Congress and continuing oversight from the federal judiciary. That's why the leaders of both the House and Senate intelligence committees, Republicans and Democrats alike, have come to the defense of these activities. It's possible that, like all government programs, these could be abused — see, for example, the IRS making life tough on tea partiers. But there is no evidence of abuse so far and plenty of evidence — in the lack of successful terrorist attacks — that these programs have been effective in disrupting terrorist plots. Granted there is something inherently creepy about Uncle Sam scooping up so much information about us. But Google, Facebook, Amazon, Twitter, Citibank and other companies know at least as much about us, because they use very similar data-mining programs to track our online movements. They gather that information in order to sell us products, and no one seems to be overly alarmed. The NSA is gathering that information to keep us safe from terrorist attackers. Yet somehow its actions have become a "scandal," to use a term now loosely being tossed around. The real

scandal here is that the Guardian and Washington Post are compromising our national security by telling our enemies about our intelligence-gathering capabilities. Their news stories reveal, for example, that only nine Internet companies share information with the NSA. This is a virtual invitation to terrorists to use other Internet outlets for searches, email, apps and all the rest. No intelligence effort can ever keep us 100% safe, but to stop or scale back the NSA's special intelligence efforts would amount to unilateral disarmament in a war against terrorism that is far from over.

Unwarranted domestic surveillance is the most significant anti-terror tool available- allows us to infiltrate terror groups and prevent weapons proliferation- has solved 53 of 54 suppressed terror attacks in recent years

Clarke et al 2013 [Report and Recommendations of the President's Review Group on Intelligence and Surveillance Technologies, "Liberty and Security in a Changing World", https://www.whitehouse.gov/sites/default/files/docs/2013-12-12_rg_final_report.pdf, Accessed 7/3/15, AX]

According to NSA, section 702 "is the most significant tool in NSA collection arsenal for the detection, identification, and disruption of terrorist threats to the US and around the world." To cite just one example, collection under section 702 "was critical to the discovery and disruption" of a planned bomb attack in 2009 against the New York City subway system and led to the arrest and conviction of Najibullah Zazi and several of his co-conspirators. According to the Department of Justice and the Office of the Director of National Intelligence in a 2012 report to Congress: Section 702 enables the Government to collect information effectively and efficiently about foreign targets overseas and in a manner that protects the privacy and civil liberties of Americans. Through rigorous oversight, the Government is able to evaluate whether changes are needed to the procedures or guidelines, and what other steps may be appropriate to safeguard the privacy of personal information. In addition, the Department of Justice provides the joint assessments and other reports to the FISC. The FISC has been actively involved in the review of section 702 collection. Together, all of these mechanisms ensure thorough and continuous oversight of section 702 activities. . . . Section 702 is vital to keeping the nation safe. It provides information about the plans and identities of terrorists allowing us to glimpse inside terrorist organizations and obtain information about how those groups function and receive support. In addition, it lets us collect information about the intentions and capabilities of weapons proliferators and other foreign adversaries who threaten the United States. In reauthorizing section 702 for an additional five years in 2012, the Senate Select Committee on Intelligence concluded: [T]he authorities provided [under section 702] have greatly increased the government's ability to collect information and act quickly against important foreign intelligence targets. The Committee has also found that [section 702] has been implemented with attention to protecting the privacy and civil liberties of US persons, and has been the subject of extensive oversight by the Executive branch, the FISC, as well as the Congress. . . . [The] failure to reauthorize [section 702] would "result in a loss of significant intelligence and impede the ability of the Intelligence Community to respond quickly to new threats and intelligence opportunities."¹⁴⁷Our own review is not inconsistent with this assessment. During the course of our analysis, NSA shared with the Review Group the details of 54 counterterrorism

investigations since 2007 that resulted in the prevention of terrorist attacks in diverse nations and the United States. In all but one of these cases, information obtained under section 702 contributed in some degree to the success of the investigation. Although it is difficult to assess precisely how many of these investigations would have turned out differently without the information learned through section 702, we are persuaded that section 702 does in fact play an important role in the nation's effort to prevent terrorist attacks across the globe.

Meta-data has stopped terror attacks

Schwartz 15 [Mattathias Schwartz, 1-26-2015, staff writer for the New Yorker and won the 2011 Livingston Award for international reporting "How to Catch a Terrorist," New Yorker, <http://www.newyorker.com/magazine/2015/01/26/whole-haystack> jf]

The N.S.A. asserts that it uses the metadata to learn whether anyone inside the U.S. is in contact with high-priority terrorism suspects, colloquially referred to as "known bad guys." Michael Hayden, the former C.I.A. and N.S.A. director, has said, "We kill people based on metadata." He then added, "But that's not what we do with this metadata," referring to Section 215.

Soon after Snowden's revelations, Alexander said that the N.S.A.'s surveillance programs have stopped "fifty-four different terrorist-related activities." Most of these were "terrorist plots." Thirteen involved the United States. Credit for foiling these plots, he continued, was partly due to the metadata program, intended to "find the terrorist that walks among us."

President Obama also quantified the benefits of the metadata program. That June, in a press conference with Angela Merkel, the German Chancellor, Obama said, "We know of at least fifty threats that have been averted because of this information." He continued, "Lives have been saved."

Even if terror is unlikely meta-data surveillance is worth it

Lake 2014 [Eli Lake, 2-17-2014, senior national-security correspondent for the Daily Beast, "Spy Chief: We Should've Told You We Track Your Calls," Daily Beast, <http://www.thedailybeast.com/articles/2014/02/17/spy-chief-we-should-ve-told-you-we-track-your-calls.html> jf]

Clapper still defends the 215 program, too. The storage of the phone records allows NSA analysts to connect phone numbers of suspected terrorists overseas to a possible network

inside the United States. Other U.S. intelligence officials say its real value is that it saves work for the FBI and the NSA in tracking down potential leads by ruling out suspicious numbers quickly.

In the interview Clapper said the 215 program was not a violation the rights of Americans. "For me it was not some massive assault on civil liberties and privacy because of what we actually do and the safeguards that are put on this," he said. "To guard against perhaps these days low probability but a very (high) impact thing if it happens." Clapper compared the 215 program to fire insurance. "I buy fire insurance ever since I retired, the wife and I bought a house out here and we buy fire insurance every year. Never had a fire. But I am not gonna quit buying my fire insurance, same kind of thing."

Meta Data is key to damage control after terrorist attacks

Lewis 14 [James Andrew Lewis, Director and Senior Fellow of the Technology and Public Policy Program at the CSIS, December 2014, "Underestimating Risk in the Surveillance Debate", Center for Strategic and International Studies, http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf pg 9 jf]

The most controversial aspect of the surveillance program involved metadata. Metadata is information describing a telephone call, such as the number from which the call was placed, the number called, and the date, time, and length of the call. The content of the phone call (e.g., the conversation) is not collected. No locational data is collected, although commentators seem confused on this point. Metadata analysis gave NSA the ability to identify individuals in the United States or individuals outside the United States who are in contact with terrorist groups.¹⁰ In 2012, NSA looked at 288 primary telephone numbers and through "call chaining" analysis reviewed 6,000 other numbers connected to these primary numbers. The 288 people had some connection to terrorism and NSA looked at the 6,000 people with whom they talked to see if they were also involved. Metadata acquired and retained under Section 215 of the Patriot Act program could only be queried when there is "reasonable articulable suspicion" that a telephone number is associated with foreign terrorist organizations. If a query merits further investigation, which requires looking at either content of the individual unmaking the call, this requires a specific, individual court order based on probable cause. If there is one constitutional requirement that was not fully observed in the metadata program authorized under the Patriot Act, it was that search requires a warrant from a court rather than an internal approval by the executive branch agency itself.¹¹ This was a significant error. The 215 program allows law enforcement and intelligence officials to determine if a terrorist event is an isolated incident or the first of a serious of attacks, and whether the attacker is a "lone wolf" or connected to a larger terrorist organization. The most important decision in the immediate aftermath of an attack is whether the incident is the first of a series. If it is the first of a series of attacks, additional steps must be taken without delay, such as closing airports and other transportation

hubs, putting police forces around the country on high alert, and mobilizing law enforcement agencies to locate and arrest the other attackers. These steps are both disruptive and expensive and knowing that they are not necessary provides immediate benefit.

Borders Links

Border surveillance is key preventing terrorism

Smarick et al. 12, (Kathleen Smarick and Gary D. LaFree of the National Consortium for the Study of Terrorism and Responses to Terrorism at the University of Maryland. 11/12 "Border Crossings and Terrorist Attacks in the United States: Lessons for Protecting against Dangerous Entrants" START, http://www.start.umd.edu/sites/default/files/files/publications/START_BorderCrossingsTerroristAttacks.pdf CCC)

An essential step in this project was determining the frequency and dynamics of border crossings by individuals who conducted or who wanted to conduct terrorism-related activities in the United States. Towards that goal, the project built upon the existing holdings of the American Terrorism Study (ATS) in this effort. The ATS, housed at the University of Arkansas, catalogs and systematically codes information on more than 300 Federal court cases involving Federal terrorist charges since 1980 and, following a review of other possible resources, proved to be the most useful starting point for compiling open-source, quantitative data on terrorist border crossings. Since 1989, the American Terrorism Study (ATS) has received lists of court cases and associated indictees that resulted from an official FBI terrorism investigation spanning 1980 through 2004. Housed at the University of Arkansas' Terrorism Research Center in Fulbright College (TRC), the ATS now includes almost 400 cases from the FBI lists. Of these, approximately 75% of cases have complete court documentation, and almost all of those collected have been coded into the ATS database, while the ATS team continues to track new cases by collecting, reviewing, and coding new and additional court documentation. The ATS includes terrorism incidents and attacks, thwarted or planned terrorism incidents sometimes referred to as preventions, material support cases for terrorism, general terrorism conspiracies, and in some cases, immigration fraud; the common denominator among all ATS events is that the FBI investigated these events as terrorism-related incidents. During preliminary research for this project, court records from 378 terrorism cases found in the ATS dataset were reviewed for information on potential border crossing events related to terrorism cases. The documents for each court case were manually reviewed by researchers to determine whether the collected records reported that one of the defendants or accomplices in a case crossed a U.S. border at some point. Thirty-eight percent of the reviewed cases—145 cases—from 1980 through 2004 were found to either have: • direct mention of a border crossing in the court documents, or • a link to a terrorism incident that involved a known border crossing, either before or after an incident. After compiling this list of court cases for inclusion, each identified court case was then linked to a criminal incident involving terrorism charges. Initial reviews revealed a connection to a border-crossing event in a total of 58 successful terrorist attacks, 51 prevented or thwarted attacks, 26 material support cases, 33 immigration fraud incidents, and 4 general terrorism conspiracies. Additional reviews of relevant information on indictees and their activities resulted in a reduction in the number of successful terrorist attacks associated with these individuals to a total of 43. Appendix 2 provides more details on the data collection process and how a reliable collection methodology was established to create the U.S. Terrorist Border Crossing Dataset (USTBC), using the ATS as a starting point. National Consortium for the Study of Terrorism and

Responses to Terrorism A Department of Homeland Security Science and Technology Center of Excellence Border Crossings and Terrorist Attacks in the United States 12 Systematic evaluation by the research team revealed that the American Terrorism Study is a reliable and useful resource for identifying individuals associated with terrorist attacks or terrorist criminal cases (such as conspiracies) and for determining which of these individuals crossed U.S. borders in advance of or in the wake of their terrorism-related behavior. This is largely because the ATS is based on court documents, which among sources of data on terrorism are the most likely to reference relevant border crossing activity. The Global Terrorism Database, which is based primarily on media sources, can serve a supporting role in this research, but the ATS is the primary source allowing for construction of a new, relational database on U.S. Terrorist Border Crossings (USTBCs). That being said, it is important to recognize that the ATS is not a perfect data source. As noted above, its contents are limited to individuals and information related to court cases in which one or more defendant was charged with Federal terrorism charges. As such, the contents of ATS clearly represent a subset of all terrorists or attempted terrorists in the United States, as it systematically omits those who: • were never arrested or faced any charges, • were charged with offenses not directly related to terrorism, • were charged at the non-Federal level, or • were engaged in dangerous activity that does not meet the FBI's definition of a terrorism case. Throughout this project, the research team was careful to respect the limitations of this data collection and to draw conclusions that recognize that the border crossing events included in this project likely represent a non-representative subset of all border crossing attempts by terrorists or intended terrorists. Despite these limitations, though, the data that was built upon the baseline of ATS provides important insights into the nexus between border crossings and terrorism. The U.S. Terrorism Border Crossing Dataset The final versions of the codebooks used to develop the U.S. Terrorist Border Crossing (USTBC) data collection are presented in Appendix 3. Based upon knowledge gained from pilot efforts (as discussed above and in Appendix 2), the project resulted in two codebooks—one focused on dynamics of a bordercrossing event involving someone associated with a Federal terrorism court case, and another focused on the characteristics of the individuals associated with Federal charges who were involved in the bordercrossing event. Data collection for the USTBC lasted for approximately one year and was primarily conducted by research assistants at the Terrorism Research Center at the University of Arkansas.³ The resultant data that comprise the USTBC are available in Appendix 4. Table 4 provides a snapshot summary of these data, which include detailed information on the location of an attempted crossing, the timing of a crossing relative to attempted or actual terrorist activity, the origin or destination of an attempted crossing, and more. The data also include specific information on border crossers, including their citizenship status, their criminal history, and key demographics (including level of education, marital status, etc.) Appendix 5 provides descriptive statistics from the border-crossing and border-crosser data. ³ Special thanks to Kim Murray and Summer Jackson of the Terrorism Research Center for their efforts in combing through the courtcase material and assembling these data for the USTBC. National Consortium for the Study of Terrorism and Responses to Terrorism A Department of Homeland Security Science and Technology Center of Excellence Border Crossings and Terrorist Attacks in the United States 13 Border Crossings Identified in USTBC Attempts to Enter the United States Of the 221 border crossings identified in this project as involving individuals who were indicted by the U.S. government in terrorism-related cases, the

majority (129 crossings) involved an individual attempting to enter the United States, while the remainder (92 crossings) involved an individual attempting to exit the United States. Eighty-seven percent of the attempted border crossings were successful, rather than being thwarted by law enforcement or foiled by some other events or developments. Additional discussion on the nature of successful crossings versus those who were apprehended at the border is presented below. Among those attempts to enter the United States, the most frequent origin for these crossing efforts was Canada.⁴ But, as Figure 2 illustrates, such attempted entries originated from all corners of the world.

US Border Patrol proves that surveillance is key to anti-terror efforts

Stamey 14 (Barclay; DOMESTIC AERIAL SURVEILLANCE AND HOMELAND SECURITY: SHOULD AMERICANS FEAR THE EYE IN THE SKY; March 2014)

The leading national agency currently using drones to combat a wide range of domestic threats is U.S. Customs and Border Protection. With its fleet of seven MQ-1 Predators and three MQ-1 Guardians—Predators modified for marine surveillance—CBP is at the forefront of large-scale drone operations. With an annual budget exceeding \$11 billion, CBP is well equipped for protecting our national security while combating potential terrorist threats.⁵⁵ But how efficiently are those funds being used, and what is meant by effectiveness? According to Merriam-Webster, effectiveness is “producing a decided, decisive, or desired effect or result.”⁵⁶ Ultimately, that desired result is safe international borders. Accomplishing this result involves the apprehension of illegal immigrants, interdiction of illicit drugs, and prevention of terrorist infiltration, which CBP does quite well, but with respect to UAS, effectiveness must be viewed on a much broader scale. This section takes into account the size of CBP, its operational budget, and couples it with published results. According to CBP, the primary mission of drone use is “anti-terrorism by helping to identify and intercept potential terrorists and illegal cross-border activity.”⁵⁷ CBP uses its Predators and Reapers to accomplish this goal through human detection and tracking, surface asset coordination, and threat detection through IR sensors in multiple scenarios. Previously mentioned sensor suites allow the Predator to detect movement along the border, identify actual personnel numbers, and track the location of threats all while being unobserved to the individuals on the ground. With their long loiter times, Predators allow officials to monitor gaps along the border while maximizing the efforts of ground personnel in actual interdiction missions. After witnessing the functionality of actual Predator operations in Afghanistan, this author realizes the value in having high definition video sensors overhead during dangerous operations. This type of technology certainly has a place in homeland security missions, and future capabilities will provide a clear advantage to U.S. personnel in combating border security. This force multiplier mindset is one CBP has adopted and publicizes regularly to justify the success of its drone program. Long loiter times, remote area access, and flexibility during National Special Security Events are common claims.

Unmanned Aerial Vehicles fill current surveillance gap on the border

Haddal 10 (CC; Homeland Security: Unmanned Aerial Vehicles and Border Surveillance CRS Report RS21698. Washington, DC: Library of Congress, Congressional Research Service, July 8, 2010.)

One potential benefit of UAVs is that they could fill a gap in current border surveillance by improving coverage along remote sections of the U.S. borders. Electro-Optical (EO) sensors (cameras) can identify an object the size of a milk carton from an altitude of 60,000 feet.¹⁴ UAVs also can provide precise and real-time imagery to a ground control operator, who would then disseminate that information so that informed decisions regarding the deployment of border patrol agents can be made quickly. Additionally, the Predator B used along the southern border can fly for more than 30 hours without having to refuel, compared with a helicopter's average flight time of just over 2 hours. The ability of UAVs to loiter for prolonged periods of time has important operational advantages over manned aircraft. The longer flight times of UAVs means that sustained coverage over a previously exposed area may improve border security. The range of UAVs is a significant asset when compared to border agents on patrol or stationary surveillance equipment. If an illegal border entrant attempts to transit through dense woods or mountainous terrain, UAVs would have a greater chance of tracking the violator with thermal detection sensors than the stationary video equipment which is often used on the borders. It is important to note, however, that rough terrain and dense foliage can degrade the images produced by a UAV's sensory equipment and thus limit their effectiveness at the borders. Nevertheless, the extended range and endurance of UAVs may lessen the burdens on human resources at the Homeland Security: Unmanned Aerial Vehicles and Border Surveillance Congressional Research Service 4 borders. Also, UAV accidents do not risk the lives of pilots, as do the helicopters that currently patrol U.S. borders

Border security stops terrorism

Zuckerman, Bucci, Carafano, no date

(Jessica Zuckerman, Steven P. Bucci, Ph.D. Director, Douglas and Sarah Allison Center for Foreign and National Security Policy and James Jay Carafano, Ph.D. Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow, 13, 7-22-2013, "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism," Heritage Foundation, <http://www.heritage.org/research/reports/2013/07/60-terrorist-plots-since-911-continued-lessons-in-domestic-counterterrorism> CCC)

Chiheb Esseghaier and Raed Jaser—April 2013. Chiheb Esseghaier and Raed Jaser were arrested in April 2013 for attempting to carry out an attack on a Via Railway train travelling from Canada to the U.S. The attack, authorities claimed, was supported by an al-Qaeda element in Iran, although there is currently no evidence that it was state-sponsored.[205] The exact route of the targeted train has not been identified, and Iranian authorities vehemently deny that al-Qaeda is operating within Iranian borders.

Esseghaier and Jaser have been charged in Canada with conspiracy to commit murder for the benefit of a terrorist group, participating in a terrorist group, and conspiring to interfere with

transportation facilities for the benefit of a terrorist group. Esseghaier has also been charged with participating in a terrorist group, and both men face up to life in prison.[206] The two men are awaiting trial. Chiheb Esseghaier wants to represent himself, basing his defense on the Quran instead of on the Canadian criminal code, which has caused delays in the proceedings.[207]

Continued use of border surveillance technology is crucial to the detection of and response to threats on the border

Haddal, Specialist in Immigration Policy, 8/11/10 (Chad C. Haddal, Congressional Research Service report, August 11, 2010, "Border Security: The Role of the U.S. Border Patrol" <https://www.fas.org/sgp/crs/homesecc/RL32562.pdf>, accessed 7/15/15 JH @ DDI)

Perhaps the most important technology used by the Border Patrol are the surveillance assets currently in place at the border. The program has gone through several iterations and name changes. Originally known as the Integrated Surveillance Information System (ISIS), the program's name was changed to the America's Shield Initiative (ASI) in FY2005. DHS subsequently folded ASI into the Secure Border Initiative (SBI) and renamed the program SBInet Technology (SBInet). Once it is beyond the pilot phase, SBInet will, according to DHS, develop and install "new integrated technology solutions to provide enhanced detection, tracking, response, and situational awareness capabilities."¹⁹ The other program under SBI is the SBI Tactical Infrastructure program, which, according to DHS, "develops and installs physical components designed to consistently slow, delay, and be an obstacle to illegal cross-border activity."²⁰ In the late 1990s, the Border Patrol began deploying a network of Remote Video Surveillance (RVS) systems (i.e., camera systems), underground sensors, and the Integrated Computer Assisted Detection (ICAD) database into a multi-faceted network designed to detect illegal entries in a wide range of climate conditions. This Integrated Surveillance Intelligence System (ISIS) attempted to ensure seamless coverage of the border by combining the feeds from multiple color, thermal, and infrared cameras mounted on different structures into one remote-controlled system with information generated by sensors (including seismic, magnetic, and thermal detectors). When a sensor is tripped, an alarm is sent to a central communications control room at a USBP station or sector headquarters. USBP personnel monitoring the control room screens use the ICAD system to re-position RVS cameras towards the location where the sensor alarm was tripped (although some camera positions are fixed and cannot be panned). Control room personnel then alert field agents to the intrusion and coordinate the response.

Information gathered from surveillance activities is key to any effective response to terrorist threats along the border

Fisher, U.S. Customs and Border Protection Office of Border Patrol Chief, 5/8/12 (Michael, Department of Homeland Security, "Written testimony of U.S. Customs and Border Protection Office of Border Patrol Chief Michael Fisher for a House Committee on Homeland Security, Subcommittee on Border and Maritime Security hearing titled "Measuring Border Security: U.S. Border Patrol's New Strategic Plan and the Path Forward.""

<http://www.dhs.gov/news/2012/05/08/written-testimony-us-customs-and-border-protection-house-homeland-security>; accessed 7/15/15 JH@ DDI)

Information gathered from reconnaissance, community engagement, sign-cutting and technology together provide situational awareness and intelligence and helps us to best understand and assess the threats we face along our borders. Information and intelligence will empower Border Patrol leadership and front line agents to get ahead of the threat, be predictive and proactive. Integration denotes CBP corporate planning and execution of border security operations, while leveraging partnerships with other federal, state, local, tribal, and international organizations. Integration of effort with these organizations will ensure we bring all available capabilities and tools to bear in addressing threats. Lastly, through rapid response, we will deploy capabilities efficiently and effectively to meet and mitigate the risks we confront. Put simply, rapid response means the Border Patrol and its partners can quickly and appropriately respond to changing threats. Goal 1: Secure America's Borders The 2012 Strategic Plan has two interrelated and interdependent goals. In the first goal, the Border Patrol will work with its federal, state, local, tribal, and international partners to secure America's borders using information, integration and rapid response in a risk-based manner. There are five objectives within this goal: Prevent Terrorists and Terrorist Weapons from Entering the United States Manage Risk Disrupt and Degrade Transnational Criminal Organizations (TCOs) Whole-of-Government Approach Increase Community Engagement I. Prevent Terrorists and Terrorist Weapons from Entering the United States The current risk environment is characterized by constantly evolving threats that are both complex and varying, and the Border Patrol must strategically apply intelligence to ensure that operations are focused and targeted against the greatest threats. The Border Patrol's ability to prevent and disrupt such threats is enhanced through increased information sharing and operational integration, planning, and execution with our domestic and foreign law enforcement partners. Integration with our federal, state, local, tribal, and international partners' intelligence and enforcement capabilities into the planning and execution of CBP operations is critical to our ability to secure our nation's borders.

The use of necessary surveillance technology is key to the identification and prevention of terrorist threats on the border

Office of Border Patrol, September 2004 (THE OFFICE OF BORDER PATROL AND THE OFFICE OF POLICY AND PLANNING, US CUSTOMS & BORDER PROTECTION, "National Border Patrol Strategy" http://www.au.af.mil/au/awc/awcgate/dhs/national_bp_strategy.pdf, accessed 7/15/15 JH @ DDI)

The Border Patrol currently uses a mix of agents, information, and technology to control the border. The Border Patrol's ability to establish situational awareness, monitor, detect, respond to, and identify potential terrorists, instruments of terrorism, and criminals relies heavily on interdiction and deterrence-based technology. Having the necessary technology to support the Border Patrol priority and traditional missions cannot be overstated. In the future, there must be continued assessment, development, and deployment of the appropriate mix of personnel, technology, and information to gain, maintain, and expand coverage of the border and ensure that resources are deployed in a cost-effective, efficient fashion. Technology which enhances operational awareness and effectiveness includes camera systems for day/ night/infrared work, biometric systems such as IDENT/IAFIS, processing systems like ENFORCE, sensing platforms, large-scale gamma X-rays, and aerial platforms, and other systems. Technologies requiring

modernization include wireless and tactical communications and computer processing capabilities. Coordination between Border Patrol and inspectional personnel at the ports of entry ensures the most efficient use of trained personnel and technology. In the future, the Border Patrol will take advantage of the targeting and selectivity tools made available in the Automated Commercial Environment (ACE) and the National Targeting Center. The continued testing, evaluation, acquisition, and deployment of appropriate border enforcement technologies will be pursued vigorously so that the maximum force-multiplier effect is achieved in support of both the priority and traditional missions.

Any gap in security on the border allows international terror groups to come into the United States

Wilson 15 [Reid Wilson, 2/26/15, covers national politics for the Washington Post, "Texas officials warn of immigrants with terrorist ties crossing southern border," Washington Post, <http://www.washingtonpost.com/blogs/govbeat/wp/2015/02/26/texas-officials-warn-of-immigrants-with-terrorist-ties-crossing-southern-border/> jf]

A top Texas law enforcement agency says border security organizations have apprehended several members of known Islamist terrorist organizations crossing the southern border in recent years, and while a surge of officers to the border has slowed the flow of drugs and undocumented immigrants, it's costing the state tens of millions of dollars. In a report to Texas elected officials, the state Department of Public Safety says border security agencies have arrested several Somali immigrants crossing the southern border who are known members of al-Shabab, the terrorist group that launched a deadly attack on the Westgate shopping mall in Nairobi, Kenya, and Al-Itihaad al-Islamiya, another Somalia-based group once funded by Osama bin Laden. Another undocumented immigrant arrested crossing the border was on multiple U.S. terrorism watch lists, the report says. According to the report, one member of al-Shabab, apprehended in June 2014, told authorities he had been trained for an April 2014 suicide attack in Mogadishu. He said he escaped and reported the planned attack to African Union troops, who were able to stop the attack. The FBI believed another undocumented immigrant was an al-Shabab member who helped smuggle several potentially dangerous terrorists into the U.S. Authorities also apprehended immigrants who said they were members of terrorist organizations in Sri Lanka and Bangladesh. The Department of Public Safety said the report, first published by the Houston Chronicle, was not meant for public distribution. "[T]hat report was inappropriately obtained and [the Chronicle was] not authorized to possess or post the law enforcement sensitive document," department press secretary Tom Vinger said in an e-mail. U.S. Customs and Border Protection did not respond to requests for comment. The department said it had come into contact in recent years with "special interest aliens," who come from countries with known ties to terrorists or where terrorist groups thrive. Those arrested include Afghans, Iranians, Iraqis, Syrians, Libyans and Pakistanis. In all, immigrants from 35 countries in Asia and the Middle East have been arrested over the past few years in the Rio Grande Valley. The department says there is no known intelligence that specifically links undocumented immigrants to terrorism plots, but the authors warn it's almost certain that foreign terrorist

organizations know of the porous border between the U.S. and Mexico. “It is important to note that an unsecure border is a vulnerability that can be exploited by criminals of all kinds,” Vinger said. “And it would be naive to rule out the possibility that any criminal organizations around the world, including terrorists, would not look for opportunities to take advantage of security gaps along our country’s international border.”

Maximized surveillance on the border is key to stopping terrorism

Willis et al 10 [Henry H. Willis, 2010, director of the RAND Homeland Security and Defense Center, with Joel B. Predd, Paul K. Davis and Wayne P. Brown, RAND.org,

“Measuring the Effectiveness of Border Security Between Ports-of-Entry”,
http://www.rand.org/content/dam/rand/pubs/technical_reports/2010/RAND_TR837.pdf, jf]

One of the unexpected results of our study was recognition of the importance of networked intelligence in elaborating objectives for and measuring effectiveness of border security.¹¹ This came about for many reasons. First, all of the focus missions are best understood in national terms: Border security contributes significantly to several high-level national objectives, but results depend sensitively on interactions with and the performance of other federal and local agencies, as well as economic and demographic conditions outside of DHS’s control. Second, national-level effectiveness depends not just on individual component or agency effectiveness but also on components’ ability to share information and work collaboratively, i.e., to network. This is perhaps most obvious with respect to preventing terrorism, in that individuals might enter the country who are vaguely suspicious but who cannot reasonably be arrested at the border. Responsibility for follow-up then transfers to, e.g., the Federal Bureau of Investigation (FBI). However, the FBI’s ability to follow up—either immediately or when further information emerges—might depend critically on information collected and effectively transferred by border agencies to the FBI. The word “effectively” is key because all agencies are deluged with data. The 9/11 Commission’s report dramatized the consequences of ineffectiveness: It is not that information for apprehending the perpetrators did not exist, but rather that the dots were not connected and the relevant agencies did not cooperate well (National Commission on Terrorist Attacks upon the United States, 2004). Third, national-level law enforcement also depends on the effectiveness of the justice system, including the ability to convict and punish. That, in turn, often depends on authorities being able to construct an extensive, fact-based story of criminal behavior from which, cumulatively, guilt can reasonably be inferred by a jury. Fourth, the nature and quality of information collected by border-security components, the consistency with which it is collected, and the effectiveness with which the data are both transferred to national databases and—where appropriate—highlighted in cross-agency actions, are leverage points for improved national-level effectiveness, especially in relation to terrorism- or drug-related functions. Border-security efforts sometimes will query detected travelers against data sets of

known or suspected terrorists or criminals. This is especially relevant at ports of entry, ports of egress in some modes, and in cases in which border enforcement detains an illegal crosser. In other settings, border-enforcement agencies collect as much information as possible on individuals, their conveyances, license plates, accounts, and other records of persons detained for crossing illegally but for whom no prior records exist. The same is true in the maritime regions when individuals are arrested for illegal drug smuggling or illegal migrant smuggling. The collected information can become future tactical intelligence (and used in prosecutions) if the detained person becomes involved in criminal or terrorist functions at a later date. Discussions with component agencies indicate that this is an important capability to measure. Technologically, it is even possible to tag individuals so that subsequent surveillance within the United States (or another country) is possible.¹²

Border surveillance prevents terrorist groups from attempting attacks

Willis et al 10 [Henry H. Willis, 2010, director of the RAND Homeland Security and Defense Center, with Joel B. Predd, Paul K. Davis and Wayne P. Brown, RAND.org,

“Measuring the Effectiveness of Border Security Between Ports-of-Entry”,
http://www.rand.org/content/dam/rand/pubs/technical_reports/2010/RAND_TR837.pdf, pg 19, jf]

The principal contributions that border security makes to counterterrorism relate to preventing certain kinds of terrorist attacks dependent on flows into the country of people or materials. These contributions can be illustrated by considering what opportunities exist to disrupt terrorist attacks while they are being planned and orchestrated. Through a number of planning efforts, DHS and its components have developed detailed planning scenarios of terrorist events (DHS, 2006). Each of these scenarios has been deconstructed into attack trees that are useful for considering how DHS border-security programs contribute to terrorism security efforts. In their most generic form, these attack trees specify dimensions of attack scenarios with respect to building the terrorist team, identifying a target, and acquiring a weapon (see Figure 4.1). This decomposition of attack planning provides a structure around which to consider how interdiction, deterrence, and networked intelligence contribute to preventing terrorist attacks and, thus, why it is relevant to measure these functions. DHS border-security efforts focus on interdiction of terrorist team members and weapons or weapon components when they cross U.S. borders. Examples of initiatives that are intended to enhance these capabilities include the Secure Border Initiative, the acquisition of Advanced Spectroscopic Portals for nuclear detection, the Secure Communities Initiative, and US-VISIT. In addition, it is often pointed out that, when border-security measures are perceived to be effective, terrorists groups may be

deterred from attacking in particular ways, or possibly from attacking at all. This could result from awareness of what type of surveillance is occurring or the capability of interdiction systems. In either case, deterrence refers to the judgment of terrorists that they will not be successful, leading them to choose another course of action. Finally, many border-security initiatives also contribute information to the national networked-intelligence picture. For example, the Secure Communities Initiative has implemented new capabilities to allow a single submission of fingerprints as part of the normal criminal arrest and booking process to be queried against both the FBI and DHS immigration and terrorism databases. This effort makes it easier for federal and local law enforcement to share actionable intelligence and makes it more difficult for terrorists to evade border-security efforts.

Drones Links

Domestic drones k2 solve for terrorism

Bauer 13 (Max Bauer, of ACLU of Massachusetts 9-11-2013, "Domestic Drone Surveillance Usage: Threats and Opportunities for Regulation," https://privacysos.org/domestic_drones CCC)

Unmanned aerial vehicles, commonly known as drones, are an emerging and rapidly-expanding development in domestic surveillance technology. [4] On Valentine's Day 2012, President Barack Obama signed the FAA Modernization and Reform Act of 2012, legislation authorizing the Federal Aviation Administration (FAA) to develop regulations to facilitate the growing usage of drones in domestic airspace. [5] Drones are best known for their use in military operations [6] including the use of weaponized drones for targeted killing. But drones have been used for domestic surveillance purposes for years [7] and their usage is expected to grow exponentially. [8] The FAA has issued 1,428 drone operator permits since 2007 (as of mid-February) and predicts there will be 10,000 drones deployed within the next five years. [9] A public information request by the Electronic Frontier Foundation showed that numerous universities and law enforcement agencies have been approved to use drones by the FAA. [10] Of course, the widespread use of drones for domestic surveillance raises serious privacy concerns. [11] Drones can be outfitted with high definition [12] and infrared cameras, [13] and even license plate readers. [14] Drones "present unique threats to privacy," in the words of one privacy advocate. [15] Why? They are smaller – potentially insect-sized, [16] can fly longer – perhaps soon in perpetuity, [17] and are not bound by the historical, practical check on law enforcement excesses we've had as a result of limited police resources. [18] In a seminal 1890 law review article aptly-titled *The Right to Privacy*, future Supreme Court Justice Louis Brandeis recognized that "instantaneous photographs... have invaded the secret precincts of private and domestic life...Of the desirability – indeed of the necessity – of some such protection there can, it is believed, be no doubt." [19] Brandeis and his co-author Samuel Warren were ahead of their time when they wrote that article but even they couldn't foresee anything like the domestic surveillance schemes that have arisen over a century later. *Drones Used in Massachusetts and Response to Boston Marathon Bombings*. Late in 2012, the Boston Globe reported that a SWAT team in Massachusetts had filed an application with the FAA for a drone. [20] As of April 2013, there were no police drones yet in Massachusetts but Waltham-based defense contractor Raytheon was flying many of them in testing capacities. [21] Surveillance and war contracting companies hope to expand their market from military to domestic law enforcement. [22] Following the explosion of two bombs at the 2013 Boston Marathon, parts of the city shut down as the search for a suspect continued, prompting Ron Paul to write: "This unprecedented move should frighten us as much or more than the attack itself." [23] Boston Police Commissioner Ed Davis told the public shortly afterward that he seeks more surveillance cameras (there are already hundreds) in downtown Boston. [24] And further, he said, he wants to have drone surveillance for next year's marathon. [25]

Drones K2 stop terrorism (foreign)

Byman, 13 (Daniel L. Byman, Director of research at Center for Middle East Policy, 8/2013, <http://www.brookings.edu/research/articles/2013/06/17-drones-obama-weapon-choice-us-counterterrorism-byman> CCC)

The Obama administration relies on drones for one simple reason: they work. According to data compiled by the New America Foundation, since Obama has been in the White House, U.S. drones have killed an estimated 3,300 al Qaeda, Taliban, and other jihadist operatives in Pakistan and Yemen. That number includes over 50 senior leaders of al Qaeda and the Taliban—top figures who are not easily replaced. In 2010, Osama bin Laden warned his chief aide, Atiyah Abd al-Rahman, who was later killed by a drone strike in the Waziristan region of Pakistan in 2011, that when experienced leaders are eliminated, the result is “the rise of lower leaders who are not as experienced as the former leaders” and who are prone to errors and miscalculations. And drones also hurt terrorist organizations when they eliminate operatives who are lower down on the food chain but who boast special skills: passport forgers, bomb makers, recruiters, and fundraisers. Drones have also undercut terrorists’ ability to communicate and to train new recruits. In order to avoid attracting drones, al Qaeda and Taliban operatives try to avoid using electronic devices or gathering in large numbers. A tip sheet found among jihadists in Mali advised militants to “maintain complete silence of all wireless contacts” and “avoid gathering in open areas.” Leaders, however, cannot give orders when they are incommunicado, and training on a large scale is nearly impossible when a drone strike could wipe out an entire group of new recruits. Drones have turned al Qaeda’s command and training structures into a liability, forcing the group to choose between having no leaders and risking dead leaders

Drones take out terrorist leaders (foreign)

Al-Haj, 15 (Ahmed Al-Haj, writer for the Stars & Stripes and AP the big story, 7/10/2015, <http://www.stripes.com/news/middle-east/us-drone-strike-kills-4-al-qaida-fighters-in-yemen-1.357473> CCC)

Yemeni security and military officials say a suspected U.S. drone strike killed four al-Qaida members travelling by car in the coastal city of Mukalla. The officials say the airstrike took place on Friday night in Mukalla, the capital of Yemen's sprawling eastern Hadramawt province. The explosion was heard in some parts of the city. Al-Qaida's Yemen branch, considered to be the most dangerous offshoot of the terror network, has made gains in the province and captured Mukalla earlier this year. The officials say at least five other militants were wounded in the airstrike. The officials spoke on condition of anonymity because they are not authorized to talk to reporters. Al-Qaida has profited from the turmoil that has engulfed Yemen, and U.S. drones have continued to target top al-Qaida leaders there.

Prisons Links

Current prisons k2 stopping terrorism

Kaplan 09 (Fred Kaplan 9, 5-29-2009, "There are already 355 terrorists in American prisons.," Slate Magazine, http://www.slate.com/articles/news_and_politics/war_stories/2009/05/there_are_already_355_terrorists_in_american_prisons.html CCC)

President Obama's remark that some Guantanamo detainees might be transferred to American prisons has prompted an extraordinary, and intellectually feeble, storm of protest. Former Vice President Dick Cheney kicked off the campaign when he said, during his May 21 speech at the American Enterprise Institute, that "to bring the worst terrorists inside the United States would be a cause for great danger and regret in the years to come." Sitting lawmakers—especially those from states such as Kansas and Colorado where federal prisons are based—raised the same specter and shouted the ancient cry of principled rebellion: "Not In My Back Yard!" It makes one wonder: Do any of these legislators know who's in their backyards already, with no apparent detriment to their constituents' daily lives, much less the nation's security? According to data provided by Traci L. Billingsley, spokeswoman for the U.S. Bureau of Prisons, federal facilities on American soil currently house 216 international terrorists and 139 domestic terrorists. Some of these miscreants have been locked up here since the early 1990s. None of them has escaped. At the most secure prisons, nobody has ever escaped, period. As recited in Congress and on cable-news talk shows, the fears of moving Gitmo prisoners here seem to be these: that the terrorist prisoners might escape (statistics to the contrary be damned), that they might convert their fellow inmates with jihadist propaganda, that other members of al-Qaida might infiltrate the surrounding communities (to do what—spring them?), or that their presence might sow panic in those communities. Maybe these people don't understand what life is like in these "supermax" prisons. Take ADX Florence, the supermax in Colorado—"the Alcatraz of the Rockies"—that serves as the home to Omar Abdel-Rahman, the "blind sheikh" who organized the 1993 World Trade Center bombing; Zacarias Moussaoui, one of the Sept. 11 plotters; Richard Reid, the shoe-bomber; Theodore Kaczynski, the "Unabomber"; and Terry Nichols, who helped plan the Oklahoma City bombing, to name a few. These are all truly dangerous people, but it's not as if they run into one another in the lunch line or the yard. There is no lunch line; there is no yard. Most of the prisoners are kept in solitary confinement for 23 hours a day. For one hour, they're taken to another concrete room, indoors, to exercise, by themselves. Their only windows face the sky, so they have no way of knowing even where they are within the prison. Phone calls to the outside world are banned. Finally, the prison is crammed with cameras and motion detectors. Compartments are separated by 1,400 remote-controlled steel doors; the place is surrounded by 12-foot-high razor-wire fences; the area between the wire and the walls is further secured by laser beams and attack dogs. The Bureau of Prisons operates similar facilities—also full of terrorists and murderers—in Terre Haute, Ind.; Marion, Ill.; and elsewhere. And the Defense Department operates a few dozen military prisons scattered around the country, some of which would be suitable for housing the exiles from Guantanamo.

Bullrun Links

The Bullrun program is key to decrypting internet communications and data relevant to international terrorism

Larson, Perlroth, and Shane, 9/5/13 (Jeff, Data Editor at ProPublica; Nicole, The New York Times; Scott, The New York Times; ProPublica, the organization that Snowden gave his leaks, " Revealed: The NSA's Secret Campaign to Crack, Undermine Internet Security" <http://www.propublica.org/article/the-nsas-secret-campaign-to-crack-undermine-internet-encryption>, accessed 7/14/15)

Many users assume — or have been assured by Internet companies — that their data is safe from prying eyes, including those of the government, and the N.S.A. wants to keep it that way. The agency treats its recent successes in deciphering protected information as among its most closely guarded secrets, restricted to those cleared for a highly classified program code-named Bullrun, according to the documents, provided by Edward J. Snowden, the former N.S.A. contractor. Beginning in 2000, as encryption tools were gradually blanketing the Web, the N.S.A. invested billions of dollars in a clandestine campaign to preserve its ability to eavesdrop. Having lost a public battle in the 1990s to insert its own "back door" in all encryption, it set out to accomplish the same goal by stealth. The agency, according to the documents and interviews with industry officials, deployed custom-built, superfast computers to break codes, and began collaborating with technology companies in the United States and abroad to build entry points into their products. The documents do not identify which companies have participated. The N.S.A. hacked into target computers to snare messages before they were encrypted. And the agency used its influence as the world's most experienced code maker to covertly introduce weaknesses into the encryption standards followed by hardware and software developers around the world. "For the past decade, N.S.A. has led an aggressive, multipronged effort to break widely used Internet encryption technologies," said a 2010 memo describing a briefing about N.S.A. accomplishments for employees of its British counterpart, Government Communications Headquarters, or GCHQ. "Cryptanalytic capabilities are now coming online. Vast amounts of encrypted Internet data which have up till now been discarded are now exploitable." When the British analysts, who often work side by side with N.S.A. officers, were first told about the program, another memo said, "those not already briefed were gobsmacked!" An intelligence budget document makes clear that the effort is still going strong. "We are investing in groundbreaking cryptanalytic capabilities to defeat adversarial cryptography and exploit Internet traffic," the director of national intelligence, James R. Clapper Jr., wrote in his budget request for the current year. In recent months, the documents disclosed by Mr. Snowden have described the N.S.A.'s broad reach in scooping up vast amounts of communications around the world. The encryption documents now show, in striking detail, how the agency works to ensure that it is actually able to read the information it collects. The agency's success in defeating many of the privacy protections offered by encryption does not change the rules that prohibit the deliberate targeting of Americans' e-mails or phone calls without a warrant. But it shows that the agency, which was sharply rebuked by a federal judge in 2011 for violating the rules and misleading the Foreign Intelligence Surveillance Court, cannot necessarily be restrained by privacy technology. N.S.A. rules permit the agency to store any

encrypted communication, domestic or foreign, for as long as the agency is trying to decrypt it or analyze its technical features. The N.S.A., which has specialized in code-breaking since its creation in 1952, sees that task as essential to its mission. If it cannot decipher the messages of terrorists, foreign spies and other adversaries, the United States will be at serious risk, agency officials say. Just in recent weeks, the Obama administration has called on the intelligence agencies for details of communications by Qaeda leaders about a terrorist plot and of Syrian officials' messages about the chemical weapons attack outside Damascus. If such communications can be hidden by unbreakable encryption, N.S.A. officials say, the agency cannot do its work.

PRISM links

The PRISM program is necessary to prevent terrorist attacks globally – empirics prove

Kelly, reporter for CNN, 8/1/13 – (Heather, CNN, August 1, 2013, “NSA chief: Snooping is crucial to fighting terrorism” <http://www.cnn.com/2013/07/31/tech/web/nsa-alexander-black-hat/>, accessed 7/15/15 JH @ DDI)

The National Security Agency's controversial intelligence-gathering programs have prevented 54 terrorist attacks around the world, including 13 in the United States, according to Gen. Keith Alexander, NSA director. Speaking before a capacity crowd of hackers and security experts Wednesday at the Black Hat computer-security conference, Alexander defended the NSA's embattled programs, which collect phone metadata and online communications in an effort to root out potential terrorists. The secret programs have come under fire since their existence was revealed in June by former CIA contractor Edward Snowden, who leaked details about them to several newspapers. "I promise you the truth -- what we know, what we're doing, and what I cannot tell you because we don't want to jeopardize our future defense," Alexander told the audience, which included a few hecklers who shouted profanities and accused him of lying. He then gave a partial recap, using PowerPoint slides, of how the two intelligence programs work. Alexander said the NSA can collect metadata on phone calls in the United States, including the date and time of the call, the numbers involved and the length of the conversations. He made a special point of saying the NSA does not have access to the content of citizens' calls or text messages. Alexander said the NSA's PRISM surveillance program, which probes digital activity such as e-mail, instant messaging and Web searches, focuses on foreign actors and does not apply to people in the United States. He said the phone and Internet data is necessary to "connect the dots" and identify potential terrorists before they act. Alexander attempted to reassure the audience that NSA officials are not abusing access to the databases to intrude on Americans' privacy. "The assumption is that people are out there just wheeling and dealing (users' information), and nothing could be further from the truth," he said. "We have tremendous oversight and compliance in these programs." Congress and courts make sure the programs operate within the bounds of the Foreign Intelligence Surveillance Act, and internal auditing systems are in place to prevent any abuse by employees, Alexander said. He added that only 35 analysts are authorized to run queries on the phone metadata.

Data gathered by PRISM is some of the most useful foreign intelligence gathered and is essential to prevent terror attacks

Thompson, contributor to Forbes on National Security and Business, 6/7/13 – (Loren, Forbes, June 7, 2013, “Why NSA's PRISM Program Makes Sense” <http://www.forbes.com/sites/lorenthompson/2013/06/07/why-nsas-prism-program-makes-sense/>, accessed 7/15/15 JH @ DDI)

President Obama's firm defense of the National Security Agency's "domestic" surveillance program on Friday should calm some of the more extravagant fears provoked by public disclosure of its existence. I put the word "domestic" in quotes because the effort to monitor Internet and other communications traffic isn't really about listening in on Americans, or even foreign nationals living here, but rather intercepting suspicious transmissions originating

overseas that just happen to be passing through the United States. That is an eminently sensible way of keeping up with terrorists, because it is so much easier than tapping into network conduits in other countries or under the seas (not that we don't do that). In order to grasp the logic of the NSA program, which is code-named PRISM, you have to understand how the Internet evolved. It was a purely American innovation at its inception, with most of the infrastructure concentrated in a few places like Northern Virginia. I live a few miles from where the Internet's first big East Coast access point was located in the parking garage of an office building near the intersection of Virginia's Routes 7 and 123, an area that some people refer to as Internet Alley. Because the Worldwide Web grew so haphazardly in its early days, it was common until recently for Internet traffic between two European countries to pass through my neighborhood. There were only a few major nodes in the system, and packet-switching sends messages through whatever pathway is available. The Washington Post story on PRISM today has a graphic illustrating my point about how bandwidth tends to be allocated globally. Like a modern version of ancient Rome's Appian Way, all digital roads lead to America. It isn't hard to see why Director of National Intelligence James R. Clapper could say on Thursday that "information collected under this program is among the most important and valuable foreign intelligence information we collect." No kidding: PRISM generated an average of four items per day for the President's daily intelligence briefing in 2012. The key point to recognize, though, is that this really is foreign intelligence. The architecture of the Internet enables NSA to collect it within U.S. borders, but there is no intention to spy on U.S. citizens. A few elementary algorithms used in narrowing the analysis of traffic should be sufficient to assure that the privacy of American citizens is seldom compromised. President Obama stressed in his comments today that safeguards have been put in place to prevent the scope of NSA surveillance from expanding beyond its original purpose.

FISA links

Prohibiting NSA data collection under FISA prevents extensive analysis of data, k2 prevent terrorism

Bradbury 15 (Steven. G, "BALANCING PRIVACY AND SECURITY", HARVARD JOURNAL OF LAW AND PUBLIC POLICY,

https://scholar.google.com/scholar?as_ylo=2011&q=FISA+approvals&hl=en&as_sdt=0,5)

Responding to public opposition to the NSA's telephone metadata program, Congress is currently considering legislation that would prohibit the collection of bulk metadata under FISA. In my view, such a restriction is a bad idea. Under this legislation, the NSA would be unable to collect data from multiple companies where necessary to assemble a single, efficiently searchable database.³¹ This restriction would also mean that the NSA would be prevented from collecting and storing data in bulk where doing so is the only way to preserve important business records that may be useful for a counterterrorism investigation.³² Without the ability for U.S. intelligence agencies to acquire the data in bulk under FISA, these important business records would only exist for as long as the private companies happen to retain the data for their own business purposes or as required by regulatory agencies for reasons unrelated to national security.³³ For example, telephone companies typically retain their metadata calling records for only 18 months, as specified by the Federal Communications Commission for purposes of resolving customer billing disputes.³⁴ Under its metadata program, on the other hand, the NSA was storing the data for five years, so that it could conduct more extensive historical analyses of calling connections involving suspected terrorist numbers—historical analyses that can often provide very important new leads for FBI investigations.

FISA is an archaic mechanism that doesn't allow law enforcement to respond to modern threats, Status quo allows for sufficient NSA capabilities

CFR 13 (Council on Foreign Relations, "U.S. Domestic Surveillance" CFR, <http://www.cfr.org/intelligence/us-domestic-surveillance/p9763>)

After 9/11, the Bush administration opted not to seek approval from the FISC before intercepting "international communications into and out of the United States of persons linked to al-Qaeda (PDF) or related terrorist organizations." The special secret court, set up in 1978 following previous administrations' domestic spying abuses, was designed to act as a neutral overseer in granting government agencies surveillance authorization. After the NSA program was revealed by the New York Times in late 2005, former attorney general Alberto R. Gonzales argued (PDF) that President Bush had the legal authority under the constitution and congressional statute to conduct warrantless surveillance on U.S. persons "reasonably believed to be linked to al-Qaeda." The 2001 Authorization for Use of Military Force (AUMF), without specifically mentioning wiretapping, grants the president broad authority to use all necessary

force "against those nations, organizations, or persons he determines planned, authorized, committed, or aided the [9/11] terrorist attacks." This includes, administration officials say, the powers to secretly gather domestic intelligence on al-Qaeda and associated groups.¶ The Bush administration maintained that the Foreign Intelligence Surveillance Act (FISA) was an outdated law-enforcement mechanism that was too time-consuming given the highly fluid, modern threat environment. Administration officials portrayed the NSA program as an "early warning system" (PDF) with "a military nature that requires speed and agility." Moreover, the White House stressed that the program was one not of domestic surveillance but of monitoring terrorists abroad, and publicly referred to the operation as the "Terrorist Surveillance Program." Opponents of the program referred to it as "domestic spying."¶ Under congressional pressure, Gonzales announced in January 2007 plans to disband the warrantless surveillance program and cede oversight to FISC, but questions about the legality of the program lingered in Congress and Gonzales resigned months later.¶ But Washington's vow to seek FISA approval for domestic surveillance was short-lived. In July 2007--weeks before Gonzales stepped down--intelligence officials pressed lawmakers for emergency legislation to broaden their wiretapping authority following a ruling by the court overseeing FISA that impacted the government's ability to intercept foreign communications passing through telecommunications "switches" on U.S. soil.

Backdoors Links

Without access to backdoors, law enforcement won't have the capacity to collect intelligence data because of increasingly complex encryption

AP 7/8 (Eric Tucker, "FBI, JUSTICE DEPT. TAKE ENCRYPTION CONCERNS TO CONGRESS")

Associated Press,

http://hosted.ap.org/dynamic/stories/U/US_FBI_ENCRYPTION?SITE=AP&SECTION=HOME&TEMPLATE=DEFAULT&CTIME=2015-07-08-06-22-03

WASHINGTON (AP) -- Federal law enforcement officials warned Wednesday that data encryption is making it harder to hunt for pedophiles and terror suspects, telling senators that consumers' right to privacy is not absolute and must be weighed against public-safety interests. ¶ The testimony before the Senate Judiciary Committee marked the latest front in a high-stakes dispute between the Obama administration and some of the world's most influential tech companies, placing squarely before Congress an ongoing discussion that shows no signs of an easy resolution. Senators, too, offered divided opinions. ¶ FBI and Justice Department officials have repeatedly asserted that encryption technology built into smartphones makes it harder for them to monitor and intercept messages from criminal suspects, such as Islamic State sympathizers who communicate online and child predators who conceal pornographic images. They say it's critical that they be able to access encrypted communications during investigations, with companies maintaining the key to unlock such data. ¶ But they face fierce opposition from Silicon Valley companies who say encryption safeguards customers' privacy rights and offers protections from hackers, corporate spies and other breaches. The companies in recent months have written to the Obama administration and used public speeches to argue for the value of strong encryption. ¶ FBI Director James Comey, who has pressed his case repeatedly over the last year before think tanks and in other settings, sought Wednesday to defuse some of the tension surrounding the dispute. He told senators that he believed technology companies were fundamentally on the same page as law enforcement, adding, "I am not here to fight a war." ¶ "Encryption is a great thing. It keeps us all safe. It protects innovation," Comey said. "It protects my children. It protects my health care. It is a great thing." ¶ But he warned that criminals were using encryption to create a safe zone from law enforcement. He said that concern was especially acute at a time when the Islamic State has been recruiting sympathizers through social media and then directing them to encrypted platforms that federal agents cannot access. ¶ "Our job is to look at a haystack the size of this country for needles that are increasingly invisible to us because of end-to-end encryption," he said. ¶

TSA Links

TSA is key to protect against dangerous weapons, explosives, and innovate in security technologies.

John S. Pistole, 3-5-2012, "Counterterrorism, Risk-Based Security and TSA's Vision for the Future of Aviation Security," Transportation Security Administration, <https://www.tsa.gov/press/speeches/counterterrorism-risk-based-security-and-tsa%E2%80%99s-vision-future-aviation-security>

Remember that before September 11, 2001, there was:¶ No cohesive system in place to check passenger names against terrorist watch lists in advance of flying;¶ Only limited technologies in place for uncovering a wide array of threats to passengers or aircraft;¶ No comprehensive federal requirements to screen checked or carry-on baggage;¶ Minimal in-flight security on most flights; and,¶ From a coordination standpoint, before 9/11 there was a lack of timely intelligence-sharing, in both directions — from the federal level down to the individual airports, as well as from an individual airport up to the national level.¶ I came to TSA more than a year and a half ago, having worked the previous 26 years in a variety of positions within the FBI. That experience with a range of partners inside the law enforcement and intelligence communities helped shape my approach to solidifying TSA's place within the national counterterrorism continuum.¶ Every day, we strive to ensure our operational planning and decision making process is timely, efficient and as coordinated as possible — and critically, based on intelligence. We work to share critical information with key industry stakeholders whenever appropriate, and we are constantly communicating with our frontline officers through shift briefings held several times a day.¶ Thanks to the effective partnerships we've forged with industry stakeholders, with our airline and airport partners, and with law enforcement colleagues at every level, TSA has achieved a number of significant milestones during its first 10 years of service.¶ These include matching 100 percent of all passengers flying into, out of, and within the United States against government watch lists through the Secure Flight program.¶ It includes screening all air cargo transported on passenger planes domestically and, as you know, we work closely with our international partners every day to screen 100% of high-risk inbound cargo on passenger planes. We're also working hard with these same partners to screen 100% of all international inbound cargo on passenger planes by the end of this year.¶ And it also includes improving aviation security through innovative technology that provides advanced baggage screening for explosives.¶ Since their inception in 2005 through February 2012, we have also conducted more than 26,000 Visible Intermodal Prevention and Response or VIPR operations. We have 25 multi-modal VIPR teams working in transportation sectors across the country to prevent or disrupt potential terrorist planning activities.¶ Additionally, since 2006, TSA has completed more than 190 Baseline Assessments for Security Enhancement for transit, which provides a comprehensive assessment of security programs in critical transit systems.¶ We are seeing the benefits of how these important steps — combined with our multiple layers of security including cutting-edge technology — keep America safe every day.¶ Since our standup in 2002, we have screened nearly six billion passengers. Our front line officers have detected thousands of firearms and countless other prohibited items and we have prevented those weapons from entering the cabin of an aircraft.¶ In fact, more than 10 years after 9/11, TSA officers still detect,

on-average, between three and four firearms every day in carry-on bags at security checkpoints around the country.¶ Deploying advanced, state-of-the-art technologies continue to factor significantly into our multi-layered approach to transportation security. In particular, we continue to see the efficacy of Advanced Imaging Technology, or AIT, machines at hundreds of passenger security checkpoints around the United States.¶ From February 2011 to June 2011, the Office of the Inspector General (OIG) assessed the manner in which TSA inspects, maintains and operates backscatter units used in passenger screening.¶ The OIG found that TSA was in compliance with standards regarding radiation exposure limits and safety requirements. As a result of intensive research, analysis, and testing, TSA concludes that potential health risks from screening with backscatter X-ray security systems are minuscule.¶ While there is still no perfect technology, AIT gives our officers the best opportunity to detect both metallic and non-metallic threats including improvised explosive devices such as the device Umar Farouk Abdulmutallab attempted to detonate on Christmas Day, 2009.¶ As manufacturers continue enhancing the detection capability and strengthening the privacy features of their machines, we maintain the ability to upgrade the software used on them to stay ahead of the rapidly shifting threat landscape. Maintaining a high level of adaptability enables us to keep an important technological advantage.¶ Throughout 2011, this and other technologies helped our officers detect hundreds of prohibited, dangerous, or illegal items on passengers.¶ These “good catches” as we call them, illustrate how effective our people, process and technology are at finding concealed metallic and non-metallic items concealed on a passenger or in their bags.¶ In an ongoing effort to help educate the traveling public, we highlight many of these good catches every week in blog posts uploaded to TSA.gov. I hope some of you have seen these. They have included incidents of items concealed in shoes, to weapons hidden in a hollowed out book, to ceramic knives, to exotic snakes strapped to a passenger’s leg. As strange as some of these tales may be, they are a stark reminder that now — more than 10 years after the September 11, 2001, attacks — people are still trying to bring deadly weapons onto aircraft. And our officers are detecting numerous weapons every day and keeping them off of planes.¶ Less than one month ago in fact, over Presidents Day weekend in February, our officers detected 19 guns in carry-on bags at various checkpoints around the country. In total, 1,306 guns were detected at airport checkpoints in 2011.

Threat to national security greater than ever, TSA is key to solve

Fox News 12-17-2014, ("TSA head: Threat from terrorism worse now but US better able to combat it," <http://www.foxnews.com/politics/2014/12/17/tsa-head-threat-from-terrorism-worse-now-but-us-better-able-to-combat-it/>)

The outgoing and longest-serving head of the Transportation Security Administration says the threat from terrorism is worse now than when he took the job four years ago, but the U.S. is better positioned to combat foreign plots.¶ "The threat today is unfortunately more expansive than what it was four-and-a-half years ago," John Pistole told Fox News during an interview

before he leaves at the end of the month, concluding 31 years of government service -- including 27 at the FBI, where he rose to the rank of deputy director.¶ "With that being said, we also have better insights into who the potential bombers are," he added.¶ From Pistole's unique position at the TSA and FBI, he watched Al Qaeda's strategy evolve from the 9/11 attacks that murdered nearly 3,000 Americans, to the failed underwear bomb plot to bring down a jet on Christmas Day 2009 and the non-metallic explosive devices buried in cargo a year later.¶ Although Al Qaeda experimented in 2012 with surgically implanted bombs before apparently abandoning the idea as impractical, Pistole suggested they are now focused on devices held close or strapped to the body.¶ "That is one of things that concerns us, how well do they design, construct and then conceal," he said.¶ Pistole will become president of his alma mater, Anderson University in Anderson, Ind., this spring.¶ Fox News asked Pistole whether the threat to American aviation had diminished since August, when the U.S. launched a bombing campaign against ISIS in Syria and Iraq, and the Al Qaeda-led "Khorasan" group. ¶ Khorasan contains long-time associates of Usama bin Laden, including Sanafi al-Nasr and Muhsin al-Fadhli, as well as a handful of operatives trained by the Yemeni bomb maker Ibrahim al-Asiri, who specializes in non-metallic bombs that traditional airport screening can miss.¶ "Without going into details about what that may look like from a classified intelligence perspective, we do remain concerned that there is active plotting going on," Pistole said.¶ And with new information that the French bomb maker David Drugeon likely survived a U.S. air strike last month, Pistole added, "there is concern that there are still individuals out there who have not only the ability to do that, but also the intent to use that on a flight to Europe or the US."¶ The TSA administrator also described classified procedures that track foreign fighters, based on their travel history, before they check in at overseas airports for U.S.-bound flights.¶ "There are individuals we are concerned about and we are again looking at if they make travel reservations, then they of course receive proper scrutiny," Pistole said.¶ The continued threat from groups like Khorasan explains why procedures, implemented in July, requiring passengers to turn on their phone and computers at some airports, remain in place. As the holiday travel season begins, TSA officials say they are not expecting big changes at the checkpoints, but if there are changes, they will be driven by new and specific intelligence.¶ Pistole said the transition from a one-size-fits-all approach after 9/11 to a risk-based strategy -- driven by intelligence -- is one of the TSA workforce's accomplishments.¶ "I think that's been one of the biggest changes. ...We're more efficient. Complaints are down. Wait times are down," he said.¶ Data provided by the TSA showed that over Thanksgiving, more than 12.5 million passengers were screened, a 1.3 percent increase from 2013, with nearly 50 percent of these passengers getting expedited screening.¶ Nationwide, TSA said 99.6 percent of passengers waited in a line for less than 20 minutes.¶ Pistole was in Australia days before the hostage situation unfolded in Sydney last weekend, telling Fox it fit the profile of a classic lone wolf attack. "I am not aware of any intelligence about it as of last week, there was no talk about something like that," he said.¶ But it's not that kind of attack that keeps Pistole up at night.¶ "My greater concern, rather than just a lone wolf, is simultaneous attacks such as you saw on 9/11 ... with that being said, we also have better insights into who the potential bombers are," he said.

Financial Surveillance Links

Financial surveillance is key to stopping terrorist organizations

Atlas 15 [Terry Atlas, 2-6-2015, Senior Writer in Foreign Policy/National Security Team for Bloomberg News, "Follow the money new game plan in thwarting terrorism," Seattle Times, <http://www.seattletimes.com/news/follow-the-money-new-game-plan-in-thwarting-terrorism/>]

Economic and financial intelligence is critical to targeting and enforcing sanctions against Iran, North Korea and Russia; strangling the flow of money to terrorist organizations, drug cartels and weapons traffickers; tracking nuclear proliferation; and assessing the strength of nations such as Russia and China that are now part of the global economy. Treasury personnel in Washington, D.C. — and in Afghanistan, Pakistan and the Persian Gulf — have worked with intelligence and military colleagues to attack the finances of the Taliban, al-Qaida and other terrorist groups. The department has provided expertise and actionable intelligence to civilian and military leaders through “threat finance cells” for Afghanistan and Iraq, and worked elsewhere with the U.S. Special Operations Command. How much the intelligence mission has changed is highlighted by the move this month by David Cohen, the Treasury undersecretary for terrorism and financial intelligence to become deputy director of the Central Intelligence Agency. Cohen, 51, whose Treasury responsibilities included sanctions policy, replaces Avril Haines, a lawyer who’s now President Obama’s deputy national security adviser. It’s the first time a Treasury official has moved into such a senior CIA post. That has been noticed in the intelligence community, where the Treasury has become a recognized power, and among the specialized legal and financial community affected by the nation’s increasing use of economic coercion against adversaries. “Financial intelligence is incredibly important, and it’s much more important than it used to be,” said attorney Christopher Swift, a former Treasury official who investigated financing of terrorist groups and weapons proliferators. “Cohen’s move to CIA underscores that.” Financial intelligence has come into its own as the U.S. increasingly turns to sanctions, asset freezes and other financial actions to thwart adversaries from al-Qaida operatives to Russian President Vladimir Putin. It’s a tactic that Ian Bremmer, the president of New York-based Eurasia Group, recently called the “weaponization of finance.” The U.S. strategy is “premised on the simple reality that all of

our adversaries, to one degree or another, need money to operate, and that by cutting off their financial lifelines, we can significantly impair their ability to function,” Cohen said at a conference in London in June. Financial intelligence exposes vulnerabilities of adversaries — whether nations or individuals — who need access to the global financial system. Concealing financial flows can be harder than avoiding surveillance of emails and phone calls, which terrorists have tried to do in the aftermath of Edward Snowden’s disclosures about U.S. communications intercepts. “When people think about intelligence, they think about James Bond and running operations against the Russians or the Chinese, and that still goes on and we shouldn’t diminish the importance of it,” said Swift, an adjunct professor of national security studies at Georgetown University in Washington, D.C. “But if you’re looking at the other types of organizations in the global community that are causing problems for the United States and its allies, a lot of them are non-state actors, they’re criminal syndicates, they’re narcotics syndicates, they’re transnational terrorist syndicates, and the best way to figure out how those organizations work, who’s part of those organizations, and the best way to degrade those organizations is follow the money,” he said. The U.S. government has vastly expanded its collection and use of financial intelligence, bolstered by a series of post-9/11 laws and executive orders that have given the Treasury Department a leading role in financial intelligence and sanctions. The Treasury Department has more than 700 personnel dealing with terrorist and financial intelligence. The Treasury’s Terrorist Finance Tracking Program, which has access to the Swift international banking transaction network, participated in investigations into the 2013 Boston Marathon bombing, threats to the 2012 London Summer Olympic Games and the 2011 plot to assassinate the Saudi Arabian ambassador in D.C., which U.S. officials said originated with senior members of the Quds force of Iran’s Islamic Revolutionary Guards Corps. The Financial Crimes Enforcement Network, a part of the Treasury’s intelligence operation that regulates the financial industry to prevent money laundering and terrorist financing, receives more than a million reports a year on potentially suspect cash movements from financial institutions, Cohen said in a speech in January. FinCen’s information, combined with data from other sources, assists investigators in “connecting the dots” involving sometimes previously unknown individuals and businesses, according to the Treasury.

2NC A2 link turns

** A2 false positives (hay stack/puzzle)

False positives are wrong – meta-data eliminates scenarios and increases efficiency

Lewis 14 [James Andrew Lewis, Director and Senior Fellow of the Technology and Public Policy Program at the CSIS, December 2014, "Underestimating Risk in the Surveillance Debate", Center for Strategic and International Studies,

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf, pg 2 jf]

NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success. Success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. In practice, analysts must simultaneously explore many possible scenarios. A collection program contributes by not only what it reveals, but also what it lets us reject as false. The Patriot Act Section 215 domestic bulk telephony metadata program provided information that allowed analysts to rule out some scenarios and suspects. The consensus view from interviews with current and former intelligence officials is that while metadata collection is useful, it is the least useful of the collection programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215, but this would not come without an increase in risk. Restricting metadata collection will make it harder to identify attacks and increase the time it takes to do this. Spying on Allies NSA's mass surveillance programs for counterterrorism were carried out in cooperation with more than 30 countries. Unilateral U.S. collection programs focused on national security problems: nonproliferation, counterintelligence (including Russian covert influence operations in Europe), and arms sales to China. The United States failed to exercise sufficient oversight over intelligence collection, but the objectives set for NSA reflect real security problems for the United States and its allies. The notion that "friends don't spy on friends" is naive. The United States has friends that routinely spy on it and yet are strong security partners. Relations among powerful states are complex and not explained by simple bromides drawn from personal life. The most startling thing about U.S. espionage against Germany was the absence of a strategic calculation of risk and benefit. There are grounds for espionage (what other major power has a former leader on Russia's payroll?), but the benefits were outweighed by the risk to the relationship. The case for spying on Brazil is even weaker. While Brazil is often antagonistic, it poses no risk to national security. If economic intelligence on Brazil is needed, the private sector has powerful incentives and legitimate means to obtain information and usually has the best data. Risk Is Not Going Away Broad surveillance of communications is the least intrusive and most effective method for discovering terrorist and espionage activity. Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity, often in cooperation with other countries, including the

United States. Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. Given resurgent authoritarianism and continuing jihad, the new context for the surveillance debate is that the likelihood of attack is increasing. Any legislative change should be viewed through this lens.

** A2 Zero sum

Funding divided between 15+ agencies, not a funding tradeoff

Sahadi 13 (Jeanne Sahadi 13, 6-7-2013, "What the NSA costs taxpayers," CNNMoney, <http://money.cnn.com/2013/06/07/news/economy/nsa-surveillance-cost/> CCC)

As a result, it's impossible to say exactly how much money the NSA is given to conduct its surveillance efforts -- which Americans learned this week has recently included collecting phone call data and monitoring online activities. That's because the NSA, a Defense Department agency created in 1952, falls under the category of a "black" program in the federal budget, a term applied to classified efforts. The NSA is one of at least 15 intelligence agencies, and combined the total U.S. intelligence budget in 2012 was \$75 billion, said Steve Aftergood, director of the government secrecy program at the Federation of American Scientists, a nonpartisan think tank that analyzes national and international security issues. The intelligence budget includes funding for both classified and unclassified activities. Funding for classified programs has tracked the upward trend in defense spending over the past decade, according to an analysis of fiscal year 2012 Defense Department budget request by Todd Harrison of the Center for Strategic and Budgetary Assessments. Aftergood estimates about 14% of the country's total intelligence budget -- or about \$10 billion -- goes to the NSA.

** A2 Recruitment

NSA recruiting is going extremely well

Libicki et al 14 [Libicki, Martin C., 2014, "Hackers Wanted: An Examination of the Cybersecurity Labor Market," RAND, http://www.rand.org/pubs/research_reports/RR430.html jf]

The NSA is the country's largest and leading employer of cybersecurity professionals. In the face of the current stresses in the market for such professionals, officials there believe they are doing quite well—fewer than 1 percent of their positions are vacant for any significant length of time, and supervisors, queried after their new hires have been working for six months, report being very happy with the personnel they get. NSA also has a very low turnover rate (losing no more to voluntary quits than to retirements). One reason is that it pays attention to senior technical development programs to ensure that employees stay current and engaged.

Yet, to get to that point, our interview indicates that NSA must and does pay a great deal of attention to workforce issues. If not its primary focus, then it is still very high up on the list. Although only 80 people have recruitment as their full-time occupation, another 300 have recruitment as an additional duty, and another 1,500 beyond that are involved in the whole

recruitment and employment process. All told, that is a great deal of effort—suggesting, from our perspective, that the difficulties of finding enough cybersecurity professionals can be largely met if sufficient energy is devoted to the task. NSA has outreach into many universities, not simply those designated its Centers of Academic Excellence (CAE),² although it pays attention to supporting cybersecurity curricula development in the CAE schools, as noted. In some cases it has people teaching in schools to encourage potential cybersecurity professionals at the pre-college levels, particularly, for obvious reasons, in the state of Maryland.

For the most part, our interview suggests that the NSA makes rather than buys cybersecurity professionals, although its recruitment process is very sensitive to the importance of determining those qualities that predispose people to make good employees. Recruiters also look hard at schools that have a reputation for educating people that go into the military. Fully 80 percent of their hires are entry level, the vast majority of whom have bachelor's degrees. They could conceivably draw deeper by finding particularly talented junior college graduates, but the latter would have to undergo a much longer training program as a result. Furthermore, they are not inclined to look for the brilliant non-degreed hacker.³

NSA has a very intensive internal schooling system, lasting as long as three years for some. This too, would be difficult for other institutions to duplicate. NSA can take advantage not only of its size, but also of its low turnover rate. The latter means that it reaps the benefits of its investments in people rather than seeing the benefits accrue to other organizations after NSA has paid the costs of the training (not least of which is the time that such students spend off the job to be trained). Employers with more turnover may logically deem it not worthwhile investing that much to educate their employees.

In all fairness, only one organization can be the most prestigious place to work, and for this line of work (and for this size of organization), NSA is hard to beat. It consistently absorbs a third of all Scholarship for Service graduates, as shown in Figure 3.1,⁴ in part because it has the most job openings but also because it has a reputation for hiring the best hackers.

Silicon valley jobs are comparatively a much bigger challenge for NSA recruitment -- the NSA has already had to deal with recruitment issues in the past

Brumfiel, science correspondent for NPR, 3/31/15 (Geoff Brumfiel, NPR, MARCH 31, 2015, "After Snowden, The NSA Faces Recruitment Challenge", <http://www.npr.org/2015/03/31/395829446/after-snowden-the-nsa-faces-recruitment-challenge>, accessed 7/17/15 JH @ DDI)

But Ziring says there's a much bigger problem: "I was at a Dartmouth career fair a few months ago," he says, "and our table was right across from Facebook. And we are looking for some of the same things that they are." Ever since the Snowden leaks, cybersecurity has been hot in Silicon Valley. In part that's because the industry no longer trusts the government as much as it once did. Companies want to develop their own security, and they're willing to pay top dollar to get the same people the NSA is trying to recruit. Students like Swann. Last summer Microsoft

paid him \$7,000 a month to work as an intern. The company even rented him a car. "It was actually really nice," Swann says. "It was a Subaru Legacy." Ziring says the agency can't compete on money, so he tries to sell it in other ways: "You know we have good health benefits, and we're government, right? So we have a huge scope of insurance to choose from," he says.

Other neg cards

Impact – Cyber attacks bring down grid and banking system, causing economic upheaval
Jonathan Fisher, 5-19-2015, "A former CIA chief says other governments could launch crippling computer attacks on the US," Business Insider, <http://www.businessinsider.com/former-cia-chief-cyberterrorism-on-mind-2015-5>

A former Director of Counterintelligence for the CIA — Barry Royden — believes that cyber terrorism is the next big threat to America. ¶ Royden, who spent 40 years in the CIA — 35 years as an operative and 5 years as head of counterintelligence — knows what he's talking about. Though he's been retired for more than a decade, he isn't blind to what he believes is a new type of threat that has emerged in an increasingly connected world:¶ "The trouble is, it's extremely difficult, in fact, it's impossible — everyone is connected to everyone, and as long as you're connected you're vulnerable. And there are firewalls, but every firewall is potentially defeatable, so it's a nightmare in my mind. You have to think that other governments have the capability to bring down the main computer systems in this country, power grids, hospitals, or banking systems — things that could cause great economic upheaval and paralyze the country."¶ He adds:¶ "Now, if they were to do it to us and we were to do it to them, it would almost be like a nuclear standoff. They could do it but if they did it what would the cost be? Because they know we have the same capabilities and that we presumably attack their computer systems the same way and we could destroy their economy. So you hope that no one is going to do that but you're vulnerable. These days, I think the cyber world is the big threat."

Impact- Cyberattacks attacking the grid collapse global military operations and cause extinction

Andres and Breetz 11 Richard Andres, Professor of National Security Strategy at the National War College and a Senior Fellow and Energy and Environmental Security and Policy Chair in the Center for Strategic Research, Institute for National Strategic Studies, at the National Defense University, and Hanna Breetz, doctoral candidate in the Department of Political Science at The Massachusetts Institute of Technology, Small Nuclear Reactors for Military Installations: Capabilities, Costs, and Technological Implications, www.ndu.edu/press/lib/pdf/StrForum/SF-262.pdf

More recently, awareness has been growing that the grid is also vulnerable to purposive attacks. A report sponsored by the Department of Homeland Security suggests that a coordinated cyberattack on the grid could result in a third of the country losing power for a period of weeks or months.⁹ Cyberattacks on critical infrastructure are not well understood. It is not clear, for instance, whether existing terrorist groups might be able to develop the capability to conduct this type of attack. It is likely, however, that some nation-states either have or are working on developing the ability to take down the U.S. grid. In the event of a war with one of these states, it is possible, if not likely, that parts of the civilian grid would cease to function, taking with them military bases located in affected regions. Government and private organizations are currently working to secure the grid against attacks; however, it is not clear that they will be successful.

Most military bases currently have backup power that allows them to function for a period of hours or, at most, a few days on their own. If power were not restored after this amount of time, the results could be disastrous. First, military assets taken offline by the crisis would not be available to help with disaster relief. Second, during an extended blackout, global military operations could be seriously compromised; this disruption would be particularly serious if the blackout was induced during major combat operations. During the Cold War, this type of event was far less likely because the United States and Soviet Union shared the common understanding that blinding an opponent with a grid blackout could escalate to nuclear war. America's current opponents, however, may not share this fear or be deterred by this possibility.

Neg- Impacts

Cyberterrorism

Cyberterror Causes Nuke War

Cyberterrorists could break into computers and launch an attack on a nuclear state—triggers global nuclear war

Fritz 09

(Jason, May 2009, International Commission on Nuclear Non-Proliferation and Disarmament, "Hacking Nuclear Command and Control," Jason is a defense researcher, served as a cavalry officer in the US Army for 6 years, masters in IR @ Bond University, icnnd.org/documents/jason_fritz_hacking_nc2.doc, 7/15/15, SM)

In order to see how cyber terrorists could detonate a nuclear weapon it is important to identify the structures which they would be attempting to penetrate. Nuclear command and control (NC2), sometimes referred to as nuclear command and control and communications (NC3) includes the personnel, equipment, communications, facilities, organisation, procedures, and chain of command involved with maintaining a nuclear weapon capability. A Command and Control Centre is typically a secure room, bunker, or building in a government or military facility that operates as the agency's dispatch centre, surveillance monitoring centre, coordination office and alarm monitoring centre all in one. A state may have multiple command and control centres within the government and military branches which can act independently or, more commonly, be used in the event a higher node is incapable of performing its function. A minimum of eight states possess a nuclear arsenal, providing eight varying nuclear command and control structures for cyber terrorist to target. The eight states which possess nuclear weapons are, in order of acquisition, the US, Russia (former Soviet Union), the UK, France, China, India, Pakistan, and North Korea. South Africa formerly possessed nuclear weapons, but has since dismantled its arsenal. Israel is also widely believed to have nuclear weapons, but has not officially confirmed their status as a nuclear state. There are approximately 20,000 active nuclear weapons in the world. The vast majority of these belong to the US and Russia, stemming from the Cold War. Nuclear command and control has inherent weaknesses in relation to cyber warfare. The concept of mutually assured destruction means a state must have the capability to launch nuclear weapons in the event of a decapitating strike. This requires having nuclear weapons spread out in multiple locations (mobility and redundancy), so an enemy could not destroy all of their capabilities. Examples of this include land based mobile launch platforms and submarine-launched ballistic missiles (SLBM). This provides terrorists with multiple locations for attaining access to these weapons. Further, under NATO nuclear weapons sharing, the US has supplied nuclear weapons to Belgium, Germany, Italy, the Netherlands, and Turkey for storage and possible deployment. This further increases the number of access points for terrorists, allowing them to assess not only installations and procedures, but also which borders and state specific laws may be easier to circumvent. The weapons themselves may all be under the complete control of the US, but the operational plans of terrorists may include items such as reconnaissance, social engineering, and crossing borders which remain unique between states. The potential collapse of a state also presents a challenge. Following the collapse of the Soviet Union, Belarus, Kazakhstan, and Ukraine were in possession of nuclear weapons. These have since been transferred to Russia, but there was, and still is, considerable concern over the security and integrity of those weapons, especially in the face of a destabilized government and

civilian hardship. Mutually assured destruction also promotes a hair trigger launch posture and the need for launch orders to be decided on quickly. The advent of SLBMs increased this high pressure tension, as the ability of a submarine to sneak up close to a state's border before launch significantly reduced response time. These short decision times make it easier for terrorists to provoke a launch as little time, and little discussion, is given to assess a situation in full. The desire to reduce the time it takes to disseminate plans to nuclear forces may expand the use of computers in nuclear command and control, or lead to the introduction of fail-deadly and autonomous systems. This chapter is by no means comprehensive, However it sheds some light on the operations of nuclear command and control and the difficulties in defending those systems from cyber terrorism. Many of the details of nuclear command and control are classified, so the information provided below may be outdated. However it points towards a pattern, and there is no certainty these systems and procedures have been updated since entering open source knowledge. Further, terrorists do not have to restrict themselves to unclassified data, and therefore may be able to obtain up to date information. The United States The US employs a nuclear deterrence triad consisted of nuclear-capable long range bombers, SLBMs, and land based intercontinental ballistic missiles (ICBMs), as well as an arsenal of nonstrategic (tactical) nuclear weapons. US nuclear command and control covers a geographically dispersed force with the US President, as Commander in Chief, being the highest authority in the decision to make a nuclear launch. There is a hierarchy of succession in the event the President cannot perform this duty, such as if the President were killed in an attack. Additionally, once the order to launch is given, it travels down a chain of command; the President does not press the button, so to speak, nor is the President physically present at the launch location. These locations would be targets in a nuclear war, so it is imperative that the leader not be there. Additionally, multiple independent launch locations make this impossible (except for cases in which multiple missiles are tied together in a Single Integrated Operational Plan). So it is theoretically possible to subvert this control by falsifying the order at any number of locations down that chain of command. The infrastructure that supports the President in his decision to launch nuclear weapons is the Nuclear Command and Control System (NCCS). "The NCCS must support situation monitoring, tactical warning and attack assessment of missile launches, senior leader decision making, dissemination of Presidential force-direction orders, and management of geographically dispersed forces" (Critchlow 2006). Key US nuclear command centres include fixed locations, such as the National Military Command Center (NMCC) and the Raven Rock Mountain Complex (Site R), and mobile platforms, such as the E-4B National Airborne Operations Center (NAOC) and the Mobile Consolidated Command Center (MCCC). The US seeks to integrate its nuclear forces into its vision of command, control, computers, communications, intelligence, surveillance, and reconnaissance (C4ISR) hinting towards a greater reliance on computer technology in maintaining and upgrading its nuclear force, not only to combat against Cold War style nuclear war, but also against perceived emerging threats from China, Iran and North Korea. In particular the US recognises these states' potential to use nuclear weapons detonated at high altitude to create an electromagnetic pulse (EMP). The threat of EMP was known during the Cold War, and a considerable amount of attention has been paid to hardening nuclear systems (Critchlow 2006). The Minimum Essential Emergency Communications Network (MEECN) links to the ICBMs, bombers, and submarine forces. Information widely available on the internet shows the US is seeking to

upgrade the MEECN's satellite communications capability through Advanced Extremely High Frequency and the Transformational Communications Satellite programs. Cyber terrorists may use this knowledge to research these new forms, or to expose weaknesses in the old system before upgrades are completed. Early warning systems and communications are essential to assessing whether a nuclear launch has been made and communicating the orders to launch a retaliatory strike. Falsifying the data provided by either of these systems would be of prime interest to terrorists. Commands emanating from the NAOC for example, include Extremely High Frequency and Very Low Frequency/Low Frequency links, and its activation during a traditional terrorist attack, as happened on 9/11, could provide additional clues as to its vulnerabilities. Blogging communities have also revealed that the 9/11 terrorist attacks revealed insights into the US continuity of operations plan as high level officials were noted heading to specific installations (Critchlow 2006). One tool designed by the US for initiating a nuclear launch is the 'nuclear football'. It is a specially outfitted briefcase which can be used by the President to authorize a nuclear strike when away from fixed command centres. The President is accompanied by an aide carrying the nuclear football at all times. This aide, who is armed and possibly physically attached to the football, is part of a rotating crew of Presidential aides (one from each of the five service branches). The football contains a secure satellite communication link and any other material the President may need to refer to in the event of its use, sometimes referred to as the 'playbook'. The attack options provided in the football include single ICBM launches and large scale pre-determined scenarios as part of the Single Integrated Operational Plan. Before initiating a launch the President must be positively identified using a special code on a plastic card, sometimes referred to as 'the gold codes' or 'the biscuit'. The order must also be approved by a second member of the government as per the two-man rule (Pike 2006). In terms of detecting and analysing a potential attack, that is, distinguishing a missile attack from the launch of a satellite or a computer glitch, the US employs dual phenomenology. This means two different systems must be used to confirm an attack, such as radar and satellite. Terrorists trying to engage a launch by falsifying this data would need to determine which two systems were being used in coordination at the target location and spoof both systems. Attempting to falsify commands from the President would also be difficult. Even if the chain of command is identified, there are multiple checks and balances. For example, doctrine recommends that the President confer with senior commanders. The Chairman of the Joint Chiefs of Staff is the primary military advisor to the President. However, the President may choose to consult other advisors as well. Trying to identify who would be consulted in this system is difficult, and falsification may be exposed at any number of steps. The 2006 Quadrennial Defense Review emphasizes that new systems of command and control must be survivable in the event of cyber warfare attacks. On the one hand, this shows that the US is aware of the potential danger posed by computer network operations and are taking action to prevent it. On the other hand, this shows that they themselves see computer network operations as a weakness in their system. And the US continues to research new ways to integrate computer systems into their nuclear command and control, such as IP-based communications, which they admit, "has not yet been proven to provide the high degree of assurance of rapid message transmission needed for nuclear command and control" (Critchlow 2006). The US nuclear arsenal remains designed for the Cold War. This means its paramount feature is to survive a decapitating strike. In order to do so it must maintain hair-trigger posture on early warning and decision-making for approximately

one-third of its 10,000 nuclear weapons. According to Bruce G. Blair, President of the Center for Defense Information, and a former Minuteman launch officer: Warning crews in Cheyenne Mountain, Colo., are allowed only three minutes to judge whether initial attack indications from satellite and ground sensors are valid or false. Judgments of this sort are rendered daily, as a result of events as diverse as missiles being tested, or fired — for example, Russia’s firing of Scud missiles into Chechnya — peaceful satellites being lofted into space, or wildfires and solar reflections off oceans and clouds. If an incoming missile strike is anticipated, the president and his top nuclear advisors would quickly convene an emergency telephone conference to hear urgent briefings. For example, the war room commander in Omaha would brief the president on his retaliatory options and their consequences, a briefing that is limited to 30 seconds. All of the large-scale responses comprising that briefing are designed for destroying Russian targets by the thousands, and the president would have only a few minutes to pick one if he wished to ensure its effective implementation. The order would then be sent immediately to the underground and undersea launch crews, whose own mindless firing drill would last only a few minutes (Blair 2003). These rapid response times don’t leave room for error. Cyber terrorists would not need deception that could stand up over time; they would only need to be believable for the first 15 minutes or so. The amount of firepower that could be unleashed in these 15 minutes, combined with the equally swift Russian response, would be equivalent to approximately 100,000 Hiroshima bombs (Blair 2008).

Cyberterrorists could directly activate nuclear weapons—triggers nuclear war

Fritz 09

(Jason, May 2009, International Commission on Nuclear Non-Proliferation and Disarmament, “Hacking Nuclear Command and Control,” Jason is a defense researcher, served as a cavalry officer in the US Army for 6 years, masters in IR @ Bond University, icnnd.org/documents/jason_fritz_hacking_nc2.doc, 7/15/15, SM)

Direct control of launch The US uses the two-man rule to achieve a higher level of security in nuclear affairs. Under this rule two authorized personnel must be present and in agreement during critical stages of nuclear command and control. The President must jointly issue a launch order with the Secretary of Defense; Minuteman missile operators must agree that the launch order is valid; and on a submarine, both the commanding officer and executive officer must agree that the order to launch is valid. In the US, in order to execute a nuclear launch, an Emergency Action Message (EAM) is needed. This is a preformatted message that directs nuclear forces to execute a specific attack. The contents of an EAM change daily and consist of a complex code read by a human voice. Regular monitoring by shortwave listeners and videos posted to YouTube provide insight into how these work. These are issued from the NMCC, or in the event of destruction, from the designated hierarchy of command and control centres. Once a command centre has confirmed the EAM, using the two-man rule, the Permissive Action Link (PAL) codes are entered to arm the weapons and the message is sent out. These messages are sent in digital format via the secure Automatic Digital Network and then relayed to aircraft via single-sideband radio transmitters of the High Frequency Global Communications System, and, at least in the past, sent to nuclear capable submarines via Very Low Frequency (Greenemeier 2008, Hardisty 1985). The technical details of VLF submarine communication methods can be

found online, including PC-based VLF reception. Some reports have noted a Pentagon review, which showed a potential “electronic back door into the US Navy’s system for broadcasting nuclear launch orders to Trident submarines” (Peterson 2004). The investigation showed that cyber terrorists could potentially infiltrate this network and insert false orders for launch. The investigation led to “elaborate new instructions for validating launch orders” (Blair 2003). Adding further to the concern of cyber terrorists seizing control over submarine launched nuclear missiles; The Royal Navy announced in 2008 that it would be installing a Microsoft Windows operating system on its nuclear submarines (Page 2008). The choice of operating system, apparently based on Windows XP, is not as alarming as the advertising of such a system is. This may attract hackers and narrow the necessary reconnaissance to learning its details and potential exploits. It is unlikely that the operating system would play a direct role in the signal to launch, although this is far from certain. Knowledge of the operating system may lead to the insertion of malicious code, which could be used to gain accelerating privileges, tracking, valuable information, and deception that could subsequently be used to initiate a launch. Remember from Chapter 2 that the UK’s nuclear submarines have the authority to launch if they believe the central command has been destroyed. ∂ Attempts by cyber terrorists to create the illusion of a decapitating strike could also be used to engage fail-deadly systems. Open source knowledge is scarce as to whether Russia continues to operate such a system. However evidence suggests that they have in the past. Perimetr, also known as Dead Hand, was an automated system set to launch a mass scale nuclear attack in the event of a decapitation strike against Soviet leadership and military. ∂ In a crisis, military officials would send a coded message to the bunkers, switching on the dead hand. If nearby ground-level sensors detected a nuclear attack on Moscow, and if a break was detected in communications links with top military commanders, the system would send low-frequency signals over underground antennas to special rockets. Flying high over missile fields and other military sites, these rockets in turn would broadcast attack orders to missiles, bombers and, via radio relays, submarines at sea. Contrary to some Western beliefs, Dr. Blair says, many of Russia’s nuclear-armed missiles in underground silos and on mobile launchers can be fired automatically. (Broad 1993)∂ Assuming such a system is still active, cyber terrorists would need to create a crisis situation in order to activate Perimetr, and then fool it into believing a decapitating strike had taken place. While this is not an easy task, the information age makes it easier. Cyber reconnaissance could help locate the machine and learn its inner workings. This could be done by targeting the computers high of level official’s—anyone who has reportedly worked on such a project, or individuals involved in military operations at underground facilities, such as those reported to be located at Yamantau and Kosvinsky mountains in the central southern Urals (Rosenbaum 2007, Blair 2008)

Cyberterrorists could unleash a nonnuclear missile to fool detection systems and trigger a nuclear war—Black Brant proves

Fritz 09

(Jason, May 2009, International Commission on Nuclear Non-Proliferation and Disarmament, “Hacking Nuclear Command and Control,” Jason is a defense researcher, served as a cavalry officer in the US Army for 6 years, masters in IR @ Bond University, icnnd.org/documents/jason_fritz_hacking_nc2.doc, 7/15/15, SM)

Indirect Control of Launch

ð Cyber terrorists could cause incorrect information to be transmitted, received, or displayed at nuclear command and control centres, or shut down these centres' computer networks completely. In 1995, a Norwegian scientific sounding rocket was mistaken by Russian early warning systems as a nuclear missile launched from a US submarine. A radar operator used Krokus to notify a general on duty who decided to alert the highest levels. Kavkaz was implemented, all three chegets activated, and the countdown for a nuclear decision began. It took eight minutes before the missile was properly identified—a considerable amount of time considering the speed with which a nuclear response must be decided upon (Aftergood 2000). ð Creating a false signal in these early warning systems would be relatively easy using computer network operations. The real difficulty would be gaining access to these systems as they are most likely on a closed network. However, if they are transmitting wirelessly, that may provide an entry point, and information gained through the internet may reveal the details, such as passwords and software, for gaining entrance to the closed network. If access was obtained, a false alarm could be followed by something like a DDoS attack, so the operators believe an attack may be imminent, yet they can no longer verify it. This could add pressure to the decision making process, and if coordinated precisely, could appear as a first round EMP burst. Terrorist groups could also attempt to launch a non-nuclear missile, such as the one used by Norway, in an attempt to fool the system. The number of states who possess such technology is far greater than the number of states who possess nuclear weapons. Obtaining them would be considerably easier, especially when enhancing operations through computer network operations. Combining traditional terrorist methods with cyber techniques opens opportunities neither could accomplish on their own. For example, radar stations might be more vulnerable to a computer attack, while satellites are more vulnerable to jamming from a laser beam, thus together they deny dual phenomenology. Mapping communications networks through cyber reconnaissance may expose weaknesses, and automated scanning devices created by more experienced hackers can be readily found on the internet. ð Intercepting or spoofing communications is a highly complex science. These systems are designed to protect against the world's most powerful and well funded militaries. Yet, there are recurring gaffes, and the very nature of asymmetric warfare is to bypass complexities by finding simple loopholes. For example, commercially available software for voice-morphing could be used to capture voice commands within the command and control structure, cut these sound bytes into phonemes, and splice it back together in order to issue false voice commands (Andersen 2001, Chapter 16). Spoofing could also be used to escalate a volatile situation in the hopes of starting a nuclear war. "In June 1998, a group of international hackers calling themselves Milw0rm hacked the web site of India's Bhabha Atomic Research Center (BARC) and put up a spoofed web page showing a mushroom cloud and the text "If a nuclear war does start, you will be the first to scream" (Denning 1999). Hacker web-page defacements like these are often derided by critics of cyber terrorism as simply being a nuisance which causes no significant harm. However, web-page defacements are becoming more common, and they point towards alarming possibilities in subversion. During the 2007 cyber attacks against Estonia, a counterfeit letter of apology from Prime Minister Andrus Ansip was planted on his political party website (Grant 2007). This took place amid the confusion of mass DDoS attacks, real world protests, and accusations between governments. ð The 2008 terrorist attacks in Mumbai illustrate several points. First, terrorists are using computer technology to enhance their capabilities. To navigate to Mumbai by sea and

to aid in reconnaissance of targets, they used the Global Positioning System (GPS) satellite system and Google Earth (Bedi 2008, Kahn and Worth 2008). They also used mobile phone SIM cards, purchased in foreign countries, VoIP phone calls, and online money transfers (Part of 26/11 plot hatched on our soil, admits Pakistan 2009). Falsified identification and stolen credit cards may have also been aided by online capabilities. Second, a false claim of responsibility was issued through an e-mail to media outlets. Initial tracking of the IP address showed the e-mail to have been sent from a computer in Russia. It was later revealed that the e-mail was sent from Pakistan and routed through Russia (Shashthi 2008). Voice-recognition software was used to allow "dictated text to be typed in the Devnagari font" (Swami 2008). Lastly, the Mumbai attacks showed an increasing reliance on information technology by the intended victims of terrorism. This included Twitter messages, Flickr photos, a map of attack locations on Google Maps, and live text and video coverage of the attacks (Beaumont 2008). Terrorists could insert disinformation into these systems in order to enhance destruction, evade capture, or increase hostility between groups. Terrorist could even clandestinely enlist the aid of their enemy to enhance destruction. For example, at the height of a terror attack they could claim to have exclusive video footage of the attack, which requires a codec to be downloaded in order to be viewed. This codec could contain a Trojan which uses the now infected computer to silently launch DDoS attacks against their desired targets, such as communications networks. Building an infidel botnet prior to an attack could take on a wide range of symbolism, from a pdf file about anti-terrorism to an unreleased Hollywood film.

Cyber Terror- Econ/Grid

Cyberterrorism targets vulnerable power grids and has large economic impacts

NBC 13

(2/19/13, NBC, "Successful hacker attack could cripple U.S. infrastructure, experts say," http://usnews.nbcnews.com/_news/2013/02/19/17019005-successful-hacker-attack-could-cripple-us-infrastructure-experts-say?lite, 7/14/15, SM)

Kevin Mandia, the founder and chief executive of Mandiant, discusses cyber-attacks on US companies and organizations. A report tying the Chinese military to computer attacks against American interests has sent a chill through cyber-security experts, who worry that the very lifelines of the United States — its energy pipelines, its water supply, its banks — are increasingly at risk. The experts say that a successful hacker attack taking out just a part of the nation's electrical grid, or crippling financial institutions for several days, could sow panic or even lead to loss of life. "I call it cyberterrorism that makes 9/11 pale in comparison," Rep. Mike Rogers, a Michigan Republican and chair of the House Intelligence Committee, told NBC News on Tuesday. An American computer security company, Mandiant, reported with near certainty that members of a sophisticated Chinese hacking group work out of the headquarters of a unit of the Chinese army outside Shanghai. The report was first detailed in The New York Times, which said that the hacking group's focus was increasingly on companies that work with American infrastructure, including the power grid, gas lines and waterworks. The Chinese embassy in Washington told The Times that its government does not engage in computer hacking. As reported, the Chinese attacks constitute a sort of asymmetrical cyberwarfare, analysts said, because they bring the force of the Chinese government and military against private companies. "To us that's crossing a line into a class of victim that's not prepared to withstand that type of attack," Grady Summers, a Mandiant vice president, said on the MSNBC program "Andrea Mitchell Reports." The report comes as government officials and outside security experts alike are sounding ever-louder alarms about the vulnerability of the systems that make everyday life in the United States possible. A new report confirmed by U.S. intelligence officials has pinpointed a building in Shanghai where those working for the Chinese military launched cyberattacks against 141 US companies spanning 20 industries. NBC's Andrea Mitchell reports. Outgoing Defense Secretary Leon Panetta warned in October that the United States was facing a threat that amounted to "cyber Pearl Harbor" and raised the specter of intentionally derailed trains, contaminated water and widespread blackouts. "This is a pre-9/11 moment," Panetta told business executives in New York. "The attackers are plotting." RELATED: Report: Chinese army tied to widespread U.S. hacking The Times report described an attack on Telvent, a company that keeps blueprints on more than half the oil and gas pipelines in North and South America and has access to their systems. A Canadian arm of the company told customers last fall that hackers had broken in, but it immediately cut off the access so that the hackers could not take control of the pipelines themselves, The Times reported. Dale Peterson, founder and CEO of Digital Bond, a security company that specializes in infrastructure, told NBC News that these attacks, known as vendor remote access, are particularly worrisome. "If you are a bad guy and you want to attack a lot of different control systems, you want to be

able to take out a lot," he said. "The dirty little secret in these control systems is once you get through the perimeter, they have no security at all. They don't even have a four-digit pin like your ATM card."ð Carlos Barria / Reutersð Locals walks in front of 'Unit 61398', a secretive Chinese military unit, in the outskirts of Shanghai. The unit is believed to be behind a series of hacking attacks, a U.S. computer security company said.ð The 34-minute blackout at the Super Bowl earlier this month highlighted weak spots in the nation's power system. A National Research Council report declassified by the government last fall warned that a coordinated strike on the grid could devastate the country.ð That report considered blackouts lasting weeks or even months across large parts of the country, and suggested they could lead to public fear, social turmoil and a body blow to the economy.ð Vital systems do not have to be taken down for very long or across a particularly widespread area, the experts noted, to cause social disorder and to spread fear and anxiety among the population.ð Last fall, after Hurricane Sandy battered the Northeast, it took barely two days for reports of gasoline shortages to cause hours-long lines at the pumps and violent fights among drivers.ð Peterson described being in Phoenix, Ariz., during a three-day gas pipeline disruption "when people were waiting in line six hours and not going to work. You can imagine someone does these things maliciously, with a little more smarts, something that takes three months to replace."ð Similarly, hacking attacks last fall against major American banks — believed by some security experts and government officials to be the work of Iran — amounted to mostly limited frustration for customers, but foreshadowed much bigger trouble if future attacks are more sophisticated.ð What worries Dmitri Alperovitch, co-founder of the computer security company CrowdStrike, is a coordinated attack against banks that modifies, rather than destroys, financial data, making it impossible to reconcile transactions.ð "You could wreak absolute havoc on the world's financial system for years," he said. "It would be impossible to roll that back."

A cyberattack on our electrical grid will have devastating impacts—blackouts, starvation, EMP nuclear threat

Landsbaum 14

(Mark, 9/5/2014, OC Register, "Mark Landsbaum: Attack on power grid could bring dark days," <http://www.ocregister.com/articles/emp-633883-power-attack.html>, 7/15/15, SM)

It could be worse. Terrorists pose an "imminent" threat to the U.S. electrical grid, which could leave the good ol' USA looking like 19th century USA for a lot longer than three days.ð Don't take my word for it. Ask Peter Pry, former CIA officer and one-time House Armed Services Committee staffer, who served on a congressional commission investigating such eventualities.ð "There is an imminent threat from ISIS to the national electric grid and not just to a single U.S. city," Pry warns. He points to a leaked U.S. Federal Energy Regulatory Commission report in March that said a coordinated terrorist attack on just nine of the nation's 55,000 electrical power substations could cause coast-to-coast blackouts for up to 18 months.ð Consider what you'll have to worry about then. If you were uncomfortable watching looting and riots on TV last month in Ferguson, Mo., as police stood by, project such unseemly behavior nationwide. For 18 months.ð It's likely phones won't be reliable, so you won't have to watch police stand idly by. Chances are, police won't show up. Worse, your odds of needing them will be excruciatingly more likely if terrorists attack the power grid using an electromagnetic pulse (EMP) burst of

energy to knock out electronic devices.ð “The Congressional EMP Commission, on which I served, did an extensive study of this,” Pry says. “We discovered to our own revulsion that critical systems in this country are distressingly unprotected. We calculated that, based on current realities, in the first year after a full-scale EMP event, we could expect about two-thirds of the national population – 200 million Americans – to perish from starvation and disease, as well as anarchy in the streets.”ð Skeptical? Consider who is capable of engineering such measures before dismissing the likelihood.ð In his 2013 book, “A Nation Forsaken,” Michael Maloof reported that the 2008 EMP Commission considered whether a hostile nation or terrorist group could attack with a high-altitude EMP weapon and determined, “any number of adversaries possess both the ballistic missiles and nuclear weapons capabilities,” and could attack within 15 years.ð That was six years ago. “North Korea, Pakistan, India, China and Russia are all in the position to launch an EMP attack against the United States now,” Maloof wrote last year.ð Maybe you’ll rest more comfortably knowing the House intelligence authorization bill passed in May told the intelligence community to report to Congress within six months, “on the threat posed by man-made electromagnetic pulse weapons to United States interests through 2025, including threats from foreign countries and foreign nonstate actors.”ð Or, maybe that’s not so comforting. In 2004 and again in 2008, separate congressional commissions gave detailed, horrific reports on such threats. Now, Congress wants another report.ð In his book, Maloof quotes Clay Wilson of the Congressional Research Service, who said, “Several nations, including reported sponsors of terrorism, may currently have a capability to use EMP as a weapon for cyberwarfare or cyberterrorism to disrupt communications and other parts of the U.S. critical infrastructure.”ð What would an EMP attack look like? “Within an instant,” Maloof writes, “we will have no idea what’s happening all around us, because we will have no news. There will be no radio, no TV, no cell signal. No newspaper delivered.ð “Products won’t flow into the nearby Wal-Mart. The big trucks will be stuck on the interstates. Gas stations won’t be able to pump the fuel they do have. Some police officers and firefighters will show up for work, but most will stay home to protect their own families. Power lines will get knocked down in windstorms, but nobody will care. They’ll all be fried anyway. Crops will wither in the fields until scavenged – since the big picking machines will all be idled, and there will be no way to get the crop to market anyway.ð “Nothing that’s been invented in the last 50 years – based on computer chips, microelectronics or digital technology – will work. And it will get worse.”

A cyberattack would destroy our critical infrastructure which is key to national security, the economy, and public health

Chance 12

(Michael, 6/1/12, Forensic Focus, “The Role of Cyber Terrorism in the Future,” <http://articles.forensicfocus.com/2012/06/01/the-role-of-cyber-terrorism-in-the-future/>, 7/15/15, SM)

INTRODUCTIONð To understand cyberterrorism, one must first be familiar with terrorism. According to the Code of Federal Regulations terrorism is “the unlawful use of force and violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives.” (Code of Federal Regulations Title 28 Section 0.85 Set. (2007). Government Inst.) This concept is fairly

easy to grasp and most American's have an understanding of what terrorism is. But when talking about cyberterrorism there seems to be some confusion as to its components. In February of 2002 Executive Assistant Director of the FBI Dale Watson gave testimony before congress stating that "cyberterrorism—meaning the use of cyber tools to shut down critical national infrastructures (such as energy, transportation, or government operations) for the purpose of coercing or intimidating a government or civilian population—is clearly an emerging threat." (<http://www.fbi.gov/congress/congress02/watson020602.htm>) While still a form of terrorism it is a different approach than conventional terrorism. Dorothy Denning, a well-known information security researcher, provides a more comprehensive definition: "Cyberterrorism is the convergence of terrorism and cyberspace. It is generally understood to mean unlawful attacks and threats of attack against computers, networks, and the information stored therein when done to intimidate or coerce a government or its people in furtherance of political or social objectives. Further, to qualify as cyberterrorism, an attack should result in violence against persons or property, or at least cause enough harm to generate fear. Attacks that lead to death or bodily injury, explosions, plane crashes, water contamination, or severe economic loss would be examples. Serious attacks against critical infrastructures could be acts of cyberterrorism, depending on their impact. Attacks that disrupt nonessential services or that are mainly a costly nuisance would not." (<http://www.cs.georgetown.edu/~denning/infosec/cyberterror.html>)

Richard Clarke, a counterterrorism expert and special advisor to President Bush on cyberspace security, described our vulnerability to a cyber terrorist attack as a digital Pearl Harbor. One where you would never see it coming and would have devastating effects. We can no longer turn a blind eye to these possibilities. In moving forward "it is imperative to imagine the ways terrorists could disrupt the nation's information infrastructure and the computer networks that control telecommunications, the electric grid, water supplies and air traffic."

METHODOLOGY

This research was conducted using open source documents that are open to the public. All documents are unclassified and openly available for viewing. References used for the analysis of the topic were found via the Internet. Examples of works cited are unclassified government documents found on government websites using search terms related to the topic. Internationally distributed newspapers were also used to support the construction of the paper. Other valid and reliable sources used in collecting data were government websites for agencies such as the Federal Bureau of Investigations. Additional research was pursued utilizing college and university websites that posted studies of similar matters. Furthermore, books written by experts were examined and relevant information was extracted to reinforce the views within this text.

In reviewing the literature it was important to disseminate that which was reputable and worthy of noting. Information that was not corroborated or from a source that was not credible was examined and excluded from use based on its merit. Data from respectable scholars and universities were studied and surveyed. Ideas were compared and contrasted and then used to support my thesis. Inquiries into this particular field produced numerous results. A logical analysis of the material was conducted and presented in this paper.

REVIEW OF THE LITERATURE

Critical Infrastructure

Critical infrastructure is defined by the USA Patriot Act as "systems and assets, whether physical or virtual, so vital to the United States that the incapacity or destruction of such systems and assets would have a debilitating impact on security, national economic security, national public health

or safety, or any combination of those matters.” (United State, 2001) It can be said that this infrastructure represents the backbone of the United States. Minimizing our vulnerabilities to terrorist threats is a shared responsibility that falls on federal, state, and local government as well as private industry. According to the National Strategy for the Physical Protection of Critical Infrastructure and Key Assets, we must commit to “secure(ing) the infrastructure and assets vital to our national security, governance, public health and safety, economy, and public confidence.” (United States, 2003. Pg vii). This network is made up of the institutions that our country relies on to function as a society. It is comprised of “agriculture, food, water, public health, emergency services, government, defense industrial base, information and telecommunications, energy, transportation, banking and finance, chemical industry and hazardous material, and postal and shipping.” (United States, 2003. Pg 6). These represent the staples of our nation and its economy. Even though they are separate entities that are self-governing they are interdependent upon one another. The relationship is complex and the disruption of one could adversely affect the other. Each sector plays a key role in our daily lives providing services that are invaluable. This infrastructure is so essential that in 1996 President Clinton devised Executive Order 13010, Critical Infrastructure Protection, which addresses “threats of electronic, radio-frequency, or computer-based attacks on the information or communications components that control critical infrastructures (“cyber threats”)

(<http://www.fas.org/irp/offdocs/eo13010.htm>)

The components of agriculture and food and water represent the most basic needs of the people of the United States. All citizens require a reliable food supply and clean drinking water. Without these necessities people would go hungry or even starve. Even something as simple as washing your hands or brushing your teeth would be impossible. Any threat to these sectors could spread panic or fear amongst the people.

AT No Cyberattack

Yes cyberattack—threat is higher than conventional terrorism because of vulnerable critical infrastructure

Hua 13

(Jian, June 13, *The Journal of Strategic Information Systems*, "The economic impact of cyber terrorism," Hua is an associate professor in the Department of Marketing, legal Studies, and Information Systems @ the School of Business and Public Administration, the University of the District of Columbia,

http://www.researchgate.net/profile/Jian_Hua3/publication/261860155_The_economic_impact_of_cyber_terrorism/links/5435603c0cf2bf1f1f29f2e0.pdf, 7/14/15, SM)

Modern economies are heavily dependent upon Information Technology (IT) based information systems for survival. Increased reliance on information systems (ISs) leads to increased vulnerabilities and risks. IS security has thus become a critical issue in the IT world (Sonnenreich et al., 2006). Investing optimally in the security of information systems can yield comparative strategic advantages (LeVeque, 2006) through trustworthiness and positive image as perceived by partners, customers and suppliers; trust is difficult for competitors to duplicate. Investing optimally implies avoiding inappropriate investment. Information systems are vulnerable and it is possible for terrorists to utilize the vulnerabilities of information systems to attack their adversaries (Jormakka and Molsa, 2005; Embar-Seddon, 2002). This has given rise to a new term, cyber terrorism. Parks and Duggan (2001) have defined cyber terrorism as an extension of traditional terrorism and a new approach adopted by terrorists to attack cyberspace. The FBI director, Robert S. Mueller, has warned that cyber terrorists will either train their own recruits or hire outsiders, with an eye toward combining physical attacks with cyber attacks. Mueller also stressed that the cyber threat cannot be fought by government alone (Nakashima, 2010). Organizations that comprise the critical infrastructure of the national economy should be aware of the potential for terrorist attack (Nickolov, 2005). Critical infrastructure refers to the essential assets which make society or a country function well and includes energy, transportation, telecommunication, water supply and waste management, agriculture and food supply, finance, public health, and essential government services. Organizations which form the critical infrastructure of a national economy must protect their information systems well. Cyber terrorists could feasibly target the information systems of critical infrastructure of countries. The threat of cyber terrorism is more dangerous than that of common IS attacks (Verton, 2003) and is becoming a major concern for most countries (Foltz, 2004). Cyber terrorists inherit not only the characteristics of terrorists, but also the characteristics of hackers. The only way to differentiate cyber terrorism from traditional hacking and other cyber crime is by ascertaining the motivation or intention of the person or group launching the attack (Embar-Seddon, 2002).

Bioterrorism

Bioterror Causes Extinction

Bioweapons are easily accessible by terrorists and lead to mass deaths

Wilson 13

(Grant, 1/17/13, University of Virginia School of Law, "MINIMIZING GLOBAL CATASTROPHIC AND EXISTENTIAL RISKS FROM EMERGING TECHNOLOGIES THROUGH INTERNATIONAL LAW," professor @ University of Virginia School of Law, <http://lib.law.virginia.edu/lawjournals/sites/lawjournals/files/3.%20Wilson%20-%20Emerging%20Technologies.pdf>, 7/15/15, SM)

ii. Risk of bioterrorism—The threat of the malicious release of bioengineered organisms (i.e., bioterrorism) poses a GCR/ER.75 Bioengineering enables a malicious actor to create an organism that is more deadly to humans, animals, or plants than anything that exists in the natural world.76 Experts contend that the barriers for a terrorist to order a DNA sequence for a highly pathogenic virus online or acquire a DNA synthesis machine online are "surmountable."77 Alternatively, bioterrorists could break into laboratories housing dangerous bioengineered organisms—like the H5N1 virus, for example—and release them. Meanwhile, third world countries with laxer standards and lower laboratory accountability are rapidly discovering and using bioengineering, which may give bioterrorists an easier pathway to obtain deadly bioengineered organisms.78 There have already been several occasions in which groups attempted to use or successfully used biological weapons. One unsophisticated example of bioterrorism occurred when an individual contaminated salads and dressing with salmonella in what apparently was an attempt to decide a local election.79 Another example occurred in 2001, when bioterrorists sent envelopes containing anthrax spores through the mail, infecting twenty-two people and killing five of them.80 While these particular acts of bioterrorism did not cause widespread death, deploying extremely deadly bioengineered organisms over a large area is a real possibility: tests by the United States in 1964 demonstrated that a single aircraft can contaminate five thousand square kilometers of land with a deadly bacterial aerosol.81 The recent engineering of an airborne H5N1 virus demonstrates society's concern over risks of bioterrorism arising from bioengineering. Before scientists could publish their results of their bioengineered airborne H5N1 virus in the widely read journals *Nature* and *Science*, the NSABB determined that the danger of releasing the sensitive information outweighed the benefits to society, advising that the findings not be published in their entirety.82 The main risk is that either a state or non-state actor could synthesize a "weaponized" version of the H5N1 virus to create a disastrous pandemic.83 There is precedent of outside groups recreating advanced bioengineering experiments, such as when many scientists immediately synthesized hepatitis C replicons upon publication of its genetic code.84 However, the NSABB's recommendation was nonbinding, and there is nothing to stop other scientists from releasing similar data in the future. Furthermore, while the NSABB merely asserts that the "blueprints" of the virus should not be printed, other biosecurity experts argue that the virus should never have been created in the first place because of risks that the viruses would escape or be stolen.85

Yes Bioterror

Terrorists using bioweapons can achieve the same mortality rates as with WMD—bioweapons are cheaper, more effective

SIU School of Medicine 14

(12/15/14, SIU School of Medicine, "Overview of Potential Agents of Biological Terrorism," <http://www.siumed.edu/medicine/id/bioterrorism.htm#threat>, 7/15/15, SM)

Biological weapons are very attractive to the terrorist because of several characteristics. Aerosols of biological agents are invisible, silent, odorless, tasteless, and are relatively easily dispersed. They are 600 - 2000 times cheaper than other weapons of mass destruction. It is estimated that the cost would be about 0.05% the cost of a conventional weapon to produce similar numbers of mass casualties per square kilometer. The production is relatively easy, using the common technology available for the production of some antibiotics, vaccines, foods, and beverages. The delivery systems such as spray devices from an airplane, boat or car are commonly available. The natural lead time provided by the organism's incubation period (3 to 7 days for most potential organisms) would allow for the terrorists' escape before any investigation starts. In addition, the use of an endemic infectious agent may cause confusion because of the inability to differentiate a biological warfare attack from a natural epidemic. For some agents potential exists for secondary or tertiary transmission by person-to-person transmission or natural vectors. The consequences of biological weapons use are many. They can rapidly produce mass effect that overwhelms services and the health care system of the communities. Most of the civilian population is susceptible to infections caused by these agents. They are associated with high morbidity and mortality rates. The resulting illness is usually difficult to diagnose and treat early, particularly in areas where the disease is rarely seen. One kilogram of anthrax powder has the capability to kill up to 100,000 people depending on the mechanism of delivery (33). The economic impact of a biological attack has been estimated to be from 478 million/100,000 persons exposed (brucellosis scenario) to 26.2 billion/100,000 persons exposed (anthrax scenario) (34). "Top Types of Bioterrorism Attacks" A bioterrorist attack may occur in 2 scenarios - overt and covert. In the past emergency responses were prepared based on overt attacks like bombings and chemical agents that cause immediate and obvious effects. However, attacks with biological agents are more likely to be covert. They pose different challenges and require emergency planning with the involvement of the public health infrastructure. The attack by a biological agent will not have an immediate impact because of the delay between exposure and onset of illness (i.e., the incubation period). Therefore, the first victims of a bioterrorism action will need to be identified by physicians or other primary health care providers. Based on the first wave of victims, public health officials will need to determine that an attack has occurred, identify the organism and prevent more casualties through prevention strategies (e.g. mass vaccination, prophylactic treatment) and infection control procedures (35). The clues to a potential bioterrorist attack include an outbreak of a rare or new disease, an outbreak of diseases in a non-endemic area, a seasonal disease during an off season time, a known pathogen with unusual resistance or unusual epidemiologic features, an unusual clinical presentation or age distribution, a genetically identical pathogen emerging rapidly in different geographical areas (36).

A bioterror attack would have catastrophic consequences—loss of \$1 trillion, mass deaths

Inglesby 14

(Tom, 2/11/14, UPMC Center for Health Security of the University of Pittsburgh medical Center, "Bioterrorism: Assessing the Threat," Tom is a director and CEO of the UPMC Center for Health Security and an Associate Professor of Medicine and Public Health at the University of Pittsburgh, <http://www.upmchealthsecurity.org/our-work/testimony/bioterrorism-assessing-the-threat>, 7/15/15, SM)

The Consequences of Biological Weaponsð The anthrax events of 2001 were shocking for the country. Letters carrying anthrax spores were sent to a number of people in different cities. Hospitals, doctors, and nurses at the time were largely unfamiliar with the disease. Elements of all three branches of government were each affected and closed at some point. Buildings had to be evacuated for prolonged periods. Cases appeared over weeks in different places. A number of people were sickened and killed. The source of the anthrax could not be identified. The communication about it from our own government was often uncertain and changing. The media coverage was constant. People were afraid of their own mail. Nothing like this had happened before in our country or any country.ð A great deal has been done to improve our ability to recognize and respond to biological weapons events since that time. I will say more about that below. But it is important for this committee to know that a future biological weapons attack on the US could look quite different from the 2001 anthrax incident - in terms of size of attack, form, and the numbers affected.ð The anthrax letters of 2001 came with a warning in them, which allowed some people to begin taking protective antibiotics and initiate evacuation. Future events are unlikely to come with warnings like that. It is more likely that the first sign of a bioterror attack will be sick people appearing in clinics and emergency rooms. And while the anthrax letters of 2001 came through the mail, future bioterrorism attacks could come in many different kinds of form. There are many means of creating aerosols. And there are clearly other means of using biological weapons against the public.ð We also need to understand that the scope of future bioweapons events could be far, far greater than what we saw in 2001. In 2009, the US National Security Council said: "The effective dissemination of a lethal biological agent within an unprotected population could place at risk the lives of hundreds of thousands of people. The unmitigated consequences of such an event could overwhelm our public health capabilities, potentially causing an untold number of deaths. The economic cost could exceed \$1 trillion for each such incident." The use of such weapons could lead to substantial loss of life and great societal disruption. Even with a small or modest-sized attack, the social and economic impact would be significant.

Agro-Terrorism

Surveillance K2 Stop Agro-Terror

Surveillance is uniquely key to discovering plots of agro terrorism and determining the most effective way to stop them.

Eli Rohn and Gil Erez, 4/12, "Fighting Agro-Terrorism in Cyberspace: A Framework for Intention Detection Using Overt Electronic Data Sources",
<http://www.iscramlive.org/ISCRAM2012/proceedings/261.pdf>

The Counter Agro Terrorism Research Center defines Agro Terrorism as "a hostile attack, towards an agricultural environment, including infrastructures and processes, in order to significantly damage national and international political interests" (CATRC 2010). It can be achieved by introducing small quantities of lethal components to every day agricultural inputs, such as water, fertilizers, seeds, sprouts, chicken or livestock feed. It is also possible to easily transmit disease agents from one sick animal to an entire flock or herd, using simple means such as rags. However, while the technicalities are quite simple, they require intention, knowledge and guidance. The last two can be easily provided anonymously, while the first one requires motivation, which can be initiated and enhanced by ideology and indoctrination, both deliverable electronically. Agro-terrorism related risks can be reduced by either means of prevention (intelligence gathering using data mining and chatter mining, for example) or means to respond to such an attack by early detection of exotic/foreign pathogenic agents, early prediction of disease dispersion patterns, implementation of biosecurity measures, and the development of future methodologies and techniques related to food defense and post-event response. Using open sources as for collecting intentions related data has a number of benefits. Obtaining the information is relatively inexpensive to obtain; it makes up the greatest volume of information accessible to collectors of such data. The activity of collecting materials from open sources is legal thus freeing collectors from risks of prosecution for espionage. Frequently, it is possible to derive sensitive information by aggregating and comparing data concerning a particular activity, individual, one or more groups or facilities. This paper concerns itself with the first means of prevention mentioned here – intentions evaluation by intelligence gathering from overt WWW sources using various techniques, such as data mining or chatter mining, analysis of the data, production of filtered memes and their dissemination to various clientele. Information seeking behavior has eight features in common, brought here with adaptation to agro- Rohn & Erez Intention Detection Using Overt Electronic Data Sources Proceedings of the 9th International ISCRAM Conference – Vancouver, Canada, April 2012 L. Rothkrantz, J. Ristvej and Z. Franco, eds. 2 terrorism: Starting activities such as the initial search for an overview of the overt resources landscape or locating key suspects in electronic communities; Chaining – following clues and links in known overt resources; Scanning primary and secondary resources; Differentiating among resources using filtering strategy; Extracting selectively from the resources filtered; Verifying the information; Monitoring the resources for relevant changes; Ending the information retrieval process (Ellis and Haugan 1997). Similarly, the United States intelligence community uses a five-step process to obtain, produce, and make deliverables available to users. The steps are: Planning and Direction, Data Acquisition, Processing and Production, and Dissemination (Federation of American Scientists 1996). The paper's sections follow the cycle described hitherto and provide an overview of the literature pertinent to each phase. PLANNING AND DIRECTION Planning and direction are done at the strategic level and the

tactical level. Strategically, intention detection efforts need to sustain or extend the organization's strategy and governance requirements whilst being transparent about benefits, costs and risks. This requires input from and coordination with key stake holders. Identification of stakeholders is by itself not a trivial task; several proven methods exist (Elias, Cavana et al. 2002; Freeman, Harrison et al. 2010). This phase also requires incorporating technologists and business management in the translation of intelligence requirements into service offerings, and the development of strategies at the tactical level to deliver these services in an effective manner. In this step specific collection capabilities are tasked, based on the type of information required, the susceptibility of the targeted activity to various types of collection activity, and the availability of collection assets. The tactical level of the planning and direction phase requires harnessing proven project management methodologies. A leading professional resource is the Project Management Book of Knowledge, also known as PMBOK (Indelicato 2009; Sanchez-Arias and Solarte-Pazos 2010). Further, intention detection efforts at the planning stage should be targeted at specific areas of agro-terror. Inflicting damage through the contamination of fertilizers, for example, requires different skills and opportunities compared to inflicting damages through sewage redirection, which is entirely different from spreading viruses that can infect large herds of livestock. Deciding on which area to focus the intention detection efforts should be based on sophisticated risk analysis techniques, offered by several researchers (Parnell, Smith et al. 2010; Fellman, Parnel et al. 2011; Merrick and Parnell 2011). The risk analysis should be reviewed periodically and revised according to changing threat. To this mix, one should add "fashion traits" among terrorists. Blowing up buildings was fashionable in the 1980's and 1990's (US Embassy bombing in Tblisi, Georgia; Khobar Towers military complex bombing; simultaneous bombing of US embassies in Nairobi, Kenya, and Dar es Salaam, Tanzania, etc.) Beheading became trendy in the beginning of the 21st century. Suffice to mention Daniel Pearl, Paul Johnson and Nick Burg as examples. The antibiotics-resistant salmonella found in Europe during the summer of 2011(The Independent 2011) along with analysis of current affairs by CATRC suggests that the next trend in Agro-Terrorism might as well be the disruption of a central hub in the food chain by agro-terror means rather than brute force.

COLLECTION The second step, collection, includes both the acquisition of information and its provisioning to organizational units that perform the processing and production. The collection process encompasses the management of various activities, including developing collection strategies that aim at optimized utilization of accessible intelligence resources. Requirements for collection of intelligence are developed to meet the needs of potential consumers. Collection activities are given specific tasks to collect information based on identified intelligence requirements. Collection operations depend on secure, rapid and reliable communications to allow for data exchange and to provide opportunities for cross-cueing of assets and tip-off exchanges between assets. Once collected, information is correlated and forwarded for processing and production. An example of a specific collection task is the ongoing monitoring of professional and scientific biomedical literature, with the aim of finding candidate viruses as potential agro-terrorism weapons. Such a surveillance mechanism serves for early warning which one can consider a preventive means. Geissler enumerated 13 traits a virus should have in order to be used as a potential weapon (Geissler 1986; Geissler and van Courtland Moon 1999). He then identified 21 viruses that meet these criteria. Hu et. al. proposed an "automated, semantic-based data mining system to identify viruses that can be

used as weapons in bio-terrorism" by mining biomedical literature (Hu, Yoo et al. 2005). A second example of a specific collection task is finding, in social networks, overlapping communities with interest in such viruses. Using an "algorithm for finding overlapping Rohn & Erez Intention Detection Using Overt Electronic Data Sources Proceedings of the 9th International ISCRAM Conference – Vancouver, Canada, April 2012 L. Rothkrantz, J. Ristvej and Z. Franco, eds. 3 communities in social networks... can be helpful in discovering groups of actors that hide their communications, possibly for malicious reasons" (Baumes, Goldberg et al. 2005). A fast algorithm for the same purpose was proposed three years later (Gregory 2008)

Agro-Terror- Econ Impact

America's agriculture industry is vulnerable to an agro-terror attack—would cost billions and exacerbate terror

Dean Olson, 2/12, "Agroterrorism: Threats to America's Economy and Food Supply," FBI, <https://leb.fbi.gov/2012/february/agroterrorism-threats-to-americas-economy-and-food-supply>

The United States enjoys a safe, plentiful, and inexpensive food supply. Americans spend only 11 percent of their income on food compared with the global average of 20 to 30 percent.¹ The nation's agricultural abundance helps drive its economic prosperity. As many as 1 of 6 jobs are linked to agriculture, a trillion-dollar industry. Agriculture-related products comprise nearly 10 percent of all U.S. exports, amounting to nearly \$68 billion in 2006.² Terrorists consider America's agriculture and food production tempting targets. They have noticed that its food supply is among the most vulnerable and least protected of all potential targets of attack. When American and allied forces overran al Qaeda sanctuaries in the caves of eastern Afghanistan in 2002, among the thousands of documents they discovered were U.S. agricultural documents and al Qaeda training manuals targeting agriculture. A subset of bioterrorism, agroterrorism is defined as "the deliberate introduction of an animal or plant disease for the purpose of generating fear, causing economic losses, or undermining social stability."³ It represents a tactic to attack the economic stability of the United States. Killing livestock and plants or contaminating food can help terrorists cause economic crises in the agriculture and food industries. Secondary goals include social unrest and loss of confidence in government. Serious Concern Agroterrorism is not new. The Assyrians poisoned enemy wells with rye ergot during the 6th century B.C. During World War I, German agents in the United States infected horses and cattle in transit across the Atlantic to France. In 1994, in The Dalles, Oregon, a religious cult intentionally contaminated 10 restaurant salad bars with salmonella, sickening more than 750 people in an attempt to influence the outcome of a local election. Since 1912, 12 documented cases have involved the substate use of pathogenic agents to infect livestock or contaminate food.⁴ Dean Olsen with Quote The agroterrorism threat emanates from four categories of perpetrators. The foremost threat is posed by transnational groups, like al Qaeda—widely believed to present the most probable threat of inflicting economic harm on the United States. The second group is comprised of economic opportunists tempted to manipulate markets. They understand that a foot and mouth disease (FMD) outbreak, for example, would have a dramatic impact on markets. By introducing the virus, they could exploit the markets for personal economic gain. The third category includes domestic terrorists who may view the introduction of FMD as a blow against the federal government. As an outlier of this category, the unbalanced individual or disgruntled employee may perpetrate an attack for a variety of idiosyncratic or narcissistic motivations. Finally, militant animal rights or environmental activists pose a threat because they consider immoral the use of animals for food. Groups, such as the Animal Liberation Front and its sister organization, the Earth Liberation Front, could view an attack on the animal food industry a positive event.⁵ Threat Environment Because it lacks the drama and spectacle of more common terrorist violence, such as bombings and murders, agroterrorism has remained a secondary consideration, and no documented attacks in the homeland have occurred since 9/11. Several recent factors may have made agroterrorism a more attractive tactic. First, the threat environment has changed dramatically. America has had recent

successes against al Qaeda's leadership. These victories have forced the group to morph in both structure and tactics. The increasingly dangerous environment it now must operate in has prevented it from mounting catastrophic terrorist attacks on the scale of 9/11. Now, al Qaeda places its emphasis on smaller, independent attacks following a "death by a thousand cuts" strategy to exhaust, overwhelm, and distract U.S. Department of Homeland Security forces. The group seeks to flood America's already information overloaded intelligence systems with myriad threats and "background noise."⁶ Agroterrorism also may serve as a way to magnify the social upheaval caused by smaller, independent attacks, like bombings. Second, Usama Bin Ladin consistently had argued that attacking the U.S. economy represented the best way to destroy America's ability to project military power abroad. Underpinning this view is al Qaeda's historical narrative that jihad against the Soviets following the invasion of Afghanistan led not only to the defeat of the Red Army but, ultimately, to the demise of the U.S.S.R.⁷ As divorced from reality as this view seems, economic harm remains one of the pillars of al Qaeda's terror strategy against the United States. In a video broadcast before the 2004 U.S. presidential elections, Usama Bin Ladin bragged that his organization "...bled Russia for 10 years until it went bankrupt and was forced to withdraw in defeat.... We are continuing in the same policy to make America bleed profusely to the point of bankruptcy...." He boasted that the 9/11 attacks had cost al Qaeda \$500,000 while inflicting a staggering \$500 billion in economic losses to America.⁸ According to Bin Ladin, "every dollar of al Qaeda defeated a million dollars [of America]...besides the loss of a huge number of jobs." Open Quotes on Blue Bar The same factors that yield inexpensive and plentiful food by promoting maximum production efficiency also make American agricultural systems inherently vulnerable. Close Quotes on Blue Bar Analysts believe that al Qaeda's evolving tactics increasingly will "focus on targets that will yield the most economic damage."⁹ Terrorist leaders realize that America's strength stems largely from its economic vitality. They pursue an overarching strategy that all attacks should focus on weakening America's economic strength, especially through protracted guerilla warfare. In their view, as the United States loses its standing in the Middle East, groups, like al Qaeda, can gain ground and remove from power regimes they view as corrupt and illegitimate.¹⁰ Terrorists know that a successful agroterrorism incident threatens America's economic welfare and its standing as a leading exporter of agricultural products to the world. A significant disruption in agricultural exports caused by such an attack would have ripple effects in the United States' and global economies. This economic disruption would occur on three levels. The first involves direct losses due to containment measures, such as stop-movement orders (SMOs) or quarantines of suspected stock. Additional costs would arise from the culling and destruction of disease-ridden livestock.¹¹ Second, indirect multiplier effects, such as compensation to farmers for destruction of agricultural commodities and losses suffered by directly and indirectly related industries, would arise.¹² And, third, international costs would result from protective trade embargoes. Less measurable consequences would include the undermining of confidence in and support of government, creation of social panic, and threat to public health on the national and global levels. Given its ease of execution and low cost to high benefit ratio, agroterrorism fits the evolving strategy of al Qaeda that focuses on inexpensive but highly disruptive attacks in lieu of monumental ones. Agroterrorism could exacerbate the social upheaval caused by random bombings. The ability to employ cheap and unsophisticated means to undermine America's economic base, combined with the added payoff to potentially overwhelm its counterterrorism

resources, makes livestock- and food-related attacks increasingly attractive.¹³ Foot and Mouth Disease Attacks directed against the cattle, swine, or poultry industries or via the food chain pose the most serious danger for latent, ongoing effects and general socioeconomic and political disruption. Experts agree that FMD presents the most ominous threat.¹⁴ Eradicated in the United States in 1929, FMD remains endemic in South America, Africa, and Asia.¹⁵ An especially contagious virus 20 times more infectious than smallpox, FMD causes painful blisters on the tongues, hooves, and teats of cloven-hoofed animals, including cattle, hogs, sheep, goats, and deer, rendering them unable to walk, give milk, eat, or drink. Although people generally cannot contract the disease, they can carry the virus in their lungs for up to 48 hours and transmit it to animals. The animal-to-animal airborne transmission range is 50 miles.¹⁶ An infected animal can shed the virus in large quantities from its upper respiratory tract via drooling, coughing, and discharging mucus. Extremely stable, FMD can survive in straw or clothing for 1 month and spread up to 100 kilometers via the wind. Because herds exist as highly crowded populations bred and reared in extremely close proximity to one another, a significant risk exists that such pathogenic agents as FMD will spread well beyond the locus of a specific outbreak before health officials become aware of a problem. An FMD outbreak could spread to as many as 25 states in as little as 5 days simply through the regulated movement of animals from farm to market.¹⁷ Open Quotes on Blue Bar ...the food production and distribution chain offers a low-tech but effective mechanism for disseminating toxins and bacteria.... Close Quotes on Blue Bar From a tactical perspective, an FMD attack holds appeal for several reasons. First, unlike biological warfare directed against humans, no issue of weaponization exists. In an FMD attack, the animals themselves serve as the primary medium for pathogenic transmission, and countries as close as those in South America offer a ready source of the virus. As one analyst described it, the virus "can be spread by simply wiping the mucus from an infected animal on a handkerchief and then transferring the virus to healthy animals by wiping their noses...by stopping on a highway in rural America and releasing the virus among curious livestock an outbreak could be initiated."¹⁸ Second, FMD is nonzoonotic, presenting no risk of accidental human infection. There exists no need for elaborate personal protective equipment or an advanced understanding of animal disease science. In a biowarfare attack targeting people, the deadly pathogen poses a threat to the perpetrators, as well as their intended victims. Preparing the pathogen so that terrorists can handle it safely yet disseminate it effectively to intended victims can prove difficult. For instance, the Aum Shinrikyo sarin gas attacks on the Tokyo subway in 1994 largely failed to kill the number of people intended due to the crude method of dissemination. Third, terrorists could introduce and subsequently disperse the virus throughout the American food production system through multiple carriers, including animals carrying and introducing it into susceptible herds; animals exposed to contraband materials, such as contaminated food, hay, feedstuffs, hides, or biologics; people wearing clothing or using equipment, including tractors and trucks, to transmit the virus to uninfected animals; and contaminated facilities, such as feed yards, sale barns, and trucks that commonly hold or transport susceptible animals.¹⁹ The same factors that yield inexpensive and plentiful food by promoting maximum production efficiency also make American agricultural systems inherently vulnerable. The highly concentrated and intensive nature of livestock production encourages the rapid spread of contagious pathogens.²⁰ Most dairies house at least 1,500 cows, with the largest facilities containing 10,000. Animals often are born on breeding farms and then

transported to another state for slaughtering and processing. Otherwise isolated and widely dispersed farms often share equipment, vehicles, and veterinary instruments. Feedlots and auctions routinely intermingle animals from a wide geographic area. On average, a pound of meat travels 1,000 miles before it reaches the consumer's table.²¹ The Food Process Chart: Seed to Plate The introduction of FMD would require the mass slaughter and disposal of infected animals. An outbreak could halt the domestic and international sale of meat and meat products for years. In this regard, in 2001, FMD in the United Kingdom affected 9,000 farms and required the destruction of more than 4,000,000 animals. Researchers believe that a similar outbreak in the United States would cost taxpayers up to \$60 billion.²² An FMD attack could result in massive herd culling, the need to destroy processed goods, and extensive decontamination efforts of production and livestock-containment facilities. Most Americans have not witnessed the intense media coverage of high-volume culling operations involving the destruction and disposal of tens of thousands of animals. Large-scale eradication and disposal of livestock likely would be especially controversial as it affects farmers and ranchers and offends the sensibilities of animal rights activists and environmental organizations.

Agricultural terrorism is easy, difficult to prevent, and can cause billions in losses for farmers and ancillary services.

Dennis L. Taylor, 9-15-2014, "Agroterrorism: A looming threat to food supply," Salinas Californian, <http://www.thecalifornian.com/story/news/local/2014/09/12/agroterrorism-looming-threat-food-supply/15541125/>

Unfortunately, many people think of Middle-East terror groups as the masterminds behind such unthinkable acts. But that is only one of many threats, said David Goldenberg, program manager and coordinator for field training at the Western Center for Food Safety and Security at the University of California, Davis. Sponsored by the Department of Homeland Security, Goldenberg is teaching a special series of classes at Hartnell College in Salinas designed for first responders, government officials and operations staff working at the scores of produce processing plants dotting the southern Salinas. Though the attacks on the World Trade Center on Sept. 11, 2001 were plotted and carried out by extremists from the Middle East, consider other historical attacks on U.S. soil. The 1995 Oklahoma City bombing killed 168 people, injured more than 680 others and caused \$652 million in damage. Then there were the shootings at Virginia Tech, Sandy Hook, Columbine, Fort Hood – the list is long and heartbreaking. All were carried out by American citizens. There is a finite amount of carnage that can be inflicted by conventional weapons, but weaponized bio-agents or toxins, particularly if introduced simultaneously at myriad locations nationwide, are open-ended in the catastrophe they would cause. Because threats can come from such a diverse cast of characters bent on disrupting the food supply or instilling fear, Goldenberg has received input from the Federal Bureau of Investigation, the Department of Homeland Security, the U.S. Food and Drug Administration and the U.S. Department of Agriculture. His courses are funded through the Rural Domestic Preparedness Consortium. "We have agroterrorism prevention efforts in place with our WMD (weapons of mass destruction) directorate," said Chris Allen, a spokesperson in FBI headquarters in Washington D.C. "The focus of these efforts is on outreach, building relationships and prevention." The directorate has many parts, including an annual agroterrorism symposium that dates began in 2006. The week-long summit gathers law enforcement with agriculture officials

who are on the front lines of preventing, detecting and investigating intentional attacks on the U.S. food supply. Under the directorate, the FBI focuses on the criminal investigation while the FDA and USDA center their attention on public health. Why Salinas could be targeted In the Salinas Valley, \$4 billion annually of lettuce, strawberries and commodity vegetables such as broccoli, spinach and cauliflower are harvested, trucked to coolers, and then trucked again to local processing plants. From there they are washed, bagged and loaded onto more trucks destined for Canada, Mexico and throughout the United States, or to commercial ports in Los Angeles, Long Beach and Oakland where they are loaded onto container ships bound for Asia. The entire process can be measured in hours, which means that if any toxin or pathogen were introduced at any point along the process, it could be on a plate at a diner in Des Moines or restaurant in Hong Kong long before anyone suspected a problem. All it would take is the combination of intent and capability – all points along the supply chain would be vulnerable to attack. Farmers live year to year on the viability of their crops. If a crop were rendered unusable, and consumers turned away from the affected product, growers easily could be ruined. And not just growers. It is estimated that the agriculture industry in the Salinas Valley supports an additional \$4 billion in ancillary services, everything from banks and tractor sales to trucking companies and fertilizer sales. That would mean an \$8 billion hit to a county with fewer than 500,000 people. Dennis Donohue, a former mayor of Salinas and a lettuce grower, acknowledges that because their livelihoods are planted outdoors, and having only limited activity at night, there is vulnerability. "There's an old saying that it's not hard to meet a grower in the daytime in the Salinas Valley, just go stand in his crop uninvited," Donohue said. "Unfortunately, farmers have to sleep." Today when a human pathogen like E. coli, listeria or salmonella contaminate a food product, often the first sign of a problem is sickness after someone, somewhere consumes the product. Both U.S. and Canadian health officials test produce and meat, but their primary task is to manage outbreaks, not prevent them. Prevention begins on the farm. The major concern of growers here is water, as a parched California lumbers through its third consecutive dry season and is trying to come to terms with a nearly unprecedented drought. More than 98 percent of California land is now considered to be in an "exceptional drought," the highest level recorded by the U.S. Drought Monitor. Still, as demonstrated by the turnout at Goldenberg's agroterrorism series, farmers are increasingly aware of the dangers from terrorism. "While it's not a high priority – water has eclipsed everything else – there is concern about contamination of well heads," said Norm Groot, executive director of the Monterey County Farm Bureau. "There are so many possible points where someone could insert something into the food chain. It's not a very difficult thing to do." Economic carnage In the aftermath of the 9/11 attacks, commerce was deeply affected. It took years for airlines to recover. Huge losses in the stock markets were sustained. Consumer confidence was shaken. History has already foreshadowed what could happen if an attack of that magnitude were leveled on agriculture. In 2006, an outbreak of Escherichia coli, commonly called E. coli, sickened 199 people and killed three. Months later, the U.S. Food and Drug Administration traced the pathogen to an Angus cattle ranch in neighboring San Benito County that had leased land to an organic spinach grower. The FDA called for bagged fresh spinach to be removed from shelves and warned people not to eat any kind of fresh spinach. California is where three-quarters of all domestically harvested spinach is grown. Farmers suffered an estimated loss of \$74 million, much of that in the Salinas Valley, which now grows more than

\$122.6 million worth of spinach annually. But it took years of aggressive marketing and the implementation of new safety systems to restore consumer confidence. Susan Pheasant, director of the Agricultural Business & Technology Institute at Hartnell College, said the courses have dual impacts – preparing individuals for both intentional and unintentional outbreaks. "The Salinas Valley has always been proactive when it comes to food safety," she said. "Whether the act is intentional or unintentional, the idea of the courses are to encourage the ag community to work not only with local first responders, but with state and federal crisis teams as well." Even pathogens that don't affect human health can wreak economic catastrophes. In 2001, England experienced its most devastating agricultural pathogen outbreak in its history, and not a single human got sick. Foot-and-mouth disease broke out on farms in Buckinghamshire and the Isle of Wigh, resulting in the worst animal slaughter in Great Britain's history – some 3.7 million cows, pigs, sheep and lambs had to be shot and cremated. Five months after the crisis, stockyards were still empty. British consumers lost faith in the industry and in their government. In the end, it cost England's agricultural industry \$16 billion – four years worth of Salinas Valley's gross crop revenue. Dairymen lost their farms and many took their own lives. "It was no different than the stock brokers who jumped off buildings in New York in the crash of 1929," Goldenberg said. Similar outbreaks of FMD have occurred in Korea, Japan and Taiwan, with horrendous economic effects that lasted years. Similar outbreaks of FMD have occurred in Korea, Japan and Taiwan, with horrendous economic effects that lasted years. Attacks on food nothing new Recorded modern-era attacks on food supplies date back to World War I when German troops introduced a glanders virus – an infectious disease that occurs primarily in horses, mules, and donkeys – into the ranks of allied troops. Before mechanized troop and supply transports, the military relied on mules and horses to carry supplies. The attack debilitated or killed the mules and effectively brought allied advances to a halt. In 1984, the word "agroterror" was not a part of anyone's vernacular. But the Rajneeshee cult living in The Dalles, Ore., carried out a near flawless attack on the town's food supply. A group of followers of Bhagwan Shree Rajneesh had hoped to incapacitate the voting population of the city so that their own candidates would win the 1984 Wasco County elections. They began spraying salad bars in 10 local restaurants with salmonella, causing the poisoning of 751 people. The incident was the first and single largest bioterrorist attack in United States history, according to Scripps-Howard News Service. It wasn't until years later that a confession uncovered the plot. Up until then, the cause was listed as unknown. Disturbing was the ease in which the cult manufactured the salmonella, Goldenberg said. Anyone with a degree in microbiology and amateur beer brewing equipment can manufacture a host of human pathogens in their bathtubs. Yet these examples are amateurish compared to what British and American troops have unearthed in Afghanistan.

Agro-terror- Food Insecurity

Agro-terrorism causes trade embargoes and spikes in food prices

Jonathan Tucker, founding director of the Chemical and Biological Weapons Nonproliferation Program, 7/11, "The Threat of Agro-Terrorism", <http://fas.org/biosecurity/education/dualuse-agriculture/1.-agroterrorism-and-foodsafety/threat-agro-terrorism.html>

Ever since the terrorist attacks of September 11, 2001, western governments have become increasingly concerned that terrorists might launch attacks against agriculture or food-processing facilities, with the aim of causing economic damage, generating fear and panic, and undermining public trust in the food supply. The deliberate introduction of a plant or animal pathogen could result in crop failures or require the slaughter of millions of infected livestock, imposing serious hardships on farmers and downstream processors. Alternatively, toxic chemicals or radioactive isotopes might be used to contaminate food and beverages. Such incidents could result in increased food prices and trade embargoes, costing billions of dollars in lost revenue.

These spikes have major impacts on food security—hunger levels increase, especially in impoverished populations and developing countries.

Stephen C. Smith, George Washington University, 2012, "Triple Threat of Unstable Food Prices," Heifer International, <http://www.heifer.org/join-the-conversation/magazine/2012/spring-2012/triple-threat-of-unstable-food-prices.html>

The scourge of hunger today is worse than it was a decade ago. In the aftermath of the first food price spike and the 2008-2009 global financial crisis, for the first time more than one billion people were significantly malnourished. Conditions improved slightly in 2010, but food prices spiked again in 2011, pushing the United Nations Food and Agriculture Organization's food price index to a record high. About 925 million are currently hungry, not far from the all-time record. A family living in poverty in a low-income country may spend almost three-quarters of their income on food. Although prices have fallen somewhat from their peak earlier in 2011, "high food prices are likely to continue and volatility may increase in coming years, making farmers, consumers and countries more vulnerable to poverty and food insecurity," according to the FAO's State of Food Insecurity in the World 2011 report. When food prices rise, so does hunger. In summer 2011, the United Nations declared a famine under way in parts of Somalia. Tens of thousands of people have died, a majority of them children, according to the U.N. Severe hunger caused by drought, conflict and inequity is now found throughout the Horn of Africa. One problem is that some local food is exported out of the famine-struck area. The reason is simple: starving people don't have sufficient means to buy food, so traders sell it elsewhere, fetching a higher price. Looking closely at the links between food prices and malnutrition can help leaders, governments and organizations lay a foundation for building sound policies and programs to end hunger. Over the previous 40 years the world has learned to grow much more food, and prices fell substantially for a time. The Green Revolution brought improved crop varieties to Asia and productivity rose, increasing output and pushing prices down. Incomes of people living in poverty rose—not nearly enough, but many were able to afford more food than before. And in some parts of the world—China most prominently—incomes grew enough that

many millions of people were able to add animal-based foods to their diet. The United Nations declared Oct. 31, 2011, the "Day of 7 Billion," a world population milestone. Within about 35 years, more than 9 billion people will need access to adequate food. Indeed, in May 2011 the U.N. raised its estimate of the peak population to 10 billion by the end of this century. But the number of people is the smaller part of the problem. The critical issue is what the people do: how much do they consume, in what ways, and what environmental damage do they cause? Without some needed adjustments, a return of the world food problem is threatening.

Extreme Poverty Graphic courtesy of Food and Agriculture Organization of the United Nations. By 2002, food prices started an unmistakable rising trend; in addition, prices became more variable and volatile; and finally, a third problem of upward spikes of food prices emerged. The Rising Food Price Trend Clearly, rising food prices harm people living in poverty. But the effects are subtle. If the price of corn rises, as it did in 2007, smallholder corn producers, who sell a little of their corn on local markets and whose incomes are slightly below the absolute poverty line, may find that this price rise increases their incomes to pull them out of absolute poverty. On the other hand, for those with too little land to be able to sell corn and who are net buyers of corn on markets, this price increase can greatly worsen their poverty. Farm laborers can find that at least a little of the higher corn prices get passed on to them in the form of higher wages, and this can more than make up for higher food prices. But the urban poor— a growing faction of people living in poverty—are nearly always hurt by food price increases. Often the evidence suggests that many of the rural poor are hurt as well, sometimes substantially. Increasing Food Price Volatility Greater volatility also makes it hard to plan for sufficient food. Smallholder farmers, many of them living in poverty yet also selling some of their harvest on the market to pay for other essentials, now face greater risks. The good news is that some years they get a pleasant surprise and find higher prices for their goods at the market. But, in other years, unexpectedly low prices can be disastrous. When they can do little more than pay for costs to farm, the family may face severe malnourishment. The New Scourge: Food Price Spikes Upward price spikes pose a third challenge for ending hunger. You can see two spikes in Figure 1. These sudden changes are about prices going up for a time, and far more than can be accounted for by any normal volatility (even while volatility is also rising). These spikes particularly harm people living in poverty who are not in the agricultural sector, such as urban dwellers and people on the margins of rural society. Although the poor often devise ingenious ways of saving even in the harshest of conditions, major food price spikes can overwhelm the ability of struggling families to cope. Rising Food Prices Graphic courtesy of Food and Agriculture Organization of the United Nations

Leading experts on food prices and their impact on people living in poverty convened at George Washington University on Sept. 30 for a daylong conference to better understand these three food price problems and consider action plans. More than 100 participants took part in the discussion. Why Is This Happening? Leading Experts Weigh In The Rising Food Price Trend Food prices are about 80 percent higher than they were in 2000, reversing a long declining trend of previous decades. Nora Lustig, a professor of Latin American Economics at Tulane University, said some of the price increases reflect longer-term forces that if left unchecked will lead to higher future food prices. These forces include diversion of food to biofuels production, increase in demand for grains through shifts to meat production due to higher incomes in China and elsewhere, a possible slowdown in the growth of output per acre of agricultural commodities, higher energy prices affecting agricultural input costs, and a decrease in available land to

convert to farming. Finally there is the negative impact of climate change on developing-country food production, with far worse effects likely ahead of us. Long-term forces cannot explain the volatility, let alone the spikes. But the spikes were exacerbated by a number of unfavorable policies that interfered with food prices, such as subsidies and mandates for biofuels. As Alain de Janvry, a professor of agricultural and resource economics at the University of California at Berkeley, pointed out, "the demand for energy is simply so big compared to the food market that it could completely overwhelm any price predictions" that do not take energy policy into account. Furthermore, there is not a large global market for food in relation to total demand. Most countries strive for food self-sufficiency, largely for national security reasons. Embargoes of food exports by such countries as Egypt, Vietnam and Russia reflect this reluctance to allow a freer global market when it comes to food. The World Bank reported in 2008 that growth in output per acre was leveling off and that prices would continue rising. In fact, prices increased far faster than even the World Bank predicted. Lustig explained that while "food is energy for human survival, food commodities have turned into industrial commodities, energy for machines." The result is less energy for people—at best, more expensive energy—when so many remain deprived of even a minimum of calories. "A majority of studies show that those who get hurt outnumber those who benefit" when food prices increase, she said.

Unstable Food Prices In the 20th century, food prices fell close to 1 percent per year. Dr. Keith Fuglie, an economist at the U.S. Department of Agriculture, said that in the early 1900s, falling shipping costs steered prices lower, with producers sending food from where it was grown cheaply and abundantly to where food prices were high. In the later decades of the 20th century, rising output per acre drove prices down. Today, that yield growth is slower, but Fuglie found we are still making gains despite smaller additions to inputs than before (especially the smaller number of workers in agriculture). This is a new and encouraging discovery. It should be putting downward pressure on food prices. Looking ahead, these forces may continue to slow the rate at which food prices increase. Findings like Fuglie's help reassure us that, while new problems complicate work toward a world free of hunger, with continued commitment the goal can still be attained. But Fuglie also found that these gains were not present in Africa, where most of the increase in population is expected. And although encouraging, his work is retrospective: It does not take into account the projected worsening of environmental stresses not only from climate change but from localized deforestation, water scarcity, falling water tables, declining soil fertility, erosion, salination and other pollutants.

Increasing Food Price Volatility As climate change increasingly plays into agricultural productivity, output will be more volatile, said Maximo Torero, an economist and division chief at International Food Policy Research Institute. Even if today's price volatility is a passing phase due to unregulated financial markets and other bad policies, volatility in some form will still be with us. So we have to take it seriously and plan to cushion people living in poverty from its harmful effects. Most of the factors pushing food prices up are also worsening the volatility of those prices, Torero said. For example, just a few countries account for the majority of exports of most staples. Government mandates to use ethanol, a corn-based biofuel, also increase volatility as well as price. And as volume in futures markets has increased, this also makes the price of food vulnerable to volatility: High volatility attracts more financial market participants, who learn that they can make money on trading, which can amplify instability. Finally, high futures market prices lead to high current market prices, a consequence of speculation. Food Prices Food Price Spikes Food price spikes are

certainly not unprecedented. Remember the major shocks of the 1970s? But food price spikes returned with a vengeance in this century and conditions threaten more. Joachim von Braun, a professor at the University of Bonn and former director general of International Food Policy Research Institute, said the new spikes are driven by three factors: Energy markets: High oil prices are not just raising the costs of fertilizer but also giving farmers in rich countries incentive to use their crops for biofuel. Financial markets: There is a clear and growing link between food market volatility and financial crises. Speculation: The "speculation effect partly depends on the 'nervousness' of the market," von Braun explained. "What is called speculation actually stabilizes prices when the market is less nervous," because it can push markets to find prices consistent with supply and demand more quickly. But speculation is destabilizing "when the market becomes nervous as a result of changes in fundamentals, policies and structures." Shifts in sentiment can result in spikes.

Food shortages will collapse global civilization and cause a laundry list of impacts.

Brown, 9—founder of both the WorldWatch Institute and the Earth Policy Institute (May 2009, Lester R., Scientific American, "Could Food Shortages Bring Down Civilization?" Ebsco)

The biggest threat to global stability is the potential for food crises in poor countries to cause government collapse. Those crises are brought on by ever worsening environmental degradation. One of the toughest things for people to do is to anticipate sudden change. Typically we project the future by extrapolating from trends in the past. Much of the time this approach works well. But sometimes it fails spectacularly, and people are simply blindsided by events such as today's economic crisis. For most of us, the idea that civilization itself could disintegrate probably seems preposterous. Who would not find it hard to think seriously about such a complete departure from what we expect of ordinary life? What evidence could make us heed a warning so dire--and how would we go about responding to it? We are so inured to a long list of highly unlikely catastrophes that we are virtually programmed to dismiss them all with a wave of the hand: Sure, our civilization might devolve into chaos--and Earth might collide with an asteroid, too! For many years I have studied global agricultural, population, environmental and economic trends and their interactions. The combined effects of those trends and the political tensions they generate point to the breakdown of governments and societies. Yet I, too, have resisted the idea that food shortages could bring down not only individual governments but also our global civilization. I can no longer ignore that risk. Our continuing failure to deal with the environmental declines that are undermining the world food economy--most important, falling water tables, eroding soils and rising temperatures--forces me to conclude that such a collapse is possible. The Problem of Failed States Even a cursory look at the vital signs of our current world order lends unwelcome support to my conclusion. And those of us in the environmental field are well into our third decade of charting trends of environmental decline without seeing any significant effort to reverse a single one. In six of the past nine years world grain production has fallen short of consumption, forcing a steady drawdown in stocks. When the 2008 harvest began, world carryover stocks of grain (the amount in the bin when the new harvest begins) were at 62 days of consumption, a near record low. In response, world grain prices in the spring and summer of last year climbed to the highest level ever. As demand for food rises faster than supplies are growing, the resulting food-price inflation puts severe stress on the governments of countries already teetering on the edge of

chaos. Unable to buy grain or grow their own, hungry people take to the streets. Indeed, even before the steep climb in grain prices in 2008, the number of failing states was expanding [see sidebar at left]. Many of their problems stem from a failure to slow the growth of their populations. But if the food situation continues to deteriorate, entire nations will break down at an ever increasing rate. We have entered a new era in geopolitics. In the 20th century the main threat to international security was superpower conflict; today it is failing states. It is not the concentration of power but its absence that puts us at risk. States fail when national governments can no longer provide personal security, food security and basic social services such as education and health care. They often lose control of part or all of their territory. When governments lose their monopoly on power, law and order begin to disintegrate. After a point, countries can become so dangerous that food relief workers are no longer safe and their programs are halted; in Somalia and Afghanistan, deteriorating conditions have already put such programs in jeopardy. Failing states are of international concern because they are a source of terrorists, drugs, weapons and refugees, threatening political stability everywhere. Somalia, number one on the 2008 list of failing states, has become a base for piracy. Iraq, number five, is a hotbed for terrorist training. Afghanistan, number seven, is the world's leading supplier of heroin. Following the massive genocide of 1994 in Rwanda, refugees from that troubled state, thousands of armed soldiers among them, helped to destabilize neighboring Democratic Republic of the Congo (number six). Our global civilization depends on a functioning network of politically healthy nation-states to control the spread of infectious disease, to manage the international monetary system, to control international terrorism and to reach scores of other common goals. If the system for controlling infectious diseases—such as polio, SARS or avian flu—breaks down, humanity will be in trouble. Once states fail, no one assumes responsibility for their debt to outside lenders. If enough states disintegrate, their fall will threaten the stability of global civilization itself.

Conflict for food will escalate to global nuclear wars—empirics prove.

FDI, Future Directions International, a Research institute providing strategic analysis of Australia's global interests citing an enormous list of experts including Chris Baker, Research Analyst, Centre for International Security Studies, University of Sydney, Lindsay Falvery, PhD in Agricultural Science and former Professor at the University of Melbourne's Institute of Land and Environment and John Noonan, Senior Lecturer, Leader, Farm Business Resilience and Safe Quality Food Programmes, School of Management, Curtin Business School, May 25th 2012, "International Conflict Triggers and Potential Conflict Points Resulting from Food and Water Insecurity," http://www.futuredirections.org.au/files/Workshop_Report_-_Intl_Conflict_Triggers_-_May_25.pdf

There is a growing appreciation that the conflicts in the next century will most likely be fought over a lack of resources. Yet, in a sense, this is not new. Researchers point to the French and Russian revolutions as conflicts induced by a lack of food. More recently, Germany's World War Two efforts are said to have been inspired, at least in part, by its perceived need to gain access to more food. Yet the general sense among those that attended FDI's recent workshops, was that the scale of the problem in the future could be significantly greater as a result of population pressures, changing weather, urbanisation, migration, loss of arable land and other farm inputs, and increased affluence in the developing world. In his book, *Small Farmers Secure Food*,

Lindsay Falvey, a participant in FDI's March 2012 workshop on the issue of food and conflict, clearly expresses the problem and why countries across the globe are starting to take note. . He writes (p.36), "...if people are hungry, especially in cities, the state is not stable – riots, violence, breakdown of law and order and migration result." "Hunger feeds anarchy." This view is also shared by Julian Cribb, who in his book, *The Coming Famine*, writes that if "large regions of the world run short of food, land or water in the decades that lie ahead, then wholesale, bloody wars are liable to follow." He continues: "An increasingly credible scenario for World War 3 is not so much a confrontation of super powers and their allies, as a festering, self-perpetuating chain of resource conflicts." He also says: "The wars of the 21st Century are less likely to be global conflicts with sharply defined sides and huge armies, than a scrappy mass of failed states, rebellions, civil strife, insurgencies, terrorism and genocides, sparked by bloody competition over dwindling resources." As another workshop participant put it, people do not go to war to kill; they go to war over resources, either to protect or to gain the resources for themselves. Another observed that hunger results in passivity not conflict. Conflict is over resources, not because people are going hungry. A study by the International Peace Research Institute indicates that where food security is an issue, it is more likely to result in some form of conflict. Darfur, Rwanda, Eritrea and the Balkans experienced such wars. Governments, especially in developed countries, are increasingly aware of this phenomenon. The UK Ministry of Defence, the CIA, the US Center for Strategic and International Studies and the Oslo Peace Research Institute, all identify famine as a potential trigger for conflicts and possibly even nuclear war.

Econ

A terrorist attack would crush the economy

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. Javed Younasis Associate Professor of Economics at the American University of Sharjah, United Arab Emirates. "The Toll of Terrorism"

<http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm>

modified for ableist language

New technology has lowered transportation costs and increased trade and capital flows across nations. But the same technology that has fostered international economic growth has also allowed terrorism to spread easily among countries whose interests are tightly interwoven. Terrorism is no longer solely a local issue. Terrorists can strike from thousands of miles away and cause vast destruction. The effects of terrorism can be terrifyingly direct. People are kidnapped or killed. Pipelines are sabotaged. Bombers strike markets, buses, and restaurants with devastating effect. But terrorism inflicts more than human casualties and material losses. It can also cause serious indirect harm to countries and economies by increasing the costs of economic transactions—for example, because of enhanced security measures to ensure the safety of employees and customers or higher insurance premiums. Terrorist attacks in Yemen on the USS Cole in 2000 and on the French tanker Limburg in 2002 seriously damaged that country's shipping industry. These attacks contributed to a 300 percent rise in insurance premiums for ships using that route and led ships to bypass Yemen entirely (Enders and Sandler, 2012). In this article we explore the economic burden of terrorism. It can take myriad forms, but we focus on three: national income losses and growth-[slowing]retarding effects, dampened foreign direct investment, and disparate effects on international trade.

Terrorism will destroy the US econ along with those of other countries

(Dan Weil, 7-16-2015, "Celente: Terrorist Attack Would Crash World Economy," Newsmax, <http://www.newsmax.com/Finance/StreetTalk/terrorist-gold-silver-HomelandSecurity/2011/07/07/id/402861>)

Another terrorist attack would create a global economic disaster, says economic and political guru Gerald Celente, director of The Trends Research Institute. The wise investment strategy in such a scenario would be to buy silver and gold while selling currencies, he tells King World News. "What will another major terror strike mean should an attack hit one of the major NATO nations?" Celente says. "The effects this time will go global. Bank holidays will be called, the U.S. and other fragile economies will crumble, gold and silver will soar, and already troubled currencies will crash. Economic martial law will be declared, promised as a temporary measure. Once in place it will remain in place." And don't expect your ATM card to be of much use. "With banks closed and economic martial law in place, restrictions will be set on the amounts, times and frequencies of withdrawals (of cash). It will be essential to have a stash of cash on hand," Celente says.

Multiple shocks on econ after terror attacks—foreign direct investment, infrastructure, trade

Sandler and Ender 10

(Todd Sandler, Professor of International Relations and Economics at the University of Southern California, Walter Enders, Bidgood Chair of Economics and Finance at the University of Alabama, July 2010, http://www.utdallas.edu/~tms063000/website/Econ_Consequences_ms.pdf)

Terrorism can impose costs on a targeted country through a number of avenues. Terrorist incidents have economic consequences by diverting foreign direct investment (FDI), destroying infrastructure, redirecting public investment funds to security, or limiting trade. If a developing country loses enough FDI, which is an important source of savings, then it may also experience reduced economic growth. Just as capital may take flight from a country plagued by a civil war (see Collier et al., 2003), a sufficiently intense terrorist campaign may greatly reduce capital inflows (Enders and Sandler, 1996). Terrorism, like civil conflicts, may cause spillover costs among neighboring countries as a terrorist campaign in a neighbor dissuades capital inflows, or a regional multiplier causes lost economic activity in the terrorism-ridden country to resonate throughout the region.¹ In some instances, terrorism may impact specific industries as 9/11 did on airlines and tourism (Drakos, 2004; Ito and Lee, 2004). Another cost is the expensive security measures that must be instituted following large attacks – e.g., the massive homeland security outlays since 9/11 (Enders and Sandler, 2006, Chapter 10). Terrorism also raises the costs of doing business in terms of higher insurance premiums, expensive security precautions, and larger salaries to at-risk employees.

Domestic terrorism deters foreign direct investment – even small attacks crush investor confidence

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. Javed Younasis Associate Professor of Economics at the American University of Sharjah, United Arab Emirates. “The Toll of Terrorism”

<http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm>

Scaring off investors Increased terrorism in a particular area tends to depress the expected return on capital invested there, which shifts investment elsewhere. This reduces the stock of productive capital and the flow of productivity-enhancing technology to the affected nation. For example, from the mid-1970s through 1991, terrorist incidents reduced net foreign direct investment in Spain by 13.5 percent and in Greece by 11.9 percent (Enders and Sandler, 1996). In fact, the initial loss of productive resources as a result of terrorism may increase manyfold because potential foreign investors shift their investments to other, presumably safer, destinations. Abadie and Gardeazabal (2008) showed that a relatively small increase in the perceived risk of terrorism can cause an outsized reduction in a country’s net stock of foreign direct investment and inflict significant damage on its economy. We analyzed 78 developing economies over the period 1984–2008 (Bandyopadhyay, Sandler, and Younas, 2014) and found that on average a relatively small increase in a country’s domestic terrorist incidents per 100,000 persons sharply reduced net foreign direct investment. There was a similarly large

reduction in net investment if the terrorist incidents originated abroad or involved foreigners or foreign assets in the attacked country. We also found that greater official aid flows can substantially offset the damage to foreign direct investment—perhaps in part because the increased aid allows recipient nations to invest in more effective counterterrorism efforts. Most countries that experienced above-average domestic or transnational terrorist incidents during 1970–2011 received less foreign direct investment or foreign aid than the average among the 122 in the sample (see table). It is difficult to assess causation, but the table suggests a troubling association between terrorism and depressed aid and foreign direct investment, both of which are crucial for developing economies. It is generally believed that there are higher risks in trading with a nation afflicted by terrorism, which cause an increase in transaction costs and tend to reduce trade. For example, after the September 11 attacks on New York City and the Washington, D.C., area, the U.S. border was temporarily closed, holding up truck traffic between the United States and Canada for an extended time. Nitsch and Schumacher (2004) analyzed a sample of 200 countries over the period 1960–93 and found that when terrorism incidents in a pair of trading countries double in one year, trade between them falls by about 4 percent that same year. They also found that when one of two trading partners suffers at least one terrorist attack, it reduces trade between them to 91 percent of what it would be in the absence of terrorism. Blomberg and Hess (2006) estimated that terrorism and other internal and external conflicts retard trade as much as a 30 percent tariff. More specifically, they found that any trading partner that experienced terrorism experienced close to a 4 percent reduction in bilateral trade. But Egger and Gassebner (2015) found more modest trade effects. Terrorism had few to no short-term effects; it was significant over the medium term, which they defined as “more than one and a half years after an attack/incident.” Abstracting from the impact of transaction costs from terrorism, Bandyopadhyay and Sandler (2014b) found that terrorism may not necessarily reduce trade, because resources can be reallocated. If terrorism disproportionately harmed one productive resource (say land) relative to another (say labor), then resources would flow to the labor-intensive sector. If a country exported labor-intensive goods, such as textiles, terrorism could actually lead to increased production and exportation. In other words, although terrorism may reduce trade in a particular product because it increases transaction costs, its ultimate impact may be either to raise or reduce overall trade. These apparently contradictory empirical and theoretical findings present rich prospects for future study. Of course terrorism has repercussions beyond human and material destruction and the economic effects discussed in this article. Terrorism also influences immigration and immigration policy. The traditional gains and losses from the international movement of labor may be magnified by national security considerations rooted in a terrorism response. For example, a recent study by Bandyopadhyay and Sandler (2014a) focused on a terrorist organization based in a developing country. It showed that the immigration policy of the developed country targeted by the terrorist group can be critical to containing transnational terrorism. Transnational terrorism targeted at well-protected developed countries tends to be more skill intensive: it takes a relatively sophisticated terrorist to plan and successfully execute such an attack. Immigration policies that attract highly skilled people to developed countries can drain the pool of highly skilled terrorist recruits and may cut down on transnational terrorism.

FDI Key to the US Econ

Foreign direct investment competitiveness is vital to sustained economic recovery

Kornecki '13 [L. PhD in Economics, Prof Embry-Riddle Aeronautical University's College of Business. "Inward FDI in the United States and its policy context" Columbia FDI Profiles, 2/4/13 http://www.vcc.columbia.edu/files/vale/documents/US_IFDI_-_FINAL_-_REVISED_Feb_4_2013.pdf]

Inward foreign direct investment (IFDI) represents an integral part of the United States (U.S.) economy, with its stock growing from US\$ 83 billion in 1980 to US\$ 3.5 trillion in 2011. The United States, which had earlier been primarily a home for multinational enterprises (MNEs) rather than a host for affiliates of foreign MNEs, has become a preferred host country for FDI since the 1980s. Foreign MNEs have contributed robust flows of FDI into diverse industries of the U.S. economy, and total FDI inflows reached US\$ 227 billion in 2011, equivalent to 15% of global inflows, the single largest share of any economy. Inflows of FDI, with a peak of US\$ 314 billion in 2000 and another of US\$ 306 billion in 2008, have been an important factor contributing to sustained economic growth in the United States. The recent financial and economic crises negatively impacted FDI flows to the United States and opened a period of major uncertainty. The effectiveness of government policy responses at both the national and international levels in addressing the financial crisis and its economic consequences will play a crucial role for creating favorable conditions for a rebound in FDI inflows. Inward foreign direct investment is an essential component of the U.S. economy, contributing to production, exports and high-paying jobs for the country's workers. As the world's largest economy, the United States is well positioned to participate in the increasingly competitive international environment for FDI that has emerged as both advanced and developing economies have recognized the value of such investment. The U.S. hosts the largest stock of IFDI among the world's economies and continues to be at the top as a destination for inward FDI flows.

Retaliation

Terrorist retaliation causes nuclear war – draws in Russia and China

Robert Ayson, Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington, 2010 (“After a Terrorist Nuclear Attack: Envisaging Catalytic Effects,” *Studies in Conflict & Terrorism*, Volume 33, Issue 7, July, Available Online to Subscribing Institutions via InformaWorld)

A terrorist nuclear attack, and even the use of nuclear weapons in response by the country attacked in the first place, would not necessarily represent the worst of the nuclear worlds imaginable. Indeed, there are reasons to wonder whether nuclear terrorism should ever be regarded as belonging in the category of truly existential threats. A contrast can be drawn here with the global catastrophe that would come from a massive nuclear exchange between two or more of the sovereign states that possess these weapons in significant numbers. Even the worst terrorism that the twenty-first century might bring would fade into insignificance alongside considerations of what a general nuclear war would have wrought in the Cold War period. And it must be admitted that as long as the major nuclear weapons states have hundreds and even thousands of nuclear weapons at their disposal, there is always the possibility of a truly awful nuclear exchange taking place precipitated entirely by state possessors themselves. But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today’s and tomorrow’s terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be “spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from.”⁴¹

Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington's relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington's early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response.

Nuclear terrorism causes global nuclear escalation – national retaliation goes global

Morgan 9 (Dennis Ray, Professor of Foreign Studies at Hankuk University, "World on Fire: Two Scenarios of the Destruction of Human Civilization and Possible Extinction of the Human Race," Futures, Vol. 41, Issue 10, p683-693, ScienceDirect)

In a remarkable website on nuclear war, Carol Moore asks the question "Is Nuclear War Inevitable??" [10].⁴ In Section 1, Moore points out what most terrorists obviously already know about the nuclear tensions between powerful countries. No doubt, they've figured out that the best way to escalate these tensions into nuclear war is to set off a nuclear exchange. As Moore points out, all that militant terrorists would have to do is get their hands on one small nuclear bomb and explode it on either Moscow or Israel. Because of the Russian "dead hand" system, "where regional nuclear commanders would be given full powers should Moscow be destroyed," it is likely that any attack would be blamed on the United States" [10]. Israeli leaders and Zionist supporters have, likewise, stated for years that if Israel were to suffer a nuclear

attack, whether from terrorists or a nation state, it would retaliate with the suicidal "Samson option" against all major Muslim cities in the Middle East. Furthermore, the Israeli Samson option would also include attacks on Russia and even "anti-Semitic" European cities [10]. In that case, of course, Russia would retaliate, and the U.S. would then retaliate against Russia. China would probably be involved as well, as thousands, if not tens of thousands, of nuclear warheads, many of them much more powerful than those used at Hiroshima and Nagasaki, would rain upon most of the major cities in the Northern Hemisphere. Afterwards, for years to come, massive radioactive clouds would drift throughout the Earth in the nuclear fallout, bringing death or else radiation disease that would be genetically transmitted to future generations in a nuclear winter that could last as long as a 100 years, taking a savage toll upon the environment and fragile ecosphere as well.

Retaliation increases terrorism—more violence, easier recruitment

John A. Nevin, *Behavior and Social Issues*, 12, 109-128 (2003). Behaviorists for Social Responsibility

Retaliation may reduce terrorism in several ways. Arresting terrorists takes them out of action and trying them within the criminal justice system legitimizes authority. Targeted killings of the leaders of terrorist organizations disrupt their operations and buy time while the terrorists regroup. Finally, large-scale attacks on terrorist groups and their supporters, coupled with mass arrests, reduce their numbers and may deter potential recruits to their cause. On the other hand, retaliation in any form may increase terrorism in several ways. It may incite terrorists to escalate the level of violence, increase their support in the population, and make it easier to recruit new members to their cause.

Retaliation is risky—multitude of escalation scenarios

Mallow 97

(Brittain P., 1997, The Industrial College of the Armed Forces, "Terror vs. Terror: Effects of Military Retaliation on Terrorism," <http://www.au.af.mil/au/awc/awcgate/icaf/97-e-12.pdf>)

Like terrorism, retaliation is a form of communication through violence. It can affect multiple audiences for many purposes: bolstering public opinion, destroying/disrupting terrorist infrastructure, and potentially deterring the choice of the terrorist tactic. Symmetry, proportionality, and discrimination in the targeting of retaliation all vary its effects on audiences. To deter terrorists and their supporters, retaliation must meet the requirements of deterrence theory: credibility, shared interest, and rationality. Examples of retaliation for terrorism indicate there are significant problems with its effectiveness as a deterrent. Its viability is diminished by the transience and fragility of credibility, the moral and legal "baggage" of retaliation itself, and the differences in values and interests between terrorists/supporters and retaliating states. Retaliation also presents substantial risks beyond its failure to deter. Force protection, dangers of escalatory violence, and risks of condemnation by the world community accompany the use of retaliation. These risks, combined with its questionable viability as a deterrent, make retaliation a difficult policy choice.

Breakdown of relations between the US and Pakistan causes conflict

Stephen Tankel, professor at American University and a nonresident fellow at the Carnegie Endowment for International Peace, A Pakistan-Based Terrorist Attack on the U.S. Homeland, August 2011

A successful terrorist attack of any proportion by a Pakistan-based group or groups would have significant domestic and foreign policy implications for the United States. Although the economic repercussions are unlikely to be as severe as those following 9/11, even a small attack could trigger a short-term dip in already shaky global markets. An attack also would reintroduce a sense of domestic vulnerability, particularly if it claims hundreds as opposed to tens of lives and/or the target is an iconic one. The origin of the attack—Pakistan—would cause a distraction from other pressing foreign policy concerns. All of these issues would be magnified by the forthcoming presidential campaign season. The immediate impact on U.S.-Pakistan relations would depend on several factors—the nature and scale of the harm committed; which group(s), if any, claimed responsibility; the immediate public response by the Pakistan civilian government and military; and the level of cooperation they subsequently offered. The number of people killed is likely to be among the largest determining factors in a response, though an attack against a political or military target that causes few casualties could also have a major impact. Any indication that individuals or entities associated with the Pakistan army or ISI had foreknowledge of the strike or had in any way aided it would have severe consequences for the bilateral relationship. Even if there were no smoking gun, the involvement of a culprit with institutional ties to the state would be incredibly deleterious, as would Pakistan's failure to cooperate with U.S. authorities in the wake of the attack. Much rests on the bilateral relationship. A complete rupture is unlikely because both sides have a lot to lose. A further deterioration in relations could seriously compromise counterterrorism and nonproliferation interests, not to mention regional diplomatic initiatives, especially in Afghanistan. Pakistan's security establishment also might enact a short-term closure of corridors through which U.S. supplies pass into Afghanistan. Were a complete rupture to occur, this could lead to an indefinite closure of these corridors, an end to Pakistani support along the Durand Line, and an increased flow of insurgents across the border. The U.S. diplomatic mission to Pakistan could shrink significantly, Pakistani counterterrorism cooperation could cease, and in a worst-case scenario the threat to American

Anti-Black Terrorism

Terrorists are destroying historically Black churches throughout the South in the wake of the mass murder in Charleston, South Carolina. This not only represents thousands of dollars in damages to the churches but also a resurfacing of decades of terror in the Jim Crow South.

Emma Green, managing editor of TheAtlantic.com, 7-1-2015, "Black Churches Are Burning Again in America," Atlantic, <http://www.theatlantic.com/national/archive/2015/07/arson-churches-north-carolina-georgia/396881/>

On Wednesday, July 1, a fire was reported at the Mount Zion African Methodist Episcopal Church in Greeleyville, South Carolina. The AP reports that an anonymous federal official said the fire did not appear to be intentionally set, but Winfred Pressley, a division operations officer at the regional Alcohol, Firearms, and Tobacco division, said that the investigation is still ongoing, as did other local investigators. Shanna Daniels, a spokesperson for the FBI, declined to comment on the case, but said that church arson "has been a hot topic over the past few days." "What's the church doing on fire?" Jeanette Dudley, the associate pastor of God's Power Church of Christ in Macon, Georgia, got a call a little after 5 a.m. on Wednesday, June 24, she told a local TV news station. Her tiny church of about a dozen members had been burned, probably beyond repair. The Bureau of Alcohol, Firearms, and Tobacco got called in, which has been the standard procedure for church fires since the late 1960s. Investigators say they've ruled out possible causes like an electrical malfunction; most likely, this was arson. The very same night, many miles away in North Carolina, another church burned: Briar Creek Road Baptist Church, which was set on fire some time around 1 a.m. Investigators have ruled it an act of arson, the AP reports; according to The Charlotte Observer, they haven't yet determined whether it might be a hate crime. Two other predominantly black churches have been the target of possible arson in the past fortnight: Glover Grove Missionary Baptist Church in Warrenton, South Carolina, which caught fire on Friday, and College Hill Seventh Day Adventist, which burned on Monday in Knoxville, Tennessee. Investigators in Knoxville told a local news station they believed it was an act of vandalism, although they aren't investigating the incident as a hate crime. (There have also been at least four other cases of fires at churches in the past fortnight. At Fruitland Presbyterian Church in Gibson County, Tennessee, and the Greater Miracle Temple Apostolic Holiness Church in Tallahassee, Florida, officials suspect the blazes were caused by lightning and electrical wires, respectively, but investigations are still ongoing. A church that is not predominantly black—College Heights Baptist Church in Elyria, Ohio—was burned on Saturday morning. The fire appears to have been started in the sanctuary, and WKYC reports that the cause is still under investigation. The town's fire and police departments did not immediately return calls for confirmation on Sunday.* And a Monday, June 29, fire at Disciples of Christ Ministries in Jackson, Mississippi, was ruled accidental.) These fires join the murder of nine people at Charleston's Emanuel African Methodist Episcopal Church as major acts of violence perpetrated against predominantly black churches in the last fortnight. Churches are burning again in the United States, and the symbolism of that is powerful. Even though many instances of arson have happened at white churches, the crime is often associated with racial violence: a highly visible attack on a core institution of the black community, often done at night, and often motivated by hate. As my colleague David Graham noted last week, the history of American church burnings dates to before the Civil War, but there was a major uptick in incidents of arson

at black churches in the middle and late 20th century. One of the most famous was the 1963 bombing of the 16th Street Baptist Church in Birmingham, Alabama, which killed four girls. Three decades later, cases of church arson rose sharply. In response, in 1995, President Bill Clinton also set up a church-arson investigative task force, and in 1996, Congress passed a law increasing the sentences for arsonists who target religious organizations, particularly for reasons of race or ethnicity. Between 1995 and 1999, Clinton's task force reported that it opened 827 investigations into burnings and bombings at houses of worship; it was later disbanded. In recent years, it's been harder to get a clear sense of the number of church fires across the country. The National Fire Protection Association reports that between 2007 and 2011, there were an average of 280 intentionally set fires at houses of worship in America each year, although a small percentage of those took place at other religious organizations, like funeral homes. One of the organization's staffers, Marty Ahrens, said that tracking church arson has become much more complicated since reporting standards changed in the late '90s. Sometimes, fires that are reported to the National Fire Incident Reporting System are considered "suspicious," but they can't be reported as arson until they're definitively ruled "intentional." Even then, it's difficult to determine what motivated an act of arson. "To know that something is motivated by hate, you either have to know who did it or they have to leave you a message in some way that makes it very obvious," she said. "There are an awful lot of [intentionally set fires] that are not hate crimes—they're run-of-the-mill kids doing stupid things." The investigations in North Carolina, Georgia, South Carolina, Florida, Ohio, and Tennessee are still ongoing, and they may end up in that broad category of fires of suspicious, but ultimately unknowable, origin that Ahrens described. But no matter why they happened, these fires are a troubling reminder of the vulnerability of our sacred institutions in the days following one of the most violent attacks on a church in recent memory. It's true that a stupid kid might stumble backward into one of the most symbolically terrifying crimes possible in the United States, but that doesn't make the terror of churches burning any less powerful.

What has the government done in response to this rise in terrorism? Nothing. Now, the aff calls to decrease domestic surveillance, making any chance of involving federal authorities to investigate who these terrorists are impossible. The burning of Black churches in the south necessitates an increase of domestic surveillance in order to prevent future horrific attacks.

Deirdre Griswold, 7-14-2015, "As Black churches burn, where are the feds?," Workers World, <http://www.workers.org/articles/2015/06/29/as-black-churches-burn-where-are-the-feds/>

As of June 29, six Black churches in the South have either been destroyed or suffered severe damage from fires since Charleston. At least three are confirmed to have been caused by arson, according to the Southern Poverty Law Center. The loss to the people of these communities comes to hundreds of thousands of dollars. Worse, the torchings are a threat of further violence to a people whose painful history at the hands of white exploiters still resonates so strongly. The first burning deemed by fire marshals to be arson destroyed the College Hills Seventh Day Adventist Church in Knoxville, Tenn., on June 22. The Knoxville fire department said the arsonist set multiple fires on the church's property. The church's van was also burned. The very next day, a fire in the sanctuary of God's Power Church of Christ in Macon, Ga., was also blamed on arson. And the day after that, a fire was deliberately set at the Briar Creek Baptist Church in Charlotte, N.C., that destroyed an education wing meant to house a summer program for children. The

gymnasium and sanctuary burned, causing an estimated \$250,000 in damage. That same week, three other Southern Black churches — in Tennessee, Florida and South Carolina — also suffered fires, although two may have had natural causes. Investigations are continuing. After what happened in Charleston, S.C., there can be little doubt that the arson fires were set by white supremacists, whose outpourings of hate in print and on the Internet call again and again for violence against people of color, using at best flimsily disguised language and at worst the vilest and most degrading terms. One might think that mass murder of the type that happened in Charleston would immediately lead to arrests of those advocating race war against Black people. We have seen many examples in recent years of elaborate sting operations set up by the FBI and local police authorities to ensnare Black militants on charges of plotting terrorist acts — which government agents had encouraged and facilitated. But just as with the murders of the three civil rights workers in 1964 — James Chaney, Andrew Goodman and Michael Schwerner — by members of the Ku Klux Klan, the authorities have not intervened to stop such attacks, even though it is logical to assume that, in this day and age of wide surveillance, they have knowledge of them.

Although before Charleston, the FBI and NSA were not doing enough to fight right-wing terrorism, after the recent increase in attacks, the focus has shifted to fight right-wing and white supremacist extremists.

Jaeah Lee, 6-17-2015, "The Rise Of Violent Right-Wing Extremism, Explained," Mother Jones, <http://www.motherjones.com/politics/2015/06/right-wing-extremism-explainer-charleston-mass-shooting-terrorism>

The federal and local governments ramped up efforts to combat domestic terrorism of all kinds in the wake of the 1995 Oklahoma City bombing that killed 168 people. A few months following the 9/11 attacks, FBI official Dale Watson testified before the Senate Intelligence Committee that "right-wing groups continue to represent a serious terrorist threat." But Johnson, German, and others assert that federal counterterrorism programs since 9/11 have focused overwhelmingly on the perceived threat from Islamic extremism. That includes the Obama administration's "countering violent extremism" strategy, which "revolves around impeding the radicalization of violent jihadists," according to a 2014 Congressional Research Service report. The attack in Charleston underscored "the failure of the federal government to keep closer tabs" on right-wing extremists, argues Gerald Horne, a historian and civil rights activist at the University of Houston. But the focus may soon increase. In February, CNN reported that DHS circulated an intelligence assessment that focused on the domestic terror threat posed by right-wing extremists. Kurzman and Schanzer also point to a handout from a training program sponsored by the Department of Justice, cautioning that the threat from antigovernment extremism "is real."

As the aff calls for a decrease in surveillance of white terrorists, justifying the murder of black people and destruction of black religious sites, they ignore the unwarranted, unjust surveillance of Black and Brown people used by local police departments to further structural racism and criminalize people of color.

Malkia Amala Cyril, 4-1-2015, "Black America's State of Surveillance," The Progressive Inc., <http://www.progressive.org/news/2015/03/188074/black-americas-state-surveillance>

Ten years ago, on Martin Luther King Jr.'s birthday, my mother, a former Black Panther, died from complications of sickle cell anemia. Weeks before she died, the FBI came knocking at our door, demanding that my mother testify in a secret trial proceeding against other former Panthers or face arrest. My mother, unable to walk, refused. The detectives told my mother as they left that they would be watching her. They didn't get to do that. My mother died just two weeks later. My mother was not the only black person to come under the watchful eye of American law enforcement for perceived and actual dissidence. Nor is dissidence always a requirement for being subject to spying. Files obtained during a break-in at an FBI office in 1971 revealed that African Americans, J. Edgar Hoover's largest target group, didn't have to be perceived as dissident to warrant surveillance. They just had to be black. As I write this, the same philosophy is driving the increasing adoption and use of surveillance technologies by local law enforcement agencies across the United States. Today, media reporting on government surveillance is laser-focused on the revelations by Edward Snowden that millions of Americans were being spied on by the NSA. Yet my mother's visit from the FBI reminds me that, from the slave pass system to laws that deputized white civilians as enforcers of Jim Crow, black people and other people of color have lived for centuries with surveillance practices aimed at maintaining a racial hierarchy. It's time for journalists to tell a new story that does not start the clock when privileged classes learn they are targets of surveillance. We need to understand that data has historically been overused to repress dissidence, monitor perceived criminality, and perpetually maintain an impoverished underclass. In an era of big data, the Internet has increased the speed and secrecy of data collection. Thanks to new surveillance technologies, law enforcement agencies are now able to collect massive amounts of indiscriminate data. Yet legal protections and policies have not caught up to this technological advance. Concerned advocates see mass surveillance as the problem and protecting privacy as the goal. Targeted surveillance is an obvious answer—it may be discriminatory, but it helps protect the privacy perceived as an earned privilege of the inherently innocent. The trouble is, targeted surveillance frequently includes the indiscriminate collection of the private data of people targeted by race but not involved in any crime. For targeted communities, there is little to no expectation of privacy from government or corporate surveillance. Instead, we are watched, either as criminals or as consumers. We do not expect policies to protect us. Instead, we've birthed a complex and coded culture—from jazz to spoken dialects—in order to navigate a world in which spying, from AT&T and Walmart to public benefits programs and beat cops on the block, is as much a part of our built environment as the streets covered in our blood. In a recent address, New York City Police Commissioner Bill Bratton made it clear: "2015 will be one of the most significant years in the history of this organization. It will be the year of technology, in which we literally will give to every member of this department technology that would've been unheard of even a few years ago." Predictive policing, also known as "Total Information Awareness," is described as using

advanced technological tools and data analysis to “preempt” crime. It utilizes trends, patterns, sequences, and affinities found in data to make determinations about when and where crimes will occur. This model is deceptive, however, because it presumes data inputs to be neutral. They aren’t. In a racially discriminatory criminal justice system, surveillance technologies reproduce injustice. Instead of reducing discrimination, predictive policing is a face of what author Michelle Alexander calls the “New Jim Crow”—a de facto system of separate and unequal application of laws, police practices, conviction rates, sentencing terms, and conditions of confinement that operate more as a system of social control by racial hierarchy than as crime prevention or punishment. In New York City, the predictive policing approach in use is “Broken Windows.” This approach to policing places an undue focus on quality of life crimes—like selling loose cigarettes, the kind of offense for which Eric Garner was choked to death. Without oversight, accountability, transparency, or rights, predictive policing is just high-tech racial profiling—indiscriminate data collection that drives discriminatory policing practices. As local law enforcement agencies increasingly adopt surveillance technologies, they use them in three primary ways: to listen in on specific conversations on and offline; to observe daily movements of individuals and groups; and to observe data trends. Police departments like Bratton’s aim to use sophisticated technologies to do all three. They will use technologies like license plate readers, which the Electronic Frontier Foundation found to be disproportionately used in communities of color and communities in the process of being gentrified. They will use facial recognition, biometric scanning software, which the FBI has now rolled out as a national system, to be adopted by local police departments for any criminal justice purpose. They intend to use body and dashboard cameras, which have been touted as an effective step toward accountability based on the results of one study, yet storage and archiving procedures, among many other issues, remain unclear. They will use Stingray cellphone interceptors. According to the ACLU, Stingray technology is an invasive cellphone surveillance device that mimics cellphone towers and sends out signals to trick cellphones in the area into transmitting their locations and identifying information. When used to track a suspect’s cellphone, they also gather information about the phones of countless bystanders who happen to be nearby. The same is true of domestic drones, which are in increasing use by U.S. law enforcement to conduct routine aerial surveillance. While drones are currently unarmed, drone manufacturers are considering arming these remote-controlled aircraft with weapons like rubber bullets, tasers, and tear gas. They will use fusion centers. Originally designed to increase interagency collaboration for the purposes of counterterrorism, these have instead become the local arm of the intelligence community. According to Electronic Frontier Foundation, there are currently seventy-eight on record. They are the clearinghouse for increasingly used “suspicious activity reports”—described as “official documentation of observed behavior reasonably indicative of pre-operational planning related to terrorism or other criminal activity.” These reports and other collected data are often stored in massive databases like e-Verify and Prism. As anybody who’s ever dealt with gang databases knows, it’s almost impossible to get off a federal or state database, even when the data collected is incorrect or no longer true. Predictive policing doesn’t just lead to racial and religious profiling—it relies on it. Just as stop and frisk legitimized an initial, unwarranted contact between police and people of color, almost 90 percent of whom turn out to be innocent of any crime, suspicious activities reporting and the dragnet approach of fusion centers target communities of color. One review of such reports collected in Los Angeles shows approximately

75 percent were of people of color. This is the future of policing in America, and it should terrify you as much as it terrifies me. Unfortunately, it probably doesn't, because my life is at far greater risk than the lives of white Americans, especially those reporting on the issue in the media or advocating in the halls of power. One of the most terrifying aspects of high-tech surveillance is the invisibility of those it disproportionately impacts. The NSA and FBI have engaged local law enforcement agencies and electronic surveillance technologies to spy on Muslims living in the United States. According to FBI training materials uncovered by Wired in 2011, the bureau taught agents to treat "mainstream" Muslims as supporters of terrorism, to view charitable donations by Muslims as "a funding mechanism for combat," and to view Islam itself as a "Death Star" that must be destroyed if terrorism is to be contained. From New York City to Chicago and beyond, local law enforcement agencies have expanded unlawful and covert racial and religious profiling against Muslims not suspected of any crime. There is no national security reason to profile all Muslims. At the same time, almost 450,000 migrants are in detention facilities throughout the United States, including survivors of torture, asylum seekers, families with small children, and the elderly. Undocumented migrant communities enjoy few legal protections, and are therefore subject to brutal policing practices, including illegal surveillance practices. According to the Sentencing Project, of the more than 2 million people incarcerated in the United States, more than 60 percent are racial and ethnic minorities. But by far, the widest net is cast over black communities. Black people alone represent 40 percent of those incarcerated. More black men are incarcerated than were held in slavery in 1850, on the eve of the Civil War. Lest some misinterpret that statistic as evidence of greater criminality, a 2012 study confirms that black defendants are at least 30 percent more likely to be imprisoned than whites for the same crime. This is not a broken system, it is a system working perfectly as intended, to the detriment of all. The NSA could not have spied on millions of cellphones if it were not already spying on black people, Muslims, and migrants. As surveillance technologies are increasingly adopted and integrated by law enforcement agencies today, racial disparities are being made invisible by a media environment that has failed to tell the story of surveillance in the context of structural racism. Reporters love to tell the technology story. For some, it's a sexier read. To me, freedom from repression and racism is far sexier than the newest gadget used to reinforce racial hierarchy. As civil rights protections catch up with the technological terrain, reporting needs to catch up, too. Many journalists still focus their reporting on the technological trends and not the racial hierarchies that these trends are enforcing. Martin Luther King Jr. once said, "Everything we see is a shadow cast by that which we do not see." Journalists have an obligation to tell the stories that are hidden from view. We are living in an incredible time, when migrant activists have blocked deportation buses, and a movement for black lives has emerged, and when women, queer, and trans experiences have been placed right at the center. The decentralized power of the Internet makes that possible. But the Internet also makes possible the high-tech surveillance that threatens to drive structural racism in the twenty-first century. We can help black lives matter by ensuring that technology is not used to cement a racial hierarchy that leaves too many people like me dead or in jail. Our communities need partners, not gatekeepers. Together, we can change the cultural terrain that makes killing black people routine. We can counter inequality by ensuring that both the technology and the police departments that use it are democratized. We can change the story on surveillance to raise the voices of those who have been left out. There are no voiceless people, only those that

ain't been heard yet. Let's birth a new norm in which the technological tools of the twenty-first century create equity and justice for all—so all bodies enjoy full and equal protection, and the Jim Crow surveillance state exists no more.

Anti-black terror at the hand of white supremacist groups is THE biggest threat to U.S. national security. It did not end with the Jim Crow South, but as we have seen in Charleston, is an ongoing concern.

Julia Craven, 6-24-2015, "White Supremacists More Dangerous Than Foreign Terrorists: Study," Huffington Post, http://www.huffingtonpost.com/2015/06/24/domestic-terrorism-charleston_n_7654720.html

Nine people were added to a long list of lives taken by domestic terrorism when Dylann Roof allegedly began shooting inside a historic black church in Charleston, South Carolina, on June 17. At least 48 people have been killed stateside by right-wing extremists in the 14 years since since the September 11 attacks -- almost twice as many as were killed by self-identified jihadists in that time, according to a study released Wednesday by the New America Foundation, a Washington, D.C., research center. The study found that radical anti-government groups or white supremacists were responsible for most of the terror attacks. The data counters many conventional thoughts on what terrorism is and isn't. Since Sept. 11, many Americans attribute terror attacks to Islamic extremists instead of those in the right wing. But the numbers don't back up this popular conception, said Charles Kurzman, a professor at the University of North Carolina at Chapel Hill. Kurzman is co-authoring a study with David Schanzer of Duke University, set to be published Thursday, that asks police departments to rank the three biggest threats from violent extremism in their jurisdiction. Law enforcement agencies reported they were more concerned about the activities of right-wing extremist groups than Islamic extremists in their jurisdictions (about 74 percent versus 39 percent) due to the "menacing" rhetoric used by some of these groups -- and that they were training officers to take caution when they saw signs of potentially violent individuals, Kurzman and Schanzer found. "Muslim extremism was taken seriously in many of these jurisdictions that we surveyed... but overall, they did not see as much of an issue with Muslim extremism as with right-wing extremism in their locations," Kurzman told The Huffington Post. He added that it's hard to get a definitive statistical picture of plots and acts of violent extremism since that definition tends to vary and data for incidents nationwide is hard to come by. The accused Charleston shooter is currently being investigated under domestic terrorism charges by the Department of Justice -- a move that acknowledges the long history of anti-black terrorist attacks. America's first federal anti-terrorism law, known as the Third Force Act or the Ku Klux Klan Act, which was passed by Congress in 1871, caused nine counties in South Carolina to be placed under martial law and led to thousands of arrests. The Supreme Court ruled the law unconstitutional in 1882. David Pilgrim, the founder and director of the Jim Crow Museum at Ferris State University, told HuffPost in February that the actions of foreign extremist groups are no better or worse than the historic violence against African-Americans by domestic actors. "There's nothing you're going to see today that's not going to have already occurred in the U.S.," he said. "If you think of these groups that behead now -- first of all, beheading is barbaric but it's no more or less barbaric than some of the lynchings that occurred in the U.S." Pilgrim said he found it offensive that, after Sept. 11, some Americans bemoaned that terrorism had finally breached U.S. borders. "That is ignoring and trivializing -- if

not just summarily dismissing -- all the people, especially the peoples of color in this country, who were lynched in this country; who had their homes bombed in this country; who were victims of race riots," he said evoking lynching victims who were often burned, castrated, shot, stabbed -- and in some cases beheaded. And while most officially acknowledged anti-black terrorism cases occurred during the eras of slavery, Reconstruction and Jim Crow, as recent news demonstrate, this type of terrorism is still an ongoing concern.

Turns Case

Terrorism is used as a justification for increased surveillance – empirics prove and turns case

Haggerty and Gazso 2005 (Kevin, Professor of Criminology and Sociology at the University of Alberta; Amber, Associate Professor in the Department of Sociology at York University, *The Canadian Journal of Sociology / Cahiers canadiens de sociologie*, Vol. 30, No. 2 (Spring, 2005), pp. 169-187 "Seeing beyond the Ruins: Surveillance as a Response to Terrorist Threats" JSTOR; accessed 7/17/15 JH @ DDI)

A climate of fear and anxiety helped ease the passage of such laws (Davis, 2001). However, a great deal of organizational opportunism was also at work. Many of the surveillance proposals adopted in the days after the attack were recycled from earlier legislative efforts. In previous incarnations these proposals had often been legitimated as essential for the international "war on drugs" or to address other crimes, such as money laundering. The September 11 th attacks gave the authorities a new and apparently unassailable legitimation for long-standing legislative ambitions. Before the dust had settled on Manhattan, the security establishment had mobilized to expand and intensify their surveillance capabilities, justifying existing proposals as necessary tools to fight the new war against terrorism. Ultimately, the police, military and security establishment reaped an unanticipated windfall of increased funding, new technology and loosened legislative constraints by strategically invoking fears of future attacks. There are several examples of such opportunism. Since at least 1999, when Congress initially turned down their request, the U.S. Justice Department has lobbied for the development of new "secret search" provisions. Likewise, prior to the attacks, the FBI and the National Telecommunications and Information Systems Security Committee had a lengthy shopping list of desired surveillance-related measures including legal enhancements to their wiretapping capabilities, legal constraints on the public use of cryptography, and provisions for governmental agents to compel Internet service providers to provide information on their customers (Burnham, 1997). All of these proposals were recycled and implemented after the September 11th attacks now justified as integral tools in the "war on terrorism." New provisions requiring banks to exercise "due diligence" in relation to their large depositors were originally justified by the authorities as a means to counter the "war on drugs." The opportunism of many of these efforts was inadvertently revealed by an RCMP Sergeant when, during a discussion about new official antiterrorism powers to monitor financial transactions, he noted that: "We've been asking for something like this for four years. It's really our best weapon against biker gangs" [emphasis added] (Corcan, 2001). In Canada, the Federal Privacy Commissioner was particularly alarmed by the development of what he referred to as a "Big Brother database." This amounts to a detailed computerized record of information about Canadian travelers. Although justified as a means to counter terrorism, the data will be made available to other government departments for any purpose they deem appropriate. Such provisions raise the specter of informational "fishing expeditions." Indeed, the Canadian government has already indicated that this ostensible anti-terrorist database will be used to help monitor tax evaders and catch domestic criminals. It will also be used to scrutinize an individual's travel history and destinations, in an effort to try and determine whether they might be a pedophile or money launderer (Radwanski, 2002). While these are laudable goals, they also reveal how a host of other surveillance agendas have been furthered by capitalizing on the new anti-terrorism discourse.

Lone wolf terror attacks are used to justify disproportionate increases in surveillance and military operations abroad

Lennard, Senior News Analyst for Vice News, 10/27/14 (Natasha Lennard, Brooklyn-based Senior News Analyst for Vice News, VICE News, October 27, 2014, "'Lone Wolf' Terrorist Acts Will Be Used to Justify the Surveillance State" <https://news.vice.com/article/lone-wolf-terrorist-acts-will-be-used-to-justify-the-surveillance-state>, accessed 7/17/15 JH @ DDI)

The phenomenon of individuals committing violent and murderous acts in the name of an ideology is nothing new in the US. The FBI's Operation Lone Wolf investigated white supremacists encouraging autonomous violent acts in the 1990s. Why, then, are we seeing pundits and politicians newly focus on the "lone wolf" category? There's no simple answer, but we can at the very least see that the old binary, distinguishing terror as the act of networked groups versus lone madman mass killings — a distinction that has tacitly undergirded post-9/11 conceptions of terrorism — doesn't serve the latest iteration of the war on terror. California Senator Dianne Feinstein, speaking on CNN's State of the Union on Sunday, suggested that "the Internet, as well as certain specific Muslim extremists, are really firing up this lone-wolf phenomenon." Whether intentionally or not, the Senate Intelligence Committee chair performed a lot of political work with that one comment. Crystallizing "lone wolves" as a key threat domestically helps legitimize the US's current military operation against the Islamic State in Iraq and Syria. With or without established connections, the Islamic State's far-reaching tentacles of online influence encouraging individuals worldwide cement the group as a threat to the homeland — which is always useful for politicians struggling to legally justify another protracted war. In this way, attributing attacks to homegrown "lone wolves" is more useful for current US political interests than attributing them to madness alone. The assumption that terror acts were always borne of connected networks problematically buoyed domestic counter-terror efforts that saw entire communities profiled as potential threats. Which is not to say that "lone wolf terrorist" is a flawed designation for attacks by ideologically motivated individuals. In many ways it seems apt, and any challenge is welcome to the all too basic distinction that imbues group terror with motive while dismissing individual acts as madness. The "lone wolf" straddles the ill-conceived gap between madman and terrorist node. It's an intersection all too complicated for the inept punditry of Fox News: "They are terrorist acts, to be sure," Megyn Kelly said about Canadian gunman Michael Zehaf-Bibeau, adding "but this guy was also a nutcase." Furthermore, the assumption that terror acts were always borne of connected networks problematically buoyed domestic counter-terror efforts that saw entire communities profiled as potential threats. Under the premise that terror networks ran like arteries through US Muslim communities enabled an era of profile-driven preemptive policing that has been nothing short of racist. Entire mosques in New York were designated terrorist organizations to enable police surveillance. The NSA's meta-data collections claim justifiability on the premise that terror was locatable by tracing networks of communication. The "lone wolf" phenomenon should at least prompt the questioning of the sort of profile-based counter-terror efforts that assumed terror lurked in any network of Muslims, and that the mass hoarding of communications data was vital to national security. However, the rhetoric surrounding this type of domestic threat already bodes ill for civil liberties. If the hunt for terrorist networks has been plagued by ethnic profiling and overreaching spycraft, an established threat of "lone wolf"

attacks gives a defensive imprimatur for unbounded NSA-style surveillance — anyone can wield a hatchet with ideological ire. As Chairman of the House Homeland Security Committee Michael McCaul said on This Week, finding such lone actors in advance of attacks is like "finding a needle in a haystack." And as Feinstein said the same day, "You have to be able to watch it, and you have to be able to disrupt them." As such, the era of the "lone wolf" terrorist does not only spell the end of the bunk distinction between motivated group and deranged individual. It ushers in the dawn of a new era of justification for our totalized state of surveillance and national security paranoia.

Surveillance would increase after a terrorist attack

Feaver 1/13/15

(Peter D., 1/13/15, Foreign Policy, "10 Lessons to Remember After a Terrorist Attack," Peter is a professor of political science and public policy and Bass Fellow @ Duke University, and director of the Triangle Institute for Security Studies and the Duke Program in American Grand Strategy, <http://foreignpolicy.com/2015/01/13/ten-lessons-to-remember-after-a-terrorist-attack/>, 7/16/15, SM)

In particular, it is striking how some of the things that were "obvious" in the days and weeks after 9/11, but then were gradually forgotten, have become obvious again:ð Terrorists succeed when they are abetted by intelligence failures. Or, put another way, terrorists only need to get lucky once to "succeed," whereas counterterrorism has to be lucky all the time to "succeed."ð Even robust intelligence and law enforcement may not guarantee 100 percent safety and security. By global standards — certainly by the standards of Western democracies — France has a particularly formidable counterterrorist structure. But it failed in this instance.ð When terrorists succeed in an attack, citizens demand that the government do more to protect them — even if they have already been doing a lot. And steps that would have seemed heavy handed before the attack, say aggressive surveillance of suspected terrorists or visible demonstrations of presence by the security forces, are deemed not just tolerable but necessary. Moreover, savvy political leaders will understand that one of the benefits of a stronger official response is that it is a hedge both against dangerously stronger vigilantism and also against additional pressure from some segments of the public to do more than is wise.

Terrorism leads to crackdowns

History.com, Reaction to 9/11, <http://www.history.com/topics/reaction-to-9-11>, 2010

"Today," the French newspaper Le Monde announced on September 12, 2001, "we are all Americans." People around the world agreed: The terrorist attacks of the previous day had felt like attacks on everyone, everywhere. They provoked an unprecedented expression of shock, horror, solidarity and sympathy for the victims and their families. Citizens of 78 countries died in New York, Washington, D.C., and Pennsylvania on September 11, and people around the world mourned lost friends and neighbors. They held candlelight vigils. They donated money and goods to the Red Cross and other rescue and relief organizations. Flowers piled up in front of American embassies. Cities and countries commemorated the attacks in a variety of ways: The Queen Mother sang the American national anthem at Buckingham Palace's Changing of the

Guard, while in Brazil, Rio de Janeiro put up huge billboards that showed the city's famous Christ the Redeemer statue embracing the New York City skyline. Meanwhile, statesmen and women rushed to condemn the attacks and to offer whatever aid they could to the United States. Russian president Vladimir Putin called the strikes "a blatant challenge to humanity," while German chancellor Gerhard Schroeder declared that the events were "not only attacks on the people in the United States, our friends in America, but also against the entire civilized world, against our own freedom, against our own values, values which we share with the American people." He added, "We will not let these values be destroyed." Canadian Prime Minister Jean Chretien denounced the "cowardly and depraved assault." He tightened security along the border and arranged for hundreds of grounded airplanes to land at Canadian airports. Even leaders of countries that did not tend to get along terribly well with the American government expressed their sorrow and dismay. The Cuban foreign minister offered airspace and airports to American planes. Chinese and Iranian officials sent their condolences. And the Palestinian leader Yasser Arafat, visibly dismayed, told reporters in Gaza that the attacks were "unbelievable, unbelievable, unbelievable." "We completely condemn this very dangerous attack," he said, "and I convey my condolences to the American people, to the American president and to the American administration." But public reaction was mixed. The leader of the Islamic militant group Hamas announced that "no doubt this is a result of the injustice the U.S. practices against the weak in the world." Likewise, people in many different countries believed that the attacks were a consequence of America's cultural hegemony, political meddling in the Middle East and interventionism in world affairs. The Rio billboards hadn't been up for long before someone defaced them with the slogan "The U.S. is the enemy of peace." Some, especially in Arab countries, openly celebrated the attacks. But most people, even those who believed that the United States was partially or entirely responsible for its own misfortune, still expressed sorrow and anger at the deaths of innocent people. On September 12, the 19 ambassadors of the North Atlantic Treaty Organization (NATO) declared that the attack on the United States was an attack on all of the member nations. This statement of solidarity was mostly symbolic—NATO did not authorize any specific military action—but it was still unprecedented. It was the first time that the organization had ever invoked the mutual defense section of its charter (intended to protect vulnerable European nations from Soviet invasion during the Cold War). NATO eventually sent five airplanes to help keep an eye on American airspace. Likewise, on September 12 the United Nations Security Council called on all nations to "redouble their efforts" to thwart and prosecute terrorists. Two weeks later, it passed another resolution that urged states to "suppress the financing of terrorism" and to aid in any anti-terrorism campaigns. But these declarations of support and solidarity didn't mean that other countries gave the United States a free hand to retaliate however, and against whomever, it pleased. Allies and adversaries alike urged caution, warning that an indiscriminate or disproportionate reaction could alienate Muslims around the world. In the end, almost 30 nations pledged military support to the United States, and many more offered other kinds of cooperation. Most agreed with George Bush that, after September 11, the fight against terrorism was "the world's fight."

Terrorism -DDIx

Risk of terrorism is low now because of communications surveillance

Lewis 14 (senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies)

(James Andrew, Underestimating Risk in the Surveillance Debate, http://csis.org/files/publication/141209_-Lewis_UnderestimatingRisk_Web.pdf)

There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences.

A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia.

Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces. The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems, nationally and in cooperation with others, including the United States, to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new "front" for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets.

The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational difficulties. These attacks are the threat that mass surveillance was created to prevent. The needed reduction in public anti-terror measures without increasing the chances of successful attack is contingent upon maintaining the capability provided by communications surveillance to detect, predict, and prevent attacks. Our opponents have not given up; neither should we.

The plan is wishful thinking that eliminates the ONLY and MOST POWERFUL tool that the US has against terrorism

Lewis 14 (senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies)

(James Andrew, Underestimating Risk in the Surveillance Debate, http://csis.org/files/publication/141209_-_Lewis_UnderestimatingRisk_Web.pdf)

The echoes of September 11 have faded and the fear of attack has diminished. We are reluctant to accept terrorism as a facet of our daily lives, but major attacks—roughly one a year in the last five years—are regularly planned against U.S. targets, particularly passenger aircraft and cities. America's failures in the Middle East have spawned new, aggressive terrorist groups. These groups include radicalized recruits from the West—one estimate puts the number at over 3,000—who will return home embittered and hardened by combat. Particularly in Europe, the next few years will see an influx of jihadis joining the existing population of homegrown radicals, but the United States itself remains a target.

America's size and population make it is easy to disappear into the seams of this sprawling society. Government surveillance is, with one exception and contrary to cinematic fantasy, limited and disconnected. That exception is communications surveillance, which provides the best and perhaps the only national-level solution to find and prevent attacks against Americans and their allies. Some of the suggestions for alternative approaches to surveillance, such as the recommendation that NSA only track "known or suspected terrorists," reflect both deep ignorance and wishful thinking. It is the unknown terrorist who will inflict the greatest harm. This administration could reasonably argue that everything it has done is legal and meets existing requirements for oversight, but this defense is universally perceived as legalistic hairsplitting. If the government can be faulted, it is for obsessive secrecy. The public debate over NSA's surveillance programs routinely exaggerates risks and errors, 1 but in the absence of a compelling official narrative, the space was filled with conjecture and distortion. This has not helped a crucial debate where a wrong answer could mean more bombings.

Terrorism guarantees extinction

Hellman, Stanford Engineering Prof, 8

[Martin E., emeritus prof of engineering at Stanford, Spring 2008, "Risk Analysis of Nuclear Deterrence" accessed 5-28-14, <http://www.nuclearrisk.org/paper.pdf>, hec)

The threat of nuclear terrorism looms much larger in the public's mind than the threat of a full-scale nuclear war, yet this article focuses primarily on the latter. An explanation is therefore in order before proceeding. A **terrorist attack involving a nuclear weapon would be a catastrophe** of immense proportions: "A 10-kiloton bomb detonated at Grand Central Station on a typical work day would likely kill some half a million people, and inflict over a trillion dollars in direct economic damage. America and its way of life would be changed forever." [Bunn 2003, pages viii-ix]. **The likelihood of such** an attack **is** also **significant**. Former Secretary of Defense William Perry has estimated the chance of a nuclear terrorist incident within the next decade to be roughly 50 percent [Bunn 2007, page 15]. David Albright, a former weapons inspector in Iraq, estimates those odds at less than one percent, but notes, "We would never accept a situation where the chance of a major nuclear accident like Chernobyl would be anywhere near 1% ... A nuclear terrorism attack is a low-probability event, but we can't live in a world where it's anything but extremely low-probability." [Hegland 2005]. In a survey of 85 national security experts, Senator Richard Lugar found a median estimate of 20 percent for the "probability of an attack involving a nuclear explosion occurring somewhere in the world in the next 10 years," with 79 percent of the respondents believing "it more likely to be carried out by terrorists" than by a government [Lugar 2005, pp. 14-15]. I support increased efforts to reduce the threat of nuclear terrorism, but that is not inconsistent with the approach of this article. Because **terrorism is one of the potential trigger mechanisms for a full-scale nuclear war**, the risk analyses proposed herein will include estimating the risk of nuclear terrorism as one component of the overall risk. If that risk, the overall risk, or

both are found to be unacceptable, then the proposed remedies would be directed to reduce whichever risk(s) warrant attention. Similar remarks apply to a number of other threats (e.g., nuclear war between the U.S. and China over Taiwan). This article would be incomplete if it only dealt with the threat of nuclear terrorism and neglected the threat of full-scale nuclear war. If both risks are unacceptable, an effort to reduce only the terrorist component would leave humanity in great peril. In fact, society's almost total neglect of the threat of full-scale nuclear war makes studying that risk all the more important. The cost of World War III The danger associated with nuclear deterrence depends on both the cost of a failure and the failure rate.³ This section explores the cost of a failure of nuclear deterrence, and the next section is concerned with the failure rate. While other definitions are possible, this article defines a **failure of deterrence to mean a full-scale exchange** of all nuclear weapons available to the U.S. and Russia, **an event that will be termed World War III.** Approximately 20 million people died as a result of the first World War. World War II's fatalities were double or triple that number—chaos prevented a more precise determination. In both cases humanity recovered, and the world today bears few scars that attest to the horror of those two wars. Many people therefore implicitly believe that a third World War would be horrible but survivable, an extrapolation of the effects of the first two global wars. In that view, World War III, while horrible, is something that humanity may just have to face and from which it will then have to recover. In contrast, some of those most qualified to assess the situation hold a very different view. In a 1961 speech to a joint session of the Philippine Congress, General Douglas MacArthur, stated, "Global war has become a Frankenstein to destroy both sides. ... If you lose, you are annihilated. If you win, you stand only to lose. No longer does it possess even the chance of the winner of a duel. It contains now only the germs of double suicide." Former Secretary of Defense Robert McNamara expressed a similar view: "If deterrence fails and conflict develops, the present U.S. and NATO strategy carries with it a high risk that Western civilization will be destroyed" [McNamara 1986, page 6]. More recently, George Shultz, William Perry, Henry Kissinger, and Sam Nunn⁴ echoed those concerns when they quoted President Reagan's belief that nuclear weapons were "totally irrational, totally inhumane, good for nothing but killing, possibly destructive of life on earth and civilization." [Shultz 2007] Official studies, while couched in less emotional terms, still convey the horrendous toll that World War III would exact: "The resulting deaths would be far beyond any precedent. Executive branch calculations show a range of U.S. deaths from 35 to 77 percent (i.e., 79-160 million dead) ... a change in targeting could kill somewhere between 20 million and 30 million additional people on each side These calculations reflect only deaths **during the first 30 days.** Additional millions would be injured, and many would eventually die from lack of adequate medical care ... millions of people might starve or freeze during the following winter, but it is not possible to estimate how many. ... further millions ... might eventually die of latent radiation effects." [OTA 1979, page 8] This OTA report also noted the possibility of serious ecological damage [OTA 1979, page 9], a concern that assumed a new potentiality when the TTAPS report [TTAPS 1983] proposed that the ash and dust from so many nearly simultaneous **nuclear explosions** and their resultant firestorms **could usher in a nuclear winter that might erase homo sapiens from the face of the earth,** much as many scientists now believe the K-T Extinction that wiped out the dinosaurs resulted from an impact winter caused by ash and dust from a large asteroid or comet striking Earth. The TTAPS report produced a heated debate, and there is still no scientific consensus on whether a nuclear winter would follow a full-scale nuclear war. Recent work [Robock 2007, Toon 2007] suggests that even a limited nuclear exchange or one between newer nuclear-weapon states, such as India and Pakistan, could have devastating long-lasting climatic consequences due to the large volumes of smoke that would be generated by fires in modern megacities. While it is uncertain how destructive World War III would be, prudence dictates that we apply the same engineering conservatism that saved the Golden Gate Bridge from collapsing on its 50th anniversary and assume that preventing World War III is a necessity—not an option.

****Uniqueness****

Terror Threat High

Terrorist threats are high now – an attack on the US is likely and intelligence is critical

Collins 5/10/15 (Eliza, writer for Politico, "Mike McCaul Warns of Growing Us Terrorist Threat")

More people are being recruited by terrorist groups than the FBI estimates, the chairman of the House Homeland Security Committee said on Sunday.¶ FBI Director James Comey said last week that hundreds, maybe thousands of people, are being recruited on encrypted websites that the FBI can't penetrate to carry out attacks in the U.S.¶ "We have this phenomenon in the United States where they can be activated by the Internet. Really, terrorism has gone viral," Rep. Mike McCaul (R-Texas) said on "Fox News Sunday."¶ The Texas shooting was a textbook case of law enforcement intercepting a threat, McCaul said, but homegrown terrorism is nonetheless difficult to stop.¶ Late last week, the U.S. raised the threat level at all U.S. military bases.¶ "This threat is like finding a needle in the haystack sometimes - and it's going to get worse, not better," McCaul warned.

The threat is increasing – recruiting levels are high and the likelihood of a homegrown attack is huge

VOA News 5/11/15 (Homeland Security Chief: Global Terror Threat Has Entered 'New Phase')

Appearing on the Fox News Sunday broadcast from Paris, Congressman Michael McCaul, chairman of the House Homeland Security Committee, said there has been an uptick in threat streams against local police and military bases.¶ "We're seeing these on an almost daily basis. It's very concerning. I'm over here with the French counter-terrorism experts on the Charlie Hebdo case, how we can stop foreign fighters coming out of Iraq and Syria to Europe. But then, we have this phenomenon in the United States where they (terrorists) can be activated by the Internet. And, really, terrorism has gone viral," said McCaul.¶ McCaul said the potential terror threat may even be greater than the FBI has outlined. He said the United States faces two threats: one from fighters coming out of the Middle East and the other from thousands at home who will take up the call to arms when the IS group sends out an Internet message. He warned the threat will only get worse, largely because of the existence of so many failed states in the Middle East and North Africa.

The likelihood of a lone wolf attack is growing

Zenko 5/19/15 (Micah, Council on Foreign Relations, "Is US Foreign Policy Ignoring Homegrown Terrorists?")

On February 12, National Counterterrorism Center Director Nicholas Rasmussen told the Senate Select Committee on Intelligence:¶ "We face a much greater, more frequent, recurring threat from lone offenders and probably loose networks of individuals. Measured in terms of frequency and numbers, it is attacks from those sources that are increasingly the most noteworthy..."¶ On February 26, during the annual worldwide threats hearing, Director of National Intelligence James Clapper warned:¶ "Home-grown violent extremists continue to pose the most likely threat to the homeland."¶ Last Friday, Secretary of Homeland Security Jeh Johnson stated on MSNBC:¶ "We're in a new phase...in the global terrorist threat where, because of effective use of social media, the Internet, by ISIL, al-Qaeda, we have to be concerned about the independent actor who is here in the homeland who may strike with little or no warning..."¶ Finally, yesterday, former CIA deputy director Michael Morell described the messaging efforts of jihadist groups generally and the self-declared Islamic State (IS) more specifically:¶ "Their narrative is pretty powerful: The West, the United States, the modern world, is a significant threat to their religion. Their answer to that is to establish a caliphate. And they are being attacked by the U.S. and other Western

nations, and by these apostate regimes in the region. Because they are being attacked they need support in two ways; people coming to fight for them, and people coming to stand up and attack coalition nations in their home.”¶ In summary, the most likely—though not most lethal—terror threats to Americans come from individuals living within the United States who are partially motivated to undertake self-directed attacks based upon their perception that the United States and the West are at war with the Muslim world.

Intelligence Increasing

US surveillance is increasing to deal with new terrorist threats

Bennett 5/18/15 (Brian, Washington based reporter for the LA Times, "White House Steps Up Warning About Terrorism on US Soil")

Alarmed about the growing threat from Islamic State, the Obama administration has dramatically stepped up warnings of potential terrorist attacks on American soil after several years of relative calm.¶ Behind the scenes, U.S. authorities have raised defenses at U.S. military bases, put local police forces on alert and increased surveillance at the nation's airports, railroads, shopping malls, energy plants and other potential targets.¶ Driving the unease are FBI arrests of at least 30 Americans on terrorism-related charges this year in an array of "lone wolf" plots, none successful, but nearly all purportedly inspired by Islamic State propaganda or appeals.¶ The group's leader, Abu Bakr Baghdadi, drove home the danger in a 34-minute audio recording released online Thursday. He urged Muslims everywhere to "migrate to the Islamic State or fight in his land, wherever that may be."¶ It is pretty easy for [Islamic State] to reach out to a very large number of people using a very robust social media presence. I suspect we should see more plots going forward.¶ - J.M. Berger, a nonresident fellow at the Brookings Institution¶ The audio was released with translations in English, French, German, Russian and Turkish, signaling the militants' increasingly ambitious attempts to draw new recruits — and to spark violence — around the world.¶ U.S. officials estimate the Sunni Muslim group has drawn 22,000 foreign fighters to Syria and Iraq, including about 3,700 from Western nations. About 180 Americans have gone, or tried to go.¶ U.S. counter-terrorism officials initially viewed Islamic State as primarily a regional security threat, focused on expanding and protecting its self-proclaimed Islamist caliphate in Syria and Iraq, rather than launching attacks abroad.¶ But the analysis has shifted sharply as gunmen inspired by the group, but not controlled or assisted by them, opened fire at the Parliament in Ottawa; at a cafe in Sydney, Australia; at a kosher grocery in Paris; and, on May 3, in Garland, Texas.¶ In the Texas case, two would-be terrorists apparently prompted by Islamic State social media messages tried to shoot their way into a provocative contest for caricatures of the prophet Muhammad. Both gunmen were shot to death, and no one else was killed. Islamic State later claimed responsibility for the assault, the first time it has done so for an attack on U.S. soil.¶ James B. Comey, the FBI director, warned this month that "hundreds, maybe thousands" of Americans are seeing recruitment pitches from Islamic State on Facebook, Twitter and other social media, as well as messages sent to smartphones of "disturbed people" who could be pushed to attack U.S. targets.¶ "It's like the devil sitting on their shoulders saying, 'Kill, kill, kill,'" Comey told reporters.¶ The United States has entered a "new phase, in my view, in the global terrorist threat," Jeh Johnson, director of Homeland Security, said Friday on MSNBC.¶ "We have to be concerned about the independent actor, and the independent actor who is here in the homeland who may strike with little or no warning," he said. "The nature of the global terrorist threat has evolved."¶ That poses a special challenge for U.S. intelligence and law enforcement agencies, which spent years desperately trying to penetrate and understand Al Qaeda's rigid hierarchy and top-down approach to terrorism.¶ Now they are struggling to detect and prevent lethal attacks by individuals — such as the April 2013 bombing of the Boston Marathon by two Russian-born brothers — with little or no outside communication or support.¶ The administration has sought to stiffen homeland defenses, and intelligence gathering, in response.

****Links****

2NC Link Framer

Broad NSA access to US data is crucial to preventing terrorist attacks in the US – their authors vastly underestimate the probability of attack. You need to evaluate link through a very high probability of attempted attack

Lewis 14 (senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies)

(James Andrew, Underestimating Risk in the Surveillance Debate, http://csis.org/files/publication/141209_-_Lewis_UnderestimatingRisk_Web.pdf)

Americans are reluctant to accept terrorism is part of their daily lives, but attacks have been planned or attempted against American targets (usually airliners or urban areas) almost every year since 9/11. Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq. The threat of attack is easy to exaggerate, but that does not mean it is nonexistent. Australia's then-attorney general said in August 2013 that communications surveillance had stopped four "mass casualty events" since 2008. The constant planning and preparation for attack by terrorist groups is not apparent to the public. The dilemma in assessing risk is that it is discontinuous. There can be long periods with no noticeable activity, only to have the apparent calm explode. The debate over how to reform communications surveillance has discounted this risk. Communications surveillance is an essential law enforcement and intelligence tool. There is no replacement for it. Some suggestions for alternative approaches to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm. The Evolution of Privacy Some of the unhappiness created by the Edward Snowden leaks reflects the unspoken recognition that online privacy has changed irrevocably. The precipitous decline in privacy since the Internet was commercialized is the elephant in the room we ignore in the surveillance debate. America's privacy laws are both limited in scope and out of date. Although a majority of Americans believe privacy laws are inadequate, the surveillance debate has not led to a useful discussion of privacy in the context of changed technologies and consumer preferences. Technology is more intrusive as companies pursue revenue growth by harvesting user data. Tracking online behavior is a preferred business model. On average, there are 16 hidden tracking programs on every website. The growing market for "big data" to predict consumer behavior and target advertising will further change privacy. Judging by their behavior, Internet users are willing to exchange private data for online services. A survey in a major European country found a majority of Internet users disapproved of Google out of privacy concerns, but more than 80 percent used Google as their search engine. The disconnect between consumer statements and behavior reduces the chances of legislating better protections. We have global rules for finance and air travel, and it is time to create rules for privacy, but governments alone cannot set these rules, nor can a single region impose them. Rules also need to be reciprocal. NSA bears the brunt of criticism, but its actions are far from unique. All nations conduct some kind of communications surveillance on their own populations, and many collect against foreign targets. Getting this consensus will be difficult. There is no international consensus on privacy and data protection. EU efforts to legislate for the entire world ignore broad cultural differences in attitudes toward privacy, and previous EU privacy rules likely harmed European companies' ability to innovate. Finding a balance between privacy, security, and innovation will not be easy since unconstrained collection creates serious concerns while a too restrictive approach threatens real economic harm. Espionage and Counterterrorism NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that

lead to dramatic, last-minute success. Success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. In practice, analysts must simultaneously explore many possible scenarios. A collection program contributes by not only what it reveals, but also what it lets us reject as false. The Patriot Act Section 215 domestic bulk telephony metadata program provided information that allowed analysts to rule out some scenarios and suspects. The consensus view from interviews with current and former intelligence officials is that while metadata collection is useful, it is the least useful of the collection programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215, but this would not come without an increase in risk. Restricting metadata collection will make it harder to identify attacks and increase the time it takes to do this. Spying on Allies NSA's mass surveillance programs for counterterrorism were carried out in cooperation with more than 30 countries. Unilateral U.S. collection programs focused on national security problems: nonproliferation, counterintelligence (including Russian covert influence operations in Europe), and arms sales to China. The United States failed to exercise sufficient oversight over intelligence collection, but the objectives set for NSA reflect real security problems for the United States and its allies. The notion that "friends don't spy on friends" is naive. The United States has friends that routinely spy on it and yet are strong security partners. Relations among powerful states are complex and not explained by simple bromides drawn from personal life. The most startling thing about U.S. espionage against Germany was the absence of a strategic calculation of risk and benefit. There are grounds for espionage (what other major power has a former leader on Russia's payroll?), but the benefits were outweighed by the risk to the relationship. The case for spying on Brazil is even weaker. While Brazil is often antagonistic, it poses no risk to national security. If economic intelligence on Brazil is needed, the private sector has powerful incentives and legitimate means to obtain information and usually has the best data. Risk Is Not Going Away Broad surveillance of communications is the least intrusive and most effective method for discovering terrorist and espionage activity. Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity, often in cooperation with other countries, including the United States. Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. Given resurgent authoritarianism and continuing jihad, the new context for the surveillance debate is that the likelihood of attack is increasing. Any legislative change should be viewed through this lens.

2NC 702 Link Ext.

NSA mass surveillance is critical – we’re drawing down in every other area of intelligence gathering which means it’s essential to preventing terrorism

Wittes 14 (Benjamin, Senior Fellow @ the Brookings Institute, April 8th 2014, "Is Al Qaeda Winning: Grading the Administration's Counter terrorism Policy, Brookings Institute)

As I said at the outset of this statement, the question of intelligence collection under Section 702 of the FAA may seem connected to the AUMF’s future in only the most distant fashion. In fact, the connection between intelligence collection authorities and the underlying regime authorizing the conflict itself is a critical one. Good intelligence is key to any armed conflict and good technical intelligence is a huge U.S. strength in the fight against Al Qaeda. Yet ironically, the more one attempts to narrow the conflict, the more important technical intelligence becomes. The fewer boots on the ground we have in Afghanistan, for example, the greater our reliance will become on technical collection. The more we rely on drone strikes, rather than large troop movements, in areas where we lack large human networks, the more we rely on technical intelligence. Particularly if one imagines staying on offense against a metastasizing Al Qaeda in the context of a withdrawal from Afghanistan and a narrowing—or a formal end—of the AUMF conflict, the burden on technical intelligence collection to keep us in the game will be huge even ignoring the many other foreign intelligence and national security interests Section 702 surveillance supports.¶ Section 702 is a complicated statute, and it is only one part of a far more complicated, larger statutory arrangement. But broadly speaking, it permits the NSA to acquire without an individualized warrant the communications of non-US persons reasonably believed to be overseas when those communications are transiting the United States or stored in the United States. Under these circumstances, the NSA can order production of such communications from telecommunications carriers and internet companies under broad programmatic orders issued by the Foreign Intelligence Surveillance Court (FISC), which reviews both targeting and minimization procedures under which the collection then takes place. Oversight is thick, both within the executive branch, and in reporting requirements to the congressional intelligence committees.¶ Make no mistake: Section 702 is a very big deal in America’s counterterrorism arsenal. It is far more important than the much debated bulk metadata program, which involves a few hundred queries a year. Section 702 collection, by contrast, is vast, a hugely significant component not only of contemporary counterterrorism but of foreign intelligence collection more generally. In 2012, the Senate Select Committee on Intelligence wrote that “[T]he authorities provided [under section 702] have greatly increased the government’s ability to collect information and act quickly against important foreign intelligence targets. . . . [The] failure to reauthorize [section 702] would ‘result in a loss of significant intelligence and impede the ability of the Intelligence Community to respond quickly to new threats and intelligence opportunities.’”[8] The President’s Review Group on Intelligence and Communications Technologies, after quoting this language, wrote that “Our own review is not inconsistent with this assessment. . . . [W]e are persuaded that section 702 does in fact play an important role in the nation’s effort to prevent terrorist attacks across the globe.”[9] The Washington Post has reported that 702 was in 2012 the single most prolific contributor to the President’s Daily Brief.[10]

Link – NSA Link Run

Surveillance works and NSA domestic programs are key

Zuckerman, Bucci and Carafano 13 (Jessica, Policy Analyst, Western Hemisphere, Heritage Foundation, Steven P., Director of the Center for Foreign and National Security Policy at the Heritage Foundation, and James Jay, PhD, Vice President for the Institute for National Security and Foreign Policy, "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism")

Strengthening the Domestic Counterterrorism Enterprise¶ Three months after the attack at the Boston Marathon, the pendulum of awareness of the terrorist threat has already begun to swing back, just as it did after 9/11. Due to the resilience of the nation and its people, for most, life has returned to business as usual. The threat of terrorism against the United States, however, remains.¶ Expecting to stop each and every threat that reaches a country's borders is unreasonable, particularly in a free society committed to individual liberty. Nevertheless, there are important steps that America's leaders can take to strengthen the U.S. domestic counterterrorism enterprise and continue to make the U.S. a harder target. Congress and the Administration should:¶ Ensure a proactive approach to preventing terrorist attacks. Despite the persistent threat of terrorism, the Obama Administration continues to focus on reactive policies and prosecuting terrorists rather than on proactive efforts to enhance intelligence tools and thwart terrorist attempts. This strategy fails to recognize the pervasive nature of the threat posed by terrorist groups such as al-Qaeda and homegrown extremism. The Administration, and the nation as a whole, should continue to keep in place a robust, enduring, and proactive counterterrorism framework in order to identify and thwart terrorist threats long before the public is in danger.¶ Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sunset provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.¶ Break down the silos of information. Washington should emphasize continued cooperation and information sharing among federal, state, and local law enforcement agencies to prevent terrorists from slipping through the cracks between the various jurisdictions. In particular, the FBI should make a more concerted effort to share information more broadly with state and local law enforcement. State and local law enforcement agencies are the front lines of the U.S. national security strategy. As a result, local authorities are able to recognize potential danger and identify patterns that the federal authorities may miss. They also take the lead in community outreach, which is crucial to identifying and stopping "lone wolf" actors and other homegrown extremists. Federal law enforcement, on the other hand, is not designed to fight against this kind of threat; it is built to battle cells, groups, and organizations, not individuals.¶ Streamline the domestic counterterrorism system. The domestic counterterrorism enterprise should base future improvements on the reality that governments at all levels are fiscally in crisis. Rather than add additional components to the system, law enforcement officials should streamline the domestic counterterrorism enterprise by improving current capabilities, leveraging state and local law enforcement resources and authorities, and, in some cases, reducing components where the terrorist threat is not high and the financial support is too thin or could be allocated more effectively. For example, the Department of Homeland Security should dramatically reduce the number of fusion centers, many of which exist in low-risk areas or areas where similar capabilities

exist. An easy way to reduce the number of fusion centers is to eliminate funding to those that are located outside the 31 urban areas designated as the highest risk.¶ Fully implement a strategy to counter violent extremism. Countering violent extremism is an important complementary effort to an effective counterterrorism strategy. In August 2011, the U.S. government released a strategic plan called "Empowering Local Partners to Prevent Violent Extremism in the United States." [209] The plan focuses on outlining how federal agencies can assist local officials, groups, and private organizations in preventing violent extremism. It includes strengthening law enforcement cooperation and helping communities understand how to counter extremist propaganda (particularly online). Sadly, this plan is not a true strategy. It fails to assign responsibilities and does not direct action or resource investments. More direction and leadership must be applied to transform a laundry list of good ideas into an effective program to support communities in protecting and strengthening civil society.¶ Vigilance Is Not Optional¶ In a political environment of sequestration on the one hand and privacy concerns on the other, there are those on both sides of the aisle who argue that counterterrorism spending should be cut and U.S. intelligence agencies reigned in. As the above list indicates however, the long war on terrorism is far from over. Most disturbingly, an increasing number of Islamist-inspired terrorist attacks are originating within America's borders. The rise of homegrown extremism is the next front in the fight against terrorism and should be taken seriously by the Administration.¶ While there has not been another successful attack on the homeland on the scale of 9/11, the bombings in Boston reminded the country that the threat of terrorism is real and that continued vigilance is critical to keeping America safe. Congress and the Administration must continue to upgrade and improve the counterterrorism capabilities of law enforcement and intelligence agencies as well exercise proper oversight of these capabilities. The American people are resilient, but the lesson of Boston is that the government can and should do more to prevent future terror attacks.

Accessing foreign data stored in the US is crucial to deter terrorism

The Washington Post 13 ("US Defends Surveillance Tactics in War on Terrorism")

A few months later, the NSA was monitoring the Yahoo user in Pakistan when a peculiar message arrived from a man named Najibullah Zazi, an Afghan American living in Colorado. He asked about "mixing of [flavour and ghee oil] and I do not know the amount, plz right away."¶ Soon after, on September 9, 2009, a second message arrived that echoed the code used in the British plot: "The marriage is ready," Zazi wrote.¶ The e-mails led the NSA to alert the FBI, which obtained a court order to place Zazi under more extensive surveillance. Officials learned that he had visited Pakistan in 2008, the same time as one of the British plotters.¶ In the end, the e-mails and additional surveillance foiled a plot by Zazi and two others to conduct suicide bombings in the New York subway system just days after he sent the "marriage is ready" e-mail. In recent days, US intelligence and law enforcement officials, as well as congressional officials, have pointed to the authority that allowed them to target the Yahoo account - Section 702 of the Foreign Intelligence Surveillance Act (FISA) - as a critical tool in identifying and disrupting terrorist plots in the US and abroad.¶ But some critics of NSA surveillance suggested that the collection of data under a programme called Prism was not essential to Zazi's capture because the British first obtained the critical e-mail address.¶ Still, the case study provides a rare glimpse of how the broad surveillance practices of the United States, often in concert with allies, are deployed.¶ "The 702 programme has been enormously useful in a large number of terrorist cases," said a US official who has access to classified records on NSA programmes. "It's beyond dispute that it is highly effective. It operates exactly as anyone paying attention would have expected it to operate based on floor debate and plain reading of law." Passage of Section 702 as an amendment to FISA in 2008 gave the government the authority to request information from US telecommunications companies on foreign targets located overseas without a court order for each individual case.

Link – PRISM

PRISM program is key to thwarting major terror attacks

Carafano 13 (James Jay, Vice President for Defense and Foreign Policy Studies at the Heritage Foundation, PRISM Is Essential to US Security in War Against Terrorism")¹³

If changes are made, however, they should to be made for the right reason. Leaders must never compromise our security for political expediency.¶ At least 60 Islamist-inspired terrorist plots have been aimed at the U.S. since the 9/11 attacks. The overwhelming majority have been thwarted thanks to timely, operational intelligence about the threats. Congress should not go back to a pre-/11 set of rules just to appeal to populist sentiment.¶ Congress and the White House have an obligation to protect our liberties and to safeguard our security -- in equal measure. Meeting that mission is more important than winning popularity polls.

****Impact****

Retaliation Impact

Terrorist retaliation causes nuclear war – draws in Russia and China

Robert Ayson, Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington, 2010 (“After a Terrorist Nuclear Attack: Envisaging Catalytic Effects,” Studies in Conflict & Terrorism, Volume 33, Issue 7, July, Available Online to Subscribing Institutions via InformaWorld)

A terrorist nuclear attack, and even the use of nuclear weapons in response by the country attacked in the first place, would not necessarily represent the worst of the nuclear worlds imaginable. Indeed, there are reasons to wonder whether nuclear terrorism should ever be regarded as belonging in the category of truly existential threats. A contrast can be drawn here with the global catastrophe that would come from a massive nuclear exchange between two or more of the sovereign states that possess these weapons in significant numbers. Even the worst terrorism that the twenty-first century might bring would fade into insignificance alongside considerations of what a general nuclear war would have wrought in the Cold War period. And it must be admitted that as long as the major nuclear weapons states have hundreds and even thousands of nuclear weapons at their disposal, there is always the possibility of a truly awful nuclear exchange taking place precipitated entirely by state possessors themselves. But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today’s and tomorrow’s terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be “spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from.”⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington’s relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too:

should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington's early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, **in the noise and confusion during the immediate aftermath of the terrorist nuclear attack**, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, **it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them**. In that situation, **the temptations to preempt such actions might grow**, although it must be admitted that any preemption would probably still meet with a devastating response.

Retaliation defense doesn't apply – three reasons

Brenner 10 (Michael, Professor of International Affairs at the University of Pittsburgh, "When do We Go To War in Yemen?" The National Journal, January 5, <http://security.nationaljournal.com/2010/01/when-do-we-go-to-war-in-yemen.php#1403177>)

We appear trapped in a room convinced that behind one of the walls lies the promised land - if only we could find through dint of physical effort the right access point. This is multi-layered insanity. It is we ourselves who have created this chamber of tears. For one thing, we angrily keep stoke stoking our collective fears. **Witness the hysterical reaction to the underwear bomber. This inept try is the most serious in eight years.** That should be occasion for some relief and satisfaction, despite the demonstration of our equally inept security services. **A second element is our tolerance for sloppy thinking and, consequently, the mis-guided policies** that it engenders. The Afghan escalation is the latest case in point. However one judges the merits of the course taken, the public arguments justifying it are full of holes. Obama's statements on the subject, frankly, are disdainful of public intelligence – much less that of people like us. Third, **the national discourse on terror has been irretrievably politicized in the worst sense of the term.** Posturing and electoral calculation predominate. Candor is away with the leave of our leaders. **Every public figure – elected or unelected, national or local, Republican or Democrat – jumps in as if it were 'garbage time' in a mid-season NBA game.**

Homegrown Terror Impact

A terror attack on US soil is likely – it would involve WMD's which would be catastrophic

Schleifer 5/12/15 (Theodore, "Former CIA Official: ISIS Terrorist Attack in US is Possible")

Islamic militants have the ability to direct individuals to conduct small-scale attacks in the United States and could pose an even greater threat in the future, according to the former deputy director of the Central Intelligence Agency.¶ Michael Morell, a longtime intelligence analyst who served as acting director of the agency after the resignation of David Petraeus in 2012, warned that if ISIS was allowed to take refuge in Iraq and Syria, they could orchestrate an attack in the United States. The group has claimed responsibility for a recent attack in Garland, Texas, where police killed two gunmen.¶ RELATED: Former CIA official takes aim at politicians¶ Morell told CNN's Jake Tapper on "The Lead" that it is "not far-fetched" that ISIS or other terrorist groups could gain access to weapons of mass destruction.¶ "That would be the nightmare scenario: a terrorist attack, here in the United States, here in New York, another major city, that involved either chemical, biological or other nuclear weapons," he said.

2NC Impact Comparison

Probability of attack is extremely high absent countermeasures

Kanani 11 (Rahim, Founder and Editor-in-Chief of World Affairs Commentary, "New al-Qaeda Chief Zawahiri Has Strong Nuclear Intent," Forbes, June 29, www.forbes.com/sites/rahimkanani/2011/06/29/new-al-qaeda-chief-zawahiri-has-strong-nuclear-intent/)

We should be especially worried about the threat of nuclear terrorism under Zawahiri's leadership. In a recent report titled "Islam and the Bomb: Religious Justification For and Against Nuclear Weapons", which I researched for and contributed to, lead author Rolf Mowatt-Larssen, former director of intelligence and counterintelligence at the U.S. Department of Energy, argues that al-Qaeda's WMD ambitions are stronger than ever. And that "this intent no longer feels theoretical, but operational." "I believe al-Qaeda is laying the groundwork for a large scale attack on the United States, possibly in the next year or two," continues Mowatt-Larssen in the opening of the report issued earlier this year by the Belfer Center for Science and International Affairs at Harvard Kennedy School. "The attack may or may not involve the use of WMD, but there are signs that al-Qaeda is working on an event on a larger scale than the 9/11 attack." Most will readily dismiss such claims as implausible and unlikely, and we hope they are right, but after spending months with Mowatt-Larssen, who also served as the former head of the Central Intelligence Agency's WMD and terrorism efforts, scrutinizing and cross-referencing Zawahiri's 268-page treatise published in 2008 titled "Exoneration", the analytics steered us towards something far more remarkable than expected. "As I read the text closely, in the broader context of al-Qaeda's past, my concerns grew that Zawahiri has written this treatise to play a part in the ritualistic process of preparing for an impending attack," states Mowatt-Larssen. "As Osama bin Laden's fatwa in 1998 foreshadowed the 9/11 attack, Ayman Zawahiri's fatwa in 2008 may have started the clock ticking for al-Qaeda's next large scale strike on America. If the pattern of al-Qaeda's modus operandi holds true, we are in the middle of an attack cycle." Among several important findings, Zawahiri sophisticatedly weaves identical passages, sources and religious justifications for a nuclear terrorist attack against the United States previously penned by radical Saudi cleric Nasir al Fahd. Indeed, the language used, research cited, and arguments put forth are nothing short of detailed and deliberate. Reading as both a religious duty to kill millions of Americans and a lengthy suicide note together, this piece of literature is something we must take seriously with Zawahiri now at the helm of al-Qaeda. The time may have come for al-Qaeda's new CEO to leave a legacy of his own. Concluding the author's note, Mowatt-Larssen states, "Even if this theory proves to be wrong, it is better to overestimate the enemy than to under-estimate him. Conventional wisdom holds that al-Qaeda is spent—that they are incapable of carrying out another 9/11. Leaving aside whether this view is correct, for which I harbor grave doubts, we will surely miss the signs of the next attack if we continue to overestimate our own successes, and dismiss what terrorists remain capable of accomplishing when they put their minds to it."

Turns all econ impacts

Cirincione 07 – (2007, Joseph, President of the Ploughshares Fund, former vice president for national security and international policy at the Center for American Progress in Washington, DC, former director for non-proliferation at the Carnegie Endowment for International Peace, "Bomb Scare: The History and Future of Nuclear Weapons," p. xi)

Profound societal damage would also occur. Physicist Charles Ferguson and scholar William Potter explain in a 1004 study:

Consequences stemming from a terrorist-detonated nuclear weapon in an America city would

emanate beyond the immediate tens or hundreds of thousands of fatalities and the massive property and financial damage. Americans who were not killed or injured by the explosion would live in fear that they could die from future nuclear terrorist attacks. Such fear would erode public confidence in the government and could spark the downfall of the administration in power. The tightly interconnected economies of the United States and the rest of the world could sink into a depression as a result of a crude nuclear weapon destroying the heart of a city.

This threat stems not only from the 27,000 nuclear weapons held by eight or nine nations today but also from the possibility that new nations or even terrorist groups will join this deadly club. Many therefore conclude that we must find a non-nuclear alternative to global security. Upon receiving the 2005 Nobel Peace Prize, Mohamed ElBaradei, the director general of the International Atomic Energy Agency, said, "I have no doubt that, if we hope to escape self-destruction, then nuclear weapons should have no place in our collective conscience, and no role in our security."⁷

Nuclear terrorism causes global nuclear escalation – national retaliation goes global

Morgan 9 (Dennis Ray, Professor of Foreign Studies at Hankuk University, "World on Fire: Two Scenarios of the Destruction of Human Civilization and Possible Extinction of the Human Race," Futures, Vol. 41, Issue 10, p683-693, ScienceDirect)

In a remarkable website on nuclear war, Carol Moore asks the question "Is Nuclear War Inevitable??" [10].⁴ In Section 1, Moore points out what most terrorists obviously already know about the nuclear tensions between powerful countries. No doubt, they've figured out that the best way to escalate these tensions into nuclear war is to set off a nuclear exchange. As Moore points out, all that militant terrorists would have to do is get their hands on one small nuclear bomb and explode it on either Moscow or Israel. Because of the Russian "dead hand" system, "where regional nuclear commanders would be given full powers should Moscow be destroyed," it is likely that any attack would be blamed on the United States" [10]. Israeli leaders and Zionist supporters have, likewise, stated for years that if Israel were to suffer a nuclear attack, whether from terrorists or a nation state, it would retaliate with the suicidal "Samson option" against all major Muslim cities in the Middle East. Furthermore, the Israeli Samson option would also include attacks on Russia and even "anti-Semitic" European cities [10]. In that case, of course, Russia would retaliate, and the U.S. would then retaliate against Russia. China would probably be involved as well, as thousands, if not tens of thousands, of nuclear warheads, many of them much more powerful than those used at Hiroshima and Nagasaki, would rain upon most of the major cities in the Northern Hemisphere. Afterwards, for years to come, massive radioactive clouds would drift throughout the Earth in the nuclear fallout, bringing death or else radiation disease that would be genetically transmitted to future generations in a nuclear winter that could last as long as a 100 years, taking a savage toll upon the environment and fragile ecosphere as well.

A2: Heg OWs

A nuclear terror attack would destroy US global leadership

Michael 12 – (2012, George, PhD, Associate Professor of Counterproliferation and Deterrence Theory, USAF Counterproliferation Center, Maxwell AFB, “Strategic Nuclear Terrorism and the Risk of State Decapitation,” Defence Studies Volume 12, Issue 1, 2012, Taylor and Francis)

In his book *Atomic Obsession: Nuclear Alarmism from Hiroshima to Al-Qaeda*, John Mueller argues that even if a single nuclear device were detonated, though catastrophic, it would not portend the demise of an entire city, much less the economy of a country, a government, or a civilization. Rather, Mueller believes that America would be resilient, citing the example of Japan during World War II, which sustained an intense nationwide conventional bombing campaign along with two nuclear attacks, yet whose civil society and government survived. Conceding that a nuclear attack could devastate a locale, Mueller still dismisses the notion that it would extinguish the rest of the country – as he puts it – ‘Do farmers in Iowa cease plowing because an atomic bomb went off in an Eastern city? Do manufacturers close down their assembly lines? Do all churches, businesses, governmental structures, community groups simply evaporate?’ 105

Arguably, though, Mueller’s analysis is somewhat facile and gives short shrift to the possibility of strategic nuclear terrorism. For instance, a nuclear device planted in a certain place (near the Capitol Building in Washington DC) at a certain time (the President’s State of the Union Address) could decapitate the US government. Although there is a plan of presidential succession, it might not be carried out smoothly. Moreover, in this scenario if power were contested by different officials, would the rest of the country recognize their authority? And without a functioning government, would the state governments, which depend so much on the federal government, really be viable for very long? In time of crisis, Americans have come to assume that the federal government will take the lead. If the federal leadership were decapitated, it might not be that easy to put Humpty Dumpty together again.

Former Defense Secretary William Perry once speculated that it was more likely that a nuclear device would arrive in Washington DC or New York City by way of a truck or freighter than a missile. 106 The federal government’s planning scenario envisages a ten-kiloton nuclear device detonated in an urban area. 107 In a case study developed by the Homeland Security Council, a ten-kiloton nuclear device was detonated near the White House. The study estimated that over 150,000 injuries would be incurred with a possible 70 percent mortality rate. Furthermore, over 100,000 persons would require decontamination, which would overwhelm regional capabilities. In the aftermath, the study predicted that over 500,000 persons would attempt to evacuate the city, effectively closing both egress and ingress routes. 108

In a typical nuclear-fission weapon explosion, about half of the energy goes into the blast. About a third of the energy goes into thermal effects. The remaining energy goes into prompt and residual radiation. Much of the radiation lies in the mushroom cloud produced by the explosion. 109 In addition to the direct effects of the detonation, people would also be killed from indirect blast effects, such as the collapse of buildings and fires caused from broken gas pipes, gasoline in cars, and so on. 110 Inasmuch as terrorists would not have the capability to deliver a nuclear bomb by air, the detonation would almost certainly be at ground level thus limiting the blast radius and the resulting firestorm. 111 Nevertheless, a ground burst weapon would loft far more radioactive debris into the atmosphere resulting in greater contamination.

At ground zero, that is, the point on the earth at which the detonation occurs, a ten-kiloton blast would produce a fireball about 72 meters (236 feet) in diameter. 112 Prompt radiation would kill approximately 95 percent of the people within a diameter of 2.4 kilometers (roughly one and a half miles) within weeks. 113 A detonation of a ten-kiloton nuclear device on Pennsylvania Avenue in the area where the Robert F. Kennedy Department of Justice Building is located would largely destroy a circle area about two miles (3.2 kilometers) in diameter which would encompass

the White House, the Capitol Building, and the Supreme Court Building. 114 Many of the people unfortunate to be in the area would be killed.

During the Cold War, the US government faced the prospect of a decapitating strike. Soviet 'Yankee'-class submarines, which regularly operated 600 nautical miles from the East Coast of the United States, had the capability of destroying Washington DC, within eight to ten minutes of launching their nuclear missiles. 115 However, an attempted decapitation strike by the Soviet Union would have been an act of irrational desperation insofar as an attack on Washington would not have prevented a devastating series of retaliatory strikes from the US military. 116 To ensure second strike capability, both the United States and the Soviet Union developed plans for the continuity of command and control of nuclear weapons in the event of a decapitation strike. 117 The Continuity of Government (COG) refers to a system of procedures that would allow the government to continue operations in the event some catastrophic event. Although protocols of succession and the replacement of elected and appointed officials were included by the framers in the Constitution, the need for COG plans took on a new sense of urgency in the nuclear era. A series of national security directives dictate procedures for government agencies in the event of a crisis. In 1998, President Bill Clinton signed Presidential Directive 67, which requires federal agencies to develop plans to ensure the continuance of operations, a chain of command, and delegation of authority. The full text of the directive remains classified. 118

The 25th amendment clarifies the procedures for the transfer of power relating to the incapacitation of the president. However, under the conditions of a nuclear attack and the ensuing societal disruption, a smooth transition may not be possible. If the sitting elected president survives, then everyone should agree that he legitimately holds the reins of power. If, however, the president is dead or missing, the lines of authority are less clear as evidenced on 30 March 1981, when John F. Hinckley Jr attempted to assassinate President Ronald Reagan. Soon thereafter, Secretary of State Alexander Haig announced that he was in charge of the executive branch because Vice President George H.W. Bush was out of town and President Reagan was incapacitated while undergoing surgery for his wound. In doing so, Haig overlooked that the Speaker of the House Tip O'Neill and the President pro tempore of the Senate Strom Thurmond preceded him in the line of succession respectively.

Ensuring the continuity of the command, control, and communications of the military is vital as well. Christened as the National Command Authority (NCA), 119 the political and military leaders who are designated as members of the chain of command for US forces must be able to survive a surprise attack in order to carry out retaliatory attacks. 120 According to the Department of Defense Directive 5100.30 issued on 2 December 1971, the NCA consists only of the president and the secretary of defense or their deputized alternatives or successors. This could lead to confusion insofar as there are twin lines of succession, one for the presidency and one for the command of US military forces. 121

In order to avoid the prospect of decapitation, the US government has established plans to evacuate the NCA authorities from Washington DC to a National Airborne Operations Center aircraft and to 96 hardened command bunkers in the Federal Relocation Arc, located about 50 miles or more from the city. 122 The 'underground White House' located inside Raven Rock Mountain in Pennsylvania is the home of the Alternative National Military Command Center and is equipped to house the president and other members of the NCA. Another important relocation center –the Western Virginia Office of Controlled Conflict Operations –was established in a man-made cavern within Mount Weather located about 50 miles northwest of Washington DC, just outside Bluemont, Virginia. 123

Though commendable, these plans might not be adequate to ensure a continuity of government in the event of a surprise decapitating strike by a terrorist group. Certain trends in contemporary America could make the issue of transition particularly contentious. One worrisome development is a seeming polarization in the United States over matters such as political partisanship, national identity, and cultural issues. Since the 1990s, the American party system has been increasingly characterized by an ideological divide. This was reflected in the rift in the electoral map of the country after the 2000 and 2004 presidential elections. Generally speaking, 'red' states favor a more conservative course for the nation, while 'blue' states prefer a more liberal orientation. The political center appears to be attenuating. As the political scientist Alan Abramowitz found in his research, in 1984, 41 percent of the voters surveyed identified themselves at the midpoint of an

ideological scale. By 2005, though, the number that identified themselves at the center had dropped to 28 percent. ¹²⁴ Historically, American political culture has favored centrism and pragmatism over ideology. And though the distribution of wealth in the country is quite uneven compared to other Western democracies as measured by the Gini Index, the middle class is still the class with which most Americans overwhelmingly identify. ¹²⁵ The festering economic crisis, though, could create a greater pool of the discontented, as evidenced by the Occupy Wall Street protests in the fall of 2011. In a highly-polarized America, establishing a consensus could be challenging in the aftermath of a severe crisis.

A2: Hasn't Prevented Any Attacks

The NSA's surveillance programs are essential to thwart terror attacks – experts agree

Eakin 13 (Britian, Al Arabiya- Washington, "NSA: Secret US Surveillance helped prevent 50-plus terror attacks")

Secret surveillance programs helped prevent more than 50 potential terror attacks worldwide, including plots to target the New York Stock Exchange and the city's subway, the director of the National Security Agency testified on Tuesday.¶ Ten of the 50 potential threats were domestic, said Army General Keith B. Alexander.¶ A hearing before the House Intelligence Committee sought to calm fears among the American public that the U.S. government spies on them unconstitutionally, and repeated assurances that none of the NSA surveillance programs can target U.S. citizens at home or abroad without a court order.¶ "These programs are limited, focused and subject to rigorous oversight," Alexander said.¶ Because of that, the civil liberties and privacy of Americans are not at stake, he added.¶ However, Bruce Fein, a specialist in constitutional law, said the NSA surveillance programs are unconstitutional because there is no demonstration of individualized suspicion, as required by the Fourth Amendment.¶ "The government has a burden to show some reasonable suspicion that someone being spied on is engaged in some wrongdoing before privacy can be invaded," said Fein.¶ Nonetheless, the witnesses defended the NSA programs as legal and necessary because of the nature of the threat of terrorism.¶ "If you're looking for a needle in a haystack, you have to get the haystack first," testified Deputy Attorney General James Cole.¶ Alexander and other senior U.S. intelligence officials testified in response to details leaked by former NSA contractor Edward Snowden about how the agency gathers data.¶ The hearing reviewed NSA surveillance programs 215 and 702. Testimony said program 215 gathers data in bulk from various providers, such as Verizon, but does not look at content or names, while program 702 applies only to foreign citizens.¶ The leak has sparked a debate among the American public over what information the government should be able to collect to safeguard national security, and how it should be allowed to gather it.¶ A recent Pew poll shows that a slight majority of Americans think the NSA surveillance programs are acceptable.¶ Meanwhile, U.S. President Barack Obama's approval ratings have dropped over the past month.¶ Alexander linked the relative safety Americans have enjoyed since the 9/11 attacks directly to the NSA surveillance programs, but Fein said people's fears are being exploited.¶ "Most people are risk-averse. They're easily frightened, and told they need to surrender their liberties in order to be safe, even if it's not true," Fein said.¶ The government has not provided any evidence that these programs are effective, he added. "It's just their say-so."¶ When questioned about whether the NSA surveillance programs previously collected any other information, Alexander said what they have and have not collected remains classified and cannot be discussed.¶ However, some details about how the programs have stopped potential terror attacks would be presented as early as Wednesday to U.S. lawmakers, he said.

Surveillance is necessary to crush terror attacks –

Sulmasy 13 (Glenn, special reporter for CNN, "Why We Need Government Surveillance")

The current threat by al Qaeda and jihadists is one that requires aggressive intelligence collection and efforts. One has to look no further than the disruption of the New York City subway bombers (the one being touted by DNI Clapper) or the Boston Marathon bombers to know that the war on al Qaeda is coming home to us, to our citizens, to our students, to our streets and our subways.¶ This 21st century war is different and requires new ways and methods of gathering information. As technology has increased, so has our ability to gather valuable, often actionable, intelligence. However, the move toward "home-grown" terror will necessarily require, by accident or purposefully, collections of U.S. citizens' conversations with potential overseas persons of interest.¶ An open society, such as the United States, ironically needs to use this technology to

protect itself. This truth is naturally uncomfortable for a country with a Constitution that prevents the federal government from conducting "unreasonable searches and seizures." American historical resistance towards such activities is a bedrock of our laws, policies and police procedures.¶ But what might have been reasonable 10 years ago is not the same any longer. The constant armed struggle against the jihadists has adjusted our beliefs on what we think our government can, and must, do in order to protect its citizens.¶ However, when we hear of programs such PRISM, or the Department of Justice getting phone records of scores of citizens without any signs of suspicious activities nor indications of probable cause that they might be involved in terrorist related activities, the American demand for privacy naturally emerges to challenge such "trolling" measures or data-mining.

A2: No Nuclear Terror – Top Level

Nuclear terror is a big deal yo – most recent evidence – they're complacency

Bunn 13 – (2013, Matthew, PhD, Professor of Practice; Co-Principal Investigator, Project on Managing the Atom, Belfer Center for Science and International Affairs, Harvard, “Beyond Crises: The Unending Challenge of Controlling Nuclear Weapons and Materials,” in Nuclear Weapons Security Crises: What Does History Teach? Ed. Henry D. Sokolski. Strategic Studies Institute, U.S. Army War College, 253-278)

In short, the threats are out there. In a world that includes terrorists with global reach, effective nuclear security and accounting measures are needed wherever nuclear weapons, plutonium, or HEU exist. All countries with such stockpiles on their soil should ensure that they are at least protected against a modest group of well-armed, well-trained outsiders; a well-placed insider; and both outsiders and an insider working together, using a broad range of tactics. Countries that face more substantial adversary threats—Pakistan being an obvious example—need to provide even higher levels of protection.⁹

Unfortunately, in many countries around the world, the security measures in place today are demonstrably not sufficient to protect against the kinds of threats terrorists and thieves have already shown they can pose. For example, a U.S. team visiting a foreign site with a Category I quantity of HEU from 2005 to 2010 found that there were no fences around the perimeter, no sensors to detect intrusions, no video surveillance systems to help guards assess the cause of alarms generated by sensors, and no vehicle barriers.¹⁰ (It is a reasonable bet that this facility also did not have an on-site armed response team to protect it from armed attackers.) The U.S. team recommended that all of these basic security measures be put in place, which the country agreed to do. But when a team of congressional auditors visited in 2010-11, some of the improvements were still under way. The fact that such glaring weaknesses still existed at a site with Category I materials years after the September 11, 2001 (9/11), attacks speaks volumes about the urgent work still ahead to plug nuclear security weak points around the world. Indeed, I would argue that every country with nuclear weapons or weapons-usable nuclear materials—including the United States—has more to do to ensure that these items are effectively protected.

PUNCTUATING COMPLACENT EQUILIBRIUM: THE U.S. CASE

If political turmoil is not the most important driver of nuclear security problems, what is? In a word, complacency—the belief that nuclear terrorism is not a serious threat, and that whatever security measures are in place today are already sufficient. The history of nuclear security is a story of punctuated equilibrium, with long stretches of complacency and little change punctuated by moments when something—typically, a major incident of some kind—made it possible to move the system to a higher-security state, from which it would then begin to drift slowly into complacency again. The results of incidents and other events are mediated by the different political cultures and institutions in different countries, so that one country might react

to an incident by establishing substantial new security rules, while another might react by having participants in the system offer explanations why it could never happen again.

A2: Can't Get a Nuke

Terrorist groups can acquire nuclear weapons from Pakistan – they have the motivation and money

Pakistan Today 5/23/15 ("IS Terrorists Say They could Buy a Nuclear Weapon from Pakistan within a year")

In the latest issue of its propaganda magazine, Dabiq, the Islamic State (IS) has suggested that the terrorist group is expanding so rapidly that it will buy its first nuclear weapon from Pakistan within a year.¶ The article, which the group attributes to British hostage John Cantlie, says that the IS surpassed its roots as “the most explosive Islamic ‘group’ in the modern world” to evolve into “the most explosive Islamic movement the modern world has ever seen” in less than twelve months.¶ The British photojournalist, Cantlie, is often used in the terrorist group’s propaganda and has made appearances in several of their videos, including a YouTube series called “Lend Me Your Ears”. Cantlie has been IS’s hostage since the past two years.¶ In the piece titled “The Perfect Storm”, the militant group mentions other terrorist organisations such as Boko Haram, which recently pledged allegiance to the IS, uniting across the Middle East, Asia and Africa to create one global movement.¶ The article claims this arrangement of groups has happened at the same time as IS militants have seized “tanks, rocket launchers, missile systems, anti-aircraft systems,” from the US and Iran before turning to the subject of more extreme weapons the group is not in possession of – such as nuclear weapons.¶ “Let me throw a hypothetical operation onto the table,” the article continues. “The Islamic State has billions of dollars in the bank, so they call on their wilāyah in Pakistan to purchase a nuclear device through weapons dealers with links to corrupt officials in the region.”¶ “It’s the sum of all fears for Western intelligence agencies and it’s infinitely more possible today than it was just one year ago.”¶ “And if not a nuke, what about a few thousand tons of ammonium nitrate explosive? That’s easy enough to make.”¶ An attack launched by IS against the United States would ridicule “the attacks of the past”.¶ “They’ll (IS) be looking to do something big, something that would make any past operation look like a squirrel shoot, and the more groups that pledge allegiance the more possible it becomes to pull off something truly epic.”¶ “Remember, all of this has happened in less than a year. How more dangerous will be the lines of communication and supply a year on from today?”¶ For now, the capability of IS to obtain such a device is beyond the group at the moment.¶ However, it should be noted that the Islamic State is indeed a well-funded group having secured numerous oil fields in Syria and Iraq. Further, the group also sells artifacts stolen from heritage sites seized during its insurgency, sometimes even for six figure sums.¶ The group also extorts money.¶ The finances of IS have been estimated to be about \$2 billion, but there is no way to verify how much money it actually has access to.¶ The threats come against a mixed series of wins and losses in both countries; the group has been driven out of Tikrit in Iraq but has overrun Ramaldi and the Syrian ancient city of Palmyra.

A2: No Nuclear Terror

Nuclear threat high- dirty bombs, theft, selling, research reactors

Vladimir Z. Dvorkin 12 Major General (retired), doctor of technical sciences, professor, and senior fellow at the Center for International Security of the Institute of World Economy and International Relations of the Russian Academy of Sciences. The Center participates in the working group of the U.S.-Russia Initiative to Prevent Nuclear Terrorism, 9/21/12, "What Can Destroy Strategic Stability: Nuclear Terrorism is a Real Threat," belfercenter.ksg.harvard.edu/publication/22333/what_can_destroy_strategic_stability.html

Hundreds of scientific papers and reports have been published on nuclear terrorism. International conferences have been held on this threat with participation of Russian organizations, including IMEMO and the Institute of U.S. and Canadian Studies. Recommendations on how to combat the threat have been issued by the International Luxembourg Forum on Preventing Nuclear Catastrophe, Pugwash Conferences on Science and World Affairs, Russian-American Elbe Group, and other organizations. The UN General Assembly adopted the International Convention for the Suppression of Acts of Nuclear Terrorism in 2005 and cooperation among intelligence services of leading states in this sphere is developing.¶ At the same time, these efforts fall short for a number of reasons, partly because various acts of nuclear terrorism are possible. Dispersal of radioactive material by detonation of conventional explosives ("dirty bombs") is a method that is most accessible for terrorists. With the wide spread of radioactive sources, raw materials for such attacks have become much more accessible than weapons-useable nuclear material or nuclear weapons. The use of "dirty bombs" will not cause many immediate casualties, but it will result into long-term radioactive contamination, contributing to the spread of panic and socio-economic destabilization.¶ Severe consequences can be caused by sabotaging nuclear power plants, research reactors, and radioactive materials storage facilities. Large cities are especially vulnerable to such attacks. A large city may host dozens of research reactors with a nuclear power plant or a couple of spent nuclear fuel storage facilities and dozens of large radioactive materials storage facilities located nearby. The past few years have seen significant efforts made to enhance organizational and physical aspects of security at facilities, especially at nuclear power plants. Efforts have also been made to improve security culture. But these efforts do not preclude the possibility that well-trained terrorists may be able to penetrate nuclear facilities.¶ Some estimates show that sabotage of a research reactor in a metropolis may expose hundreds of thousands to high doses of radiation. A formidable part of the city would become uninhabitable for a long time.¶ Of all the scenarios, it is building an improvised nuclear device by terrorists that poses the maximum risk. There are no engineering problems that cannot be solved if terrorists decide to build a simple "gun-type" nuclear device. Information on the design of such devices, as well as implosion-type devices, is available in the public domain. It is the acquisition of weapons-grade uranium that presents the sole serious obstacle. Despite numerous preventive measures taken, we cannot rule out the possibility that such materials can be bought on the black market. Theft of weapons-grade uranium is also possible. Research reactor fuel is considered to be particularly vulnerable to theft, as it is scattered at sites in dozens of countries. There are about 100 research reactors in the world that run on weapons-grade uranium fuel, according to the International Atomic Energy Agency (IAEA).¶ A terrorist "gun-type" uranium bomb can have a yield of least 10-15 kt, which is comparable to the yield of the bomb dropped on Hiroshima. The explosion of such a bomb in a modern metropolis can kill and wound hundreds of thousands and cause serious economic damage. There will also be long-term sociopsychological and political consequences.¶ The vast majority of states have introduced unprecedented security and surveillance measures at transportation and other large-scale public facilities after the terrorist attacks in the United States, Great Britain, Italy, and other countries. These measures have proved burdensome for the countries' populations, but the public has accepted them as necessary. A nuclear terrorist attack will make the public accept further measures meant to enhance control even if these measures significantly restrict the democratic liberties they are accustomed to. Authoritarian states could be expected to adopt even more restrictive measures.¶ If a nuclear terrorist act occurs, nations will

delegate tens of thousands of their secret services' best personnel to investigate and attribute the attack. Radical Islamist groups are among those capable of such an act. We can imagine what would happen if they do so, given the anti-Muslim sentiments and resentment that conventional terrorist attacks by Islamists have generated in developed democratic countries. Mass deportation of the non-indigenous population and severe sanctions would follow such an attack in what will cause violent protests in the Muslim world. Series of armed clashing terrorist attacks may follow. The prediction that Samuel Huntington has made in his book "The Clash of Civilizations and the Remaking of World Order" may come true. Huntington's book clearly demonstrates that it is not Islamic extremists that are the cause of the Western world's problems. Rather there is a deep, intractable conflict that is rooted in the fault lines that run between Islam and Christianity. This is especially dangerous for Russia because these fault lines run across its territory. To sum it up, the political leadership of Russia has every reason to revise its list of factors that could undermine strategic stability. BMD does not deserve to be even last on that list because its effectiveness in repelling massive missile strikes will be extremely low. BMD systems can prove useful only if deployed to defend against launches of individual ballistic missiles or groups of such missiles. Prioritization of other destabilizing factors—that could affect global and regional stability—merits a separate study or studies. But even without them I can conclude that nuclear terrorism should be placed on top of the list. The **threat of nuclear terrorism is real**, and a successful nuclear terrorist attack would lead to a radical transformation of the global order. All of the threats on the revised list must become a subject of thorough studies by experts. States need to work hard to forge a common understanding of these threats and develop a strategy to combat them.

A2: No Retaliation

Even crude devices make escalation likely

Conley 3 ACC chief of Systems Analysis Branch, 2003 Harry, "Not with Impunity Assessing US Policy for Retaliating to a Chemical or Biological Attack", 3-5, <http://www.airpower.maxwell.af.mil/airchronicles/apj/apj03/spr03/conley.html>

The number of American casualties suffered due to a WMD attack may well be the most important variable in determining the nature of the US reprisal. A key question here is how many Americans would have to be killed to prompt a massive response by the United States. The bombing of marines in Lebanon, the Oklahoma City bombing, and the downing of Pan Am Flight 103 each resulted in a casualty count of roughly the same magnitude (150–300 deaths). Although these events caused anger and a desire for retaliation among the American public, they prompted no serious call for massive or nuclear retaliation. The body count from a single biological attack could easily be one or two orders of magnitude higher than the casualties caused by these events. Using the rule of proportionality as a guide, one could justifiably debate whether the United States should use massive force in responding to an event that resulted in only a few thousand deaths. However, what if the casualty count was around 300,000? Such an unthinkable result from a single CBW incident is not beyond the realm of possibility: "According to the U.S. Congress Office of Technology Assessment, 100 kg of anthrax spores delivered by an efficient aerosol generator on a large urban target would be between two and six times as lethal as a one megaton thermo-nuclear bomb."⁴⁶ Would the deaths of 300,000 Americans be enough to trigger a nuclear response? In this case, proportionality does not rule out the use of nuclear weapons. Besides simply the total number of casualties, the types of casualties- predominantly military versus civilian- will also affect the nature and scope of the US reprisal action. Military combat entails known risks, and the emotions resulting from a significant number of military casualties are not likely to be as forceful as they would be if the attack were against civilians. World War II provides perhaps the best examples for the kind of event or circumstance that would have to take place to trigger a nuclear response. A CBW event that produced a shock and death toll roughly equivalent to those arising from the attack on Pearl Harbor might be sufficient to prompt a nuclear retaliation. President Harry Truman's decision to drop atomic bombs on Hiroshima and Nagasaki- based upon a calculation that up to one million casualties might be incurred in an invasion of the Japanese homeland⁴⁷- is an example of the kind of thought process that would have to occur prior to a nuclear response to a CBW event. Victor Utgoff suggests that "if nuclear retaliation is seen at the time to offer the best prospects for suppressing further CB attacks and speeding the defeat of the aggressor, and if the original attacks had caused severe damage that had outraged American or allied publics, nuclear retaliation would be more than just a possibility, whatever promises had been made."⁴⁸

A2: Low Probability

9-11 and the black market prove – nuclear terrorism is the greatest threat in the world today

Yusuf 2K9 [MoEED, Fellow, Frederick S. Pardee Center for the Study of the Longer-Range Future Boston University, “Predicting Proliferation: The History of the Future of Nuclear Weapons” POLICY PAPER Number 11, January 2009, http://www.brookings.edu/papers/2009/~media/Files/rc/papers/2009/01_nuclear_proliferation_yusuf/01_nuclear_proliferation_yusuf.pdf]

Perhaps the most striking development in efforts to predict the role of nuclear weapons in the post-Cold War era has been the importance accorded to nuclear terrorism. While the mention of the issue remained peripheral for the most part prior to the collapse of the Soviet Union, it came into the limelight immediately after the USSR’s dissolution. Ever since, the inevitability of the spread of nuclear terrorism and that of a successful terrorist attack in the distant future were taken for granted. The period after the 9/11 attacks on the United States and the 2003 revelation of the nuclear black market fostered considerable pessimism about the menace of terrorism.¹⁹⁵ As confirmed by former State Department Official William J. Perry in a recent Congressional testimony, nuclear terrorism is widely considered to be the “greatest danger today”.

With globalization, the nuclear black market and access to information has made the potential of nuclear terrorism even greater

Yusuf 2K9 [MoEED, Fellow, Frederick S. Pardee Center for the Study of the Longer-Range Future Boston University, “Predicting Proliferation: The History of the Future of Nuclear Weapons” POLICY PAPER Number 11, January 2009, http://www.brookings.edu/papers/2009/~media/Files/rc/papers/2009/01_nuclear_proliferation_yusuf/01_nuclear_proliferation_yusuf.pdf]

Another facet introduced into the debate in the 1990s was the linkage between proliferation to non-state actors and the increased mobility of human movement and enhanced communications brought about by globalization.²⁰¹ Some experts even saw the possibility of states willingly providing terrorists with operational weapons to use against opponents.²⁰² However, the majority continued to believe that the repercussions were high enough for states not to contemplate such a move.²⁰³ A more important strand of this argument however was the concern about non-states actors benefiting from the relatively easy access to nuclear technology, not only as end users but also as suppliers of sensitive materials and technology to those seeking weapons capabilities.²⁰⁴ Interestingly, nuclear scientists were considered to pose a serious threat. Following the demise of the Soviet Union, a number of ex-Soviet nuclear scientists were left jobless and were seen as key targets for terrorists interested in gaining technological know-how.²⁰⁵ The danger of nuclear scientists divulging valuable knowledge was proven by the revelation of the A.Q. Khan-led nuclear black market.

A2: Deterrence Solves

Risks of nuclear terrorism high, deterrence won't solve

Daily Times, February 25, 2014, <http://www.dailytimes.com.pk/opinion/25-Feb-2014/preventing-nuclear-terrorism>

On October 11, 2001, exactly a month after the terrorist attacks on the World Trade Centre, President George W Bush was informed by his CIA director, George Tenet, about the presence of al Qaeda-linked terrorists in New York City with a 10-kiloton nuclear bomb. Overwhelmed by paralysing fear that terrorists could have smuggled another nuclear weapon into Washington DC as well, President Bush ordered Vice President Dick Cheney, along with several hundred federal employees from almost a dozen government agencies, to leave for some undisclosed location outside the capital where they could ensure the continuity of government in case of a nuclear explosion in Washington DC. Although, after subsequent investigations, the CIA's report turned out to be false, this incident showed that even a false alarm signalling a nuclear attack could lead to a much higher probability of disaster. A nuclear attack in downtown Washington DC has the potential to kill hundreds of thousands of people immediately and wipe the White House, the State Department and many other buildings off the face of the earth, making the 9/11 attacks a 'historical footnote'.

It is evident that the spectre of a terrorist-controlled nuclear weapon is a real threat and is global in scope. Given the potentially disastrous consequences, even a small possibility of terrorists obtaining and detonating a nuclear device justifies urgent action. The most urgent security threat to the world today is the possibility of the stealing of weapons or fissile materials by terrorists. After the collapse of the Soviet Union, hundreds of confirmed cases of successful theft of nuclear materials were reported in Russia. In 1997, General Alexander Lebed, assistant for national security affairs to Boris Yeltsin, revealed that 84 out of 132 special KGB 'suitcase nuclear weapons' were unaccounted for in Russia. There are also widespread apprehensions expressed by the international community that militants could steal Pakistan's nuclear weapons or fissile material. Unfortunately, some incidents of jihadi penetration of Pakistan's armed forces have further fuelled this perception. In 2001, US officials discovered that Osama bin Laden and his deputy, Ayman al Zawahiri, were in contact with two retired Pakistani nuclear scientists for assistance in making a small nuclear device. Later in 2003, some junior Pakistani army and air force officers colluded with al Qaeda terrorists to attempt to assassinate President Musharraf and enforce sharia in Pakistan. Notwithstanding that the dangers about the security of Pakistan's nuclear weapons might be highly exaggerated; some genuine concerns arising due to links between terrorists and government authorities must be immediately addressed. Umar Khalid Khurasani, the ameer (head) of the Mohmand Agency chapter of the Tehreek-e-Taliban Pakistan (TTP), also wants to seize nuclear weapons and overthrow the government of Pakistan. Another potential source for the theft of fissile material is more than 130 civilian research reactors worldwide operating with Highly Enriched Uranium (HEU). Most of these facilities have very modest security - in many cases, no more than a night watchman. Unlike the Cold War period, when both the US and the Soviet Union knew that a nuclear attack from either side would be met with a massive retaliatory strike, conventional deterrence does not work against the terrorist groups. In a famous 2007 Wall Street Journal article by Henry Kissinger, George Shultz, William Perry and Sam Nunn (together known as the 'four horsemen'), it was claimed that, "Most alarmingly, the likelihood that non-state terrorists will get their hands on nuclear weaponry is increasing. In today's war waged on world order by terrorists, nuclear weapons are the ultimate means of mass destruction...unless urgent new actions are taken, the US soon will be compelled to enter a new nuclear era that will be more precarious, psychologically disorienting, and economically even more costly than was the Cold War."

A2: Can't Build a Bomb

They can build a bomb

Joyner 9 (Christopher C., Professor of International Law at Georgetown University, "Nuclear Terrorism in a Globalizing World: Assessing the Threat and the Emerging Management Regime," Stanford Journal of International Law, Summer, p. 218, <http://www.thefreelibrary.com/Nuclear+terrorism+in+a+globalizing+world%3A+assessing+the+threat+and...-a0216486733>)

A further cause for alarm is the relative ease with which nuclear weapons can be produced. According to experts, production of a nuclear weapon is relatively simple once nuclear materials are obtained. (69) Indeed, the simplest design for a nuclear weapon--the gun-type design used at Hiroshima--can be made after simply referring to literature available in the public domain. (70) As noted in a report by Congress in the 1970s, in order to build a viable nuclear device one would need "modest machine-shop facilities.... The financial resources for the acquisition of necessary equipment on open markets need not exceed a fraction of a million dollars[,] ... a person capable of researching and understanding the literature in several fields and a jack-of-all trades technician," (71) in addition to the nuclear material. Considering that inexperienced graduate students have produced both simple gun-type and more complex implosion-type bombs, U.S. intelligence concluded that prior to 9/11 the capacity to make such a bomb was well within the capabilities of al-Qaeda. (72)

Terrorism -Emory

*****SHELL*****

1NC – Terrorism DA

Broad authority for mass surveillance is critical to counter-terrorism --- requiring targeted searches prevents the ability to identify networks and disrupt operations.

Richard A. Posner, 2008. Judge, United States Court of Appeals for the Seventh Circuit; Senior Lecturer in Law, The University of Chicago. "Privacy, Surveillance, and Law," 75 University of Chicago Law Review 245, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=2808&context=journal_articles.

What is most notable about the amendments, as indeed of the Terrorist Surveillance Program to which they seem addressed, is their backing away from reliance on warrants to prevent abuses of electronic surveillance. The warrant is a poorly designed means for balancing the security and liberty interests involved in counterterrorist surveillance. It is true that instead of requiring probable cause to believe that the target of an interception is a terrorist, FISA could be amended to require merely reasonable suspicion. But even that would be too restrictive from the standpoint of effective counterterrorism; effective surveillance cannot be confined to suspected terrorists when the object is to discover who may be engaged in terrorism or ancillary activities. Further attenuation of FISA's standard for obtaining a warrant might be possible without running afoul of the Fourth Amendment. Conceivably the issuance of a warrant could be authorized on the basis of a showing that while the target was probably not a terrorist, national security required making assurance doubly sure by intercepting some of his electronic communications. A model might be the criterion for issuing a search warrant to the Canadian Security Intelligence Service, where a warrant can be issued on the basis of a factually supported "belief, on reasonable grounds, that [it] ... is required to enable the Service to investigate a threat to the security of Canada." 9 Such a criterion might pass muster under the Fourth Amendment, which requires probable cause for the issuance of a warrant but does not state what it is that there must be probable cause to believe. The Supreme Court has said that there must be probable cause to believe that the search will yield contraband or evidence of crime when the search is part of a criminal investigation." The Constitution binds the government more tightly when it is exerting its powers to convict people of crimes than in other areas of government activity. A search intended not to obtain evidence of crime but to obtain information about terrorism might, as under Canadian law, require only probable cause to believe that the search would yield such information. The lower the standard for getting a warrant, however, the more porous the filter that the requirement of a warrant creates, bearing in mind the ex parte character of a warrant proceeding. If all the application need state is that an interception might yield data having value as intelligence, judges would have no basis for refusing to issue the warrant. Alternatively, reliance on warrants could invite legislation to expand the reach of the criminal laws relating to terrorism in order to make it easier to establish probable cause to believe that a search will reveal evidence of a crime. That expansion could raise issues under the First Amendment, since the natural route for expanding criminal laws

against terrorism is to criminalize extremist speech or even attendance at extremist (though peaceful) speeches and rallies, as activities that may be preparatory to or encouraging of terrorism. Warrants that satisfy FISA's standard as traditionally understood should continue to be required for all physical searches, because they are far greater intrusions on privacy than electronic interceptions, and for all electronic surveillance for which FISA's existing probable cause requirement can reasonably be satisfied (mainly cases in which the government wanted to intercept communications of a person who they had probable cause to believe was a terrorist). With these exceptions, civil libertarians' preoccupation with warrants is not only harmful to national security (and possibly to civil liberties if it induces legislation to expand the reach of the criminal law) but also anachronistic. The government's ready access to the vast databases that private and public entities compile for purposes unrelated to national security has enabled it to circumvent much of the protection of privacy that civil libertarians look to warrant requirements to secure. There are a number of possible measures, apart from requiring warrants, that Congress could adopt in order to minimize abuses of domestic surveillance. If all were adopted, the risk of such abuses would be slight. The temporary FISA amendments take tiny steps in this direction. Bolder steps would include the following: 1. Congress could create a steering committee for national security electronic surveillance, composed of the attorney general, the director of national intelligence, the secretary of homeland security, and a retired federal judge or justice appointed by the chief justice of the Supreme Court. The committee would monitor all such surveillance to assure compliance with the Constitution and federal statutes. The requirement in the temporary amendments that the attorney general and the director of national intelligence devise procedures for a new warrantless surveillance program is one of the tiny steps to which I referred." The other, and legally dubious one, is requiring submission of the procedures for approval by the Foreign Intelligence Surveillance Court; that court becomes in effect the steering committee. 2. The NSA could be required to submit to the steering committee, to departmental inspectors general, to the Privacy and Civil Liberties Oversight Board (a White House agency created by the Intelligence Reform Act), to the congressional intelligence and judiciary committees, and to an independent watchdog agency of Congress modeled on the GAO every six months a list of the names and other identifying information of all persons whose communications had been intercepted in the previous six months without a warrant, with a brief statement of why these persons had been targeted. 3. The responsible officials of the NSA could be required to certify annually to the watchdog groups that there had been no violations of the statute during the preceding year. False certification would be punishable as perjury. But lawsuits challenging the legality of the Terrorist Surveillance Program should be precluded. Such lawsuits would distract officials from their important duties to no purpose if the kind of statute that I am suggesting were enacted. The statute should sunset after five years. 4. The use of intercepted information for any purpose other than investigating threats to national security would be forbidden. Information could not be used as evidence or leads in a prosecution for ordinary crime-this to alleviate concern that wild talk bound to be picked up by electronic surveillance would lead to criminal investigations unrelated to national security. Violations of this provision would be made felonies punishable by substantial prison sentences and heavy fines. But the punishments must not be made too severe lest they cause intelligence officers to steer so far clear of possible illegality that they fail to conduct effective surveillance. The risk of abuses is not great enough to justify savage penalties

in order to deter them, because intelligence officers have no interest in assisting in the enforcement of criminal laws unrelated to national security. A neglected point is that violations of privacy and civil liberties tend to emanate from the White House and the top management level of executive branch agencies rather than from the working or middle-management levels.

5. To limit the scope of surveillance, "threats to national security" should be narrowly defined as threats involving a potential for mass deaths or catastrophic damage to property or to the economy. That would exclude, for the time being anyway, ecoterrorism, animal-rights terrorism, and other political violence that, though criminal, does not threaten catastrophic harm (yet). Congressional action is also needed to protect the phone companies that cooperated with the NSA's surveillance program from potentially immense liability for allegedly having violated federal law protecting the privacy of telephone records; a number of suits are pending. The intelligence system is enormously dependent on informal assistance from private companies in communications, banking, and other industries. At times such assistance is made a legal duty, as in the federal law requiring banks to report cash transactions of \$10,000 or more; and this is also a feature of the new amendments to FISA. Were it not for the threat of liability, which the amendments do not address, voluntary assistance would probably as in the past be all the government needed. But if voluntary assistance—even when tendered in a national emergency, as in the wake of the 9/11 terrorist attacks—places companies in legal jeopardy, such assistance will dry up. FISA needs to be amended not only to authorize more extensive domestic surveillance than its anachronistic terms permit but also to insulate from liability conduct that may have violated the Act or some other statute but that would be permitted under the amended regime. Until the temporary amendments were enacted, the type of approach that I am advocating (call it the "nonwarrant" approach) for regularizing domestic surveillance was getting little attention from Congress and the Bush Administration, possibly because the Administration wanted to retain a completely free hand and thought it could fend off the sort of restrictions that I have sketched. (It is remarkable how tepid the public reaction to the Terrorist Surveillance Program has been.) A related possibility is that the Administration's aggressive claims of presidential power prevented it from acknowledging the legitimacy of congressional controls over intelligence and hence of a legislative solution to the controversy over the program. Still another possibility was (and is) that because no one is in charge of domestic intelligence, authority over which is divided among the attorney general, the FBI director, the Department of Homeland Security, and the director of national intelligence (among others), no one is formulating a comprehensive legislative and public relations strategy for ending the controversy over the role of electronic surveillance in such intelligence. (At this writing, the only confirmed senior official in the Justice Department is the solicitor general.) And another possibility is the grip of our legalistic culture, which makes us think that the regulation of national security must be modeled on the regulation of criminal law enforcement. The temporary amendments suggest, however, that the logjam may be breaking, though one of the reasons, it appears, is that the Administration's decision to bring the Terrorist Surveillance Program under FISA resulted in a paper jam at the Foreign Intelligence Surveillance Court as the number of warrant applications soared. We should be playing to our strengths, and one of the greatest of them is technology. We may not be able to prevail against terrorism with one hand tied behind our back. Critics of surveillance argue that since our enemies know that we monitor electronic communications, they will foil us by simply ceasing to use such communications. That

is wrong. We know it is wrong because we do intercept terrorist communications. 24 But if it were true that our monitoring caused the terrorists to abandon the telephone and the internet, that would be an enormous victory for counterterrorism, as it is extremely difficult to coordinate and execute a major terrorist attack if all communications among the plotters must be face to face to avoid detection. The greater danger is that encryption and other relatively cheap and simple countermeasures will defeat our surveillance. Opponents of efforts to amend FISA point out that the Foreign Intelligence Surveillance Court has almost never turned down an application for a warrant. In 2005, for example, although more than 2,000 applications were filed, not a single one was denied in whole or in part. 5 The inference the critics wish drawn is that FISA is not inhibiting surveillance. The correct inference is that the Justice Department is too conservative in seeking warrants. The analogy is to a person who has never missed a plane in his life because he contrives always to arrive at the airport eight hours before the scheduled departure time. The effect of our legalistic culture is to cause law enforcement agencies, notably the FBI, to avoid not only violating the law but also steering so close to the wind that they might be accused, albeit groundlessly, of violating the law or of being "insensitive" to values that inform the law, even when those values have not been enacted into law.

AND --- nuclear terrorism risks extinction --- the threat of an attack is significant.

Hellman 8 (Martin E. Hellman, emeritus prof of engineering @ Stanford, "Risk Analysis of Nuclear Deterrence" SPRING 2008 THE BENT OF TAU BETA PI, <http://www.nuclearrisk.org/paper.pdf>)

The threat of nuclear terrorism looms much larger in the public's mind than the threat of a full-scale nuclear war, yet this article focuses primarily on the latter. An explanation is therefore in order before proceeding. A terrorist attack involving a nuclear weapon would be a catastrophe of immense proportions: "A 10-kiloton bomb detonated at Grand Central Station on a typical work day would likely kill some half a million people, and inflict over a trillion dollars in direct economic damage. America and its way of life would be changed forever." [Bunn 2003, pages viii-ix]. The likelihood of such an attack is also significant. Former Secretary of Defense William Perry has estimated the chance of a nuclear terrorist incident within the next decade to be roughly 50 percent [Bunn 2007, page 15]. David Albright, a former weapons inspector in Iraq, estimates those odds at less than one percent, but notes, "We would never accept a situation where the chance of a major nuclear accident like Chernobyl would be anywhere near 1% A nuclear terrorism attack is a low-probability event, but we can't live in a world where it's anything but extremely low-probability." [Hegland 2005]. In a survey of 85 national security experts, Senator Richard Lugar found a median estimate of 20 percent for the "probability of an attack involving a nuclear explosion occurring somewhere in the world in the next 10 years," with 79 percent of the respondents believing "it more likely to be carried out by terrorists" than by a government [Lugar 2005, pp. 14-15]. I support increased efforts to reduce the threat of nuclear terrorism, but that is not inconsistent with the approach of this article. Because terrorism is one of the potential trigger mechanisms for a full-scale nuclear war, the risk

analyses proposed herein will include estimating the risk of nuclear terrorism as one component of the overall risk. If that risk, the overall risk, or both are found to be unacceptable, then the proposed remedies would be directed to reduce whichever risk(s) warrant attention. Similar remarks apply to a number of other threats (e.g., nuclear war between the U.S. and China over Taiwan). This article would be incomplete if it only dealt with the threat of nuclear terrorism and neglected the threat of full-scale nuclear war. If both risks are unacceptable, an effort to reduce only the terrorist component would leave humanity in great peril. In fact, society's almost total neglect of the threat of full-scale nuclear war makes studying that risk all the more important. The cost of World War III The danger associated with nuclear deterrence depends on both the cost of a failure and the failure rate.³ This section explores the cost of a failure of nuclear deterrence, and the next section is concerned with the failure rate. While other definitions are possible, this article defines a failure of deterrence to mean a full-scale exchange of all nuclear weapons available to the U.S. and Russia, an event that will be termed World War III. Approximately 20 million people died as a result of the first World War. World War II's fatalities were double or triple that number—chaos prevented a more precise determination. In both cases humanity recovered, and the world today bears few scars that attest to the horror of those two wars. Many people therefore implicitly believe that a third World War would be horrible but survivable, an extrapolation of the effects of the first two global wars. In that view, World War III, while horrible, is something that humanity may just have to face and from which it will then have to recover. In contrast, some of those most qualified to assess the situation hold a very different view. In a 1961 speech to a joint session of the Philippine Congress, General Douglas MacArthur, stated, "Global war has become a Frankenstein to destroy both sides. ... If you lose, you are annihilated. If you win, you stand only to lose. No longer does it possess even the chance of the winner of a duel. It contains now only the germs of double suicide." Former Secretary of Defense Robert McNamara expressed a similar view: "If deterrence fails and conflict develops, the present U.S. and NATO strategy carries with it a high risk that Western civilization will be destroyed" [McNamara 1986, page 6]. More recently, George Shultz, William Perry, Henry Kissinger, and Sam Nunn⁴ echoed those concerns when they quoted President Reagan's belief that nuclear weapons were "totally irrational, totally inhumane, good for nothing but killing, possibly destructive of life on earth and civilization." [Shultz 2007] Official studies, while couched in less emotional terms, still convey the horrendous toll that World War III would exact: "The resulting deaths would be far beyond any precedent. Executive branch calculations show a range of U.S. deaths from 35 to 77 percent (i.e., 79-160 million dead) ... a change in targeting could kill somewhere between 20 million and 30 million additional people on each side These calculations reflect only deaths during the first 30 days. Additional millions would be injured, and many would eventually die from lack of adequate medical care ... millions of people might starve or freeze during the following winter, but it is not possible to estimate how many. ... further millions ... might eventually die of latent radiation effects." [OTA 1979, page 8] This OTA report also noted the possibility of serious ecological damage [OTA 1979, page 9], a concern that assumed a new potentiality when the TTAPS report [TTAPS 1983] proposed that the ash and dust from so many nearly simultaneous nuclear explosions and their resultant firestorms could usher in a nuclear winter that might erase homo sapiens from the face of the earth, much as many scientists now believe the K-T Extinction that wiped out the dinosaurs resulted from an impact winter caused by ash

and dust from a large asteroid or comet striking Earth. The TTAPS report produced a heated debate, and there is still no scientific consensus on whether a nuclear winter would follow a full-scale nuclear war. Recent work [Robock 2007, Toon 2007] suggests that even a limited nuclear exchange or one between newer nuclear-weapon states, such as India and Pakistan, could have devastating long-lasting climatic consequences due to the large volumes of smoke that would be generated by fires in modern megacities. While it is uncertain how destructive World War III would be, prudence dictates that we apply the same engineering conservatism that saved the Golden Gate Bridge from collapsing on its 50th anniversary and assume that preventing World War III is a necessity—not an option.

*****UNIQUENESS*****

1NC – Uniqueness CP

Text:

- The United States federal government should authorize warrantless non-targeted domestic mass surveillance and provide liability protection to all phone companies that cooperate with the National Security Agency.**
- Congress should create a steering committee for national security electronic surveillance and require the NSA to submit to that committee and provide annual certification of legal compliance.**
- Congress should also forbid the use of any information from warrantless mass surveillance for anything other than investigating threats to national security.**
- Congress should narrowly define threats to national security as those involving a potential for mass deaths or catastrophic damage to property or to the economy.**

Broad authorization of mass surveillance is critical to counter-terrorism --- requiring targeted searches prevents the ability to identify networks and disrupt operations. Congressional oversight prevents abuse of the program.

Richard A. Posner, 2008. Judge, United States Court of Appeals for the Seventh Circuit; Senior Lecturer in Law, The University of Chicago. "Privacy, Surveillance, and Law," 75 University of Chicago Law Review 245, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=2808&context=journal_articles.

What is most notable about the amendments, as indeed of the Terrorist Surveillance Program to which they seem addressed, is their backing away from reliance on warrants to prevent abuses of electronic surveillance. The warrant is a poorly designed means for balancing the security and liberty interests involved in counterterrorist surveillance. It is true that instead of requiring probable cause to believe that the target of an interception is a terrorist, FISA could be amended to require merely reasonable suspicion. But even that would be too restrictive from the standpoint of effective counterterrorism; effective surveillance cannot be confined to suspected terrorists when the object is to discover who may be engaged in terrorism or ancillary activities. Information could not be used as evidence or leads in a prosecution for ordinary crime-this to alleviate concern that wild talk bound to be picked up by electronic surveillance would lead to criminal investigations unrelated to national security. Violations of this provision would be made felonies punishable by substantial prison sentences and heavy fines. But the punishments must not be made too severe lest they cause intelligence officers to steer so far clear of possible illegality that they fail to conduct effective surveillance. The risk of abuses is not great enough to justify savage penalties in order to deter them, because intelligence officers have no interest in assisting in the enforcement of criminal laws unrelated to national security. A neglected point is that violations of privacy and civil liberties tend to emanate from the White House and the top management level of executive branch agencies rather than from the working or middle-management levels. 5. To limit the scope of surveillance, "threats to national security" should be narrowly defined as threats involving a potential for mass deaths or catastrophic damage to property or to the economy. That would exclude, for the time being anyway, ecoterrorism, animal-rights terrorism, and other political violence that, though criminal, does not threaten catastrophic harm (yet). Congressional action is also needed to protect the phone companies that cooperated with the NSA's surveillance program from potentially immense liability for allegedly having violated federal law protecting the privacy of telephone records; a number of suits are pending. The intelligence system is enormously dependent on informal assistance from private companies in communications, banking, and other industries. At times such assistance is made a legal duty, as in the federal law requiring banks to report cash transactions of \$10,000 or more; and this is also a feature of the new amendments to FISA. Were it not for the threat of liability, which the amendments do not address, voluntary assistance would probably as in the past be all the government needed. But if voluntary assistance-even when tendered in a national emergency, as in the wake of the 9/11 terrorist attacks- places companies in legal jeopardy, such assistance will dry up. FISA needs to be amended not only to authorize more extensive domestic surveillance than its anachronistic terms permit but also to insulate from liability conduct that may have violated the Act or some other statute but that would be permitted under the amended regime. Until the temporary amendments were enacted, the type of approach that I am advocating (call it the "nonwarrant" approach) for regularizing domestic surveillance was getting little attention from Congress and the Bush Administration, possibly because the Administration wanted to retain a completely free hand and thought it could fend off the sort of restrictions that I have sketched. (It is remarkable how tepid the public reaction to the Terrorist Surveillance Program has been.) A related possibility is that the Administration's aggressive

claims of presidential power prevented it from acknowledging the legitimacy of congressional controls over intelligence and hence of a legislative solution to the controversy over the program. Still another possibility was (and is) that because no one is in charge of domestic intelligence, authority over which is divided among the attorney general, the FBI director, the Department of Homeland Security, and the director of national intelligence (among others), no one is formulating a comprehensive legislative and public relations strategy for ending the controversy over the role of electronic surveillance in such intelligence. (At this writing, the only confirmed senior official in the Justice Department is the solicitor general.) And another possibility is the grip of our legalistic culture, which makes us think that the regulation of national security must be modeled on the regulation of criminal law enforcement. The temporary amendments suggest, however, that the logjam may be breaking, though one of the reasons, it appears, is that the Administration's decision to bring the Terrorist Surveillance Program under FISA resulted in a paper jam at the Foreign Intelligence Surveillance Court as the number of warrant applications soared. We should be playing to our strengths, and one of the greatest of them is technology. We may not be able to prevail against terrorism with one hand tied behind our back. Critics of surveillance argue that since our enemies know that we monitor electronic communications, they will foil us by simply ceasing to use such communications. That is wrong. We know it is wrong because we do intercept terrorist communications. 24 But if it were true that our monitoring caused the terrorists to abandon the telephone and the internet, that would be an enormous victory for counterterrorism, as it is extremely difficult to coordinate and execute a major terrorist attack if all communications among the plotters must be face to face to avoid detection. The greater danger is that encryption and other relatively cheap and simple countermeasures will defeat our surveillance. Opponents of efforts to amend FISA point out that the Foreign Intelligence Surveillance Court has almost never turned down an application for a warrant. In 2005, for example, although more than 2,000 applications were filed, not a single one was denied in whole or in part. 5 The inference the critics wish drawn is that FISA is not inhibiting surveillance. The correct inference is that the Justice Department is too conservative in seeking warrants. The analogy is to a person who has never missed a plane in his life because he contrives always to arrive at the airport eight hours before the scheduled departure time. The effect of our legalistic culture is to cause law enforcement agencies, notably the FBI, to avoid not only violating the law but also steering so close to the wind that they might be accused, albeit groundlessly, of violating the law or of being "insensitive" to values that inform the law, even when those values have not been enacted into law.

2NC – Uniqueness

NSA still has sufficient surveillance authority despite the PATRIOT Act expiration.

Salon, 6/1/2015. Marcy Wheeler. “Reports of the Patriot Act’s death are greatly exaggerated,” http://www.salon.com/2015/06/01/reports_of_the_patriot_acts_death_are_greatly_exaggerated/.

The PATRIOT Act-authorized phone dragnet expired last night. For the first time since 2006, the NSA won’t receive records of the phone calls you make within the United States.

But that doesn’t mean spying on Americans has stopped. The NSA still obtains records of calls — potentially all calls — you make with people overseas. It still tracks Americans’ Internet communications using metadata obtained overseas. The FBI can still access the content of any communications Americans have with foreigners targeted under PRISM without a warrant or even any evidence of wrong doing. FBI can still, and indeed does, obtain phone records of individuals in conjunction with national security investigations without any court review.

Not even the spying conducted under Section 215 — the authority that had been used to collect all of Americans’ phone records, but which is also used to collect certain kinds of Internet data — or the two other expiring provisions will stop. Because they’re tied to more focused investigations (though the Internet collection is probably not targeted at one individual), they will probably continue under a grandfather clause allowing ongoing investigations using those authorities to continue.

NSA surveillance authority is likely to be restored.

Slate, 6/1/2015. Lily Hay Newman. “NSA Bulk Data Collection Expired Last Night. What’s Different Today?” http://www.slate.com/blogs/future_tense/2015/06/01/portions_of_the_patriot_act_expired_on_may_31_what_does_that_mean.html.

Yesterday bulk collection was in effect, but are we being surveilled today? For the first time in 14 years, there’s no automatic NSA mechanism for recording who you call and when you call them. But there are still ways for the NSA to use its network abroad to get information about your international calls and online browsing. The agency can even still get the content of your international communications through PRISM. Salon’s Marcy Wheeler writes, “Reports of the Patriot Act’s death are greatly exaggerated”

The NSA still obtains records of calls—potentially all calls—you make with people overseas. It still tracks Americans’ Internet communications using metadata obtained overseas. The FBI can still access the content of any communications Americans have with foreigners targeted under

PRISM without a warrant or even any evidence of wrongdoing. The FBI can still, and indeed does, obtain phone records of individuals in conjunction with national security investigations without any court review.

In addition to the halt in bulk NSA communication surveillance, the act's expiration means that the FBI can no longer use it to get sweeping wiretap orders to track a suspect when he or she changes phones. Each new device now requires a fresh warrant. Additionally, the agency can no longer use the act to justify wiretaps of "lone wolf" terrorism suspects—individuals who don't have a known affiliation to a larger group.

As the New York Times points out, though, it seems that the NSA is keeping its existing trove of data, since the Justice Department will have grandfathered ability to continue to access files for ongoing investigations. The Times also indicates that law enforcement agencies have other workarounds to continue to get the approvals they want.

In the tension between the security need for surveillance and the desire to preserve individuals' rights to privacy, it seems like eliminating bulk surveillance would be an obvious solution. So that would make today a better day than yesterday, right? But there is strong bipartisan agreement that some surveillance is necessary to maintain safety from international bad actors. Rep. Adam Schiff, a Democrat from California, called the expiration "a lose-lose."

The Senate will probably restore the expired portions of the act this week. And Congress has been mulling alternatives, like the USA Freedom Act, which would notably mandate that phone companies, not the government itself, store bulk collections. That way, agencies would have to go through the Foreign Intelligence Surveillance Act court in order to pull individual records, instead of having full, broadly approved access.

*****LINK/INTERNAL*****

2NC – Link Extensions

Warrantless mass surveillance is critical to prevent terrorism --- casting a wide net and being able to act quickly is critical to identify networks.

John Yoo, 5/8/2015. Emanuel Heller professor of law at the University of California at Berkeley and a Visiting Scholar at the American Enterprise Institute, former official in the Office of Legal Counsel in the U.S. Department of Justice. “Will Congress reject the dangerous NSA ruling by reauthorizing the Patriot Act?” American Enterprise Institute, <https://www.aei.org/publication/will-congress-reject-todays-dangerous-nsa-ruling-by-reauthorizing-the-patriot-act/>.

Finally, the Court displays a deep misunderstanding of the challenges of counterterrorism policy, which Congress understands far better. As Judge Richard Posner has recognized, an intelligence search “is a search for the needle in a haystack.” Rather than pursue suspects who have already committed a crime and whose identity is already known, intelligence agencies must search for clues among millions of potentially innocent connections, communications, and links. “The intelligence services,” Posner writes, “must cast a wide net with a fine mesh to catch the clues that may enable the next attack to be prevented.” Our government can detect terrorists by examining phone and e-mail communications, as well as evidence of joint travel, shared assets, common histories or families, meetings, and so on. If our intelligence agents locate a lead, they must quickly follow its many possible links to identify cells and the broader network of terrorists. A database of call data would allow a fast search for possible links in the most important place — the United States, where terrorists can inflict the most damage. Most of the calling records may well be innocent (just as most of the financial records of a suspected white-collar criminal may also be innocent), but the more complete the database, the better our intelligence agencies can pursue a lead into the U.S.

The NSA program has been empirically effective --- it has neutralized over fifty plots.

USA Today, 6/19/2013. “NSA director: Surveillance foiled 50 terror plots,” <http://www.usatoday.com/story/news/nation/2013/06/18/nsa-surveillance-secret-programs-terror-plots/2434193/>.

National Security Agency Director Keith Alexander told a House committee Tuesday that more than 50 terror threats throughout the world have been disrupted with the assistance of two secret surveillance programs that were recently disclosed by former defense contractor Edward Snowden.

More than 10 of the plots targeted the U.S. homeland, Alexander told the House Intelligence Committee, including a plot to attack the New York Stock Exchange.

"I would much rather be here today debating this," Alexander told lawmakers, referring to the programs' value, "than explaining why we were unable to prevent another 9/11" attack.

At the rare open committee hearing, Alexander and Deputy Attorney General Jim Cole told lawmakers that both surveillance operations — a domestic telephone tracking system that collects records of millions of Americans and an Internet monitoring program targeting non-citizens outside the U.S. — have been subject to rigorous oversight to guard against privacy abuses.

"This isn't some rogue operation that some guys at the NSA are operating," said Alexander, also an Army general.

Deputy FBI Director Sean Joyce described another threat Tuesday that was neutralized by the surveillance programs: Investigators used the phone tracking system to identify an operative in San Diego who was providing support to terrorists in Somalia.

Joyce also referred to two disrupted plots that were disclosed last week as having been thwarted by the surveillance operations, including a 2009 plan to bomb the New York subway system.

In that case, authorities used its Internet monitoring program to identify overseas communications involving Najibullah Zazi in Colorado, who was later convicted in connection with the subway attack plan.

"This is not a program that is off the books," Cole said, outlining the executive, legislative and judicial controls attached to both surveillance operations.

Requiring warrants undermines effective counter-terrorism searches --- the ability to identify unknown terrorists outweighs the risk of false positives.

Richard A. Posner, 2008. Judge, United States Court of Appeals for the Seventh Circuit; Senior Lecturer in Law, The University of Chicago. "Privacy, Surveillance, and Law," 75 University of Chicago Law Review 245, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=2808&context=journal_articles.

I now want to bring law into the picture. After the Supreme Court ruled in a conventional criminal case that wiretapping and, by implication, other forms of electronic surveillance were to be deemed "searches" within the meaning of the Fourth Amendment,⁶ Congress enacted Title III of the Omnibus Crime Control and Safe Streets Act of 1968.⁶ Title III created procedures for obtaining warrants for electronic surveillance that were modeled on the procedures for conventional search warrants. Ten years later—and thus long before the danger of global terrorism was recognized and electronic surveillance transformed by the digital revolution—the Foreign Intelligence Surveillance Act was enacted.⁶ It is a complicated statute, but basically it requires that interceptions in the United States of the international communications of a US

citizen, or permanent resident, or of anyone in the United States if the interception is made here, be conducted pursuant to warrants based on probable cause to believe that one of the parties to the communication is a foreign terrorist. That is the wrong approach as 9/11 has taught us and as Congress is beginning to recognize, evidenced by amendments to FISA enacted since the conference for which this paper was prepared. 8 (The amendments were to be in effect for only six months; Congress is now considering a more permanent restructuring of FISA.) FISA in its preamendment form remains usable for regulating the monitoring of communications of known terrorists, but it is useless for finding out who is a terrorist, 9 even though "the problem of defeating the enemy consists very largely of finding him." 10 Hence the importance of "collateral intercepts"-such as intercepts of communications that seem likely to yield information of intelligence value even if probable cause to believe that a party to the communication is a terrorist is lacking. It is true that surveillance not cabined by a conventional probable cause requirement produces many false positives-interceptions that prove upon investigation to have no intelligence value. But that is not a valid criticism. The cost of false positives must be balanced against that of false negatives. The failure to detect the 9/11 plot was an exceptionally costly false negative. The intelligence services have no alternative to casting a wide net with a fine mesh if they are to have reasonable prospects of obtaining the clues that will enable future terrorist attacks on the United States to be prevented."

Requiring warrants risks intelligence disclosure --- that accelerates plots.

Andrew McCarthy, 5/10/2005. Senior fellow for the Foundation for the Defense of Democracies. Federal Document Clearing House Congressional Testimony, Patriot Act Reauthorization Hearings, 5/10, lexis.

Another frequent and understandable complaint about Section 215 revolves around its so-called "gag rule," which prohibits recipients to disclose the fact of a subpoena. To be sure, the desirability of openness as a check on government over-reaching is unassailable if national security is not threatened. A public safety threat, however, requires reasonable balance between the public interest in disclosure and the reality that disclosure makes our enemies, to be blunt, more efficient at killing us. It can alert them to the fact of an investigation which may thwart our ability to identify key players and locations that threaten Americans. It may endanger the lives of informants or dry up other crucial sources of information (such as wiretaps) since, once terrorists -- or, for that matter, members of any criminal organization -- realize the government knows enough to seek certain records, their first priority often becomes attempting to determine how they have been compromised. Finally, it may trigger a planned attack. On this last score, it is again important to note that terrorists are not like other criminals. They are not in it for the money, and they are not as apt to flee and live to fight another day if they believe their cover is blown. Many of them are devoted to their missions to the point of committing suicide to accomplish them. Publicly revealing an investigation before agents have reached the point of being able to thwart an ongoing terrorist plot may serve to accelerate the terrorist plot.

Terror threats are growing at home and abroad --- continued mass surveillance is critical to detect threats and thwart plots.

Jessica Zuckerman, Steven P. Bucci, Ph.D. and James Jay Carafano, Ph.D., 7/22/2013. Policy Analyst, Western Hemisphere @ Heritage; Director, Douglas and Sarah Allison Center for Foreign and National Security Policy @ Heritage; and Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow @ Heritage. "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism," Heritage Foundation, <http://www.heritage.org/research/reports/2013/07/60-terrorist-plots-since-911-continued-lessons-in-domestic-counterterrorism>.

Three months after the attack at the Boston Marathon, the pendulum of awareness of the terrorist threat has already begun to swing back, just as it did after 9/11. Due to the resilience of the nation and its people, for most, life has returned to business as usual. The threat of terrorism against the United States, however, remains.

Expecting to stop each and every threat that reaches a country's borders is unreasonable, particularly in a free society committed to individual liberty. Nevertheless, there are important steps that America's leaders can take to strengthen the U.S. domestic counterterrorism enterprise and continue to make the U.S. a harder target. Congress and the Administration should:

Ensure a proactive approach to preventing terrorist attacks. Despite the persistent threat of terrorism, the Obama Administration continues to focus on reactive policies and prosecuting terrorists rather than on proactive efforts to enhance intelligence tools and thwart terrorist attempts. This strategy fails to recognize the pervasive nature of the threat posed by terrorist groups such as al-Qaeda and homegrown extremism. The Administration, and the nation as a whole, should continue to keep in place a robust, enduring, and proactive counterterrorism framework in order to identify and thwart terrorist threats long before the public is in danger.

Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sunset provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.

Break down the silos of information. Washington should emphasize continued cooperation and information sharing among federal, state, and local law enforcement agencies to prevent terrorists from slipping through the cracks between the various jurisdictions. In particular, the FBI should make a more concerted effort to share information more broadly with state and local law enforcement. State and local law enforcement agencies are the front lines of the U.S. national security strategy. As a result, local authorities are able to recognize potential danger and identify patterns that the federal authorities may miss. They also take the lead in community outreach, which is crucial to identifying and stopping “lone wolf” actors and other homegrown extremists. Federal law enforcement, on the other hand, is not designed to fight against this kind of threat; it is built to battle cells, groups, and organizations, not individuals.

Streamline the domestic counterterrorism system. The domestic counterterrorism enterprise should base future improvements on the reality that governments at all levels are fiscally in crisis. Rather than add additional components to the system, law enforcement officials should streamline the domestic counterterrorism enterprise by improving current capabilities, leveraging state and local law enforcement resources and authorities, and, in some cases, reducing components where the terrorist threat is not high and the financial support is too thin or could be allocated more effectively. For example, the Department of Homeland Security should dramatically reduce the number of fusion centers, many of which exist in low-risk areas or areas where similar capabilities exist. An easy way to reduce the number of fusion centers is to eliminate funding to those that are located outside the 31 urban areas designated as the highest risk.

Fully implement a strategy to counter violent extremism. Countering violent extremism is an important complementary effort to an effective counterterrorism strategy. In August 2011, the U.S. government released a strategic plan called “Empowering Local Partners to Prevent Violent Extremism in the United States.”[209] The plan focuses on outlining how federal agencies can assist local officials, groups, and private organizations in preventing violent extremism. It includes strengthening law enforcement cooperation and helping communities understand how to counter extremist propaganda (particularly online). Sadly, this plan is not a true strategy. It fails to assign responsibilities and does not direct action or resource investments. More direction and leadership must be applied to transform a laundry list of good ideas into an effective program to support communities in protecting and strengthening civil society.

Vigilance Is Not Optional

In a political environment of sequestration on the one hand and privacy concerns on the other, there are those on both sides of the aisle who argue that counterterrorism spending should be cut and U.S. intelligence agencies reigned in. As the above list indicates however, the long war on terrorism is far from over. Most disturbingly, an increasing number of Islamist-inspired terrorist attacks are originating within America’s borders. The rise of homegrown extremism is the next front in the fight against terrorism and should be taken seriously by the Administration.

While there has not been another successful attack on the homeland on the scale of 9/11, the bombings in Boston reminded the country that the threat of terrorism is real and that continued vigilance is critical to keeping America safe. Congress and the Administration must continue to upgrade and improve the counterterrorism capabilities of law enforcement and intelligence

agencies as well exercise proper oversight of these capabilities. The American people are resilient, but the lesson of Boston is that the government can and should do more to prevent future terror attacks.

XT – Mass Surveillance Key

Mass surveillance is critical to find actionable intelligence.

John Yoo, 6/12/2013. Emanuel Heller professor of law at the University of California at Berkeley and a Visiting Scholar at the American Enterprise Institute, former official in the Office of Legal Counsel in the U.S. Department of Justice. “John Yoo: NSA activities shouldn't be aired in public,” <http://www.usatoday.com/story/opinion/2013/06/12/nsa-surveillance-john-yoo-editorials-debates/2417377/>.

But fear should not provoke a rush to harm our war against al-Qaeda. Surveillance of enemy communications not only has a long history in the annals of American arms, but it is also the most effective means for gaining actionable intelligence on terrorists.

President Obama has discarded superior tools: He has stopped the interrogation of al-Qaeda leaders, and his leak-loving staff has blown the penetrations of al-Qaeda cells by intelligence agencies.

By combining telephone call records (but not the content of calls) and foreigners' e-mails abroad — neither of which is protected by the Fourth Amendment — the NSA can at least create the data necessary to quickly identify and frustrate terrorist plans.

Of course, the NSA should not receive a blank check. But it is unnecessary, and even harmful, to air its activities in public.

Al-Qaeda closely monitors our government affairs and reacts quickly. In the 1990s, for example, Osama bin Laden stopped using his personal cellphone only 48 hours after the White House leaked that it was tapped.

Instead of risking the loss of intelligence sources and methods, we should continue to follow the constitutional design. A time-tested system has promoted legislative oversight of classified activities without losing the virtues of speed and secrecy abroad. American intelligence agencies regularly disclose their most sensitive covert operations to congressional leaders, who can exercise their power of the purse to stop bad ideas.

The Framers recognized that our elected representatives would need such secrecy to protect the national security, which is why the Constitution allows for closed congressional proceedings. We should allow the system of representative democracy to decide intelligence policy, rather than sacrifice a critical advantage to satisfy the whims of those who do not understand that we are still a nation at war.

NSA surveillance of meta-data is critical --- PATRIOT Act authorities are key.

John Yoo, 5/15/2015. Emanuel Heller professor of law at the University of California at Berkeley and a Visiting Scholar at the American Enterprise Institute, former official in the Office of Legal

Counsel in the U.S. Department of Justice. "The USA Freedom Act Would Take Us Back to the Pre-9/11 Security Status Quo," National Review, <http://www.nationalreview.com/corner/418462/usa-freedom-act-would-take-us-back-pre-911-security-status-quo-john-yoo>.

I worry that the representatives who voted to pass the USA Freedom Act in the House do not understand its full import in terms of our national security. The bill practically repeals Section 215 of the Patriot Act, but makes it appear as if those who voted for the bill advanced security in some way. The result of the legislation's enactment, however, would not be significantly different than if Section 215 were simply allowed to expire. Even before the Patriot Act, the government could get a warrant from a judge to get call metadata from a phone company. The Freedom Act requires phone companies to keep the calling records, but of course they do that already in order to bill customers. So the Freedom Act eliminates the advantages of Section 215 and practically restores the system that existed before. It is politically superficial but also substantively destructive. As we saw on 9/11, that previous system failed. The reason why is that it slowed everything down (as would the Freedom Act). If our intelligence agencies have a lead — say they capture a terrorist leader or intercept his calls — they will have to act quickly to see what other phone numbers and e-mail addresses that the leader contacted to discover the broader network. The other terrorists, of course, will be switching to other numbers and addresses as soon as they suspect that one of their number has been compromised. Taking the time to (a) prepare a request for a warrant; (b) get it approved by a judge; and then (c) search through multiple phone company databases, will give the terrorists time to hide and cover their tracks. Speed is of the greatest essence exactly when we are trying to find the links in the U.S., where the terrorists will be closest to their targets and our defenses at their weakest. If this program had been in effect before 9/11, the government could have quickly searched the databases to discover the links between the two hijackers known to the CIA to have entered the U.S. That could have quickly led the government to the rest of the hijackers (just as those calling, e-mail, and financial records allowed the FBI to reconstruct the 9/11 terror cells within a day or so after the attacks). Another problem is that having the database dispersed among the different phone companies means our government cannot be sure that it has searched thoroughly for all of the possible links. The value of these metadata searches is reduced if the database is not as complete as possible. The databases will also be in private hands, where they might easily be open to invasions of privacy and penetration by foreign intelligence services.

XT – Executive Flexibility I/L

Flexibility is key to counter-terrorism --- executive must react quickly to intel --- deliberation in Court or Congress risks leaks and undermines rapid reaction.

Glenn Sulmasy 9, law faculty of the United States Coast Guard Academy, , Anniversary Contributions: Use of Force: Executive Power: the Last Thirty Years, 30 U. Pa. J. Int'l L. 1355

Since the attacks of 9/11, the original concerns noted by Hamilton, Jay, and Madison have been heightened. Never before in the young history of the United States has the need for an energetic executive been more vital to its national security. The need for quick action in this arena requires an executive response - particularly when fighting a shadowy enemy like al Qaeda - not the deliberative bodies opining on what and how to conduct warfare or determining how and when to respond. The threats from non-state actors, such as al Qaeda, make the need for dispatch and rapid response even greater. Jefferson's concerns about the slow and deliberative institution of Congress being prone to informational leaks are even more relevant in the twenty-first century. The advent of the twenty-four hour media only leads to an increased need for retaining enhanced levels of executive [*1362] control of foreign policy. This is particularly true in modern warfare. In the war on international terror, intelligence is vital to ongoing operations and successful prevention of attacks. Al Qaeda now has both the will and the ability to strike with the equivalent force and might of a nation's armed forces. The need to identify these individuals before they can operationalize an attack is vital. Often international terror cells consist of only a small number of individuals - making intelligence that much more difficult to obtain and even more vital than in previous conflicts. The normal movements of tanks, ships, and aircrafts that, in traditional armed conflict are indicia of a pending attack are not the case in the current "fourth generation" war. Thus, the need for intelligence becomes an even greater concern for the commanders in the field as well as the Commander-in-Chief.¶ Supporting a strong executive in foreign affairs does not necessarily mean the legislature has no role at all. In fact, their dominance in domestic affairs remains strong. Additionally, besides the traditional roles identified in the Constitution for the legislature in foreign affairs - declaring war, ratifying treaties, overseeing appointments of ambassadors, etc. - this growth of executive power now, more than ever, necessitates an enhanced, professional, and apolitical oversight of the executive. An active, aggressive oversight of foreign affairs, and warfare in particular, by the legislature is now critical. Unfortunately, the United States - particularly over the past decade - has witnessed a legislature unable to muster the political will necessary to adequately oversee, let alone check, the executive branch's growing power. Examples are abundant: lack of enforcement of the War Powers Resolution around the executive's unchecked invasions of Grenada, Panama, and Kosovo, and such assertions as the Authorization for the Use of Military Force, the USA Patriot Act, military commissions, and the updated Foreign Intelligence Surveillance Act ("FISA"). There have been numerous grand-standing complaints registered in the media and hearings over most, if not all, of these issues. However, in each case, the legislature has all but abdicated their constitutionally mandated role and allowed the judicial branch to serve as the only real check on alleged excesses of the executive branch. This

deference is particularly dangerous and, in the current environment of foreign affairs and warfare, tends to unintentionally politicize the Court.¶ The Founders clearly intended the political branches to best serve the citizenry by functioning as the dominant forces in [*1363] guiding the nation's foreign affairs. They had anticipated the political branches to struggle over who has primacy in this arena. In doing so, they had hoped neither branch would become too strong. The common theme articulated by Madison, ambition counters ambition, n17 intended foreign affairs to be a "give and take" between the executive and legislative branches. However, inaction by the legislative branch on myriad policy and legal issues surrounding the "war on terror" has forced the judiciary to fulfill the function of questioning, disagreeing, and "checking" the executive in areas such as wartime policy, detentions at Guantanamo Bay, and tactics and strategy of intelligence collection. The unique nature of the conflict against international terror creates many areas where law and policy are mixed. The actions by the Bush administration, in particular, led to outcries from many on the left about his intentions and desire to unconstitutionally increase the power of the Presidency. Yet, the Congress never firmly exercised the "check" on the executive in any formal manner whatsoever.¶ For example, many policymakers disagreed with the power given to the President within the Authorization to Use Military Force ("AUMF"). n18 Arguably, this legislation was broad in scope, and potentially granted sweeping powers to the President to wage the "war on terror." However, Congress could have amended or withdrawn significant portions of the powers it gave to the executive branch. This lack of withdrawal or amendment may have been understandable when Republicans controlled Congress, but as of November 2006, the Democrats gained control of both houses of the Congress. Still, other than arguing strongly against the President, the legislature did not necessarily or aggressively act on its concerns. Presumably this inaction was out of concern for being labeled "soft on terror" or "weak on national security" and thereby potentially suffering at the ballot box. This virtual paralysis is understandable but again, the political branches were, and remain, the truest voice of the people and provide the means to best represent the country's beliefs, interests, and national will in the arena of foreign affairs. It has been this way in the past but the more recent (certainly over the past thirty years and even more so in the past decade) intrusions of the judicial branch into what [*1364] was intended to be a "tug and pull" between the political branches can properly be labeled as an unintended consequence of the lack of any real legislative oversight of the executive branch.¶ Unfortunately, now nine unelected, life-tenured justices are deeply involved in wartime policy decision making. Examples of judicial policy involvement in foreign affairs are abundant including *Rasul v. Bush*; n19 *Hamdi v. Rumsfeld*; n20 *Hamdan v. Rumsfeld*; n21 as well as last June's *Boumediene v. Bush* n22 decision by the Supreme Court, all impacting war policy and interpretation of U. S. treaty obligations. Simply, judges should not presumptively impact warfare operations or policies nor should this become acceptable practice. Without question, over the past thirty years, this is the most dramatic change in executive power. It is not necessarily the strength of the Presidency that is the change we should be concerned about - the institutional search for enhanced power was anticipated by the Founders - but they intended for Congress to check this executive tendency whenever appropriate. Unfortunately, this simply is not occurring in twenty-first century politics. Thus, the danger does not necessarily lie with the natural desire for Presidents to increase their power. The real danger is the judicial branch being forced, or compelled, to fulfill the constitutionally mandated role of the Congress

in checking the executive.¶ 4. PRESIDENT OBAMA AND EXECUTIVE POWER¶ The Bush presidency was, and continues to be, criticized for having a standing agenda of increasing the power of the executive branch during its eight-year tenure. Numerous articles and books have been dedicated to discussing these allegations. n23 However, as argued earlier, the reality is that it is a natural bureaucratic tendency, and one of the Founders presciently anticipated, that each branch would seek greater powers whenever and wherever possible. As the world becomes increasingly interdependent, technology and armament become more sophisticated, and with [*1365] the rise of twenty-first century non-state actors, the need for strong executive power is not only preferred, but also necessary. Executive power in the current world dynamic is something, regardless of policy preference or political persuasions, that the new President must maintain in order to best fulfill his constitutional role of providing for the nation's security. This is simply part of the reality of executive power in the twenty-first century. n24

2NC – Intel Key

Intel is key to preventing WMD terrorism --- compromising secrecy risks attacks.

John Yoo, 2004. Professor of Law @ UC-Berkeley, visiting scholar @ the American Enterprise Institute, served as a deputy assistant attorney general in the Office of Legal Council at the U.S. Department of Justice between 2001 and 2003. "War, Responsibility, and the Age of Terrorism," UC-Berkeley Public Law and Legal Theory Research Paper Series, <http://works.bepress.com/cgi/viewcontent.cgi?article=1015&context=johnyoo>.

Third, the nature of warfare against such unconventional enemies may well be different from the set-piece battlefield matches between nation-states. Gathering intelligence, from both electronic and human sources, about the future plans of terrorist groups may be the only way to prevent September 11-style attacks from occurring again. Covert action by the Central Intelligence Agency or unconventional measures by special forces may prove to be the most effective tool for acting on that intelligence. Similarly, the least dangerous means for preventing rogue nations from acquiring WMD may depend on secret intelligence gathering and covert action, rather than open military intervention. A public revelation of the means of gathering intelligence, or the discussion of the nature of covert actions taken to forestall the threat by terrorist organizations or rogue nations, could render the use of force ineffectual or sources of information useless. Suppose, for example, that American intelligence agencies detected through intercepted phone calls that a terrorist group had built headquarters and training facilities in Yemen. A public discussion in Congress about a resolution to use force against Yemeni territory and how Yemen was identified could tip-off the group, allowing terrorists to disperse and to prevent further interception of their communications.

Intel gathering is key to execute a divide and conquer strategy --- that's key to preventing WMD terrorism.

Kurt M. Campbell and Richard Weitz, September 2006. PhD International Relations @ Oxford, Senior Vice President, Henry A. Kissinger Chair in National Security, and Director of the International Security Program at the Center for Strategic and International Studies in Washington; and PhD Political Science @ Harvard, Senior Fellow and Associate Director of Hudson Institute's Center for Future Security Strategies. "Non-Military Strategies For Countering Islamist Terrorism: Lessons Learned From Past Counterinsurgencies," The Princeton Project Papers, <https://www.princeton.edu/~ppns/papers/counterinsurgency.pdf>.

In both counterinsurgency and counterterrorist campaigns, a divide-and-conquer strategy can have three dimensions: exploiting divisions within the adversary's camp, separating the operatives from their domestic supporters, and isolating them from their foreign sponsors. Past

insurgencies show how divisions among the guerrillas, or the people they seek to influence, can assist the counterinsurgency. In Malaya, the existence of a disaffected Chinese ethnic minority made the insurgency possible, but the fact that the majority of Malays identified the guerrillas as predominately ethnic Chinese limited their influence. In Algeria, Vietnam, and Soviet-occupied Afghanistan, however, the authorities could not persuasively depict the insurgents as an unrepresentative minority, particularly given their own dependence on non-native troops, which allowed the guerrillas to characterize the war as a “liberation” insurgency. 49 French, American, and Soviet policy makers also had very little success in exploiting divisions among the insurgent leaders. Furthermore, they proved unable to cultivate a viable “third force” of moderate nationalists that could stand up to the insurgents without extensive foreign backing – something that remains an issue in Afghanistan and Iraq today. The value of amnesty programs in weakening insurgencies is less clear. Their purpose is to encourage defections by less dedicated or otherwise dissatisfied guerrillas. If successful, their direct effect is to reduce the insurgents’ ranks; their indirect impact is to provide additional intelligence sources as well as visible signs that the counterinsurgency is succeeding. In Malaya, the British amnesty program yielded important tactical and strategic intelligence and encouraged further defections. Financial rewards proved especially fruitful. One senior communist leader’s own bodyguards murdered him so they could collect a \$200,000 reward. 50 Other surrendered enemy personnel frequently led the military or police to their former guerrilla units. 51 In the Philippines, offers of free land and basic supporting infrastructure (i.e., roads, housing, and liberal loans) induced some Huk guerrillas to surrender. Similar programs proved far less successful in Algeria or Vietnam. Although the South Vietnamese government began offering amnesty and “rehabilitation” (job training, welfare services, and resettlement assistance) to Viet Cong (VC) and North Vietnamese defectors as early as 1966, the program encountered several problems. Former Prime Minister Nguyen Ky lamented: “Often the Vietcong used the program to get medical attention, decent food, and a few weeks’ vacation from the war. Once they were rested, they re-defected to the communists and continued to fight us.” 52 Low-level VC or even fake guerillas participated for the free food, shelter, and other material benefits. Monetary awards for South Vietnamese responsible for a defection (under the “third-party inducement plan”) led to phony defectors who split the reward money with corrupt officials. 54 Defectors also encountered suspicion and other resistance when they genuinely sought to reintegrate into South Vietnamese society. The various amnesty programs introduced recently in Afghanistan also have experienced only modest success. 55 Pursuing a “divide-and-conquer” strategy in the GWOT would mean attempting to undo al Qaeda’s most important achievement – its success in combining terrorist foot-soldiers from many different ethnic groups and nationalities into a single, eclectic but cohesive movement with operations in more than sixty countries. 56 Bin Laden has managed to get antagonistic rivals – such as Egypt’s two main terrorist groups, the Egyptian Islamic Jihad and the Islamic Group – to set aside years of mutual hostility to cooperate against common enemies. 57 In the GWOT, logical fissures to exploit include divisions within al Qaeda, between al Qaeda and its affiliate terrorist groups, and between the terrorists and their active network of supporters. 58 At a minimum, U.S. policies should aim to counter al Qaeda’s strategy of subsuming all local conflicts under a war of civilizations between the Muslim world on the one hand, and the United States and its non-Muslim allies on the other. Left to themselves, local groups will give priority to local concerns. Most Islamist terrorists in Palestine,

Xinjiang, and Chechnya want to focus on their immediate enemies (Israel, China, and Russia, respectively) and will seek to avoid becoming entangled in a direct conflict with the United States unless given cause to do so. Tensions between Shiite and Sunni extremists offer another opportunity for dividing the adversary. Many Shia Muslims in Iraq have declined to join the insurgency because some Sunni Muslim terrorists – influenced by Takfiri ideology, which depicts Shia Muslims as apostates – have attacked Shias. Some Sunni terrorist groups in Pakistan also have designated Shia Muslims as explicit targets. Bin Laden’s strengthened ties with Shiite-hater Abu Musab al-Zarqawi, especially his designation of him as al Qaeda’s leader in Iraq, provided additional opportunities for the United States to cultivate Shiite support against Sunni terrorist organizations like al Qaeda. A further division within the global Islamist terrorist movement might be emerging between the Arab members of al Qaeda and its Central Asian allies. During the late 1990s, these two groups worked in harmony under the auspices of the IMU, which developed extensive connections with al Qaeda and the Taliban. In May 2001, Taliban authorities even appointed IMU military leader Juma Namangani head of a sort of Islamic foreign legion. Consisting of a variety of non-Afghan Islamic fighters, including Pakistanis, Turks, Uighurs, and Uzbeks, the brigade fought against the Afghani Northern Alliance until U.S. forces destroyed it after September 11, 2001. 59 Pakistan’s recent crackdown on the terrorist operatives who subsequently fled to North and South Waziristan has led to friction between the Arabs and Central Asians there. The two groups compete for hideouts and the affiliation of the local tribes. They also have different priorities, with the Central Asians focused on overthrowing the region’s secular governments rather than attacking Americans, which could draw the U.S. military further into their region. According to media reports, this rivalry has seen captured Chechen, Tajik, and Uzbek suspects divulging information to Pakistani intelligence about the identity and whereabouts of senior Arab members of al Qaeda – including the arrested Libyan operative, Abu Faraj al-Libbi, described as al Qaeda’s third-highest leader. 60 Another way to counter the extremists is to empower Islamic moderates. Just as Social Democrats represented one of the strongest bulwarks against Soviet-allied Communist Parties in Western Europe during the Cold War, so Islamic moderates can drain support and legitimacy from jihadi extremists. Even some otherwise radical Islamist groups could, whatever their subjective views, objectively assist the United States to counter jihadi terrorism. Some of these groups opposed al Qaeda’s 9/11 operation on the grounds that the timing was inappropriate. In particular, they maintained that the strikes should not have occurred until Muslims were more united and better prepared to resist U.S. retaliation. 61 (Bin Laden anticipated that the attacks would further such unity by rallying Muslims against the expected harsh and indiscriminate U.S. response. 62) A salient if controversial target for such a strategy might be the Hizb-ut-Tahrir (“Party of Islamic Liberation”), an international Islamic movement with as many as one hundred thousand adherents concentrated in Eurasia. Although its followers seek to replace the existing regimes in the Middle East and Central Asia with a multinational Caliphate governed by the Islamic laws and practices that existed at the time of the Prophet Muhammad, they insist that such change must occur through non-violent means and dismiss the violent tactics of IMU and al Qaeda as ineffective. Despite the Hizb-ut-Tahrir’s anti-American rhetoric and some of its adherents’ conversion to violent terrorism, the U.S. government has persistently refused to designate it a Foreign Terrorist Organization like al Qaeda. Keeping such “café Islamists” preoccupied with theocratic debates and their never-ending project of writing the perfect constitution for their

envisaged state should become an important goal. The presence of Hizb-ut-Tahrir and other nonviolent Islamic movements, notwithstanding their immoderate rhetoric, provides a non-violent means of expression for many Muslims. Its elimination would likely result in many of its adherents joining radical Islamist terrorist groups. On the other hand, the United States should continue to exert pressure on violent Islamist extremists to exacerbate differences among them – just as the firm U.S. stand against the Sino-Soviet alliance during the 1950s helped divide rather than unite them. In essence, the Soviets feared that the Chinese communists would drag them into a conflict with Washington over Taiwan. Similarly, al Qaeda’s affiliate organizations might break with the radical Islamist network to avoid the fate of the Taliban if, for example, al Qaeda operatives sought to attack a U.S. target in their geographic area of operations notwithstanding the heightened American antiterrorist response that would ensue. Exploiting such differences also could enhance U.S. deterrence against WMD attacks. 64 U.S. policies must make clear to all terrorist groups that joining al Qaeda’s violently anti-American network would result in their becoming targets of an exceptionally robust U.S. response. Intelligence Requirements Conducting an effective divide-and-conquer strategy requires excellent intelligence regarding policy disputes, ideological differences, and private vendettas between the terrorist leaders. For example, the United States needs to know more about the relationships between al Qaeda and its regional affiliates, between Osama bin Laden and Ayman al-Zawahiri, and between bin Laden and other regional leaders. 65 As the global network of radical terrorist groups continues to fragment – seen most saliently in the rise of the “lone wolf” individual inspired by, but not connected with, a specific terrorist group – intelligence analysts will find it increasingly challenging to keep abreast of the network’s evolving components, diverse goals, strategies, and tactics. 66

Complete elimination of terrorism impossible --- intel key to prevent attacks.

John Yoo, 2005. Professor of Law @ UC-Berkeley, visiting scholar @ the American Enterprise Institute, served as a deputy assistant attorney general in the Office of Legal Council at the U.S. Department of Justice between 2001 and 2003. “Enemy Combatants and Judicial Competence,” in *Terrorism, the Laws of War, and the Constitution*, ed. Peter Berkowitz, 83-84, http://media.hoover.org/sites/default/files/documents/0817946225_69.pdf.

Add to these concerns the important military interest, only made more acute by the unconventional nature of the war with al Qaeda, of interrogating enemy combatants for information about coming attacks. Unlike previous wars, the current enemy is a stateless network of religious extremists who do not obey the laws of war, who hide among peaceful populations, and who seek to launch surprise attacks on civilian targets with the aim of causing massive casualties. They have no armed forces to target, no territory to defend, no people to protect, and no fear of killing themselves in their attacks. The front line is not solely a traditional battlefield, and the primary means of conducting the war includes the efforts of military, law enforcement, and intelligence officers to stop attacks before they occur. Information is the primary weapon in the conflict against this new kind of enemy, and intelligence gathered from

captured operatives is perhaps the most effective means of preventing future terrorist attacks upon U.S. territory.

2NC – Deterrence/Perception I/L

Expiration of NSA authority is a massive signal of weakness --- terrorist groups are looking to exploit any vulnerability.

Daily Mail, 5/31/2015. "Head of CIA warns that US is at risk of lone wolf terror attack after NSA powers to monitor all phone calls expired – as Isis 'watch carefully' for security gaps," <http://www.dailymail.co.uk/news/article-3105089/Senate-makes-ditch-bid-extend-NSA-s-bulk-collection-phone-records-Rand-Paul-swears-block-legislation-let-Patriot-Act-expire.html>.

The head of the CIA has warned that Americans are now at risk after the Senate was unable to extend laws giving authorities special powers to fight terrorists.

Politicians in the upper house were unable to come to an agreement to extend key parts of the Patriot Act - that legalize controversial methods of surveillance by the National Security Agency (NSA) - which expired on Sunday.

Attempts were frustrated by Presidential candidate Rand Paul, who has taken a firm stance against the extension of powers allowing the mass collection of phone records, wire taps and warrants without evidence.

But the Head of the CIA John Brennan claims ordinary Americans, who expect the NSA to do their jobs, have been put at risk by 'political grandstanding and crusading for ideological causes' that fueled the debate.

Speaking on CBS show Face The Nation, he warned that the US - and Europe - is now in danger from technologically 'sophisticated' terrorists who are watching developments carefully and 'looking for the seams to operate' within.

He claimed that the authorities do not abuse the powers, extended in 2011 to help fight lone wolf terror suspects not connected to a specific group, and that without them, it's difficult for the NSA to protect America.

Mr Brennan said: 'I think terrorist elements have watched very carefully what has happened here in the United States, whether or not it's disclosures of classified information or whether it's changes in the law and policies. They are looking for the seams to operate within.

'And this is something that we can't afford to do right now, because if you look at the horrific terrorist attacks and violence that is being perpetrated around the globe, we need to keep our country safe. And our oceans are not keeping us safe the way they did a century ago.'

The Patriot Act was passed in 2001 in the wake of the 9/11 terror attacks. Now that the provisions have expired, government agents will need to subpoena phone companies for the records.

The White House previously justified collecting the records because of the Patriot Act's Section 215, which expired on Sunday.

Two other provisions, added in 2011, also expired with it. The first is a 'roving wiretap' provision which allows government agencies to keep tracking suspects as they switch devices.

The second is a 'lone wolf' clause which allows warrants to be granted without any evidence linking a suspect to a foreign power or terrorist group.

Political struggles over the NSA and its data collection have become a national issue since whistleblower Edward Snowden revealed the extent of government programs in 2013.

The senate's efforts to pass a replacement bill were frustrated by Kentucky's junior senator Rand Paul, who has spoken at length against the NSA's activities, which he has excoriated as illegal and unconstitutional.

Paul, a Republican who is running for president, came up against members of his own party, as well as the Obama administration.

With his presidential campaign waning, he has been accused of irresponsible political opportunism by opponents, by fighting a bill on ideological grounds that may put ordinary people at risk.

He was criticized by the White House Sunday night, which called the Patriot Act expiration an 'irresponsible lapse'.

While Brennan didn't mention Paul by name, he said on Face The Nation: 'Unfortunately I think there is a little too much political grandstanding and crusading for ideological causes that have really fuelled the debate on this issue.'

He added: 'These are authorities that have been used by the government to make sure that we're able to safeguard Americans. And the sad irony is that most Americans expect the government to protect them. And so although there's a lot of debate that goes on, on the Congress and the Hill on this issue, I think, when you go out to Boise or Tampa or Louisville, Americans are expecting their law enforcement and homeland security and intelligence professionals to do their work. And these authorities are important.'

Paul argued 'there must be another way' but even he agrees that the lapse in these powers are likely to be temporary as politicians work on the USA Freedom Act, which is expected to pass within the next week.

Republican Senate Majority Leader Mitch McConnell called a rare Sunday session to try to pass the replacement law, but was unable to push it through in time.

And although the replacement is set to pass this week, Paul said the expiration was 'a victory no matter how you look at it'.

In a statement, he said: 'It might be short lived, but I hope that it provides a road for a robust debate, which will strengthen our intelligence community, while also respecting our Constitution.'

He added: 'The expiration of the NSA's sweeping, all-encompassing and ineffectual powers will not relinquish functions necessary for protecting national security. The expiration will instead do what we should have done all along - rely on the Constitution for these powers.'

According to a top lawmaker, as of 8pm Sunday no NSA employee could access their enormous phone records database, which holds metadata on millions of phone conversations handed over by telecoms companies like Verizon and AT&T.

Senate Intelligence Committee chairman Richard Burr said on Sunday: 'There is no way to get any type of agreement tonight -- either an extension or passage of a bill. So at 8pm tonight, NSA employees can not query the database'.

In a statement issued Sunday night, Obama's press secretary Josh Earnest, urged action to pass the USA Freedom Act as quickly as possible.

He said: 'The Senate took an important - if late - step forward tonight. We call on the Senate to ensure this irresponsible lapse in authorities is as short-lived as possible.'

'On a matter as critical as our national security, individual Senators must put aside their partisan motivations and act swiftly. The American people deserve nothing less.'

Some lawmakers have said the lapse raises alarming questions about how US authorities can keep the homeland safe with a diminished security toolbox.

'I think it's very very unfortunate that we're in this position,' said Senator Mike Lee, a conservative Republican who supports the reform bill.

'We've known this date was coming for four years. Four years. And I think it's inexcusable that we adjourned' for a weeklong break last week without resolving the issue.

Lee, too, conceded that the reform bill would most likely pass in the coming week.

With the clock ticking, CIA chief John Brennan warned Sunday that allowing vital surveillance programs to lapse could increase terror threats, and argued that the phone metadata dragnet has not abused civil liberties and only serves to safeguard citizens.

'This is something that we can't afford to do right now,' Brennan said of allowing the counterterrorism provisions to expire.

'Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,' he said on CBS talk show Face the Nation.

Brennan added that online threats from groups like Isis would continue to grow over the next five to ten years.

He said: 'Isis has been very sophisticated and adept at using the Internet to propagate its message and reach out to individuals. We see what is happening as far as thousands upon thousands of individuals, including many thousands from the West, that have traveled into Syria and Iraq. And a number of these individuals are traveling back.'

'And what we see, they're also using the Internet as a way to incite and encourage individuals to carry out acts of violence.

'So as the director of FBI says, you know, this use of these websites and their Internet capabilities is something of great concern. So yes, I think ISIS is a threat not just in the Middle East and South Asia and African regions but also to Europe as well as to the United States.'

Deterrence works against terrorism --- AQ expects high reliability levels for operations --- they will wait for weakness.

Gordon Woo, 2002. Dr. Gordon Woo was trained in mathematical physics at Cambridge, MIT and Harvard, and has made his career as a calculator of catastrophes. His diverse experience includes consulting for IAEA on the seismic safety of nuclear plants and for BP on offshore oil well drilling. As a catastrophist at Risk Management Solutions, he has advanced the insurance modelling of catastrophes, including designing a model for terrorism risk. "Quantitative Terrorism Risk Assessment,"

http://isc.temple.edu/economics/wkpapers/Homeland/Quantitative_Terrorism_Risk_Assessment.pdf.

The term macroterrorism has been coined to describe a spectacular act of terrorism, (which may be a multiple strike at several locations), which causes more than \$1 billion of loss, or 500 deaths. Minor (micro) terrorist acts, such as house bombing, may occur haphazardly, but not signify a change in the terrorism environment. However, this is not the case with macroterrorism. Following an act of macroterrorism, security and border controls are inevitably strengthened, and emergency government funding made available for improving protective measures. Civil liberties may be temporarily curtailed as suspects are detained without trial, and minority communities potentially supporting sleeper cells are placed under tight surveillance. Although copycat attacks may be attempted in the aftermath of a successful strike, they are likely to fail due to the heightened security. In the harsher security regime soon after a successful strike, terrorists may rationally decide to lie low, and delay any further action until security is relaxed, border controls are eased, civil liberties lawyers intervene, and public risk awareness fades: circumstances which would give a later attack a higher chance of success. There are other reasons favoring a delay. Logistically, resources may need to be replenished after a macroterror attack. Furthermore, once a terrorist's message has been delivered across the media through a spectacular macroterrorism event, (perhaps after a series of failures), a publicity reminder may not be needed for a while. The change in system state following a successful macroterrorism event implies that, rather like great earthquakes, such events do not satisfy the prerequisites of a Poisson process. Although it would require an elaborate Monte Carlo simulation to realize the temporal pattern of successful al-Qaeda macroterror attacks, the simplest representation is a two-state Markov process. In the first state, security is comparatively relaxed, and conducive to a successful macroterror attack. In the second state, security is comparatively strict, and not conducive to a successful macroterror attack. With the almost infinite payoff of paradise promised to martyrs, patience in waiting for security

weaknesses is an optimal strategy. Indeed, it is known that Osama bin Laden has expected very high reliability levels for martyrdom operations. As a didactic illustration, consider the binary situation where successful macroterror attacks only take place during the relaxed security state. If the rate of successful macroterror attacks in this first state is U , and the erosion rate of security in the second state is V , then, assuming a successful macroterror attack causes a state transition from 1 to 2, the limiting proportion of time spent in state 1 is $V/(U+V)$, and the limiting frequency of successful macroterror attacks is $UV/(U+V)$. The effect of maintaining security measures is to keep V low, and hence suppress the limiting frequency of successful macroterror attacks.

XT – Deterrence Works

Deterrence works in this context --- terrorists might not care about death, but they are risk-averse in terms of executing their plots.

Robert Anthony, May 2003. Institute for Defense Analyses. "Deterrence and the 911 Terrorists," <http://oai.dtic.mil/oai/oai?verb=getRecord&metadataPrefix=html&identifier=ADA430351>.

The 11 September 2001 attacks on the World Trade Center and the Pentagon using hijacked commercial aircraft as weapons provide a chilling example of a failure to thwart committed suicide terrorists. This paper argues that it should be possible to deter even suicide terrorists, and analyzes why our security protections failed to achieve the conditions necessary to deter the 9-11 attacks. Based on our current understanding and mathematical model of the psychology of deterrence, analysis of the 9-11 attacks shows that the terrorists were cautious and risk averse, yet we as a nation failed to challenge them at the threshold levels necessary to deter their attack. While publicly available empirical data is insufficient to support a complete analysis, both qualitative and quantitative techniques indicate wide gaps between where we were on September 10th and where we need to be to deter such terrorists.

B. BACKGROUND: DETERRENCE AND AVIATION SECURITY

One would expect that as the chances of being caught, imprisoned, killed, or humiliated increase, many terrorists would quit, put off their attack, or chose different, less protected targets. Even suicide terrorists do not want to waste their lives on a futile attack and exhibit extreme caution in all of their preparations. In addition, they probably do not wish to appear as powerless or inept, embarrass their cause, reveal larger plans, or bring shame on their families and supporters.

2NC – AT: Intel Cooperation Turn

Intelligence cooperation is robust despite NSA surveillance.

Defense One, 2/11/2015. Patrick Tucker. “‘Dramatic Improvement’ in US and European Intel Sharing Because of ISIS,” <http://www.defenseone.com/technology/2015/02/dramatic-improvement-us-and-european-intel-sharing-because-isis/105120/>.

More than ever, European countries are voluntarily providing the United States with large amounts of information about their citizens, particularly as those citizens attempt to travel, the nation’s top counterterrorism official said.

Compared to the summer of 2013, U.S.intelligence professionals have seen a “pendulum swing” in the willingness of European law enforcement to share information with the U.S. on European citizens, said Nicholas J. Rasmussen, director of the National Counterterrorism Center, or NCTC, on Wednesday.

Things have turned around since summer 2013, when NSA contractor Edward Snowden first disclosed some of the nation’s most closely kept secrets on surveillance capabilities. Rasmussen said that “the politics are difficult for some of our European partners” but tracking Islamic State fighters, or ISIS, has become a priority.

Rasmussen, before the House Committee on Homeland Security, said that European partners continue to differ from U.S. counterparts on the issue of bulk metadata collection. But European reservations about data sharing in more targeted investigations had “seen a dramatic improvement,” particularly in populating the NCTC’s database, called the Terrorist Identities Datamart Environment, or TIDE. It is one of the key person-of-interest watch lists that the U.S. and other countries use to track potential or suspected terrorists.

Intelligence cooperation is inevitable despite any political disputes over surveillance.

PBS, 10/25/2013. Ray Suarez, PBS; P.J. Crowley, former assistant secretary of state for public affairs, now a professor at George Washington University; and Philip Mudd, senior research fellow at the New America foundation, and held senior positions at the CIA, FBI and the National Security Council. “What are the diplomatic costs of the NSA surveillance revelations for the U.S.?” http://www.pbs.org/newshour/bb/government_programs-july-dec13-snowden2_10-25/

RAY SUAREZ: What impact have the revelations had on U.S. interests abroad and intelligence operations?

P.J. Crowley is a former assistant secretary of state for public affairs, now a professor at George Washington University. And Philip Mudd is a senior research fellow at the New America foundation, and held senior positions at the CIA, FBI and the National Security Council.

P.J. Crowley, these latest revelations of the surveillance of the communication of heads of state and heads of government, is that a serious breach, serious diplomatic problem for the United States now?

P.J. CROWLEY, former U.S. Assistant Secretary of State for Public Affairs: It is a serious and awkward diplomatic problem for the United States.

You know, that said, at the end of the day, interests drive relationship. Politics matters. It animates those relationships and the willingness of leaders to stand together in common cause and do whatever needs to be done to keep their respective countries safe, you know, those relationships also matter.

We have been through these stresses and strains before. We went through them with WikiLeaks. Remember that Iraq wasn't very popular during the Bush administration. So I'm confident that because the relationship between the United States and Europe is so deep, is so broad, is so meaningful, we will get through this. But it will take some time.

RAY SUAREZ: Philip Mudd, how seriously should we take the fury coming from Europe today?

PHILIP MUDD, New America Foundation: I think this is a short-term problem.

As P.J. suggested, I'm not sure it is a long-term issue. The issue here though really is not just these revelations in isolation. It is this cascade through the summer and into the fall about spying on Americans, spying on citizens in Europe, spying on foreign leaders.

This cascade is going to, I think, lead to months, maybe a little longer of tension. These political leaders have to respond. But when security services feel a threat, for example, a threat from terror cells, they will continue to cooperate, regardless of what we're seeing at the political level.

XT – Intel Cooperation High

The perceived threat of terrorism is driving greater EU collaboration on surveillance --- objections to the NSA haven't undermined cooperation.

AP, 5/20/2015. Associated Press. Lori Hinnant and Ken Dilanian. "For US allies, paradigm shift in intelligence collection,"

http://hosted2.ap.org/WVLOG/f0fb39ba210e4705b63f4a0f168573df/Article_2015-05-20-EU--Rethinking%20Intel/id-e41396bf63a04689a4daaabc3fc48651.

PARIS (AP) — Fearful of an expanding extremist threat, countries that for years have relied heavily on U.S. intelligence are quickly building up their own capabilities with new technology, new laws and — in at least one case — a searing debate on how much the American government should be allowed to spy on their own citizens.

Responding to a jihadi movement that is successfully recruiting people from around the world, France and Canada are both passing laws that would dramatically ramp up their intelligence apparatus. In France, lawmakers are on the verge of approving a bill that would let the government install "black boxes" to collect metadata from every major phone and Internet company.

Canada's measures were rushed through after a two separate attacks in October 2014 on Canadian soldiers — including one that ended when the gunman stormed Parliament and was shot to death by guards and police. France's law went into high gear after the January terror attacks on the satirical weekly Charlie Hebdo and a kosher supermarket that left 20 dead, including the gunmen.

Analysts say it's not so much a question of diminishing cooperation with the U.S. — the revelations of Edward Snowden have ultimately done little to harm relationships between allies — as a push to increase domestic capacities ill-equipped to face the rising threat of Islamic State and other jihadi groups.

"These are not people coming from the outside, these are not people who are taking plane trips, they are not people who attracted notice outside our countries. These are people who come from the heart of our society," said Alain Chouet, a former French intelligence official who recently returned from an extended trip to Canada where he debated the measures in both countries. "International cooperation in this area isn't hugely useful."

Technologically, France goes the furthest with the planned creation of a 'Made in France' mass collection of metadata that has the potential to go beyond a National Security Agency program. Where the NSA collected landline metadata for nearly every U.S. citizen but never really got into scooping up cell data, France is pushing to essentially vacuum up and analyze everything — landline, mobile and Internet metadata.

The law authorizing that NSA program is set to expire June 1, but the U.S. House of Representatives last week (if it moves Sunday) passed legislation ending the collection by the

government and only allowing the NSA to ask telephone companies for the metadata on a case-by-case basis. That bill may still face changes in the U.S. Senate.

The Canadian proposals are more measured, but would dramatically expand domestic intelligence capabilities, including disrupting terrorist on-line communications and propaganda, expanding the no-fly list and allowing agencies to share more information, according to Wesley Wark, a Canadian security and intelligence expert. Unlike the French proposals, the Canadian measures began coming under strong public opposition as time went on, including an open letter from 60 executives and a Twitter campaign that included a dire warning this month from author Margaret Atwood: "See you in the slammer, kids."

France and Canada are likely to have new laws before summer. In Germany, the debate is just starting.

The German weekly Der Spiegel reported that the Federal Intelligence Service for years monitored telecoms traffic using filters provided by the NSA because it lacked the capacity — and the legal authority — to do so itself. By 2008, German intelligence agents discovered that some of the filters — known as selectors — related to European arms companies and French authorities.

Neither the government nor the BND, as the intelligence service is known, would comment on reports that Germany has stopped sharing some Internet surveillance data from a German spy station with the NSA. The French appear unworried that their top officials may have been targeted: "We trust the German government," said France's chief spokesman, Stephane Le Foll.

But the Germans may be caught between a history of Nazi and East German regimes and the potential of hundreds of returning Islamic State fighters in their future. Germany has very strict data privacy laws that place serious restrictions on the collection of data. It has been an open secret, however, that German security services have relied on data collected by its allies, particularly the U.S., in their own fight against domestic terrorism.

"There is a lot of caution as to the role of intelligence and in a way, I think, for Germans over the decades it had always been a comforting situation to know we are doing this in cooperation with our allies. Because we had this sort of internal dimension of abuse of secret services," said Daniela Schwarzer, the Berlin-based head of the Europe Program, German Marshall Fund think tank.

"So it's a huge thing and we're just only starting this debate," she said.

Most prominently, German authorities were able to foil a plot in 2007, thanks to information from U.S. intelligence services, by radicals to attack American soldiers and civilians at facilities including the U.S. Air Force's Ramstein Air Base in Germany. In 2013, Chancellor Angela Merkel acknowledged that the security services could not have foiled the plot without "tips from American sources."

Despite German debate over the latest revelations — and French objections to some of the data collection methods revealed by NSA leaker Edward Snowden — none of the allies are actually

proposing diminishing cooperation with the NSA, just beefing up their own capacities, said John "Chris" Inglis, who retired in 2014 as the NSA deputy director.

In France, he said, he sees "the law and policy catching up to what they have already been doing."

In Germany, where many are deeply opposed to government surveillance, he noted that the German government is not forswearing cooperation with the NSA.

And Canada's role as a vital part of the "Five Eyes" intelligence-sharing program joining the U.S., Australia, Britain and New Zealand has not been called into question.

"I do not think we are seeing a trend of Europeans seeking to break away from America as much as a reaction to the increasingly global threat of domestic extremists and returning foreign fighters," said Raj De, who retired as NSA general counsel this year and is now a partner at the Mayer Brown law firm in Washington. "Europeans are having to openly confront the notion that their governments must protect their homeland independently or in continued cooperation with the U.S."

*****IMPACT*****

2NC – Lone Wolf Scenario

Expiration of NSA authority prevents our ability to detect lone wolf terrorists --- they are looking for any vulnerability.

Daily Mail, 5/31/2015. "Head of CIA warns that US is at risk of lone wolf terror attack after NSA powers to monitor all phone calls expired – as Isis 'watch carefully' for security gaps," <http://www.dailymail.co.uk/news/article-3105089/Senate-makes-ditch-bid-extend-NSA-s-bulk-collection-phone-records-Rand-Paul-swears-block-legislation-let-Patriot-Act-expire.html>.

The head of the CIA has warned that Americans are now at risk after the Senate was unable to extend laws giving authorities special powers to fight terrorists.

Politicians in the upper house were unable to come to an agreement to extend key parts of the Patriot Act - that legalize controversial methods of surveillance by the National Security Agency (NSA) - which expired on Sunday.

Attempts were frustrated by Presidential candidate Rand Paul, who has taken a firm stance against the extension of powers allowing the mass collection of phone records, wire taps and warrants without evidence.

But the Head of the CIA John Brennan claims ordinary Americans, who expect the NSA to do their jobs, have been put at risk by 'political grandstanding and crusading for ideological causes' that fueled the debate.

Speaking on CBS show Face The Nation, he warned that the US - and Europe - is now in danger from technologically 'sophisticated' terrorists who are watching developments carefully and 'looking for the seams to operate' within.

He claimed that the authorities do not abuse the powers, extended in 2011 to help fight lone wolf terror suspects not connected to a specific group, and that without them, it's difficult for the NSA to protect America.

Mr Brennan said: 'I think terrorist elements have watched very carefully what has happened here in the United States, whether or not it's disclosures of classified information or whether it's changes in the law and policies. They are looking for the seams to operate within.

'And this is something that we can't afford to do right now, because if you look at the horrific terrorist attacks and violence that is being perpetrated around the globe, we need to keep our country safe. And our oceans are not keeping us safe the way they did a century ago.'

The Patriot Act was passed in 2001 in the wake of the 9/11 terror attacks. Now that the provisions have expired, government agents will need to subpoena phone companies for the records.

The White House previously justified collecting the records because of the Patriot Act's Section 215, which expired on Sunday.

Two other provisions, added in 2011, also expired with it. The first is a 'roving wiretap' provision which allows government agencies to keep tracking suspects as they switch devices.

The second is a 'lone wolf' clause which allows warrants to be granted without any evidence linking a suspect to a foreign power or terrorist group.

Political struggles over the NSA and its data collection have become a national issue since whistleblower Edward Snowden revealed the extent of government programs in 2013.

The senate's efforts to pass a replacement bill were frustrated by Kentucky's junior senator Rand Paul, who has spoken at length against the NSA's activities, which he has excoriated as illegal and unconstitutional.

Paul, a Republican who is running for president, came up against members of his own party, as well as the Obama administration.

With his presidential campaign waning, he has been accused of irresponsible political opportunism by opponents, by fighting a bill on ideological grounds that may put ordinary people at risk.

He was criticized by the White House Sunday night, which called the Patriot Act expiration an 'irresponsible lapse'.

While Brennan didn't mention Paul by name, he said on Face The Nation: 'Unfortunately I think there is a little too much political grandstanding and crusading for ideological causes that have really fuelled the debate on this issue.'

He added: 'These are authorities that have been used by the government to make sure that we're able to safeguard Americans. And the sad irony is that most Americans expect the government to protect them. And so although there's a lot of debate that goes on, on the Congress and the Hill on this issue, I think, when you go out to Boise or Tampa or Louisville, Americans are expecting their law enforcement and homeland security and intelligence professionals to do their work. And these authorities are important.'

Paul argued 'there must be another way' but even he agrees that the lapse in these powers are likely to be temporary as politicians work on the USA Freedom Act, which is expected to pass within the next week.

Republican Senate Majority Leader Mitch McConnell called a rare Sunday session to try to pass the replacement law, but was unable to push it through in time.

And although the replacement is set to pass this week, Paul said the expiration was 'a victory no matter how you look at it'.

In a statement, he said: 'It might be short lived, but I hope that it provides a road for a robust debate, which will strengthen our intelligence community, while also respecting our Constitution.'

He added: 'The expiration of the NSA's sweeping, all-encompassing and ineffectual powers will not relinquish functions necessary for protecting national security. The expiration will instead do what we should have done all along - rely on the Constitution for these powers.'

According to a top lawmaker, as of 8pm Sunday no NSA employee could access their enormous phone records database, which holds metadata on millions of phone conversations handed over by telecoms companies like Verizon and AT&T.

Senate Intelligence Committee chairman Richard Burr said on Sunday: 'There is no way to get any type of agreement tonight -- either an extension or passage of a bill. So at 8pm tonight, NSA employees can not query the database'.

In a statement issued Sunday night, Obama's press secretary Josh Earnest, urged action to pass the USA Freedom Act as quickly as possible.

He said: 'The Senate took an important - if late - step forward tonight. We call on the Senate to ensure this irresponsible lapse in authorities is as short-lived as possible.'

'On a matter as critical as our national security, individual Senators must put aside their partisan motivations and act swiftly. The American people deserve nothing less.'

Some lawmakers have said the lapse raises alarming questions about how US authorities can keep the homeland safe with a diminished security toolbox.

'I think it's very very unfortunate that we're in this position,' said Senator Mike Lee, a conservative Republican who supports the reform bill.

'We've known this date was coming for four years. Four years. And I think it's inexcusable that we adjourned' for a weeklong break last week without resolving the issue.

Lee, too, conceded that the reform bill would most likely pass in the coming week.

With the clock ticking, CIA chief John Brennan warned Sunday that allowing vital surveillance programs to lapse could increase terror threats, and argued that the phone metadata dragnet has not abused civil liberties and only serves to safeguard citizens.

'This is something that we can't afford to do right now,' Brennan said of allowing the counterterrorism provisions to expire.

'Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,' he said on CBS talk show Face the Nation.

Brennan added that online threats from groups like Isis would continue to grow over the next five to ten years.

He said: 'Isis has been very sophisticated and adept at using the Internet to propagate its message and reach out to individuals. We see what is happening as far as thousands upon thousands of individuals, including many thousands from the West, that have traveled into Syria and Iraq. And a number of these individuals are traveling back.'

'And what we see, they're also using the Internet as a way to incite and encourage individuals to carry out acts of violence.

'So as the director of FBI says, you know, this use of these websites and their Internet capabilities is something of great concern. So yes, I think ISIS is a threat not just in the Middle East and South Asia and African regions but also to Europe as well as to the United States.'

Dispersion of technology enables lone wolf terrorists to access WMD.

Gary A. ACKERMAN, Director of the Special Projects Division at the National Consortium for the Study of Terrorism and Responses to Terrorism (START), University of Maryland, AND Lauren E. PINSON, Senior Research/Project Manager at START and PhD student at Yale University, 14 ["An Army of One: Assessing CBRN Pursuit and Use by Lone Wolves and Autonomous Cells," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

The first question to answer is whence the concerns about the nexus between CBRN weapons and isolated actors come and whether these are overblown. The general threat of mass violence posed by lone wolves and small autonomous cells has been detailed in accompanying issue contributions, but the potential use of CBRN weapons by such perpetrators presents some singular features that either amplify or supplement the attributes of the more general case and so are deserving of particular attention. Chief among these is the impact of rapid technological development. Recent and emerging advances in a variety of areas, from synthetic biology³ to nanoscale engineering,⁴ have opened doors not only to new medicines and materials, but also to new possibilities for malefactors to inflict harm on others. What is most relevant in the context of lone actors and small autonomous cells is not so much the pace of new invention, but rather the commercialization and consumerization of CBRN weapons-relevant technologies. This process often entails an increase in the availability and safety of the technology, with a concurrent diminution in the cost, volume, and technical knowledge required to operate it. Thus, for example, whereas fifty years ago producing large quantities of certain chemical weapons might have been a dangerous and inefficient affair requiring a large plant, expensive equipment, and several chemical engineers, with the advent of chemical microreactors,⁵ the same processes might be accomplished far more cheaply and safely on a desktop assemblage, purchased commercially and monitored by a single chemistry graduate student.

The rapid global spread and increased user-friendliness of many technologies thus represents a potentially radical shift from the relatively small scale of harm a single individual or small autonomous group could historically cause.⁶ From the limited reach and killing power of the sword, spear, and bow, to the introduction of dynamite and eventually the use of our own infrastructures against us (as on September 11), the number of people that an individual who was unsupported by a broader political entity could kill with a single action has increased from single digits to thousands. Indeed, it has even been asserted that "over time ... as the leverage provided by technology increases, this threshold will finally reach its culmination—with the ability of one man to declare war on the world and win."⁷ Nowhere is this trend more perceptible in the current age than in the area of unconventional weapons.

These new technologies do not simply empower users on a purely technical level. Globalization and the expansion of information networks provide new opportunities for disaffected individuals in the farthest corners of the globe to become familiar with core weapon concepts and to purchase equipment—online technical courses and eBay are undoubtedly a boon to would-be purveyors of violence. Furthermore, even the most solipsistic misanthropes, people who would never be able to function socially as part of an operational terrorist group, can find radicalizing influences or legitimation for their beliefs in the maelstrom of virtual identities on the Internet.

All of this can spawn, it is feared, a more deleterious breed of lone actors, what have been referred to in some quarters as “super-empowered individuals.”⁸ Conceptually, super-empowered individuals are atomistic game-changers, i.e., they constitute a single (and often singular) individual who can shock the entire system (whether national, regional, or global) by relying only on their own resources. Their core characteristics are that they have superior intelligence, the capacity to use complex communications or technology systems, and act as an individual or a “lone-wolf.”⁹ The end result, according to the pessimists, is that if one of these individuals chooses to attack the system, “the unprecedented nature of his attack ensures that no counter-measures are in place to prevent it. And when he strikes, his attack will not only kill massive amounts of people, but also profoundly change the financial, political, and social systems that govern modern life.”¹⁰ It almost goes without saying that the same concerns attach to small autonomous cells, whose members' capabilities and resources can be combined without appreciably increasing the operational footprint presented to intelligence and law enforcement agencies seeking to detect such behavior.

With the exception of the largest truck or aircraft bombs, the most likely means by which to accomplish this level of system perturbation is through the use of CBRN agents as WMD. On the motivational side, therefore, lone actors and small autonomous cells may ironically be more likely to select CBRN weapons than more established terrorist groups—who are usually more conservative in their tactical orientation—because the extreme asymmetry of these weapons may provide the only subjectively feasible option for such actors to achieve their grandiose aims of deeply affecting the system. The inherent technical challenges presented by CBRN weapons may also make them attractive to self-assured individuals who may have a very different risk tolerance than larger, traditional terrorist organizations that might have to be concerned with a variety of constituencies, from state patrons to prospective recruits.¹¹ Many other factors beyond a “perceived potential to achieve mass casualties” might play into the decision to pursue CBRN weapons in lieu of conventional explosives,¹² including a fetishistic fascination with these weapons or the perception of direct referents in the would-be perpetrator's belief system.

Others are far more sanguine about the capabilities of lone actors (or indeed non-state actors in general) with respect to their potential for using CBRN agents to cause mass fatalities, arguing that the barriers to a successful large-scale CBRN attack remain high, even in today's networked, tech-savvy environment.¹³ Dolnik, for example, argues that even though homegrown cells are “less constrained” in motivations, more challenging plots generally have an inverse relationship with capability,¹⁴ while Michael Kenney cautions against making presumptions about the ease with which individuals can learn to produce viable weapons using only the Internet.¹⁵ However, even most of these pundits concede that low-level CBR attacks emanating from this quarter will

probably lead to political, social, and economic disruption that extends well beyond the areas immediately affected by the attack. This raises an essential point with respect to CBRN terrorism: irrespective of the harm potential of CBRN weapons or an actor's capability (or lack thereof) to successfully employ them on a catastrophic scale, these weapons invariably exert a stronger psychological impact on audiences—the essence of terrorism—than the traditional gun and bomb. This is surely not lost on those lone actors or autonomous cells who are as interested in getting noticed as in causing casualties.

Proven Capability and Intent

While legitimate debate can be had as to the level of potential threat posed by lone actors or small autonomous cells wielding CBRN weapons, possibly the best argument for engaging in a substantive examination of the issue is the most concrete one of all—that these actors have already demonstrated the motivation and capability to pursue and use CBRN weapons, in some cases even close to the point of constituting a genuine WMD threat. In the context of bioterrorism, perhaps the most cogent illustration of this is the case of Dr. Bruce Ivins, the perpetrator behind one of the most serious episodes of bioterrorism in living memory, the 2001 “anthrax letters,” which employed a highly virulent and sophisticated form of the agent and not only killed five and seriously sickened 17 people, but led to widespread disruption of the U.S. postal services and key government facilities. 16

Other historical cases of CBRN pursuit and use by lone actors and small autonomous cells highlight the need for further exploration. Among the many extant examples: 17

Thomas Lavy was caught at the Alaska-Canada border in 1993 with 130 grams of 7% pure ricin. It is unclear how Lavy obtained the ricin, what he planned to do with it, and what motivated him.

In 1996, Diane Thompson deliberately infected twelve coworkers with shigella dysenteriae type 2. Her motives were unclear.

In 1998, Larry Wayne Harris, a white supremacist, was charged with producing and stockpiling a biological agent—bacillus anthracis, the causative agent of anthrax.

In 1999, the Justice Department (an autonomous cell sympathetic to the Animal Liberation Front) mailed over 100 razor blades dipped in rat poison to individuals involved in the fur industry.

In 2000, Tsiugio Uchinshi was arrested for mailing samples of the mineral monazite with trace amounts of radioactive thorium to several Japanese government agencies to persuade authorities to look into potential uranium being smuggled to North Korea.

In 2002, Chen Zhengping put rat poison in a rival snack shop's products and killed 42 people.

In 2005, 10 letters containing a radioactive substance were mailed to major organizations in Belgium including the Royal Palace, NATO headquarters, and the U.S. embassy in Brussels. No injuries were reported.

In 2011, federal agents arrested four elderly men in Georgia who were plotting to use ricin and explosives to target federal buildings, Justice Department officials, federal judges, and Internal Revenue Service agents.

Two recent events may signal an even greater interest in CBRN by lone malefactors. First, based on one assessment of Norway's Anders Breivik's treatise, his references to CBRN weapons a) suggest that CBRN weapons could be used on a tactical level and b) reveal (to perhaps previously uninformed audiences) that even low-level CBRN weapons could achieve far-reaching impacts driven by fear. ¹⁸ Whether or not Breivik would actually have sought or been able to pursue CBRN, he has garnered a following in several (often far-right) extremist circles and his treatise might inspire other lone actors. Second, Al-Qaeda in the Arabian Peninsula (AQAP) released two issues of Inspire magazine in 2012. Articles, on the one hand, call for lone wolf jihad attacks to target non-combatant populations and, on the other, permit the use of chemical and biological weapons. The combination of such directives may very well influence the weapon selection of lone actor jihadists in Western nations. ¹⁹

XT – Lone Wolf Threat Growing

Lone wolf terrorism's growing now

Christopher HEWITT, Emeritus Professor of Sociology at the University of Maryland, Baltimore County, 14 ["Law Enforcement Tactics and Their Effectiveness in Dealing With American Terrorism: Organizations, Autonomous Cells, and Lone Wolves," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

The results of our study have some obvious implications for law enforcement practices and policies. Routine policing by local law enforcement agencies played an unexpectedly significant role in catching terrorists. Therefore it is imperative that local police forces should be given adequate resources (funding, training, and equipment) commensurate with that role.

The importance of the general public as witnesses and otherwise providing information to police is clear, but attempts to encourage even greater public cooperation—"See something, say something"—have problems. Appeals for help in locating or identifying suspects are costly in terms of manpower expended in tracking down false leads. The government and the media typically exaggerate the threat from terrorism. The changing colors published by Homeland Security showing the supposed level of terrorist threat initially increased public fears, and later led to claims that the authorities were crying wolf after so many false alarms had been publicized. The ideal should be a vigilant but not a hysterical citizenry.

One function of policing is preventive, seeking to identify potential criminal or terrorist threats. Generally informants or surveillance are used, not to catch terrorists after they have committed their crimes, but to prevent terrorist attacks from occurring in the first place. However, this raises significant civil liberties concerns. To what extent is it legitimate to gather intelligence on extremist movements and activists if they have not actually engaged in violence? Intelligence gathering by these means is even more troubling if it involves spying on members of the general public. Since 9/11, it is alleged that police departments have been guilty of placing entire Muslim communities under scrutiny without any evidence of wrongdoing. Indeed in April 2012, the Pulitzer Prize for investigative reporting was awarded to the Associated Press for a series of critical articles about the policies of the New York City Police Department's Intelligence Department. The Associated Press articles claimed that the NYPD "put American citizens under surveillance and scrutinized where they ate, prayed, and worked, not because of charges of wrongdoing but because of their ethnicity The documents describe in extraordinary detail a secret program intended to catalog life inside Muslim neighborhoods." The NYPD was accused of using "mosque crawlers" to monitor sermons, employing undercover officers and confidential informants, and of infiltrating Muslim student groups and monitoring their Internet activities. 28

A chronology of terrorist incidents and plots since 9/11 reveals the major role played by undercover agents and informants, as well as the frequency with which electronic surveillance is employed. Of 47 plots, all were carried out by lone wolves or a group of friends, and none were by members of organized groups. 29 Most plots were by Islamist extremists (53%) or right-wing

extremists (34%), with the remainder by anarchists, militant Jews, and anti-abortionists. For the 38 plots for which information is available, Table 2 shows what factors were successful in how they were uncovered.

There are some striking differences between police tactics in dealing with plots and dealing with actual incidents. Obviously since no actual attack had taken place, the absence of clues from the crime scene or witnesses is understandable. Tips from the public or routine policing are much less important, while the role of undercover agents is a major factor. An examination of several of the cases suggests that many of the plots discovered were a result of sting operations, sometimes verging on entrapment.

Overall, the difference between the earlier organized campaigns and the later lone wolf terrorism is evident. The main reason for this transition lies in the repressive powers available to modern states. Extremist groups which threaten violence become the objects of repression. Historically, the decline of the Klan, Black militants, Puerto Rican nationalists, and right-wing extremists was a result of mass arrests and police harassment. 30 Leaderless resistance emerged as a strategy among right-wing militants because of the imprisonment and prosecution of their leaders and activists. Similarly, the jihadist movement resorted to lone wolf actions after the decapitation of al Qaeda and the destruction of most of its leadership. Since both in the United States and Europe there exists large and growing numbers of both angry jihadists and White nationalists, we can expect an increase in lone-wolf terrorism in the future.

Lone wolves growing—can't decapitate an ideology

Sam Jones 14, Financial Times (FT), 14 ["Al-Qaeda: on the march," January 19, 2014, <http://www.ft.com/cms/s/2/d8662d86-8124-11e3-95aa-00144feab7de.html#slide0>]

But al-Qaeda has proved to have a Hydra-like quality. Far from withering, it has proliferated. The group and its affiliates have never controlled more land, had as many recruits in their ranks or been as well financially resourced as now.

In recent months, al-Qaeda franchises have scored successes or near-victories in an arc stretching from the Sahel in east Africa through to the Levant via the Horn of Africa, Yemen and Iraq.

In 2012, al-Qaeda forces came within hours of seizing control of Bamako, the capital of Mali. In 2013, its militants radicalised the conflict in Syria. This year has begun with fighters storming the city of Fallujah in Iraq, just 70km from Baghdad. They still control it.

Last Wednesday, the US House Intelligence committee opened an inquiry to investigate the resurgence of the group. Mike Rogers, the Republican congressman who chairs the committee, called the demise of al-Qaeda a "false narrative" and warned against complacency in Washington. He cautioned: "The defeat of an ideology requires more than just drone strikes."

Three fundamental questions are of concern to the west in its handling of the group's rebound. How resilient is the resurgence, how centralised is its structure and how much of a threat does it still pose internationally?

The hope among its opponents is that al-Qaeda's renaissance belies a still dangerous but fatally weakened foe. Many see the group as a disparate set of franchises that have fed off disenchantment caused by the Arab Spring, but which ultimately are either locally focused and pragmatic. Or they believe it will burn itself out through its own brutality, alienating local Muslim populations by persecuting them as much as waging jihad against the west and its regional allies.

They point to the situation in Syria, where jihadis fighting for the Islamic State of Iraq and al-Sham are committing atrocities against civilians, turning other Islamist groups against them.

But Isis's brutality – and the “seeds of its own destruction” narrative of al-Qaeda that is perpetuated by such actions in the west – is far from the complete picture.

Al-Qaeda is certainly disparate and no longer controlled to the same degree by a central authority. But it has proved very adaptable, and very aware of the mistakes it made in the past.

Afghanistan and Pakistan

In Afghanistan, the rout of al-Qaeda has been extensive. Intelligence analysts put the number of al-Qaeda operatives functioning in the country as low as 200, although many fear a rebound if aid to the fragile Afghan government dries up.

For now, al-Qaeda's core presence in the area – and the world – remains in Pakistan, where Ayman al-Zawahiri, the successor to Osama bin Laden, is based.

Its links in Pakistan run deep. It is telling that it took the US a decade to find the whereabouts of bin Laden, who turned out to be living in a compound in urban Abbottabad. While al-Qaeda is known to have a significant presence in the Federally Administered Tribal Areas of the country, many analysts believe its core leadership operates comfortably – or could even be based in – its most populated, metropolitan areas.

The US drone campaign explains why. “You can't just go and bomb an urban area,” says Shashank Joshi, research fellow at the Royal United Services Institute, a UK think-tank. “Al-Qaeda has adapted to our counterterrorism measures and it has become more resilient. [While] its leadership has been shattered at various points, it is clearly not any longer an organisation dependent on a small coterie of individuals for its survival.”

Syria and Iraq

It is now difficult to imagine that before the 2003 US invasion of Iraq, al-Qaeda and affiliated groups had almost no presence in the Levant. The ill-fated US occupation created both a lawless environment for radical jihadi governments to take root and fomented an ideologically potent cause for them to pursue.

Al-Qaeda's early success in Iraq under Jordanian Abu Musab al-Zarqawi was unwound from 2006, thanks to the US-funded *sahwa* (awakening) of local Sunni tribes in Iraq's Anbar province,

who revolted against al-Qaeda's excesses. It has since been resurgent. In Syria, the relentless and brutal assault on mostly peaceful Sunni protesters by Bashar al-Assad, the country's Alawite president, has provided al-Qaeda with an expansive presence in the region. In Iraq, political mismanagement on the part of President Nouri al-Maliki and the spillover from Syria have contributed to the group's renewed presence in Anbar province.

Both Jahbat Al-Nusra, led by Abu Mohammed al-Joulani, and the Islamic State of Iraq and al-Sham, led by Abu Bakr al-Baghdadi, claim affiliation to al-Qaeda in the region.

But in Syria, it is Al-Nusra – Syrian- led and more tolerant – that has the support of Mr Zawahiri, and not the more brutal Iraqi-dominated Isis, which has already alienated swaths of the indigenous Syrian population with its ruthlessness.

Yemen

The remote mountains of southern Yemen gave birth to al-Qaeda and to this day remain one of the group's most cohesive strongholds in the world. The group has found solace among the mountains and fiercely independent tribes of the south, tapping into the deep pool of resentment born of grinding poverty, anti-northern sentiment and, more recently, US drone strikes that have all too often hit innocent targets.

The Yemeni and Saudi branches of the group merged in 2009 to form al-Qaeda in the Arabian Peninsula, led by Nasir al-Wuhaishi, Osama bin Laden's former secretary and one of Mr Zawahiri's closest allies. AQAP is considered by western intelligence agencies the most dangerous branch of al-Qaeda, and it has proved resilient: a government campaign in 2012 to expel the group from Abyan and Sabwah provinces is still continuing.

AQAP has more recently adapted its method of exporting jihad by using other militant groups around the world as proxies.

"This may be the kind of relationship that we increasingly see between AQAP and other groups with the promotion of Mr Wuhaishi – loose operational guidance with seed funding and, where possible, the provision of fighters to participate in high-profile plots, especially in the fluid security environments of north Africa," says John Nugent, terrorism analyst at Control Risks, a security consultancy.

Horn of Africa

In the Horn, al-Qaeda's current largest affiliate is al-Shabaab (the Boys), the former youth movement of the Islamic Courts Union (ICU), the radical Islamist group that once controlled most of Somalia.

While it has been forced to cede huge swaths of territory in the past 18 months, it remains a well-resourced organisation, and embedded throughout Somalia.

The UN estimated it earned \$50m a year when it controlled the port of Kismayo. It has also exploited the illegal ivory trade, killing hundreds of elephants in the region, according to environmental campaigners.

As al-Shabaab has been pushed back, it has sought to export violence to the home soil of those fighting it, such as Kenya. The group orchestrated the deadly Westgate shopping mall attack in Nairobi last September, in which more than 60 people died.

The ICU itself had strong ties with al-Qaeda core, with many of its founding leaders trained in Afghanistan, but al-Shabaab has often chosen to follow its own path.

In 2010 Mr Zawahiri sought to replace al-Shabaab's leader, Ahmed Godane, but his ruling was ignored. Mr Godane swore allegiance to Mr Zawahiri again in 2012.

The Sahel and Maghreb

More than a year after staging a spectacular attack on a remote Algerian oil and gas facility, and 18 months after nearly seizing control of Mali, al-Qaeda of the Islamic Maghreb appears on the defensive. French troops have pushed back AQIM, led by Abu Musab Abdel Wadoud, a veteran of Algeria's 1990s civil war. Algeria's security forces have cornered extremist groups.

But from Mauritania to Libya, the longstanding ethnic and political grievances still fester. The abuses of the civil war that fed Algerian Islamist anger have never been resolved. The official neglect that led ethnic Tuaregs to seek an autonomous Saharan homeland has worsened.

"No one should underestimate the narrow margin that existed between AQ and their goal of seeking to take over the organs of a whole state and create a safe haven," says Stephen O'Brien, the UK prime minister's special envoy to the Sahel, referring to AQIM's near takeover of Bamako, Mali's capital, in 2012.

"What is clear is that the franchise's approach has become much more about winning over the hearts and minds of populations by the provision of basic services."

2NC – Threats Real (Domestic)

Terror threats are growing --- NSA surveillance is vital.

John R. Bolton, 4/28/2015. Formerly served as the U.S. permanent representative to the United Nations, and under secretary of state for arms control and international security. At AEI, Ambassador Bolton's area of research is U.S. foreign and national security policy. "NSA activities key to terrorism fight," American Enterprise Institute, <https://www.aei.org/publication/nsa-activities-key-to-terrorism-fight/>.

Congress is poised to decide whether to re-authorize programs run by the National Security Agency that assess patterns of domestic and international telephone calls and emails to uncover linkages with known terrorists. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, have played a vital role in protecting America and our citizens around the world from the still-metastasizing terrorist threat.

The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural protections to prevent spying on U.S. citizens.

Nonetheless, critics from the right and left have attacked the NSA for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics, hoping to score political points with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail."

The ill-informed nature of the debate has facilitated scare-mongering, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And there is an important asymmetry at work here as well. The critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond. By definition, the programs' success rests on the secrecy fundamental to all intelligence activities. Frequently, therefore, explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists and others, in turn, could use to stymie future detection efforts.

After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since his approach to foreign and defense issues has consistently reflected

near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces.

In fact, just in the year since Congress last considered the NSA programs, the global terrorist threat has dramatically increased. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. Boko Haram is expanding beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016.

This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Homegrown terrorism threat is increasing --- domestic surveillance is essential.

Jessica Zuckerman, Steven P. Bucci, Ph.D. and James Jay Carafano, Ph.D., 7/22/2013. Policy Analyst, Western Hemisphere @ Heritage; Director, Douglas and Sarah Allison Center for Foreign and National Security Policy @ Heritage; and Vice President for the Kathryn and Shelby Cullom Davis Institute for National Security and Foreign Policy, and the E. W. Richardson Fellow @ Heritage. "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism," Heritage Foundation, <http://www.heritage.org/research/reports/2013/07/60-terrorist-plots-since-911-continued-lessons-in-domestic-counterterrorism>.

Three months after the attack at the Boston Marathon, the pendulum of awareness of the terrorist threat has already begun to swing back, just as it did after 9/11. Due to the resilience of the nation and its people, for most, life has returned to business as usual. The threat of terrorism against the United States, however, remains.

Expecting to stop each and every threat that reaches a country's borders is unreasonable, particularly in a free society committed to individual liberty. Nevertheless, there are important steps that America's leaders can take to strengthen the U.S. domestic counterterrorism enterprise and continue to make the U.S. a harder target. Congress and the Administration should:

Ensure a proactive approach to preventing terrorist attacks. Despite the persistent threat of terrorism, the Obama Administration continues to focus on reactive policies and prosecuting terrorists rather than on proactive efforts to enhance intelligence tools and thwart terrorist attempts. This strategy fails to recognize the pervasive nature of the threat posed by terrorist groups such as al-Qaeda and homegrown extremism. The Administration, and the nation as a

whole, should continue to keep in place a robust, enduring, and proactive counterterrorism framework in order to identify and thwart terrorist threats long before the public is in danger.

Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sun setting provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.

Break down the silos of information. Washington should emphasize continued cooperation and information sharing among federal, state, and local law enforcement agencies to prevent terrorists from slipping through the cracks between the various jurisdictions. In particular, the FBI should make a more concerted effort to share information more broadly with state and local law enforcement. State and local law enforcement agencies are the front lines of the U.S. national security strategy. As a result, local authorities are able to recognize potential danger and identify patterns that the federal authorities may miss. They also take the lead in community outreach, which is crucial to identifying and stopping “lone wolf” actors and other homegrown extremists. Federal law enforcement, on the other hand, is not designed to fight against this kind of threat; it is built to battle cells, groups, and organizations, not individuals.

Streamline the domestic counterterrorism system. The domestic counterterrorism enterprise should base future improvements on the reality that governments at all levels are fiscally in crisis. Rather than add additional components to the system, law enforcement officials should streamline the domestic counterterrorism enterprise by improving current capabilities, leveraging state and local law enforcement resources and authorities, and, in some cases, reducing components where the terrorist threat is not high and the financial support is too thin or could be allocated more effectively. For example, the Department of Homeland Security should dramatically reduce the number of fusion centers, many of which exist in low-risk areas or areas where similar capabilities exist. An easy way to reduce the number of fusion centers is to eliminate funding to those that are located outside the 31 urban areas designated as the highest risk.

Fully implement a strategy to counter violent extremism. Countering violent extremism is an important complementary effort to an effective counterterrorism strategy. In August 2011, the U.S. government released a strategic plan called “Empowering Local Partners to Prevent Violent Extremism in the United States.”[209] The plan focuses on outlining how federal agencies can

assist local officials, groups, and private organizations in preventing violent extremism. It includes strengthening law enforcement cooperation and helping communities understand how to counter extremist propaganda (particularly online). Sadly, this plan is not a true strategy. It fails to assign responsibilities and does not direct action or resource investments. More direction and leadership must be applied to transform a laundry list of good ideas into an effective program to support communities in protecting and strengthening civil society.

Vigilance Is Not Optional

In a political environment of sequestration on the one hand and privacy concerns on the other, there are those on both sides of the aisle who argue that counterterrorism spending should be cut and U.S. intelligence agencies reined in. As the above list indicates however, the long war on terrorism is far from over. Most disturbingly, an increasing number of Islamist-inspired terrorist attacks are originating within America's borders. The rise of homegrown extremism is the next front in the fight against terrorism and should be taken seriously by the Administration.

While there has not been another successful attack on the homeland on the scale of 9/11, the bombings in Boston reminded the country that the threat of terrorism is real and that continued vigilance is critical to keeping America safe. Congress and the Administration must continue to upgrade and improve the counterterrorism capabilities of law enforcement and intelligence agencies as well exercise proper oversight of these capabilities. The American people are resilient, but the lesson of Boston is that the government can and should do more to prevent future terror attacks.

2NC – AT: No WMD Terrorism (Lone Wolf)

Their defense doesn't assume lone wolves and dual tech

Patrick D. ELLIS, WMD/Homeland Security Analyst and Instructor at the U.S. Air Force Counterproliferation Center, Air University, 14 ["Lone Wolf Terrorism and Weapons of Mass Destruction: An Examination of Capabilities and Countermeasures," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

Today, the specters of lone wolves and autonomous cells acquiring and using chemical, biological, radiological, and nuclear (CBRN) weapons of mass destruction, whether in their traditional military forms or the more non-traditional industrial forms, seems less far-fetched. Fortunately, military CBRN agents and weapons are not normally accessible to lone wolves or autonomous cells and are often located in highly secured areas. Therefore, lone wolves and autonomous cells may be drawn to materials similar to CBRN located in less secure areas. These commonplace industrial chemicals, biological contaminants, and radioactive materials could be used to cause disruptions or mass casualties. The dual use nature of these materials and technologies enables them to be turned into weapons and delivered by nonmilitary means. Future "over-the-horizon" threats, such as the proliferation of new biotechnologies and amateur do-it-yourself capabilities, pose a risk that lone wolves could develop weapons at a time when travel, access to knowledge, and dual-use technologies, in the globalizing environment, make lone wolf terrorists more dangerous. Thus, the author explores existing countermeasures, such as laws, strategies, passive and active measures designed to stop these dangerous threats. In particular, capabilities to prevent, protect, respond, and recover from CBRN terrorist acts are examined.

Risk is high—WMD barriers are falling fast

Gary A. ACKERMAN, Director of the Special Projects Division at the National Consortium for the Study of Terrorism and Responses to Terrorism (START), University of Maryland, AND Lauren E. PINSON, Senior Research/Project Manager at START and PhD student at Yale University, 14 ["An Army of One: Assessing CBRN Pursuit and Use by Lone Wolves and Autonomous Cells," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

Yet, even though the probability of lone actors or autonomous cells possessing the technical and operational capabilities to deploy CBRN agents on the scale of a WMD is currently low, this should not lull security agencies into a sense of complacency with respect to the future threat. After all, the philosopher David Hume⁶⁵ and others have warned us not to put too much stock in prior experience—while historical patterns can often be valuable indicators, the future is an undiscovered country variously populated by Black Swans and Wild Cards.⁶⁶ This is especially true in the current technological environment. As described in the introductory section, rapid and more importantly, accelerating technological advancement, suggests a dramatic rise in the

number of alienated adepts with the capability to twist these advances to a baleful design. The probability that the wrong individual will come into contact with the wrong technology at the wrong time might thus be trending inexorably upwards. Several individuals have already tried and at least one, Bruce Ivins, came extremely close. So, even though current empirical data does not indicate a CBRN threat of catastrophic magnitude emanating from lone actors or autonomous cells, we need to at least remain cognizant of the possibility, to our disquiet, that it might be only a matter of time before a misanthropic individual or small, nebulous group becomes superempowered and attains a WMD capability. Given the colossal difficulties in an open and free society of interdicting these insidious actors before they strike, researchers and security agencies alike should be exerting the maximum effort to monitor developments in this area and evolve their own powers of detection if they wish to forestall the threat.

2NC – Bioweapons Impact

Lone wolves will use bio-weapons—tech is accessible and will spread globally

Patrick D. ELLIS, WMD/Homeland Security Analyst and Instructor at the U.S. Air Force Counterproliferation Center, Air University, 14 [“Lone Wolf Terrorism and Weapons of Mass Destruction: An Examination of Capabilities and Countermeasures,” *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

Since the mapping of the human genome in the early 2000s, the biotechnological fields have grown dramatically. 40 A driver for this growth has been the convergence of engineering, physical sciences, and life sciences, creating a cross-pollination environment for the transfer of individual “tool sets from one science to another.” 41 This of course is of concern to military professionals who are worried that the proliferation of “biotechnology and life sciences—including the spread of expertise to create modified or novel organisms—present the prospect of new toxins, live agents, and bioregulators.” 42 With these skills, it would be possible for a small group to take the convergence in sciences and “inflict untold damage if armed with the right unconventional weapon.” 43 It is the dual nature of these dynamic technologies that could bring unforeseen horror if used improperly and “provide bad actors increased capacity to build and deploy more dangerous biological weapons.” 44 As these technologies and sciences are diffused through more than 4,070 45 biotechnology companies, security professionals should be aware that a lone wolf insider could have access to these skills, especially since these technologies and knowledge are also being diffused to larger populations. In recent years, there has emerged a community of amateur do-it-yourself biologists “dedicated to making biology an accessible pursuit for citizen scientists, amateur biologists and biological engineers.” 46 They provide the “mechanisms for amateurs to increase their knowledge and skills.” 47 However, while the majority of these do-it-yourself biologist activities remain benign, there runs a risk that lone wolves could acquire this technology to develop a weapon.

In his book *Hot Zone*, Richard Preston points out how easy it is for diseases to move globally: “A hot virus from the rain forest lives within a twenty-four hour plane ride from every city on earth. All of the earth's cities are connected by a web of airline routes. The web is a network. Once a virus hits the net, it can shoot anywhere in a day—Paris, Tokyo, New York, Los Angeles, wherever planes fly.” 48 In 2008, passengers travelled over 4,621 billion kilometers, 49 compared with over 1,500 billion kilometers in 1990, 50 and by 2028 it will rise to 12,090 billion. 51 If a lone wolf terrorist infected himself with an infectious disease, such as plague or a future DIY disease, and flew on a major airline through several major hubs, a serious pandemic could occur. Just note how the 2002–2003 outbreak of the severe acute respiratory syndrome (SARS)—starting in Hong Kong—became a global problem very quickly.

Extinction

Nathan MYHRVOLD, PhD in theoretical and mathematical physics from Princeton, former chief technology officer of Microsoft, 13 [July 2013, “Strategic Terrorism: A Call to Action,” *The*

A virus genetically engineered to infect its host quickly, to generate symptoms slowly—say, only after weeks or months—and to spread easily through the air or by casual contact would be vastly more devastating than HIV. It could silently penetrate the population to unleash its deadly effects suddenly. This type of epidemic would be almost impossible to combat because most of the infections would occur before the epidemic became obvious. A technologically sophisticated terrorist group could develop such a virus and kill a large part of humanity with it. Indeed, terrorists may not have to develop it themselves: some scientist may do so first and publish the details. Given the rate at which biologists are making discoveries about viruses and the immune system, at some point in the near future, someone may create artificial pathogens that could drive the human race to extinction. Indeed, a detailed species-elimination plan of this nature was openly proposed in a scientific journal. The ostensible purpose of that particular research was to suggest a way to extirpate the malaria mosquito, but similar techniques could be directed toward humans.¹⁶ When I've talked to molecular biologists about this method, they are quick to point out that it is slow and easily detectable and could be fought with biotech remedies. If you challenge them to come up with improvements to the suggested attack plan, however, they have plenty of ideas. Modern biotechnology will soon be capable, if it is not already, of bringing about the demise of the human race— or at least of killing a sufficient number of people to end high-tech civilization and set humanity back 1,000 years or more. That terrorist groups could achieve this level of technological sophistication may seem far-fetched, but keep in mind that it takes only a handful of individuals to accomplish these tasks. Never has lethal power of this potency been accessible to so few, so easily. Even more dramatically than nuclear proliferation, modern biological science has frighteningly undermined the correlation between the lethality of a weapon and its cost, a fundamentally stabilizing mechanism throughout history. Access to extremely lethal agents—lethal enough to exterminate *Homo sapiens*—will be available to anybody with a solid background in biology, terrorists included. The 9/11 attacks involved at least four pilots, each of whom had sufficient education to enroll in flight schools and complete several years of training. Bin Laden had a degree in civil engineering. Mohammed Atta attended a German university, where he earned a master's degree in urban planning—not a field he likely chose for its relevance to terrorism. A future set of terrorists could just as easily be students of molecular biology who enter their studies innocently enough but later put their skills to homicidal use. Hundreds of universities in Europe and Asia have curricula sufficient to train people in the skills necessary to make a sophisticated biological weapon, and hundreds more in the United States accept students from all over the world. Thus it seems likely that sometime in the near future a small band of terrorists, or even a single misanthropic individual, will overcome our best defenses and do something truly terrible, such as fashion a bioweapon that could kill millions or even billions of people. Indeed, the creation of such weapons within the next 20 years seems to be a virtual certainty.

AT: No Impact (Bioweapons)

Bioweapons cause extinction—nuclear weapons don't.

Singer 1— Clifford Singer, Director of the Program in Arms Control, Disarmament, and International Security at the University of Illinois at Urbana—Champaign [Spring 2001, "Will Mankind Survive the Millennium?" The Bulletin of the Program in Arms Control, Disarmament, and International Security, University of Illinois at Urbana-Champaign, 13.1, http://www.acdis.uiuc.edu/research/S&Ps/2001-Sp/S&P_XIII/Singer.htm]

In recent years the fear of the apocalypse (or religious hope for it) has been in part a child of the Cold War, but its seeds in Western culture go back to the Black Death and earlier. Recent polls suggest that the majority in the United States that believe man would survive into the future for substantially less than a millennium was about 10 percent higher in the Cold War than afterward. However fear of annihilation of the human species through nuclear warfare was confused with the admittedly terrifying, but much different matter of destruction of a dominant civilization. The destruction of a third or more of much of the globe's population through the disruption from the direct consequences of nuclear blast and fire damage was certainly possible. There was, and still is, what is now known to be a rather small chance that dust raised by an all-out nuclear war would cause a so-called nuclear winter, substantially reducing agricultural yields especially in temperate regions for a year or more. As noted above mankind as a whole has weathered a number of mind-boggling disasters in the past fifty thousand years even if older cultures or civilizations have sometimes eventually given way to new ones in the process. Moreover the fear that radioactive fallout would make the globe uninhabitable, publicized by widely seen works such as "On the Beach," was a metaphor for the horror of nuclear war rather than reality. The epidemiological lethal results of well over a hundred atmospheric nuclear tests are barely statistically detectable except in immediate fallout plumes. The increase in radiation exposure far from the combatants in even a full scale nuclear exchange at the height of the Cold War would have been modest compared to the variations in natural background radiation doses that have readily been adapted to by a number of human populations. Nor is there any reason to believe that global warming or other insults to our physical environment resulting from currently used technologies will challenge the survival of mankind as a whole beyond what it has already handily survived through the past fifty thousand years.

There are, however, two technologies currently under development that may pose a more serious threat to human survival. The first and most immediate is biological warfare combined with genetic engineering. Smallpox is the most fearsome of natural biological warfare agents in existence. By the end of the next decade, global immunity to smallpox will likely be at a low unprecedented since the emergence of this disease in the distant past, while the opportunity for it to spread rapidly across the globe will be at an all time high. In the absence of other complications such as nuclear war near the peak of an epidemic, developed countries may respond with quarantine and vaccination to limit the damage. Otherwise mortality there may match the rate of 30 percent or more expected in unprepared developing countries. With

respect to genetic engineering using currently available knowledge and technology, the simple expedient of spreading an ample mixture of coat protein variants could render a vaccination response largely ineffective, but this would otherwise not be expected to substantially increase overall mortality rates. With development of new biological technology, however, there is a possibility that a variety of infectious agents may be engineered for combinations of greater than natural virulence and mortality, rather than just to overwhelm currently available antibiotics or vaccines. There is no a priori known upper limit to the power of this type of technology base, and thus the survival of a globally connected human family may be in question when and if this is achieved.

AT: No Tech Access (Bioweapons)

Tech access becoming easier all the time

Patrick D. ELLIS, WMD/Homeland Security Analyst and Instructor at the U.S. Air Force Counterproliferation Center, Air University, 14 ["Lone Wolf Terrorism and Weapons of Mass Destruction: An Examination of Capabilities and Countermeasures," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

A WMD in the hands of a lone wolf terrorist is a scenario we all hope will never happen. However, we live in a world where traditional WMD weapons are being proliferated and new Janus-headed technologies and systems can become weapons. The proliferation of WMD technology through legitimate as well as illegitimate programs in recent years continues to warn us of the uncertain nature of who might be able to acquire such weapons in the future. A more clear and present danger may very well be from the more accessible sources of radiation, bacteria, or other industrial chemicals that are always in our communities. Do-it-yourself biology and access to other technologies might open the doors for newer forms of violent diseases that could spread through populations. The ease of acquiring the skills and knowledge to cultivate known diseases such as plague and anthrax are as close as a small university microbiology program. Access to dual-use miniaturized laboratory technologies is not as hard to obtain as it was in the past. The future possibility of cross-pollination between bad actors such as terrorist and criminals due to "a convergence of interests and methods" 94 will become more problematic and of grave concern to security practitioners. The requirement for security professionals to continue to develop their capacity to envision future threats based on technological advancements will become key to creating future solutions to potentially destructive new weapons.

2NC – WMD Terrorism Impact – Turns Economy

Nuke terror would end the economy.

John Kenneth Galbraith, April 2000. Professor of Economics at Harvard. "Economic Aspects," from the IPPNW Nuclear Weapons Convention Monitor, <http://www.reachingcriticalwill.org/legal/nwc/mon1galb.html>.

Such is the vulnerability of the American economy that in the form we know it, it could be brought to an end by the most elementary of nuclear attacks. This could be accomplished by a tactical nuclear weapon on downtown New York. With such an attack there would, of course, be massive death and destruction. But additionally the American economy would be made non-functional. No longer in the economic world would it be known what was owned and what possessed in the banks. That knowledge would be destroyed along with the people that convey the information. The trading of securities would, of course, come to an end but, as seriously, so would the knowledge throughout the country of what is owned. Those with ownership in and income from the financial world — stocks, bonds and other financial instruments — would find a record of their possessions eliminated. It would be true for individuals and for corporations throughout the country. Ownership would come to an end; of assets possessed there would no longer be a record. Capitalism as it is known would be finished. This, to repeat, would be the result of one small nuclear weapon.

A terrorist attack would cause massive economic damage.

Raneta Mack et al, 2004. Professor of Law at Creighton University. Equal Justice in the Balance, p. 13-14.

In addition to the psychological and strategic impact of terrorism, such pervasive, continuing, and unpredictable violence (or the threat of such violence) also inflicts a severe economic wound on its victims. Although terrorists rarely have as their ultimate goal the devastation of a nation's economic infrastructure, one of the inevitable consequences of large-scale terrorist violence is economic downturn and a corresponding reassessment of economic resource allocation. In the aftermath of the September 11 attacks, the United States has endured a dramatic economic upheaval in both the business and consumer markets. Widespread economic uncertainty has resulted in a declining investment market, reduced overall spending, and massive layoffs. Moreover, to fight the escalating war on terrorism, the government has radically refocused its mission to support the counterterrorism effort, which, in turn, requires equally dramatic budgetary revamping. To cite a few examples, in February 2002 Attorney General John Ashcroft requested an additional \$2 billion to help the Department of Justice (DOJ) fight the terrorism battle. On the legislative front, Congress approved a \$15 billion emergency assistance package to help the ailing airline industry recover from the 9/11 attacks. The bailout package included immediate cash payments to compensate for the shutdown of the airlines

after the attacks and loan guarantees of \$10 billion. But arguably the most devastated sector of the economy is the insurance industry, which is expected to pay out record claims to those who lost loved ones and property as a result of the attacks. Analysts predict that these claims could reach a crippling \$50 billion. A draft report by NATO's Economics and Security Committee entitled *The Economic Consequences of 11 September and the Economic Dimension of Anti-terrorism* anticipated that "many of the losses associated with the [September 11] attacks are essentially 'one-off' costs that will not endure over the long-term. There are, however, several important exceptions. Insurance [premiums], particularly against terrorist attacks, have probably risen permanently [and] ... the costs of increased security no doubt will continue to weigh on national economies for the foreseeable future and will disproportionately hit certain sectors like airlines and insurance."

2NC – WMD Terrorism Impact – Turns Rights

A nuclear terrorist attack turns the case by crushing constitutional liberties

Robert Chesney, 1997. Law Clerk to the Hon. Lewis A. Kaplan (S.D.N.Y.); B.S., Tex. Christian Univ.; J.D., Harvard Law School. "National Insecurity: Nuclear Material Availability and the Threat of Nuclear Terrorism," 20 Loy. L.A. Int'l & Comp. L.J. 29, lexis.

The horrible truth is that the threat of nuclear terrorism is real, in light of the potential existence of a black market in fissile material. Nuclear terrorists might issue demands, but then again, they might not. Their target could be anything: a U.S. military base in a foreign land, a crowded U.S. city, or an empty stretch of desert highway. In one fell swoop, nuclear terrorists could decapitate the U.S. government or destroy its financial system. The human suffering resulting from a detonation would be beyond calculation, and in the aftermath, the remains of the nation would demand both revenge and protection. Constitutional liberties and values might never recover. When terrorists strike against societies already separated by fundamental social fault lines, such as in Northern Ireland or Israel, conventional weapons can exploit those fault lines to achieve significant gains. 1 In societies that lack such pre-existing fundamental divisions, however, conventional weapon attacks do not pose a top priority threat to national security, even though the pain and suffering inflicted can be substantial. The bedrock institutions of the United States will survive despite the destruction of federal offices; the vast majority of people will continue to support the Constitution despite the mass murder of innocent persons. The consequences of terrorists employing weapons of mass destruction, however, would be several orders of magnitude worse than a conventional weapons attack. Although this threat includes chemical and biological weapons, a nuclear weapon's devastating [*32] potential is in a class by itself. 2 Nuclear terrorism thus poses a unique danger to the United States: through its sheer power to slay, destroy, and terrorize, a nuclear weapon would give terrorists the otherwise-unavailable ability to bring the United States to its knees. Therefore, preventing terrorists from obtaining nuclear weapons should be considered an unparalleled national security priority dominating other policy considerations.

The disad turns the case – a terrorist attack will lead to a crackdown on rights and enemy construction

Lee Epstein et al, April 2005. Professor of Political Science and Law at Washington University. "The Supreme Court during crisis: How war affects only non-war cases," New York University Law Review, 80(1): 1-116, http://dash.harvard.edu/bitstream/handle/1/4214882/King_SupremeCourt.pdf?sequence=2.

When societies confront crises, they respond in different ways. Sometimes they use military force to attack their aggressors; sometimes they do not. n27 Sometimes they impose economic sanctions; sometimes they do not. n28 Sometimes they undertake diplomatic efforts;

sometimes they do not. n29 But, as many studies reveal, one response is essentially universal: In times of emergency - whether arising from wars, internal rebellions, or terrorist attacks - governments tend to suppress the rights and liberties of persons living within their borders. n30 They may respond in this way out of a desire to present [*12] a unified front to outsiders, their perception that cleavages are "dangerous," n31 or, of course, their belief that national security and military "necessity" must outweigh liberty interests if government is to be protected and preserved. n32 Whatever the reason, the United States is no exception to this rule. n33 Indeed, America's history is replete with executive and legislative attempts, during times of "urgency," to restrict the people's ability to speak, publish, and organize; to erode guarantees usually afforded to the criminally accused; or to tighten restrictions on "foreigners" or [*13] perceived "enemies." n34 The "ink had barely dried on the First Amendment," n35 as Justice Brennan once observed, when Congress passed two restrictive legislative enactments: the Sedition Act, n36 which prohibited speech critical of the United States, and the Enemy Alien Act, n37 which empowered the President to detain or deport alien enemies n38 and which the government has used during declared wars to stamp out political opponents. n39 During the Civil War, President Abraham Lincoln took steps to suppress "treacherous" behavior, most notably by suspending habeas corpus, out of the belief "that the [*14] nation must be able to protect itself in war against utterances which actually cause insubordination." n40 Prior to America's entry into World War I, President Woodrow Wilson "predicted a dire fate for civil liberties should we become involved." n41 With passage of the Espionage Act of 1917 n42 and the Sedition Act of 1918, n43 Wilson's prediction was realized - with Wilson as a prime accomplice. World War II brought yet more repressive measures, most notably executive orders limiting the movement of and providing for the internment of Japanese Americans. n44 The Korean War and the supposed "communist menace" n45 resulted in an "epidemic of witch-hunting, paranoia, and political grandstanding" directed against "reds" across the country. n46 And Vietnam was accompanied by governmental efforts to silence war protests. n47 Thus, in the United States, "the struggle between the needs of national security and political or civil liberties has been a continual one." n48 Of course, politicians would have a difficult time enacting and implementing such curtailments on rights and liberties if those measures lacked public support. n49 But that has not been the case during[*15] crises for which we have survey data. In a general sense, the data reveal that public confidence in the President, who is often the catalyst for repressive legislation, n50 soars in the face of international crises. n51 This "rally effect" n52 gave Franklin Roosevelt a twelve-point increase after the Japanese attacked Pearl Harbor, John Kennedy a thirteen-point lift during the Cuban Missile Crisis, and George H.W. Bush a fourteen-point boost when Iraq invaded Kuwait. n53 As Figure 1 shows, in the wake of September 11, 2001, George W. Bush's approval rating jumped a record-setting thirty-five points, from fifty-one percent on September 7 to eighty-six percent on September 14. [*16] [mg f:'nyu10101.eps',w28.,d17.6]

Figure 1: Percentage of Americans approving of the way George W. Bush is handling his job: The "rally effect" generated by September 11, 2001. n54 Survey data also reveal a public supportive of specific efforts on the part of political actors to curtail rights and liberties. Consider Americans' response to September 11. n55 As Table 1 shows, all but one restriction on rights designed to furnish the government with significant authority to combat terrorism - the indefinite detainment of terrorist suspects without charging them - attained the support of a substantial majority of respondents. n56

2NC – Threats Real (Al Qaeda)

Al-Qaeda is planning mass casualty attacks on the West --- continued surveillance is critical to prevent them.

Wall Street Journal, 1/8/2015. Cassell Bryan-Low. "U.K. MI5 Chief Andrew Parker Warns of Threat of al Qaeda Attack in West," <http://www.wsj.com/articles/u-k-mi5-chief-andrew-parker-warns-of-threat-of-al-qaeda-attack-in-west-1420757705>.

LONDON—The head of the U.K.'s domestic intelligence agency said Thursday that al Qaeda continued to pose an immediate threat and was planning large-scale attacks against the West.

In a rare public speech, MI5 chief Andrew Parker said "a group of core al Qaeda terrorists in Syria is planning mass casualty attacks against the West," without elaborating on how advanced such planning was. The comments underscore that the terrorist threat remains diverse despite the recent focus on Islamic State, which has gained territory in Syria and Iraq.

The comments, made at MI5's London headquarters, come on the heels of Wednesday's shooting attack in Paris, which left 12 people dead. While authorities haven't yet confirmed any possible connections of the perpetrators to terrorist organizations, intelligence officials have said that links to al Qaeda were a possibility.

In his remarks, Mr. Parker briefly addressed the Paris attack. "It is too early for us to come to judgments about the precise details or origin of the attack, but it is a terrible reminder of the intentions of those who wish us harm," Mr. Parker said.

Speaking more generally, Mr. Parker said, "we face a very serious level of threat that is complex to combat and unlikely to abate significantly for some time." He added that in recent months, authorities have prevented three U.K. terrorist plots that "would certainly" have resulted in deaths.

Mr. Parker said there had been an increase in the number of "crude but potentially deadly plots" and cited last year's attacks in Canada and Australia as examples. "Such attacks are inherently harder for intelligence agencies to detect," he said. "They are often the work of volatile individuals, motivated by terrorist propaganda rather than working as part of sophisticated networks. They often act spontaneously or after very short periods of prior training."

He focused in particular on the threat stemming from the conflict in Syria. There have been more than 20 terrorist plots outside of Syria and Iraq that were either directed or provoked by extremist groups in Syria, including those in Canada, Australia, Belgium and France, according to Mr. Parker.

Britain's security agencies in August raised the assessment of the threat from international terrorism to "severe" from "substantial," the second-highest level on its five-point scale, primarily because of the threat of Islamist militants in Syria. The change, which triggered a step-

up in security measures such as visible police patrols, reflects an assessment that an attack is highly likely but that there isn't intelligence to suggest an imminent terror strike.

The MI5 chief said some 600 extremists now had traveled from Britain to Syria and that a "significant proportion" of those had joined Islamic State, also known as ISIL.

He also talked about the stiff challenges intelligence agencies face, ranging from the difficulty in collecting intelligence in Syria, where the U.K. has no partner agency to work with to technological challenges more broadly.

As the terrorism threat is increasing, intelligence agencies are finding their ability to counter them is decreasing, he said. The reasons include the increased availability—and use—of encryption that makes it harder for intelligence agencies to intercept communications.

"Changes in the technology that people are using to communicate are making it harder for the agencies to maintain the capability to intercept the communications of terrorists," he said. "The further reduction of this capability will seriously harm our ability to investigate and disrupt such threats in the future."

Mr. Parker also waded into Britain's feud with Internet companies over how much they should help in combating terrorist activity. British authorities say they remain frustrated that U.S. Internet companies don't feel obliged to comply with U.K. warrants requesting information about users.

He said intelligence agents need to be able to access communication among terrorists if they are to do their job, which means including the assistance of companies which hold relevant data. "Currently this picture is patchy," he said.

He also defended the communications-data gathering work by intelligence agencies, which has come under criticism following the disclosure of mass-surveillance techniques by former U.S. National Security Agency contractor Edward Snowden.

"MI5 does not browse through the private lives of the population at large," he said. "We need to have powerful capabilities that enable us to range widely, with the potential to reach anyone who might threaten national security—but with our efforts always concentrated on the tiniest minority who actually present threats."

AQAP has demonstrated capacity and intent for attacks on the US --- the threat is high.

Michael Kugelman, 1/9/2015. Senior associate for South Asia at the Woodrow Wilson International Center for Scholars. "Why Al Qaeda Poses a Greater Terror Threat to the U.S. Than ISIS," Wall Street Journal, <http://blogs.wsj.com/washwire/2015/01/09/why-al-qaeda-poses-a-greater-terror-threat-to-the-u-s-than-isis/>.

Al Qaeda in the Arabian Peninsula has long posed a direct threat to the West, a threat arguably more serious than that posed by Islamic State. Yet many seem surprised by this after news reports that one of the suspects in Wednesday's attack on the Charlie Hebdo offices in Paris may have had links to AQAP.

The suspect, Said Kouachi, reportedly received training in Yemen in 2011. During that trip, he allegedly met with Anwar al-Awlaki, the U.S.-born preacher closely associated with AQAP until he was killed by a U.S. drone strike later that year.

In recent years, Washington has deemed Al Qaeda in the Arabian Peninsula the most dangerous terror threat to the West because of its global reach and technical savvy. And unlike Islamic State, AQAP has staged attacks in the West, including in the United States.

The "underwear bomber" who tried to blow up an airliner on Christmas Day 2009, the 2013 massacre at Fort Hood, and the 2010 plot to send parcel bombs to Chicago all had some connection to AQAP.

Islamic State extremists have done no such things—yet. To this point, ISIS has appeared content to terrorize Westerners in Syria and Iraq, where the group holds sway. Its core objective for now appears to be managing the territory it controls in those countries, not taking its fight to the West.

Now, many observers have good reason to fear that Westerners who go to the Middle East to fight for Islamic State could eventually return home and stage attacks.

Perhaps a more immediate fear, however, is that Al Qaeda in the Arabian Peninsula—a group that has demonstrated its intent and ability to strike in the West—will carry out its own attacks, much like the one in Paris this week.

And, unfortunately, the United States could be the next target.

Competition between AQ and ISIS increases the incentive to pull off large-scale attacks.

Bloomberg, 3/21/2015. Ian Wishart. "Al Qaeda-Islamic State Rivalry Worsens Threat, de Kerchove Says," <http://www.bloomberg.com/news/articles/2015-03-21/al-qaeda-islamic-state-rivalry-worsens-threat-de-kerchove-says>.

Competition for the "leadership of global jihad" could incite al-Qaeda to carry out a terrorist attack in Europe to prove its credibility, according to the European Union's counter-terrorism chief.

Rivalry between al-Qaeda and Islamic State, also known by the Arabic acronym Daesh, has only added to the terror threat Western policy makers grapple with, Gilles de Kerchove said at a forum in Brussels Saturday.

“The fierce competition between al-Qaeda and Daesh over the leadership of global jihad -- we may see at some stage in Europe or in some part of Africa, al-Qaeda wanting to launch an attack to show they are still relevant,” de Kerchove said.

At least one of the three gunmen who killed 17 people in attacks in Paris in January had connections to al-Qaeda in the Arabian Peninsula, the Yemen-based group that swears allegiance to Osama bin Laden’s original movement. Another declared allegiance to Islamic State in a video.

Islamic State, which controls parts of Iraq and Syria, claimed responsibility for the killing at least 22 people at a museum in Tunis on Wednesday.

2NC – AT: No Nuclear Terrorism (General)

High risk of nuke terror—there's motivation and capability

Kenneth C. Brill is a former U.S. ambassador to the I.A.E.A. Kenneth N. Luongo is president of the Partnership for Global Security. Both are members of the Fissile Material Working Group, a nonpartisan nongovernmental organization ["Nuclear Terrorism: A Clear Danger," www.nytimes.com/2012/03/16/opinion/nuclear-terrorism-a-clear-danger.html?_r=0]

Terrorists exploit gaps in security. The current global regime for protecting the nuclear materials that terrorists desire for their ultimate weapon is far from seamless. It is based largely on unaccountable, voluntary arrangements that are inconsistent across borders. Its weak links make it dangerous and inadequate to prevent nuclear terrorism.

Later this month in Seoul, the more than 50 world leaders who will gather for the second Nuclear Security Summit need to seize the opportunity to start developing an accountable regime to prevent nuclear terrorism.

There is a consensus among international leaders that the threat of nuclear terrorism is real, not a Hollywood confection. President Obama, the leaders of 46 other nations, the heads of the International Atomic Energy Agency and the United Nations, and numerous experts have called nuclear terrorism one of the most serious threats to global security and stability. It is also preventable with more aggressive action.

At least four terrorist groups, including Al Qaeda, have demonstrated interest in using a nuclear device. These groups operate in or near states with histories of questionable nuclear security practices. Terrorists do not need to steal a nuclear weapon. It is quite possible to make an improvised nuclear device from highly enriched uranium or plutonium being used for civilian purposes. And there is a black market in such material. There have been 18 confirmed thefts or loss of weapons-usable nuclear material. In 2011, the Moldovan police broke up part of a smuggling ring attempting to sell highly enriched uranium; one member is thought to remain at large with a kilogram of this material.

Their take-outs are wrong—the motivation and technical capability exist—acquisition is the only barrier

Bunn 10— Associate Professor at Harvard University's John F. Kennedy School of Government, Harvard Senior Research Associate, Managing the Atom Project [April, 2010, Matthew Bunn, "Securing the Bomb 2010," http://www.nti.org/e_research/Securing_The_Bomb_2010.pdf]

Complacency about the threat is perhaps the biggest obstacle to forging the urgent, in-depth international cooperation needed to secure nuclear stockpiles and reduce the danger of nuclear terrorism. Many policymakers around the world continue to believe that it would take a

Manhattan Project to make a nuclear bomb, that it would be almost impossible for terrorists to get the necessary nuclear material, and that the risk of terrorists getting and using a nuclear bomb is therefore vanishingly small. The experience of finding that Iraq did not have nuclear, chemical, or biological weapons in 2003 has made many justifiably skeptical of other assertions about serious threats from such weapons. Unfortunately, while no one can say precisely what the probability of nuclear terrorism is, the danger is very real. Several unfortunate facts shape the risk the world faces.

Some Terrorists are Seeking Nuclear Weapons

Most terrorist groups are focused on small-scale violence to attain local objectives. For them, the old adage that “terrorists want a lot of people watching, not a lot of people dead” holds true, and nuclear weapons are likely to be irrelevant or counterproductive for their goals. But a small set of terrorists with global ambitions and nihilistic visions clearly are eager to get and use a nuclear bomb. Osama bin Laden has called the acquisition of nuclear weapons or other weapons of mass destruction a “religious duty.”¹

For years, al Qaeda operatives have repeatedly expressed the desire to inflict a “Hiroshima” on the United States.² Al Qaeda operatives have made repeated attempts to buy nuclear material for a nuclear bomb, or to recruit nuclear expertise.

Shortly before the 9/11 attacks, for example, bin Laden and Ayman al-Zawahiri met with two senior Pakistani nuclear scientists to discuss nuclear weapons.³ Former CIA Director George Tenet reports that the two provided al Qaeda with a rough sketch of a nuclear bomb design, and that U.S. officials were so concerned about the activities of the “charity” they had established (whose board of directors also included a range of senior retired military officers, and which reportedly also offered nuclear weapons help to Libya) that President Bush directed him to fly to Pakistan and discuss the matter directly with Pakistani President Pervez Musharraf.⁴ Sultan Bashiruddin Mahmud, the more senior of the two, had long argued that Pakistan’s nuclear weapons rightfully belonged to the whole worldwide “ummah,” or Muslim community, and had advocated sharing nuclear weapons technology.⁵

After the 9/11 attacks, intelligence agencies from the United States and other countries learned that in the years leading up to the attacks, al Qaeda had a focused nuclear weapons program managed by Abdel Aziz al-Masri (aka Ali Sayyid alBakri), an Egyptian explosives expert. The program reported directly to Zawahiri, as did al Qaeda’s anthrax efforts, its other major strategic-scale weapons of mass destruction program. This program reportedly got to the point of carrying out tests of conventional explosives for use in a nuclear bomb.⁶

Al Qaeda’s nuclear efforts apparently continued after the disruptions the group faced following the overthrow of the Taliban government and the removal of al Qaeda’s Afghan sanctuary. In 2002-2003, U.S. intelligence received a “stream of reliable reporting” that the leadership of al Qaeda’s cell in Saudi Arabia was negotiating to purchase three objects they believed to be Russian “nuclear devices,” and that al Qaeda’s central leadership had approved the purchase if a Pakistani expert using his equipment confirmed that they were genuine. (The actual nature of these “devices,” if they existed, the name of the Pakistani expert, and the type of equipment he was to use to examine the devices have never been learned.)⁷ At the same time these

discussions were taking place, bin Laden arranged for a radical Saudi cleric to issue a fatwa or religious ruling authorizing the use of nuclear weapons against American civilians. 8 The cleric who issued the fatwa was the “steady companion” of the al Qaeda operative leading the negotiations over the nuclear devices. 9

Before al Qaeda, the Japanese terror cult Aum Shinrikyo also made a concerted effort to get nuclear weapons. 10 Chechen terrorists have certainly pursued the possibility of a radioactive “dirty bomb,” and there are at least suggestive indications that they also have pursued nuclear weapons—including two incidents of terrorists conducting reconnaissance at secret nuclear weapon storage sites, confirmed by Russian officials. There are at least some indications that Pakistani groups such as Lashkar-e-Taiba may also be interested—a particularly troubling possibility given the deep past connections these groups have had with Pakistani security services, their ongoing cooperation with al Qaeda, and the example of in-depth cooperation on unconventional weapons provided by al Qaeda’s work with Jemaah Islamiyah on anthrax. 11

With at least two groups going down this path in the last 15 years, and possibly more, there is no reason to expect that others will not do so in the future.

Some Terrorist Groups might be able to make Crude Nuclear Bombs

Repeated assessments by the U.S. government and other governments have concluded that it is plausible that a sophisticated terrorist group could make a crude nuclear explosive—capable of destroying the heart of a major city—if they got enough plutonium or HEU. A “gun-type” bomb made from HEU, in particular, is basically a matter of slamming two pieces of HEU together at high speed. An “implosion-type” bomb—in which precisely arranged explosives crush nuclear material to a much higher density, setting off the chain reaction—would be substantially more difficult for terrorists to accomplish, but is still plausible, particularly if they got knowledgeable help (as they have been actively attempting to do). 12

One study by the now-defunct congressional Office of Technology Assessment summarized the technical reality: “A small group of people, none of whom have ever had access to the classified literature, could possibly design and build a crude nuclear explosive device... Only modest machine-shop facilities that could be contracted for without arousing suspicion would be required.” 13 Indeed, even before the revelations from Afghanistan, U.S. intelligence concluded that “fabrication of at least a ‘crude’ nuclear device was within al-Qa’ida’s capabilities, if it could obtain fissile material.” 14

It is important to understand that making a crude, unsafe, unreliable bomb of uncertain yield that might be carried in the back of a large van is a dramatically simpler task than designing and building a safe, secure, reliable, and efficient weapon deliverable by a ballistic missile, which a state might want to incorporate into its arsenal. Terrorists are highly unlikely to ever be able to make a sophisticated and efficient weapon, a task that requires a substantial nuclear weapons enterprise— but they may well be able to make a crude one. Their task would be easier if they managed to recruit experts with experience in key aspects of a national nuclear weapons program. Nuclear weapons themselves generally have substantial security measures and would be more difficult to steal than nuclear materials. If terrorists nevertheless managed to steal an assembled nuclear weapon from a state, there is a significant risk that they might figure out how

to set it off—though this, too, would in most cases be a difficult challenge for a terrorist group. 15 Many modern U.S. and Russian nuclear weapons are equipped with sophisticated electronic locks, known in the United States as “permissive action links” or PALs, intended to make it difficult to detonate the weapon without inserting an authorized code, which terrorists might find very difficult to bypass. Some weapons, however, are either not equipped with PALs or are equipped with older versions that lack some of the highestsecurity features (such as “limited try” features that would permanently disable the weapon if the wrong code is inserted too many times or attempts are made to bypass the lock). 16 Many nuclear weapons also have safety features designed to prevent the weapon from detonating unless it had gone through its expected flight to its target—such as intense acceleration followed by unpowered flight for a ballistic missile warhead—and these would also have to be bypassed, if they were present, for terrorists to be able to make use of an assembled nuclear weapon they acquired.

If they could not figure out how to detonate a stolen weapon, terrorists might choose to remove its nuclear material and fashion a new bomb. Some modern, highly efficient designs might not contain enough material for a crude, inefficient terrorist bomb; but multistage thermonuclear weapons, with nuclear material in both the “primary” (the fission bomb that sets off the fusion reaction) and the “secondary” (where the fusion takes place) probably would provide sufficient material. In any case, terrorists in possession of a stolen nuclear weapon would be in a position to make fearsome threats, for no one would know for sure whether they could set it off.

Domestic surveillance successfully checks terror incidents now. Prefer longitudinal studies.

Boot '13 Max Boot is a Senior Fellow in National Security Studies at the Council on Foreign Relations. In 2004, he was named by the World Affairs Councils of America as one of "the 500 most influential people in the United States in the field of foreign policy." In 2007, he won the Eric Breindel Award for Excellence in Opinion Journalism. From 1992 to 1994 he was an editor and writer at the Christian Science Monitor. Boot holds a bachelor's degree in history, with high honors, from the University of California, Berkeley and a master's degree in history from Yale University. Boot has served as an adviser to U.S. commanders in Iraq and Afghanistan. He is the published author of *Invisible Armies: An Epic History of Guerrilla Warfare from Ancient Times to the Present*. From the article: "Stay calm and let the NSA carry on" - LA Times – June 9th - <http://articles.latimes.com/2013/jun/09/opinion/la-oe-boot-nsa-surveillance-20130609>

After 9/11, there was a widespread expectation of many more terrorist attacks on the United States. So far that hasn't happened. We haven't escaped entirely unscathed (see Boston Marathon, bombing of), but on the whole we have been a lot safer than most security experts, including me, expected. In light of the current controversy over the National Security Agency's monitoring of telephone calls and emails, it is worthwhile to ask: Why is that? It is certainly not due to any change of heart among our enemies. Radical Islamists still want to kill American infidels. But the vast majority of the time, they fail. The Heritage Foundation estimated last year that 50 terrorist attacks on the American homeland had been foiled since 2001. Some, admittedly, failed through sheer incompetence on the part of the would-be terrorists. For instance, Faisal Shahzad, a Pakistani American jihadist, planted a car bomb in Times Square in 2010 that started smoking before exploding, thereby alerting two New Yorkers who in turn called police, who were able to defuse it. But it would be naive to adduce all of our security success to pure serendipity. Surely more attacks would have succeeded absent the ramped-up counter-terrorism efforts undertaken by the U.S. intelligence community, the military and law enforcement. And a large element of the intelligence community's success lies in its use of special intelligence — that is, communications intercepts. The CIA is notoriously deficient in human intelligence — infiltrating spies into terrorist organizations is hard to do, especially when we have so few spooks who speak Urdu, Arabic, Persian and other relevant languages. But the NSA is the best in the world at intercepting communications. That is the most important technical advantage we have in the battle against fanatical foes who will not hesitate to sacrifice their lives to take ours. Which brings us to the current kerfuffle over two NSA monitoring programs that have been exposed by the Guardian and the Washington Post. One program apparently collects metadata on all telephone calls made in the United States. Another program provides access to all the emails, videos and other data found on the servers of major Internet firms such as Google, Apple and Microsoft. At first blush these intelligence-gathering activities raise the specter of Big Brother snooping on ordinary American citizens who might be cheating on their spouses or bad-mouthing the president. In fact, there are considerable safeguards built into both programs to ensure that doesn't happen. The phone-monitoring program does not allow the NSA to listen in on conversations without a court order. All that it can do is to collect information on the time, date and destination of phone calls. It should go without saying that it

would be pretty useful to know if someone in the U.S. is calling a number in Pakistan or Yemen that is used by a terrorist organizer. As for the Internet-monitoring program, reportedly known as PRISM, it is apparently limited to "non-U.S. persons" who are abroad and thereby enjoy no constitutional protections. These are hardly rogue operations. Both programs were initiated by President George W. Bush and continued by President Obama with the full knowledge and support of Congress and continuing oversight from the federal judiciary. That's why the leaders of both the House and Senate intelligence committees, Republicans and Democrats alike, have come to the defense of these activities. **It's possible that, like all government programs, these could be abused** — see, for example, the IRS making life tough on tea partiers. **But there is no evidence of abuse so far and plenty of evidence** — in the lack of successful terrorist attacks — **that these programs have been effective in disrupting terrorist plots.** Granted there is something inherently creepy about Uncle Sam scooping up so much information about us. But Google, Facebook, Amazon, Twitter, Citibank and other companies know at least as much about us, because they use very similar data-mining programs to track our online movements. They gather that information in order to sell us products, and no one seems to be overly alarmed. The NSA is gathering that information to keep us safe from terrorist attackers. Yet somehow its actions have become a "scandal," to use a term now loosely being tossed around. The real scandal here is that the Guardian and Washington Post are compromising our national security by telling our enemies about our intelligence-gathering capabilities. Their news stories reveal, for example, that only nine Internet companies share information with the NSA. This is a virtual invitation to terrorists to use other Internet outlets for searches, email, apps and all the rest. No intelligence effort can ever keep us 100% safe, but **to stop or scale back the NSA's special intelligence efforts would amount to unilateral disarmament** in a war **against terrorism** that is far from over.

Curtailing surveillance boosts terror risks- that risk is serious and underestimated

Lewis '14 James Andrew Lewis is a senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies in Washington, D.C., where he writes on technology, security, and the international economy. Before joining CSIS, he worked at the US Departments of State and Commerce as a Foreign Service officer and as a member of the Senior Executive Service. His diplomatic experience included negotiations on military basing in Asia, the Cambodia peace process, and the five-power talks on arms transfer restraint. Lewis received his Ph.D. from the University of Chicago. "Underestimating Risk in the Surveillance Debate" - CENTER FOR STRATEGIC & INTERNATIONAL STUDIES - STRATEGIC TECHNOLOGIES PROGRAM – December - <http://csis.org/publication/underestimating-risk-surveillance-debate>

Americans are reluctant to accept terrorism is part of their daily lives, but attacks have been planned or attempted against American targets (usually airliners or urban areas) **almost every year since 9/11.** Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq. **The threat of attack is easy to exaggerate, but that does not mean it is nonexistent.** Australia's then-attorney general said in August 2013 that communications surveillance had stopped four "mass casualty events" since 2008. The constant planning and preparation for attack by terrorist groups is not apparent to the public. **The dilemma in assessing risk is that it is discontinuous. There can be long periods**

with no noticeable activity, only to have the apparent calm explode. The debate over how to reform communications surveillance has discounted this risk. Communications surveillance is an essential law enforcement and intelligence tool. There is no replacement for it. Some suggestions for alternative approaches to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm.

Strong intelligence gathering is key to discourages initiation of BW attacks.

Pittenger '14 US Rep. Robert Pittenger, chair of Congressional Task Force on Terrorism, "Bipartisan bill on NSA data collection protects both privacy and national security" - Washington Examiner, 6/9/14, http://washingtonexaminer.com/rep.-robert-pittenger-bipartisan-bill-on-nsa-data-collection-protects-both-privacy-and-national-security/article/2549456?custom_click=rss&utm_campaign=Weekly+Standard+Story+Box&utm_source=weeklystandard.com&utm_medium=referral

This February, I took that question to a meeting of European Ambassadors at the Organization for Security and Cooperation in Europe. During the conference, I asked three questions: 1. What is the current worldwide terrorist threat? 2. What is America's role in addressing and mitigating this threat? 3. What role does intelligence data collection play in this process, given the multiple platforms for attack including physical assets, cyber, chemical, biological, nuclear and the electric grid? Each ambassador acknowledged the threat was greater today than before 9/11, with al Qaeda and other extreme Islamist terrorists stronger, more sophisticated, and having a dozen or more training camps throughout the Middle East and Africa. As to the role of the United States, they felt our efforts were primary and essential for peace and security around the world. Regarding the intelligence-gathering, their consensus was, "We want privacy, but we must have your intelligence." As a European foreign minister stated to me, "Without U.S. intelligence, we are blind." We cannot yield to those loud but misguided voices who view the world as void of the deadly and destructive intentions of unrelenting terrorists. The number of terrorism-related deaths worldwide doubled between 2012 and 2013, jumping from 10,000 to 20,000 in just one year. Now is not the time to stand down. Those who embrace an altruistic worldview should remember that vigilance and strength have deterred our enemies in the past. That same commitment is required today to defeat those who seek to destroy us and our way of life. We must make careful, prudent use of all available technology to counter their sophisticated operations if we are to maintain our freedom and liberties.

Bioterror attacks cause extinction

Mhyrvold '13 Nathan, Began college at age 14, BS and Masters from UCLA, Masters and PhD, Princeton "Strategic Terrorism: A Call to Action," Working Draft, The Lawfare Research Paper Series Research paper NO . 2 – 2013

As horrible as this would be, such a pandemic is by no means the worst attack one can imagine, for several reasons. First, most of the classic bioweapons are based on 1960s and 1970s technology because the 1972 treaty halted bioweapons development efforts in the United States and most other Western countries. Second, the Russians, although solidly committed to biological weapons long after the treaty deadline, were never on the cutting edge of biological research. Third and most important, the science and technology of molecular biology have made

enormous advances, utterly transforming the field in the last few decades. High school biology students routinely perform molecular-biology manipulations that would have been impossible even for the best superpower-funded program back in the heyday of biological-weapons research. The biowarfare methods of the 1960s and 1970s are now as antiquated as the lumbering mainframe computers of that era. Tomorrow's terrorists will have vastly more deadly bugs to choose from. Consider this sobering development: in 2001, Australian researchers working on mousepox, a nonlethal virus that infects mice (as chickenpox does in humans), accidentally discovered that a simple genetic modification transformed the virus.^{10, 11} Instead of producing mild symptoms, the new virus killed 60% of even those mice already immune to the naturally occurring strains of mousepox. The new virus, moreover, was unaffected by any existing vaccine or antiviral drug. A team of researchers at Saint Louis University led by Mark Buller picked up on that work and, by late 2003, found a way to improve on it: Buller's variation on mousepox was 100% lethal, although his team of investigators also devised combination vaccine and antiviral therapies that were partially effective in protecting animals from the engineered strain.^{12, 13} Another saving grace is that the genetically altered virus is no longer contagious. Of course, it is quite possible that future tinkering with the virus will change that property, too. Strong reasons exist to believe that the genetic modifications Buller made to mousepox would work for other poxviruses and possibly for other classes of viruses as well. Might the same techniques allow chickenpox or another poxvirus that infects humans to be turned into a 100% lethal bioweapon, perhaps one that is resistant to any known antiviral therapy? I've asked this question of experts many times, and no one has yet replied that such a manipulation couldn't be done. This case is just one example. Many more are pouring out of scientific journals and conferences every year. Just last year, the journal *Nature* published a controversial study done at the University of Wisconsin–Madison in which virologists enumerated the changes one would need to make to a highly lethal strain of bird flu to make it easily transmitted from one mammal to another.¹⁴ Biotechnology is advancing so rapidly that it is hard to keep track of all the new potential threats. Nor is it clear that anyone is even trying. In addition to lethality and drug resistance, many other parameters can be played with, given that the infectious power of an epidemic depends on many properties, including the length of the latency period during which a person is contagious but asymptomatic. Delaying the onset of serious symptoms allows each new case to spread to more people and thus makes the virus harder to stop. This dynamic is perhaps best illustrated by HIV, which is very difficult to transmit compared with smallpox and many other viruses. Intimate contact is needed, and even then, the infection rate is low. The balancing factor is that HIV can take years to progress to AIDS, which can then take many more years to kill the victim. What makes HIV so dangerous is that infected people have lots of opportunities to infect others. This property has allowed HIV to claim more than 30 million lives so far, and approximately 34 million people are now living with this virus and facing a highly uncertain future.¹⁵ A virus genetically engineered to infect its host quickly, to generate symptoms slowly—say, only after weeks or months—and to spread easily through the air or by casual contact would be vastly more devastating than HIV. It could silently penetrate the population to unleash its deadly effects suddenly. This type of epidemic would be almost impossible to combat because most of the infections would occur before the epidemic became obvious. A technologically sophisticated terrorist group could develop such a virus and kill a large part of humanity with it. Indeed, terrorists may not have to develop it themselves:

some scientist may do so first and publish the details. Given the rate at which biologists are making discoveries about viruses and the immune system, at some point in the near future, someone may create **artificial pathogens** that **could drive the human race to extinction**. Indeed, a detailed species-elimination plan of this nature was openly proposed in a scientific journal. The ostensible purpose of that particular research was to suggest a way to extirpate the malaria mosquito, but similar techniques could be directed toward humans.¹⁶ When I've talked to molecular biologists about this method, they are quick to point out that it is slow and easily detectable and could be fought with biotech remedies. If you challenge them to come up with improvements to the suggested attack plan, however, they have plenty of ideas. Modern biotechnology will soon be capable, if it is not already, of bringing about the demise of the human race— or at least of killing a sufficient number of people to end high-tech civilization and set humanity back 1,000 years or more. That terrorist groups could achieve this level of technological sophistication may seem far-fetched, but keep in mind that it takes only a handful of individuals to accomplish these tasks. Never has lethal power of this potency been accessible to so few, so easily. Even more dramatically than nuclear proliferation, modern biological science has frighteningly undermined the correlation between the lethality of a weapon and its cost, a fundamentally stabilizing mechanism throughout history. Access to extremely lethal agents—lethal enough to exterminate *Homo sapiens*—will be available to anybody with a solid background in biology, terrorists included.

Clarke '13 (et al); This is the Final Report and Recommendations of The President's Review Group on Intelligence and Communications Technologies. President Obama ordered a blue-ribbon task force to review domestic surveillance. This report releases the findings of that group. The report was headed by five experts – including Richard Alan Clarke, who is the former National Coordinator for Security, Infrastructure Protection, and Counter-terrorism for the United States. Other expert contributors include Michael Joseph Morell, who was the deputy director of the Central Intelligence Agency and served as acting director twice in 2011 and from 2012 to 2013 and Cass Robert Sunstein, who was the Administrator of the White House Office of Information and Regulatory Affairs in the Obama administration and is currently a Professor of Law at Harvard Law School. "LIBERTY AND SECURITY IN A CHANGING WORLD" – December 12th, 2013 – Easily obtained via a google search.

The **government should base its decisions on** a careful **analysis of consequences, including both benefits and costs** (to the extent feasible). In many areas of policy, public officials are increasingly insistent on the need for careful analysis of the consequences of their decisions and on the importance of relying not on intuitions and anecdotes, but on evidence and data, including benefits and costs (to the extent feasible). In the context of government regulation, President Ronald Reagan established a national commitment to careful analysis of regulations in his Executive Order 12291, issued in 1981. In 2011, President Barack Obama issued Executive Order 13563, which renewed and deepened the commitment to quantitative, evidence-based analysis, and added a number of additional requirements to improve regulatory review, directing agencies "to use the best available techniques to quantify anticipated present and future benefits and costs as accurately as possible" in order to achieve regulatory ends. A central component of Executive Order 13563 involves "retrospective analysis," meant to ensure not merely prospective analysis of (anticipated) costs and benefits, but also continuing efforts to explore what policies have actually achieved, or failed to achieve, in the real world. In our view, both prospective and retrospective analyses have important roles to play in the domain under discussion, though they also present distinctive challenges, above all because of limits in available knowledge and challenges in quantifying certain variables. Before they are undertaken, **surveillance decisions should depend** (to the extent feasible) **on** a careful **assessment of the anticipated consequences**, including the full range of relevant risks. Such decisions should also be subject to continuing scrutiny, including retrospective analysis, to ensure that any errors are corrected. As we have seen, there is always a possibility that acquisition of more information—whether in the US or abroad—might ultimately prove helpful. But that abstract possibility does not, by itself, provide a sufficient justification for acquiring more information. Because risk management is inevitably involved, the question is one of benefits and costs, which requires careful attention to the range of possible outcomes and also to the likelihood that they will

actually occur. To the extent feasible, such attention must be based on the available evidence. Where evidence is unavailable, public officials must acknowledge the limits of what they know. In some cases, public officials are reasonably attempting to reduce risks that are not subject to specification or quantification in advance. In such cases, experience may turn out to be the best teacher; it may show that programs are not working well, and that the benefits and costs are different from what was anticipated. Continued learning and constant scrutiny, with close reference to the consequences, is necessary to safeguard both national security and personal privacy, and to ensure proper management of the full range of risks that are involved. Finally, in constructing oversight and monitoring of intelligence agencies and particularly of surveillance, the US Government must take care to address perceptions of potential abuse, as well as any realities. To maintain and enhance the required level of public trust, especially careful oversight is advisable. For reasons that we have outlined, it is always challenging to strike the right balance between the often competing values of national security and individual liberty, but as history teaches, it is particularly difficult to reconcile these values in times of real or perceived national crisis. Human nature being what it is, there is inevitably a risk of overreaction when we act out of fear. At such moments, those charged with the responsibility for keeping our nation safe, supported by an anxious public, have too often gone beyond programs and policies that were in fact necessary and appropriate to protect the nation and taken steps that unnecessarily and sometimes dangerously jeopardized individual freedom. This phenomenon is evident throughout American history. Too often, we have overreacted in periods of national crisis and then later, with the benefit of hindsight, recognized our failures, reevaluated our judgments, and attempted to correct our policies going forward. We must learn the lessons of history. As early as 1798, Congress enacted the Sedition Act, now widely regarded as a violation of the most fundamental principles of freedom of expression. Nor is the historical verdict kind to a wide range of liberty restricting measures undertaken in other periods of great national anxiety, including the repeated suspensions of the writ of habeas corpus during the Civil War, the suppression of dissent during World War I, the internment of Japanese-Americans during World War II, the campaign to expose and harass persons suspected of “disloyalty” during the McCarthy era, and the widespread and unlawful spying on critics of the government’s policies during the Vietnam War. It is true that when the nation is at risk, or engaged in some kind of military conflict, the argument for new restrictions may seem, and even be, plausible. Serious threats may tip preexisting balances. But it is also true that in such periods, there is a temptation to ignore the fact that risks are on all sides of the equation, and to compromise liberty at the expense of security. One of our central goals in this Report is to provide secure foundations for future decisions, when public fears may heighten those dangers. With respect to surveillance in particular, the nation’s history is lengthy and elaborate, but the issues in the modern era can be traced back directly to the Vietnam War. Presidents Lyndon Johnson and Richard Nixon encouraged government intelligence agencies to investigate alleged “subversives” in the antiwar movement. The Federal Bureau of Investigation (FBI) engaged in extensive infiltration and electronic surveillance of individuals and organizations opposed to the war; the Central Intelligence Agency (CIA) monitored a broad array of antiwar organizations and activities, accumulating information on more than 300,000 people; and Army intelligence initiated its own domestic spying operation, gathering information on more than 100,000 opponents of the Vietnam War, including Members of Congress, civil rights leaders, and journalists. The

government sought not only to investigate its critics on a massive scale, but also to expose, disrupt, and neutralize their efforts to affect public opinion.

National Security interests outweigh the Aff's privacy concerns.

Branda '14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. “Amici” means “friend of the court” and – in this context - is legal reference to the Reporters Committee – October 2nd - <https://www.eff.org/document/governments-smith-answering-brief>)

In light of the imperative national-security interests the program serves and the numerous privacy protections that the statute and the Foreign Intelligence Surveillance Court require the government to observe, the program is reasonable under the Fourth Amendment. See U.S. Const. amend. IV. That reasonableness standard requires balancing “the promotion of legitimate governmental interests against the degree to which [any search] intrudes upon an individual’s privacy.” Maryland v. King, 133 S. Ct. 1958, 1970 (2013) (citation and internal quotation marks omitted). The interest in preventing terrorist attacks by identifying and tracking terrorist operatives is a national security concern of compelling importance. See Haig v. Agee, 453 U.S. 280, 307 (1981) (“no governmental interest is more compelling” than national security); In re Directives, 551 F.3d 1004, 1012 (FISC-R 2008) (“the relevant governmental interest—the interest in national security—is of the highest order of magnitude”). The Section 215 bulk telephony metadata program enhances the government’s ability to uncover and monitor known and unknown terrorist operatives who could otherwise elude detection, and has meaningfully contributed to counterterrorism investigations. SER 20-26, ER 74-76. Any Fourth Amendment privacy interest implicated by the Section 215 program, in contrast, is minimal. The governing Foreign Intelligence Surveillance Court orders strictly limit review and analysis of the metadata, and there is no nonspeculative basis to believe that any information concerning plaintiff’s calls—or those of the vast bulk of other telephone subscribers—has been or will ever be seen by any person. See King, 133 S. Ct. at 1979-80 (finding no Fourth Amendment violation where safeguards limiting DNA analysis to identification information alone reduced any intrusion into privacy); Bd. of Educ. v. Earls, 536 U.S. 822, 833-34 (2002) (no Fourth Amendment violation where restrictions on access to drug testing results lessened intrusion on privacy); Vernonia Sch. Dist., 515 U.S. at 658 (no Fourth Amendment violation where student athletes’ urine was tested for illegal drugs and not for any medical condition); Sitz, 496 U.S. at 450-51 (no Fourth Amendment violation where safety interests served by drunk-driving checkpoints outweighed motorists’ interests in driving without being stopped). The government obtains telephony metadata in bulk to preserve the information for future analysis based on a reasonable, articulable suspicion; the information is then only accessed as part of the highly restricted querying process, which requires judicial approval.

Terrorism risk outweighs the specific privacy interest at hand

Branda '14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. “Amici”

means “friend of the court” and – in this context - is legal reference to the Reporters Committee – October 2nd - <https://www.eff.org/document/governments-smith-answering-brief>)

There is no basis for plaintiff’s request for the extraordinary remedy of preliminary injunctive relief. The Section 215 telephony metadata program serves important national security interests, and courts are rightly sensitive to the risks of handcuffing the government’s efforts to prevent harm to the Nation. Plaintiff claims to suffer irreparable harm from this anti-terrorism program, but waited six months after filing her complaint before seeking preliminary relief. Plaintiff has at most a minimal privacy interest in having metadata about her calls removed from the Section 215 database, one that is outweighed by the public interest in maintaining the program’s important capabilities in combating the continuing terrorist threat.

Neg’s terror disad on-point outweighs privacy advantage.

Branda ‘14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. “Amici” means “friend of the court” and – in this context - is legal reference to the Reporters Committee – October 2nd - <https://www.eff.org/document/governments-smith-answering-brief>)

The balance of equities and the public interest also tip markedly in the government’s favor. Any privacy interest plaintiff has at stake here is surely minimal, particularly given the remote likelihood that metadata pertaining to her calls would ever be reviewed by a human analyst. On the other side of the ledger, the government has a substantial interest in continuing the Section 215 program, a valuable program in the government’s antiterrorism arsenal, for reasons already explained.

Security interests of this program outweigh privacy concerns.

Branda ‘14

(et al; JOYCE R. BRANDA, Acting Assistant Attorney General, BRIEF FOR THE APPELLEES - Amicus Brief for Smith v. Obama – before the United States Ninth Circuit Court of Appeals. “Amici” means “friend of the court” and – in this context - is legal reference to the Reporters Committee – October 2nd - <https://www.eff.org/document/governments-smith-answering-brief>)

Even if obtaining bulk telephony metadata from the business records of telecommunications companies were a Fourth Amendment “search,” it would nevertheless be constitutionally permissible. The Fourth Amendment bars only unreasonable searches and seizures, and the Section 215 telephony-metadata program is reasonable under the standard applicable to searches that serve “special needs” of the government. See, e.g., *Vernonia Sch. Dist. 47J v. Acton*, 515 U.S. 646, 653 (1995). The national security and safety interests served by the Section 215 program are special needs of the utmost importance that go beyond ordinary law

enforcement needs. See Nat'l Treasury Emps. Union v. Von Raab, 489 U.S. 656, 674 (1989) (noting "national security" interest in deterring drug use among Customs Service employees); United States v. U.S. Dist. Court (Keith), 407 U.S. 297, 322-23 (1972); Cassidy v. Chertoff, 471 F.3d 67, 82 (2d Cir. 2006); MacWade v. Kelly, 460 F.3d 260, 270-71 (2d Cir. 2006) (citing Sitz, 496 U.S. at 444). Plaintiff agrees that **the special-needs doctrine** applies where compliance with "the warrant and probable-cause requirements" is "impracticable." Pl. Br. 29. That standard **governs here because**, as the government has shown and the Foreign Intelligence Surveillance Court has repeatedly concluded, **the Section 215 bulk telephony-metadata program provides an efficient means to identify otherwise-unknown associations** (within one or two steps of contact) with telephone numbers and other selectors **that are reasonably suspected of being used by terrorist organizations.** The bulk collection of metadata allows the government to identify connections using retrospective analysis of calls that occurred before the relevant terrorist connection became known. The Foreign Intelligence Surveillance Court orders authorizing the Section 215 bulk telephony-metadata program permit the government to retain a historical repository of up to five years' worth of telephony metadata, cutting across multiple providers, for intelligence analysis purposes that could not be accomplished as effectively, if at all, with more targeted investigative tools, such as probable-cause warrants. SER 20-26, ER 74-76. Under current law, "serving the phone companies with demands for records relating to particular terrorism suspects," Pl. Br. 34, does not allow the historical analysis conducted under the Section 215 program to occur as effectively. SER 25.

race

Terror attack spikes racial hate crimes

Akram '2

Et al - SUSAN MUSARRAT AKRAM, Professor and Supervising Attorney - Boston University International Human Rights Clinical Program. She holds a JD from The Georgetown University Law Center. Was formerly a Visiting Professor at AL-QUDS UNIVERSITY, PALESTINE SCHOOL OF LAW. Her research and publications focus on immigration, asylum, refugee and human and civil rights. "Race, Civil Rights, and Immigration Law after September 11, 2001: The Targeting of Arabs and Muslims." NYU Annual Survey of American Law 58 (2002), 295-355.
<http://www.privacysos.org/sites/all/files/akram.pdf>

Times of crisis are often accompanied by hostility toward minorities in the United States. For Arabs and Muslims, this may be even more problematic, as perpetrators of hate crimes against Arabs and Muslims frequently fail to differentiate among persons based on religion or ethnic origin, from Pakistanis, Indians, Iranians, and Japanese to Muslims, Sikhs and Christian Arabs.⁸⁹ The widespread perception in the United States is that Arabs and Muslims are identical and eager to wage a holy war against the United States.⁹⁰ In fact, according to a 1993 report, only 12% of the Muslims in the United States at that time were Arab,⁹¹ and Arab Muslims are even a minority in the Arab-American community.⁹² Although there are Muslim "extremists," the majority of Muslims are "decent, law-abiding, productive citizens."⁹³ Because of the lack of differentiation between different types of Arabs and Muslims, terrorist acts by small groups of Arabs and Muslims often have been followed by generalized hostility toward entire communities of Arabs and Muslims in the United States. For example, after Lebanese Shi'a gunmen in 1985 hijacked TWA Flight 847 to Beirut, beat an American on the plane to death, and held the remaining passengers hostage for over two weeks,⁹⁴ violent attacks against persons of Arab and Muslim origin occurred across the United States.⁹⁵ Islamic centers and Arab-American organizations were vandalized and threatened. A Houston mosque was firebombed. A bomb exploded in the American-Arab Anti-Discrimination Committee office in Boston, severely injuring two policemen. ⁹⁶ Later that same year, after terrorists hijacked the Achille Lauro cruise liner and murdered a passenger, a wave of anti-Arab violence swept the country, including the bombing of an American-Arab Anti-Discrimination Committee office that killed its regional executive director.⁹⁷

empirics prove

King, 12

(Ryan D. King is an associate professor of sociology at the State University of New York at Albany in the United States. His research focuses on extremist violence and hate crime in the United States and Europe, "Terrorist Attacks and Hate Crimes: Lessons from 9/11", <http://extremisproject.org/2012/12/terrorist-attacks-and-hate-crimes-lessons-from-911/>, December 10, 2012, ak.)

On September 15th, 2001, Balbir Singh Sodhi walked out of the Chevron station he owned in Mesa, Arizona, to arrange a flowerbed outside the store. Seconds later, a pickup truck pulled into the gas station, stopped briefly, and the driver fired several shots from a .38 handgun.

Sodhi, a Sikh immigrant from India and the father of two daughters, was shot five times and lay dead in front of his store, the victim of the first, but not the last, fatal hate crime following the terrorist attacks of September 11th. Sodhi's assailant, Frank Roque, subsequently fired on two other persons that day who appeared in his eyes to be Arab or Muslim. When apprehended, Roque stated he was "a patriot" and "stood for America all the way." Much scholarly attention has been directed towards the terrorist attacks of 9/11 in the United States, and rightly so. It's imperative that we learn what warning signs were missed and what security measures were inadequate. Yet there is also a story to be told about the aftermath, and **among the lessons we learned from 9/11 is that a backlash in the form of hate crime is likely to follow.** The murder of Balbir Sodhi was one of many hate crimes perpetrated **against Muslims and Arabs, or those who appeared to be of that faith or ethnicity,** beginning on September 11th, 2001. According to hate crime statistics provided by the FBI, there were over 1,000 hate crimes with an anti-Muslim or anti-Arab motive during the fourteen-day period beginning on September 11th.* By comparison, fewer than 300 hate crimes with this motivation were reported to the FBI between January 1st and September 10th of that year. If we focus only on anti-Islamic hate crimes (omitting anti-Arab), 60% of the hate crimes that year occurred during that two-week stretch. **The post-9/11 hate crime wave was fueled largely by the emotion of anger and the desire for retribution** that pervaded the United States, a fact that should not surprise us. **The 20th century is replete with examples of mass violence against minority groups that were ignited by terrorist attacks** or assassinations. For instance, the Kristallnacht pogrom that took the lives of many German Jews in November of 1938 followed the assassination of a German diplomat at the hands of a Jewish youth. The psychologist Brian Lickel and his colleagues refer to this tendency as **'vicarious retribution'** – a **proclivity to punish innocent third parties who in some way resemble the perpetrators of an attack** – and **this sentiment is often found in the wake of terrorist acts.** When my colleagues, Ilir Disha (University at Albany and lead author of the study) and James Cavendish (University of South Florida), and I wrote about post-9/11 hate crimes in the United States in the journal *Social Problems*, we focused on the broader lessons to be learned from the 9/11 case. Our study looked at the pre and post-9/11 hate crimes in detail, breaking down crimes by day and type to answer some fundamental questions. For instance, how long did the post-9/11 hate crime wave last? Were hate crimes more likely to be perpetrated in New York and Washington than places not directly targeted by the terrorists? Were these crimes perpetrated by organized groups? And what, if anything, might be done to stymie hate crime waves in the future? Our results suggest a few patterns. Hate crime waves following terrorist attacks are intense but short in duration. With respect to the first issue – the duration of the hate crime wave – our analysis shows that post 9/11 hate crimes took the form of a peak more than a plateau (see Figure below). The crime wave began abruptly on September 11th and reached its highpoint within 48 hours, and the subsequent decline was nearly as rapid. In short, we can expect hate crime waves following terrorist attacks by foreign groups to be immediate and intense, but ultimately short in duration. There is some evidence that hate crime levels never fully returned to pre-9/11 averages, but clearly the initial wave quickly subsided. Attacks are geographically dispersed and victimization risk is associated with target population size. We also find that hate crimes increased across the country. That Balbir Sodhi was murdered thousands of miles from the site of the attacks is not anomalous. Anti-Muslim hate crimes increased in Mesa as well as New York; in Chicago as much as in Washington. Among the few

demographic characteristics that help sort out where Arabs and Muslims were at higher risk are the size of these respective populations. Intuitively, the raw number of hate crimes was more likely in counties with larger Arab and Muslim populations, largely because of opportunity; more targets equate to more crimes. Yet if we look at the rate of hate crimes per Arab or Muslim population, our analysis suggests that individual Arabs and Muslims were at higher risk of victimization where they were small in number. Counties with large Arab populations, such as Wayne County in Michigan (largest city is Detroit) experienced more hate crimes than other large counties, but when standardizing this number by the Arab population the rate was far smaller than other counties. From the victim's perspective we might say there is safety in numbers. Evidence suggests hate crimes were rarely the work of organized hate groups. Finally, there is no evidence that a sizeable proportion of hate crime was perpetrated by organized hate groups. According to the Southern Poverty Law Center, an organization that tracks extremist groups, the number of anti-Muslim hate groups increased after the attacks of 2001, yet the FBI data and media reports of hate crimes indicate that people like Frank Roque were the more common perpetrator – angry men with a grievance, but not actively involved with an extremist organization. Two additional points are pertinent to the aftermath of mass terrorism, particularly as it relates to hate crime. First, is the post 9/11 hate crime wave unique? Or should we expect a similar backlash in other settings? In my assessment 9/11 is unique only in its magnitude. We saw a smaller but hardly negligible increase in hate crimes against Muslims following the Oklahoma City Bombing in 1995, for which responsibility was initially attributed to Islamic fundamentalists (it was soon revealed that an American, Timothy McVeigh, was responsible, and the anti-Muslim attacks ceased). As the economist Steven Machin has found in his research, attacks against Muslims also rose sharply following the bombing of the London Underground in July of 2005. A violent wave of anti-Islamic attacks also followed a deadly attack on a train in India in February of 2002. A backlash seems predictable, particularly following lethal attacks in which responsibility is attributed to a specific minority group. Finally, can anything be done to prevent hate crimes against innocent civilians if another terrorist attack occurs? My guess is there is little that local or federal governments could have done to prevent the murder of Mr. Sodhi. However, if the goal is to minimize the intensity of attacks on innocent third parties following a terrorist act, two actions are worth trying. The first is simply disseminating information to at-risk populations. Arabs and Muslims (and Sikhs as well) should take extra precautions during the week following a terrorist attack in which Islamist fundamentalists are suspects. They are clearly at a higher risk of victimization during the week or two after an attack such as 9/11 or July 7. A second action calls on leaders to confront the issue early and publicly. About a week following the 9/11 attacks President Bush gave a speech stating that the true faith of Islam was not about terrorism, and that Muslim Americans should be treated with respect. Whether this speech truly had an effect is beyond the scope of this blog (although hate crimes decreased after the speech), but setting the tone at the top is among the few weapons in the government's arsenal. Our first hope is that terrorism does not occur. But if it does, the lessons of 9/11 suggest that the potential for reactionary crime and violence is high, and we should plan accordingly.

torture

In the aftermath of a terror attack, the government uses torture to deal with the threat

Conrad et al, 14

(Courtenay R. Conrad Associate Professor of Political Science at the University of California, Merced, Justin Conrad is an assistant professor in the Department of Political Science and Public Administration at the University of North Carolina at Charlotte, James, Associate Professor (with tenure), Department of Political Science, The Pennsylvania State University, "Who Tortures the Terrorists? Transnational Terrorism and Military Torture", <http://onlinelibrary.wiley.com/doi/10.1111/fpa.12066/full>, October, 13, 2014, ak.)

Terrorist attacks can have far-reaching, long-term consequences.² Successful attacks directly and indirectly harm the target state's economy (Enders and Sandler 2006), especially as attacks often occur within the context of larger, more costly civil conflicts (Findley and Young 2011). Terrorist attacks can also lead to loss of support for incumbent leaders and influence voting patterns in democracies (Berrebi and Klor 2008). These negative consequences **create strong pressures** for governments **to prevent attacks** and minimize their repercussions when they do occur, and we argue that **such pressures might lead governments to engage in higher levels of torture and physical abuse**. First, although there is popular debate about the quality of intelligence produced when detainees are questioned under physical duress,³ government officials may torture terrorist suspects to generate information about future attacks (e.g., Dershowitz 2002; Ignatieff 2004). For example, Bush administration official Mark **Thiessen** **argues that the "enhanced interrogations" of Khalid Sheik Mohammed yielded intelligence that foiled terrorist plans** to fly an aircraft into a California skyscraper: "Without enhanced interrogations, there could be a hole in the ground in Los Angeles to match the one in New York" (Thiessen 2009). Second, torture may deter future terrorist activities. Potential terrorists may be dissuaded from engaging in attacks against states that respond to terrorism with human rights violations and other forms of indiscriminate violence (Lyal 2009).⁴ We discuss each of these mechanisms in turn.⁵ Torture and Intelligence Governments often lack reliable information about terrorist groups and their activities. This is by design on the part of the terrorists themselves. Organizations that engage in transnational and domestic terrorism do so most often because they are weak, lacking the capabilities to engage in conventional military strategies, and because they lack popular support for their goals to engage in political mobilization (Crenshaw 1998; Lake 2002; Kydd and Walter 2006). Because of their relative weakness compared with the states they target, it is crucial for terrorists to keep their organization and activities clandestine, to misrepresent their capabilities and resolve (Lake 2002) and to keep secret the geographic location of their operations. Although some states have successfully negotiated with terrorists (e.g., Jones and Libicki 2008), the increased probability of bargaining failures and the higher risks of defection by terrorist actors make such negotiations fraught with difficulty, even if the state is willing to offer concessions.⁶ States therefore frequently seek to deal with terrorism by eliminating groups and their members through policing and military action. Due to the clandestine and opaque nature of terrorism and terrorist threats, a critical barrier to effective counterterrorism policy is a lack of intelligence about the

details of terrorist organizations themselves and their plans for future terrorist attacks. During the height of the Iraq War, US government sources frequently cited lack of information about terrorist groups as a key reason for the persistence of the terrorist threat. As an example of the staggering dynamism and complexity of terrorist movements in that conflict, one journalist compiled a list of 103 groups claiming responsibility for attacks on Americans and Iraqis during a 6-month period in 2005 (Filkins 2008). As authorities become better able to gather intelligence on terrorist threats, the likelihood of successful deterrence, defence, and bargaining increases. Consequently, the occurrence of terrorist attacks is lower when states have accurate information about the capabilities and intentions of terrorist organizations that facilitates better counterterrorism efforts. Because intelligence collection is necessary for preventing terrorist attacks, governments faced with terrorist threats are incentivized to use whatever intelligence gathering techniques are available to generate counterterrorism information, including the use of physical abuse and torture of suspects and detainees. State officials have long engaged in torture both to establish the credibility of witness testimony and to aid in the determination of guilt or innocence (Rejali 2007). Proponents have argued that torture of suspected terrorists and their supporters can provide actionable intelligence (Johnson and Ryan 2012), increasing the state's ability to foil future attacks, identify members and/or destroy terrorist group cells. State agents are especially likely to engage in torture when they believe that it will generate information to eliminate a potential threat (Wantchekon and Healy 1999) and/or prevent a future attack.⁷ Increased intelligence is also important if the state wishes to respond to terrorism with more targeted violence. Indiscriminate repression, which is directed at the general population rather than specifically at members of terrorist and dissident groups, is unlikely to control dissent (e.g., Kalyvas and Kocher 2007; Kocher, Pepinsky, and Kalyvas 2011), eliminate insurgency (e.g., Findley and Young 2007, Sullivan 2011), or reduce terrorist attacks (e.g., Walsh and Piazza 2010; Dugan and Chenoweth 2012). Torture offers a focused method of gathering information about dissident activities, which increases the likelihood that state violence is targeted at insurgents and terrorists rather than at the population more generally. Torture and Deterrence Second, supporters of torture frequently claim it has a deterrent effect on terrorism. Torture—more broadly and indiscriminately applied—may be used to punish individual terrorists or as part of a strategy to intimidate and deter members and supporters of the terrorist organization. Physical punishment as a means of deterrence is a centuries-old legal and philosophical concept viewed as a legitimate function of sovereign governments (e.g., Hobbes 1651; Locke 1689). Sullivan (2011:6) argues that one of the “desired results” of torture is to, “create a link between disobedient behavior and pain, thereby reinforcing legal norms by associating transgression with negative sanctions.” As with punishment for criminal offenses, individuals may refrain from participating in or supporting terrorism if authorities have a reputation for torturing suspected terrorists and sympathizers. The French Army, for instance, randomly tortured Algerian citizens during the Algerian War in the 1960s (DiMarco 2006), suggesting that torture was used as a punitive and deterrent tool to prevent additional terrorist attacks.⁸ Supporters of this tactic argue that using torture to encourage fear (Walter 1969, Wantchekon and Healy 2005) among terrorist sympathizers and within the general populace can potentially stem the future growth of terrorist organizations.

Especially true with the increased risk of terrorism

(Courtenay R. Conrad Associate Professor of Political Science at the University of California, Merced, Justin Conrad is an assistant professor in the Department of Political Science and Public Administration at the University of North Carolina at Charlotte, James, Associate Professor (with tenure), Department of Political Science, The Pennsylvania State University, "When do countries respond to terrorism with torture?", <http://www.washingtonpost.com/blogs/monkey-cage/wp/2015/01/13/understanding-when-states-rarely-respond-to-terrorism-with-torture/>, January 13, 2015, ak.)

Militaries have historically devoted most of their attention to planning for war, not counterterrorism. Torture is a practice that they can implement quickly and (seemingly) cheaply to gain intelligence about terrorist threats, making it a tempting solution to a novel policy challenge. Police and prison officials, in contrast, are less likely to view responding to transnational threats as central to their organizational missions, and thus do not respond by increasing the degree to which they torture. We assess this argument with data from the Ill-Treatment and Torture Data Collection Project, which disaggregates the agencies engaging in torture for countries around the world from 1995 through 2005. Figure 1 illustrates this relationship by depicting the predicted probability that a country's military will engage in greater degrees of torture. The likelihood of widespread, systemic torture by military forces increases sharply with the number of transnational terrorist attacks, while the chance that the military will refrain from torturing declines. We further find that this response is most likely in established democracies. At first glance, this claim is surprising because democracies are less likely to engage in abuses of human rights, are more likely to cease torturing and long-established and stable democracies are the least likely to torture. Yet most democracies engage in torture, suggesting that they see utility in the practice or at least view the costs of stopping torture as unacceptably high. The value of torture for democratic states increases during periods of foreign threat, including as that posed by transnational terrorists. Democracies have long responded to external threats by increasing repression at home. Citizens are less likely to object to the torture of suspected terrorists who are members of "out-groups," including foreign nationals, and their preferences carry greater weight in democratic regimes.

Public opinion condones detention and enhanced interrogation against Muslims

Piazza, 14

(James, Associate Professor (with tenure), Department of Political Science, The Pennsylvania State University, Ph.D. Politics (Comparative Politics and International Relations), New York University, 1999 M.A. Middle East Studies, University of Michigan, 1994 B.A. Political Science, Loyola University Chicago, 1992, "Terrorist Suspect Religious Identity and Public Support for Harsh Interrogation and Detention Practices", <http://onlinelibrary.wiley.com/doi/10.1111/pops.12190/full>, April 1, 2014, ak.)

The study, therefore, finds some evidence that the religious identity of terrorism suspects is an important factor in the American public's approval of the use of some of the new, harsh counterterrorism techniques adopted after the 9/11 terrorist attacks. The religious identity of a

terror suspect—measured in terms of stereotypical Muslim versus Anglo names and in terms of alleged membership in a radical Muslim versus domestic, right-wing terrorist organization—significantly affects respondent support for the application of harsh detention practices against suspects, such as detention without charge, without access to an attorney, and without access to civilian courts. No significant effects were found for subjecting suspects to harsh interrogation. These findings illustrate the utility of the outgroup-hate and ingroup-love theoretical model of individual reaction to perception of threat and desire to apply punitive measures to outgroup transgressors to understanding public opinion regarding a highly salient contemporary policy issue in the United States: detention of terror suspects. This same theoretical model might apply to other War on Terror policy issues such as the use of drones for security, NSA surveillance, or the creation of new counterterrorism laws or granting of new counterterror powers to law enforcement. Future studies could test whether or not public support for these is contingent on the religious identity of the targeted population. As previously stated, the purpose of surveying respondent support for both harsh interrogation and detention practices was to use the fullest possible complement of post-9/11 counterterrorism practices against terror suspects in measuring the public's attitudes. The a priori theoretical expectation was that the American public was more permissive of harsh treatment in general of Muslim-identified suspects. The hypotheses of the study, supported by existing theoretical work, are not clearly specified in terms of specific counterterrorism practices. However, there are a couple of possible explanations for the different findings for interrogation and detention in this study and some ideas that future research could investigate. First, the interrogation activities portrayed in the survey, such as waterboarding, have received significantly more media attention than have the more abstract and legalistic practices depicted in the detention questions. The subject of physical abuse of people detained for terrorism charges—brought to public attention through public debate over abuse scandals at Guantanamo Bay, Baghram Air Force Base in Afghanistan, and Abu Ghraib prison in Iraq—also was hotly debated in national politics, prompting public condemnation by national figures such as U.S. Senator John McCain, a Congressional legislative action to ban various torture practices in 2005 through the Detainee Treatment Act, and a veto of this act by President Bush. (Jansen, 2008). In contrast, there has been little contentious public debate about extraordinary detention of detainees. The result has been that the American public has access to a clearly articulated criticism of extraordinary interrogation and vivid images of the outcome of such interrogation practices on actual Muslims but little information at all about extraordinary detention. This asymmetry might condition respondent attitudes, making them discount the negative impact of detention on Muslim suspects and therefore more tolerant of such practices. Future research might directly test this by interacting measures of respondent familiarity with or exposure to news stories about interrogation versus detention practices with support for subjecting Muslim suspects to these practices. Second, most of the activities depicted in the 10 questions about interrogation of terror suspects have since 2009 been made illegal via President Obama's Executive Order requiring interrogation and treatment of terror suspects, held both abroad and within the United States, to conform to the U.S. Army Field Manual on Interrogations (White House, 2009). In contrast, the detention practices depicted in the survey remain legal, having been interpreted as legally valid by both the Bush and Obama Justice Departments (White House, 2001). This may also condition respondent attitudes, as respondents might regard

application of extraordinary interrogation, regardless of suspect identity, to be a legally questionable tactic while extraordinary detention, particularly against suspects depicted as “foreign,” is not freighted with such concerns. These are only speculations. Future research may survey respondents about their level of awareness of post-9/11 interrogation and detention techniques in order to determine why the public has different levels of toleration for these two practices. As a final discussion point, it should be noted that although the results provide evidence that both the personal religious identity and the group affiliation of the suspects are significant predictors of respondent tolerance of extreme detention, the Muslim name treatment is more frequently significant in the tests of respondent support for specific types of detention. This is a finding that could be further explored in future studies. If it were to be consistently reproduced, it might suggest that individual religious identity itself primes tolerance for harsh treatment, which would be more consistent with the identity-based theories that motivate the article.

Conclusion The finding that the American public is more tolerant of subjecting individuals suspected of terrorist activity to extreme detection if the suspects are Muslim or are claimed to be members of a Muslim extremist group—if valid—has several public policy implications, potentially identifying a loophole in popular democratic constraint of executive branch counterterrorism behavior. Counterterrorism officials may recognize that currently the public is generally hesitant about authorizing enhanced interrogation and detention techniques in the War on Terror but may bank on greater public leniency in dealing with some types of terror suspects. This opens the possibility of a nuanced and gradual erosion of standards for civil liberties and human rights standards in the United States, with less risk of the type of public backlash that a general, nondiscriminatory policy of terror suspect abuse might provoke.

Xenophobia

Attacks create unwarranted profiling of Muslim Americans.

Shamsi & Harwood 14 – Hina Shamsi, director of the ACLU's National Security Project, and Matthew Harwood, ACLU's senior writer/editor, 2014 ("How Surveillance Turns Ordinary People Into Terrorism Suspects," Mother Jones, Nov. 6th, Accessed 6/16/15, J.L.)

The SAR database is part of an ever-expanding domestic surveillance system established after 9/11 to gather intelligence on potential terrorism threats. At an abstract level, such a system may seem sensible: far better to prevent terrorism before it happens than to investigate and prosecute after a tragedy. Based on that reasoning, the government exhorts Americans to "see something, say something"—the SAR program's slogan. Indeed, just this week at a conference in New York City, FBI Director James Comey asked the public to report any suspicions they have to authorities. "When the hair on the back of your neck stands, listen to that instinct and just tell somebody," said Comey. And seeking to reassure those who do not want to get their fellow Americans in trouble based on instinct alone, the FBI director added, "We investigate in secret for a very good reason, we don't want to smear innocent people." There are any number of problems with this approach, starting with its premise. Predicting who exactly is a future threat before a person has done anything wrong is a perilous undertaking. That's especially the case if the public is encouraged to report suspicions of neighbors, colleagues, and community members based on a "hair-on-the-back-of-your-neck" threshold. Nor is it any comfort that the FBI promises to protect the innocent by investigating "suspicious" people in secret. The civil liberties and privacy implications are, in fact, truly hair-raising, particularly when the Bureau engages in abusive and discriminatory sting operations and other rights violations. At a fundamental level, suspicious activity reporting, as well as the digital and physical infrastructure of networked computer servers and fusion centers built around it, depends on what the government defines as suspicious. As it happens, this turns out to include innocuous, First Amendment-protected behavior. As a start, a little history: the Nationwide Suspicious Activity Reporting Initiative was established in 2008 as a way for federal agencies, law enforcement, and the public to report and share potential terrorism-related information. The federal government then developed a list of 16 behaviors that it considered "reasonably indicative of criminal activity associated with terrorism." Nine of those 16 behaviors, as the government acknowledges, could have nothing to do with criminal activity and are constitutionally protected, including snapping photographs, taking notes, and "observation through binoculars." Under federal regulations, the government can only collect and maintain criminal intelligence information on an individual if there is a "reasonable suspicion" that he or she is "involved in criminal conduct or activity and the information is relevant to that criminal conduct or activity." The SAR program officially lowered that bar significantly, violating the federal government's own guidelines for maintaining a "criminal intelligence system." There's good reason for, at a minimum, using a reasonable suspicion standard. Anything less and it's garbage in, garbage out, meaning counterterrorism "intelligence" databases become anything but intelligent. When the Mundane Looks Suspicious The SAR program provides striking evidence of this. In 2013, the ACLU of Northern California obtained nearly 2,000 SARs from two state fusion centers, which collect, store, and analyze such reports, and then share those their intelligence analysts find worthwhile across what the federal government calls its Information Sharing Environment. This connects the fusion centers and

other federal agencies into an information-sharing network, or directly with the FBI. Their contents proved revealing. A number of reports were concerned with "ME"—Middle Eastern—males. One headline proclaimed, "Suspicious ME Males Buy Several Large Pallets of Water at REDACTED." Another read, "Suspicious Activities by a ME Male in Lodi, CA." And just what was so suspicious about this male? Read into the document and you discover that a sergeant at the Elk Grove Police Department had long been "concerned about a residence in his neighborhood occupied by a Middle Eastern male adult physician who is very unfriendly." And it's not just "Middle Eastern males" who provoke such suspicion. Get involved in a civil rights protest against the police and California law enforcement might report you, too. A June 2012 SAR was headlined "Demonstration Against Law Enforcement Use of Excessive Force" and reported that "a scheduled protest" by demonstrators "concerned about the use of excessive force by law enforcement officers" was about to occur. What we have here isn't just a failure to communicate genuine threat information, but the transformation of suspicion into pernicious ideological, racial, and religious profiling, often disproportionately targeting activists and American Muslims. Again, that's not surprising. Throughout our history, in times of real or perceived fear of amorphously defined threats, government suspicion focuses on those who dissent or look or act differently. Counterterrorism Accounting Law enforcement officials, including the Los Angeles Police Department's top counterterrorism officer, have themselves exhibited skepticism about suspicious activity reporting (out of concern with the possibility of overloading the system). In 2012, George Washington University's Homeland Security Policy Institute surveyed counterterrorism personnel working in fusion centers and in a report generally accepting of SARs noted that the program had "flooded fusion centers, law enforcement, and other security outfits with white noise," complicating "the intelligence process" and distorting "resource allocation and deployment decisions." In other words, it was wasting time and sending personnel off on wild goose chases. A few months later, a scathing report from the Senate subcommittee on homeland security described similar intelligence problems in state-based fusion centers. It found that Department of Homeland Security (DHS) personnel assigned to the centers "forwarded 'intelligence' of uneven quality—oftentimes shoddy, rarely timely, sometimes endangering citizens' civil liberties and Privacy Act protections... and more often than not unrelated to terrorism." Effectiveness doesn't exactly turn out to be one of the SAR program's strong suits, though the government has obscured this by citing the growing number of SARs that have triggered FBI investigations. However, according to a report from the Government Accountability Office (GAO), the FBI doesn't track whether SARs uploaded into the domestic intelligence network actually help thwart terrorism or lead to arrests or convictions. You are, of course, what you measure—in this case, not much; and yet, despite its dubious record, the SAR program is alive and kicking. According to the GAO, the number of reports in the system exploded by 750%, from 3,256 in January 2010 to 27,855 in October 2012. And being entered in such a system, as Wiley Gill found out, can prove just the beginning of your problems. Several months after his home was searched, his telephone rang. It was a Chico police officer who told Gill to shut down his Facebook page. Gill refused, responding that there was only one reason he thought the police wanted his account deleted: its references to Islam. The phone call ended ominously with the officer warning Gill that he was on a "watchlist." The officer may have been referring to yet another burgeoning secret database that the federal government calls its "consolidated terrorism watchlist." Inclusion in this database—

and on government blacklists that are generated from it—can bring more severe repercussions than unwarranted law enforcement attention. It can devastate lives.

Twenty-First-Century Blacklists

When small business owner Abe Mashal reached the ticket counter at Chicago's Midway Airport on April 20, 2010, an airline representative informed him that he was on the no-fly list and could not travel to Spokane, Washington, on business. Suddenly, the former Marine found himself surrounded by TSA agents and Chicago police. Later, FBI agents questioned him at the airport and at home about his Muslim faith and his family members. The humiliation and intimidation didn't end there. A few months later, FBI agents returned to interview Mashal, focusing again on his faith and family. Only this time they had an offer to make: if he became an FBI informant, his name would be deleted from the no-fly list and he would be paid for his services. Such manipulative quid pro quos have been made to others. Mashal refused. The meeting ended abruptly, and he wasn't able to fly for four years. As of August 2013, there were approximately 47,000 people, including 800 US citizens and legal permanent residents like Mashal, on that secretive no-fly list, all branded as "known or suspected terrorists." All were barred from flying to, from, or over the United States without ever being given a reason why. On 9/11, just 16 names had been on the predecessor "no transport" list. The resulting increase of 293,650%—perhaps more since 2013—isn't an accurate gauge of danger, especially given that names are added to the list based on vague, broad, and error-prone standards. The harm of being stigmatized as a suspected terrorist and barred from flying is further compounded when innocent people try to get their names removed from the list. In 2007, the Department of Homeland Security established the Traveler Redress Inquiry Program through which those who believe they are wrongly blacklisted can theoretically attempt to correct the government's error. But banned flyers quickly find themselves frustrated because they have to guess what evidence they must produce to refute the government's unrevealed basis for watchlisting them in the first place. Redress then becomes a grim bureaucratic wonderland. In response to queries, blacklisted people receive a letter from the DHS that gives no explanation for why they were not allowed to board a plane, no confirmation of whether they are actually on the no-fly list, and no certainty about whether they can fly in the future. In the end, the only recourse for such victims is to roll the dice by buying a ticket, going to the airport, and hoping for the best. Being unable to board a plane can have devastating consequences, as Abe Mashal can attest. He lost business opportunities and the ability to mark life's milestones with friends and family. There is hope, however. In August, four years after the ACLU filed a lawsuit on behalf of 13 people on the no-fly list, a judge ruled that the government's redress system is unconstitutional. In early October, the government notified Mashal and six others that they were no longer on the list. Six of the ACLU's clients remain unable to fly, but at least the government now has to disclose just why they have been put in that category, so that they can contest their blacklisting. Soon, others should have the same opportunity. Suspicion First, Innocence Later... Maybe The No Fly List is only the best known of the government's web of terrorism watchlists. Many more exist, derived from the same master list. Currently, there are more than one million names in the Terrorist Identities Datamart Environment, a database maintained by the National Counterterrorism Center. This classified source feeds the Terrorist Screening Database (TSDB), operated by the FBI's Terrorist Screening Center. The TSDB is an unclassified but still secret list known as the "master watchlist," containing what the government describes as "known or suspected terrorists," or KSTs. According to documents recently leaked to the Intercept, as of August 2013

that master watchlist contained 680,000 people, including 5,000 US citizens and legal permanent residents. The government can add people's names to it according to a shaky "reasonable suspicion" standard. There is, however, growing evidence that what's "reasonable" to the government may only remotely resemble what that word means in everyday usage. Information from a single source, even an uncorroborated Facebook post, can allow a government agent to watchlist an individual with virtually no outside scrutiny. Perhaps that's why 40% of those on the master watchlist have "no recognized terrorist group affiliation," according to the government's own records. Nothing encapsulates the post-9/11, Alice-in-Wonderland inversion of American notions of due process more strikingly than this "blacklist first, innocence later... maybe" mindset. The Terrorist Screening Database is then used to fill other lists. In the context of aviation, this means the no-fly list, as well as the selectee and expanded selectee lists. Transportation security agents subject travelers on the latter two lists to extra screenings, which can include prolonged and invasive interrogation and searches of laptops, phones, and other electronic devices. Around the border, there's the State Department's Consular Lookout and Support System, which it uses to flag people it thinks shouldn't get a visa, and the TECS System, which Customs and Border Protection uses to determine whether someone can enter the country. Inside the United States, no watchlist may be as consequential as the one that goes by the moniker of the Known or Appropriately Suspected Terrorist File. The names on this blacklist are shared with more than 17,000 state, local, and tribal police departments nationwide through the FBI's National Crime Information Center (NCIC). Unlike any other information disseminated through the NCIC, the KST File reflects mere suspicion of involvement with criminal activity, so law enforcement personnel across the country are given access to a database of people who have secretly been labeled terrorism suspects with little or no actual evidence, based on virtually meaningless criteria. This opens up the possibility of increased surveillance and tense encounters with the police, not to speak of outright harassment, for a large but undivulged number of people. When a police officer stops a person for a driving infraction, for instance, information about his or her KST status will pop up as soon as a driver's license is checked. According to FBI documents, police officers who get a KST hit are warned to "approach with caution" and "ask probing questions." When officers believe they're about to go face to face with a terrorist, bad things can happen. It's hardly a stretch of the imagination, particularly after a summer of police shootings of unarmed men, to suspect that an officer approaching a driver whom he believes to be a terrorist will be quicker to go for his gun. Meanwhile, the watchlisted person may never even know why his encounters with police have taken such a peculiar and menacing turn. According to the FBI's instructions, under no circumstances is a cop to tell a suspect that he or she is on a watchlist. And once someone is on this watchlist, good luck getting off it. According to the government's watchlist rulebook, even a jury can't help you. "An individual who is acquitted or against whom charges are dismissed for a crime related to terrorism," it reads, "may nevertheless meet the reasonable standard and appropriately remain on, or be nominated to, the Terrorist Watchlist." No matter the verdict, suspicion lasts forever.

American Muslims face an onslaught of hate crimes after each crisis.

Dado 14 – Natash Amer Dado, Arab American News reporter and Wayne State University graduate, 2014 (<http://newamericamedia.org/2014/09/muslim-americans-say-isis-terrorism->

may-lead-to-more-hate-crimes.php, USC Annenberg California Endowment Health Fellowships, September 10th, Accessed 9/18/2015, J.L.)

Muslim Americans Say ISIS Terrorism May Lead to More Hate Crimes Muslim Americans Say ISIS Terrorism May Lead to More Hate Crimes Story tools Comments AAAResize Print Share and Email Arab American News, News Report, Natasha Dado, Posted: Sep 10, 2014 Linda Sarsour, the executive director of the Arab American Association of New York, was a victim of a hate crime this week that wouldn't have occurred had it not been for the phenomenon of the terrorist group "Islamic State" (ISIS). Sarsour, who has become a voice for Muslim Americans nationally, discussed the incident on social media. "My deputy director and I were harassed by a bigoted drunk who hurled hateful Islamophobic and anti-Arab epithets at us on 5th Avenue in Bay Ridge [a neighborhood in Brooklyn]," Sarsour wrote in a Facebook post about the incident. "He said, 'you are cutting people's heads off, sharmoota, I'm going to cut off your head and see how you will feel, you Arab b.....'" The attacker appeared to be referencing the IS, which beheaded American journalists James Foley and Steve Sotloff. The IS claimed the men were murdered in retaliation for the United States' involvement in Iraq. Sarsour said the attacker had some sort of item or tool in his back pocket. The man ran after them and picked up a huge NYC metal garbage can and threw it at them, causing them to run into oncoming traffic. Muslim Americans still face widespread challenges fighting hate and discrimination more than a decade after 9/11, and IS terrorism seems to be creating even more misunderstanding about members of the community and their faith. Since ISIS first gained a stronghold in Mosul, Iraq in early June, Muslim American religious and community leaders have repeatedly condemned the group publically to prove it doesn't represent their faith. "The Islamic State is actually succeeding in causing damage to the image of Muslims and Islam," said Majid Shah, a Muslim American from Washington D.C. In response to IS terrorism, users on social media sites have been posting derogatory comments about Arabs and Muslims. For many Muslim Americans another attack on the United States by a group that commits acts of terrorism in the name of Islam would be detrimental and possibly increase hate crimes against the community. After 9/11 many people blamed Islam for the attacks, and took out their anger and frustration on the community. Former Vice President Dick Cheney recently predicted an attack this decade that would be far deadlier than 9/11. On Monday, King Abdullah of Saudi Arabia warned that ISIS could attack the United States within two months and Europe in one month if more action against the IS wasn't taken. Iraqi American Alia Almulla said the situation for Muslim Americans would be worse than it was after 9/11 if the IS attacked the United States. "I feel like it will be way worse than what happened with Sept. 11," she said. Almulla was a victim of a hate crime after 9/11. The incident occurred in 2007 while she was pregnant and living in Oklahoma City. She was sitting at a park with her family when people started questioning her about the headscarf she was wearing. Someone approached her and pulled off the headscarf. "Over there they are not educated at all about Islam or wearing a scarf. They have not even seen these things," she said. The attackers asked why she had the headscarf on and whether she was wearing it because she was bald and had lice. "They pulled it off to see if I really have hair or whatever," she said. Speaking to The Arab American News, one Muslim woman who did not want to be identified remembered that when the Boston bombings happened she was worried about what it would mean to her community if the perpetrators were Muslim. "When the Boston bombing happened I was praying, 'God please don't let that be a Muslim, because when an incident like that happens you

pay a price,” she said. She said that after the Boston bombing, women in parts of Massachusetts were attacked because they were wearing hijabs. S

Animosity toward Muslims and people of other nationalities

Schwartz, 11

(Allan Schwartz, LCSW, Ph.D. was in private practice for more than thirty years. He is a Licensed Clinical Social Worker in the states of Colorado (#127) and New York (#R039535). He received both his MSW (1988, Wurzweiler School of Social Work)) and Ph.D. (1976, Ferkhauf Graduate School) from Yeshiva University in New York City. Dr. Schwartz is a Certified Psychoanalyst having graduated from NPAP (National Psychological Association for Psychoanalysis) in 1992. He now lives and writes about psychotherapy in Boulder, Colorado and Southwest Florida, “Acts of Violence, Fear of The Unknown, Xenophobia”, <https://www.mentalhelp.net/blogs/acts-of-violence-fear-of-the-unknown-xenophobia/>, July 27, 2011, ak.)

Last week’s tragedy in Norway once again raises important questions about ethnic hatred and violence. Norway is known for being one of the most peaceful nations in the world. It’s people are tolerant, gentle and generous. It is for these reasons that they happily accepted and embraced immigrants into their country. It seems that this is what led to the violent bombing and shootings that caused so many deaths and shook Norwegians and other Europeans to the core. According to news reports, Anders Behring Breivik, the suspect, professes anti Muslim, pro white and pro Christian beliefs and politics. His plan was to incite similar minded people around the world to rise up and commit similar violent acts against foreigners. His professed fear was that Europe and the world were being colonized by Muslims. Why do violent acts as those based on ethnic hatred, occur? The answer has a lot to do with the term, xenophobia. We know that a phobia is a fear of something to which we have been exposed that had an aversive impact on our lives. For instance, I have known people who, after having been stuck in an elevator, cannot enter any other such conveyance because of a deep seated fear that they cannot control. Xenophobia is much the same except for the fact that the fearful response is to people who are foreign or alien. After the 9/11 attacks, some Americans become xenophobic to anyone perceived to be Arab or Muslim. Airplane passengers refused to fly with them, others demanded that Muslims be deported and a few even perpetrated violent acts upon completely innocent American Muslims and Arabs. In at least one case that was reported, someone from India was mistaken for being Muslim and was attacked almost ending his life. A unique reality of life today is that modern travel and communication has brought the world together as never before. Through the internet people communicate with each other from the most distant places possible. Internet communication comes not only through E. Mail but through internet telephone service that has made calling inexpensive. More than a telephone call, people can use Skype and other video services, to have face to face contact with one another without leaving their office or home. Several years ago, I received an E. Mail inquiry from someone in George...the former soviet state and now an independent country. I was startled when he told me that he wanted to see me about couples counseling for him and his girlfriend. The appointment was made with information about my address, etc. I was even more startled when he and his girlfriend appeared for the session. Speaking perfect English and with only the

slightest of accents, they told me about their problems. Several weeks later they flew back to Georgia. This is the paradox of today. The fact that modern technology has brought the world close together, that very close proximity has spurred fear and hatred. This fear of anyone foreign is irrational and dangerous. Yet, in a time of great anxiety about the world's economy and acts of terrorism, it's important that everyone resist the appeal of demagogues who want to prey upon our worst nightmares. It is too easy, as it always has been in troubled times, to pick a scapegoat and use them as a target for all of our frustrations. This is not healthy and can lead to dreadful consequences.

Fear

APA, no date

(The American Psychological Association is the largest scientific and professional organization representing psychology in the United States, with more than 122,500 researchers, educators, clinicians, consultants and students as its members, "Managing traumatic stress: coping with terrorism", <http://www.apa.org/helpcenter/terrorism.aspx>, ak.)

Terrorism threatens a society by instilling fear and helplessness in its citizens. It seeks to hold a society or government hostage by fear of destruction and harm. When terrorist acts occur, people generally look for ways to cope with the acute stress and trauma. Terrorism evokes a fundamental fear of helplessness. The violent actions are random, unprovoked and intentional, and often are targeted at defenseless citizens. Trying to cope with the irrational information that is beyond normal comprehension can set off a chain of psychological events culminating in feelings of fear, helplessness, vulnerability and grief. Xenophobia — fear or hatred of strangers or foreigners — can be heightened under a terrorist threat and can become a social and psychological danger. The fear generated by terrorism can be exacerbated by a population's diversity if there is distrust between groups, categories and classification of citizens.

public pressure

In the wake of domestic terror, politicians face enormous political pressures to increase torture, internment, and surveillance of suspected ethnicities

Fearon, 3

(James D. Fearon is Theodore and Frances Geballe Professor in Stanford University's School of Humanities and Sciences, Professor of Political Science, and a Senior Fellow at the Freeman-Spogli Institute for International Studies. His research focuses mainly on armed conflict and political violence. Fearon is a member of the National Academy of Sciences, the American Academy of Arts and Sciences, and a program member of the Canadian Institute for Advanced Research, "Catastrophic terrorism and civil liberties in the short and long run", <https://web.stanford.edu/group/fearon-research/cgi-bin/wordpress/wp-content/uploads/2013/10/Catastrophic-terrorism-and-civil-liberties-in-the-short-and-long-run.pdf>, October 9, 2003, ak.)

What **will** our **politicians** do? Will they judiciously consider how to construct and reform our institutions to monitor and control the application of the new government powers that will be increasingly necessary to reduce the risk of catastrophic terrorism? Or will they respond in a disconnected and frenzied fashion, **ratcheting up arbitrary and unchecked** government powers of **surveillance**, investigation, and detention **with each new attack**? I suspect **the answer will depend on** a largely unpredictable factor: **the pace and success of terrorist attacks** in the coming years. If we manage to go for five years or so without another major homeland terrorist attack, then prospects are relatively good that Congress and the country will recover some equanimity and confront the problems of legislative and judicial reform from a more long-run perspective. If and when a Democrat wins back the White House, and if the Republicans still control part or all of Congress, then the Republicans are sure to want to revisit the powers granted to or assumed by Bush since post 9/11. I would hope that the Democrats would be more willing to go along as a matter of serving their constituents' preferences. If, on the other hand, terrorists of whatever stripe "get lucky" one or more times in the near future, then we will see more of what Laura Donohue calls "the counterterrorist spiral."⁹ **After a dramatic terrorist attack, politicians face extremely strong pressures to "do something," which for reelection purposes needs to be highly visible and easily explainable to voters.** Changing laws to give greater powers to law enforcement fits the bill, and has almost always been the immediate response of democratic governments to major terrorist attacks. Donohue notes that in the case she knows best, Northern Ireland, **counterterrorist laws put on the books in reaction to big attacks** have tended to **stay on the books**. **Politicians don't want to risk being called "soft on terrorism"** in the midst of a conflict. **The result has been a ratchet effect, or spiral, to the great detriment of civil liberty.** Over the course of the last century, the United States has faced a succession of apparent domestic security threats that led to spasms of legislation and police action. In retrospect, these spasms were widely viewed as having been misguided and unconstitutional. It is instructive to consider these in thinking about the likely future course of civil liberties law in the face of catastrophic terrorism. In a hysterical response to a few package bombs, **the Palmer Raids of 1919-20** locked up thousands essentially on the presumption that they were communists or anarchists. **During World War II**, citizens and non-citizens of **Japanese** ancestry **were locked up**

as potential traitors in camps in the western deserts. After World War II, suspected association with the Communist Party was, for a time, grounds for active government persecution and FBI harassment. Most recently, after the 1996 Oklahoma City bombing and after 9/11, Congress passed a series of acts of questionable constitutionality, while the president has used executive authority to detain thousands of unnamed noncitizens who have no legal recourse or representation, both noncitizens living in the U.S. and hundreds captured in “non-war” in Afghanistan. The constitutional lawyer David Cole points to a pattern, or evolution, in these several episodes.¹⁰ In the midst of each one, the U.S. courts and judicial system acquiesced to or deliberately authorized laws that, shortly afterwards, they and many others saw as clearly unconstitutional. After the great fears had waned, the courts crafted and fleshed out new constitutional doctrines intended to prevent future abuses along the lines of the last episode. Thus, during and after World War I, U.S. laws explicitly criminalized advocating certain political views, such as communism or even opposition to the draft. In the 1917 Supreme Court opinion known for the famous line about there being no constitutional right to cry fire in a crowded theatre if there was no fire, Oliver Wendell Holmes was actually arguing (successfully) that the state could jail a person for distributing leaflets opposing the draft for “the Great War.”¹¹ Later rulings clarified that such laws were simply inconsistent with the First Amendment right of freedom of expression. Understanding these judicial precedents, in the McCarthy era the state criminalized not opinions and speech, but associations. “Are you now or have you ever been a member of the Communist party?” After the hysteria subsided, Supreme Court rulings in 1957 and 1961 asserted what should have been asserted from the start – that this was clearly unconstitutional. Cole argues that in the present episode, since Oklahoma and 9/11, government has evolved new tactics for restricting civil liberties that do not criminalize speech, and that target freedom of association only indirectly. He focuses on laws that make it a criminal act for one to provide “material support” to a “terrorist association,” even if one does not intend that the support supplied be used for terrorist purposes. The executive branch (via the State Department) decides what a “terrorist organization” is, according to no legally defined or justiciable criteria. Cole notes that since 9/11, almost every criminal “terrorism” case brought by the government has charged the defendant under the “material support” provisions.¹² Cole finds depressing this historical pattern of Fear-induced civil rights abuses, post-Fear judicial action to prevent the repetition of such abuses, and then, with the next Fear, government invention of new ways to get around the Bill of Rights. He says there is no “progress,” just the repetition of history. To the contrary, I would view it as notable progress if, over time, our political system is able to improve itself by forcing government abuse of the constitution to take ever more subtle forms. The more interesting question is whether the self-correction part of the cycle will continue to operate in the present case, with the threat of catastrophic terrorism. In the past, the Fear had to subside for self-correction to occur. But if the risk of catastrophic terrorism is a technological problem that will grow more and more pressing over time, then will the Fear ever subside enough to allow the political space necessary for our political class to come to grips with it in an intelligent way? Or will periodic major terrorists attacks produce a permanent condition akin to counterinsurgency, in which both public and politicians acquiesce to what would once have been considered massive civil rights violations by a more powerful and arbitrary state? All I can say is that I certainly hope not, and that I hope that U.S. foreign policy is revised in ways that will genuinely lower rather than possibly increase the short-run risk of more

attacks. But, unfortunately, I'm not sure if we have all that much control here. To a great extent we are hostage to the terrorists' luck, or lack thereof.

civil liberties

Even an infinitesimal risk of our disad should outweigh the aff – all of their harms assume “potential” surveillance and ignore that another domestic terror attack would decimate the civil liberties that exist now

Friedman, 13

(Thomas L. Friedman became The New York Times foreign affairs Op-Ed columnist in 1995. He joined the paper in 1981, after which he served as the Beirut bureau chief in 1982, Jerusalem bureau chief in 1984, and then in Washington as the diplomatic correspondent in 1989, and later the White House correspondent and economic correspondent. Mr. Friedman was awarded the 1983 Pulitzer Prize for international reporting (from Lebanon) and the 1988 Pulitzer Prize for international reporting (from Israel). He also won the 2002 Pulitzer Prize for commentary. Mr. Friedman is the author of “From Beirut to Jerusalem,” which won the National Book Award in 1989. He has written several other books, including “Hot, Flat and Crowded,” an international best seller. Born in Minneapolis, Mr. Friedman received a B.A. degree in Mediterranean studies from Brandeis University in 1975. In 1978 he received a master’s in modern Middle East studies from Oxford, “Blowing a Whistle”, <http://www.nytimes.com/2013/06/12/opinion/friedman-blowing-a-whistle.html>, June 12, 2013, ak.)

I’m glad I live in a country with people who are vigilant in defending civil liberties. But as I listen to the debate about the disclosure of two government programs designed to track suspected phone and e-mail contacts of terrorists, I do wonder if some of those who unequivocally defend this disclosure are behaving as if 9/11 never happened — that the only thing we have to fear is government intrusion in our lives, not the intrusion of those who gather in secret cells in Yemen, Afghanistan and Pakistan and plot how to topple our tallest buildings or bring down U.S. airliners with bombs planted inside underwear, tennis shoes or computer printers. Yes, I worry about potential government abuse of privacy from a program designed to prevent another 9/11 — abuse that, so far, does not appear to have happened. But I worry even more about another 9/11. That is, I worry about something that’s already happened once — that **was staggeringly costly** — **and** that **terrorists aspire to repeat**. I worry about that even more, not because I don’t care about civil liberties, but because what I cherish most about America is our open society, and I believe that **if there is one more 9/11 — or worse, an attack involving nuclear material — it could lead to the end of the open society as we know it**. If there were another 9/11, I fear that **99 percent of Americans would tell** their members of **Congress: “Do whatever you need to do to, privacy be damned, just make sure this does not happen again.”** That is what I fear most. That is why I’ll reluctantly, very reluctantly, trade off the government using data mining to look for suspicious patterns in phone numbers called and e-mail addresses — and then have to go to a judge to get a warrant to actually look at the content under guidelines set by Congress — to prevent a day where, out of fear, we give government a license to look at anyone, any e-mail, any phone call, anywhere, anytime. What we don’t need is to give up our freedoms just to address levels of paranoia that are, frankly, infantile. So I don’t believe that Edward Snowden, the leaker of all this secret material, is some heroic whistle-blower. No, I believe Snowden is someone who needed a whistle-blower. He needed someone to challenge him with the argument that we don’t live in a world any longer where our government can protect its citizens

from real, not imagined, threats without using big data — where we still have an edge — under constant judicial review. It's not ideal. But if one more 9/11-scale attack gets through, the cost to civil liberties will be so much greater. A hat tip to Andrew Sullivan for linking on his blog to an essay by David Simon, the creator of HBO's "The Wire." For me, it cuts right to the core of the issue. "You would think that the government was listening in to the secrets of 200 million Americans from the reaction and the hyperbole being tossed about," wrote Simon. "And you would think that rather than a legal court order, which is an inevitable consequence of legislation that we drafted and passed, something illegal had been discovered to the government's shame. Nope. ... The only thing new here, from a legal standpoint, is the scale on which the F.B.I. and N.S.A. are apparently attempting to cull anti-terrorism leads from that data. ... I know it's big and scary that the government wants a database of all phone calls. And it's scary that they're paying attention to the Internet. And it's scary that your cellphones have GPS installed. ... The question is not should the resulting data exist. It does. ... The question is more fundamental: Is government accessing the data for the legitimate public safety needs of the society, or are they accessing it in ways that abuse individual liberties and violate personal privacy — and in a manner that is unsupervised. And to that, The Guardian and those who are wailing jeremiads about this pretend-discovery of U.S. big data collection are noticeably silent. We don't know of any actual abuse." We do need to be constantly on guard for abuses. But the fact is, added Simon, that for at least the last two presidencies "this kind of data collection has been a baseline logic of an American anti-terrorism effort that is effectively asked to find the needles before they are planted into haystacks, to prevent even such modest, grass-rooted conspiracies as the Boston Marathon bombing before they occur." To be sure, secret programs, like the virtually unregulated drone attacks, can lead to real excesses that have to be checked. But here is what is also real, Simon concluded: "Those planes really did hit those buildings. And that bomb did indeed blow up at the finish line of the Boston Marathon. And we really are in a continuing, low-intensity, high-risk conflict with a diffuse, committed and ideologically motivated enemy. And, for a moment, just imagine how much bloviating would be wafting across our political spectrum if, in the wake of an incident of domestic terrorism, an American president and his administration had failed to take full advantage of the existing telephonic data to do what is possible to find those needles in the haystacks." And, I'd add, not just bloviating. Imagine how many real restrictions to our beautiful open society we would tolerate if there were another attack on the scale of 9/11. Pardon me if I blow that whistle.

More attacks create programs that encroach on civil liberties.

Khanna 13 – Derek Khanna, Yale Law Fellow & Congressional staffer for the House Republican Study Committee, 2013 ("If PRISM Is Good Policy, Why Stop With Terrorism?" The Atlantic, Jul. 4th , <http://www.theatlantic.com/politics/archive/2013/07/if-prism-is-good-policy-why-stop-with-terrorism/277531/> Accessed 6/15/15, JL)

The government's policies in the NSA's PRISM program reflect perhaps the perfect storm of public-policy conundrums. This surveillance seems to offer short-term advantages, with the real costs hidden, diffuse, unknown, and, seemingly, far in the future. What, many ask, is the real price of giving up privacy? The government has presented PRISM, and other similar surveillance

programs, as a solution to a danger and fear -- terrorism -- which is almost impossible to comprehend: Terrorism is everywhere and nowhere; the battlefield is across the globe; the threat is omnipresent. It is difficult for the average person to perceive and understand until it is splashed across television screens. Terrorism is by definition designed to "shock and awe." It is theatre of the macabre. The government has used this fear to justify unprecedented intrusions into our privacy, including monitoring who we call, our location data, and allegedly even the contents of our communication (if there is a 51 percent chance that one party to the communication is foreign). Our personal calling data, emails, letters, credit-card transaction data -- everything seems fair game. The fact that the NSA wants this much information shouldn't be surprising. The old maxim that to a hammer every problem looks like a nail is appropriate here. A spy agency specializing in "signals" intelligence is always looking for more phone calls, emails, and other signals-based data to analyze. The more data NSA receives, the more powerful it becomes. The most worrying facet of this story is the willingness of some Americans and members of Congress to so quickly disregard the Fourth Amendment and our liberty in the name of terrorism. Not so long ago, the U.S. faced arguably higher stakes, and more significant dangers, but made the opposite choices -- choices more consistent with our founding principles. Throughout the Cold War there was a real threat of apocalyptic proportions. The Soviet Union assembled and deployed more than 45,000 nuclear warheads, enough destructive power to annihilate the United States and end humanity as we know it. The U.S. government did plenty of reprehensible things during the Cold War, including trying to assassinate elected leaders, subverting democracies, and wiretapping political rivals and "subversives" such as Martin Luther King Jr. As a result of these scandals, along with Watergate, the American people responded and demanded accountability through the Church and Pike Committees of the 1970s in the House and Senate.* Will they do the same today? The most worrying facet of the PRISM story is the willingness of some Americans and members of Congress to so quickly disregard the Fourth Amendment in the name of terrorism. If the justification for PRISM and associated programs is predicated on their potential effectiveness, why shouldn't such logic be applied elsewhere? Here are several other even more effective public-policy solutions that also violate the Fourth Amendment in similar ways and are just as reprehensible. There is some dispute over whether PRISM and other reported programs are legal or Constitutional. I believe, and have argued, that third-party records should be protected under the Fourth Amendment, so that access to these records requires a warrant. This is not the perspective the courts have taken. But if we are going to use personal data obtained through PRISM for terrorism purposes in a way that violates our privacy and which I would argue violates the Fourth Amendment, why not do it for other legitimate purposes? 1. Child Pornography: Whenever the FBI receives a computer for a routine search, it searches the computer for known "hashes" of video and picture files of child pornography. This allows it to quickly and easily search every computer brought in, time permitting, for known child pornography. Of course the FBI receives many computers through warrants, but this is still a small percentage of all computers. Since the NSA seems to have access to a substantial amount of web traffic, what if it used spare capacity for "deep packet inspection" technology to identify known child-pornography pictures and videos? Software would only flag the transfer if there were a 100 percent certainty of it being the exact same file. (Since this is a hypothetical, let's assume the technology exists and can be implemented.) Laws against child pornography are partially designed to dry up the market for child exploitation. This

policy could greatly reduce child pornography, catch potential pedophiles, and reduce existing child exploitation. From a legal perspective, the courts have found that individuals have no reasonable expectation of privacy for contraband; therefore, if such a search only finds contraband then it may be on more solid legal territory. Should the government be able to use technologies like PRISM and related exposed programs to find child pornography? 2. Speed Limits: Many accidents are related to reckless driving, and speeding can make them significantly more dangerous and deadly. What if instead of enforcing speed limits by stationing police officers to patrol our streets, a relatively ineffective and costly method of enforcement, the government instead monitored the speed of all cars in real time using cellphones. If NSA data on phone location were analyzed in real time, it could potentially determine the speed of any user. All phones traveling below 20 mph would be excluded on the assumption that they're not driving. All phones traveling faster than 20 mph would be plotted to discern what road they are traveling on and what the speed limit is for that road. The government could then identify drivers who were speeding and send them tickets in the mail, text them to slow down (then ticket them for opening it while driving!), or dispatch an officer to catch them. Further data analysis could identify potential drunk driving for police investigation, based upon erratic driving patterns or when phones were at known bars for several hours before being in a vehicle. Such policies could potentially save tens of thousands of lives and increase revenues from speeding fines while reducing the costs of patrolling the road. Should the government be able to use technologies like PRISM and related exposed programs to make our roads safer? 3. Illegal Downloading: Millions of Americans have used BitTorrent or other technologies to illegally download music, movies, TV shows, and software. While torrents can be used to download non-copyrighted and copyrighted digital goods, a substantial amount (one study found 89 percent) of the traffic appears to be used for illegal downloading. NSA PRISM level surveillance could be of use in identifying which users are using BitTorrent, then identifying the users who have uploaded or downloaded the most, and identifying whether their downloads involved illegal content. (Again, let's assume the technology is available.) This information could be forwarded to the Department of Justice for prosecution (or more crafty lobbyists could get the information forwarded to a private entity like the RIAA or MPAA for lawsuits). Should the government be able to use technologies like PRISM and related exposed programs to protect copyright holders? **** If the barometer for violating the Fourth Amendment is efficacy, then why should these not also be up for discussion? The answer is clear: The Fourth Amendment was not designed for efficacy. It was designed for privacy and to defend our liberty. If that's not the case, why even stop with these examples? Most of our phones have cameras and microphones that, at least in some circumstances, can be turned on remotely that would surely provide invaluable information for intelligence and law enforcement (the FBI has used this for organized crime prosecution, remotely turning on the microphone of phones to record non phone-call conversations). Information given to the government for the NSA may be made available to other agencies such as the IRS, why wouldn't it be? We already know that it has been shared with foreign agencies (e.g., Dutch intelligence, German intelligence, and British intelligence). Even if a court were to find that PRISM data violates the Fourth Amendment, courts have traditionally held that even information that was illegally obtained can be used in court to impeach testimony -- in other words, it could plausibly be admissible to catch a tax cheat. If elected leaders were angels there would be less need for protection of our privacy. But they are

not angels. And as many of us in the technology world know, once something exists in data form it is often retained forever. In an era where data storage is cheap and getting cheaper, American citizens' information will likely be retained indefinitely (the NSA is building that capacity in a Utah facility). At some point this massive repository of information may be hacked, at some point could be available to political appointees looking for partisan gain, or it may be used for "security" reasons against "troublemakers" trying to change our society -- social change often comes through those who are perceived to be dangerous to the state. As James Madison argued in Federalist 51, "If men were angels, no government would be necessary. If angels were to govern men, neither external nor internal controls on government would be necessary." But men are not angels and we have experience with elected leaders that are partisan, opportunist, short-sighted and, sometimes, even corrupt. Government's natural inclination is to abuse its power, one critical reason why our Founders limited it. The danger of a surveillance state is not the obscure chance of a truly evil person abusing the system; rather, the actual threat, the real danger, is a person with good intentions who believes that their draconian actions are morally justified and prudent. It is such a leader, perhaps with the best of intentions, who can make the most heinous of mistakes with eyes wide open and belief that the ends justify the means. Those ends never justify eviscerating the Fourth Amendment. * This is not to say that the Church and Pike Committees completely dealt with abuses -- they did not -- but they were a clear step in the right direction and demanding accountability and limits to government abuse.

The aff's focus on civil liberties doesn't necessarily preclude security impacts – middle ground is best because unequivocal focus on security is unrealistic and improbable in the wake of public perception

Foreign Policy 15 (January 6th, J.M. Berger, analytical researcher and reporter on terrorism, Brookings Fellow, "Europe Cracks Down After attacks in Paris, Sydney, and Canada, Western countries are flexing counterterrorism muscles. But civil liberties, not would-be jihadis, will be the casualty," <http://foreignpolicy.com/2015/01/16/europe-cracks-down-terrorism-civil-liberties-after-paris/>) aj

In response to this escalating threat, Western countries are looking at an array of new laws and government powers to deal with the problem. In Europe and Australia, proposals to enhance counterterrorism powers are in full bloom. In the United States, similar ideas of lesser scope are quietly circulating behind the scenes, likely to emerge into public view soon enough. The proposals are varied, but they all increase the power that a government has to act against suspects, decrease the amount of evidence needed to use such power, or both. Among the laws that have been either proposed or enacted: Australia has instituted a variety of new government powers to deal with both foreign fighters and terrorism suspects, the most controversial of which are control orders allowing uncharged terrorism suspects' civil liberties to be severely curtailed and greatly expanded collection of metadata. France, in the wake of the Charlie Hebdo attack, is considering new laws that would double down on broad new authorities adopted in September that include restrictions on travel, a ban on publishing material "glorifying" terrorism, online censorship provisions, and the creation of new classes of crimes targeting so-called "lone wolves" by criminalizing a wide range of behavior. British Prime Minister David Cameron has pledged that, if re-elected, he will pursue broad new authorities for surveillance of electronic communications, potentially including bans on widely used encrypted

messaging platforms. The European Parliament is reconsidering a previously shelved proposal requiring airlines to provide information on passengers to national governments, albeit with some talk of added civil liberties protections. The Canadian government is considering vaguely defined new counterterrorism powers in the wake of consecutive lone-wolf attacks by supporters of the Islamic State in October. Other specific measures have been discussed or implemented in Germany, Portugal, Greece, Serbia, Kosovo, Cyprus, and elsewhere as other countries worry that they could become the targets of similar attacks. In many ways, this is the continuation of a debate that started on Sept. 11, 2001: What price is freedom willing to pay for security? Most Western countries have enshrined individual liberties as a fundamental principle. But they also accept that the government has a role in preventing crime and risk of harm to citizens. When a tragic, traumatic attack takes place, the balance between these concerns is disrupted. But the 9/11 paradigm of large, complicated terrorist attacks that occur only rarely is giving way to a new dynamic of smaller, simpler plots that take place frequently. The re-evaluation of priorities that took place on Sept. 12, 2001, has become a continuous process of adjustments that are often more reflexive than reflective.

Post-FREEDOM Act public poll proves that general consensus is that civil liberties should not be compromised, even in counter-terror efforts

Gass 6/10 (Nick Gass, POLITICO breaking news reporter, citing a Gallup poll, "Poll: Americans say terrorism shouldn't trump civil liberties," <http://www.politico.com/story/2015/06/poll-terrorism-civil-liberties-118812.html>) aj

Americans would appear to agree with Congress' latest efforts to limit the scope of its anti-terrorism efforts, with more than six in 10 saying that the federal government should take steps to prevent terrorism but not violate civil liberties, according to a Gallup poll released Wednesday. Among all Americans surveyed, 65 percent prioritized civil liberties over counterterrorism efforts, compared with 30 percent who said that the government should take all steps necessary to prevent acts of terror, even if that infringes on civil liberties. Gallup conducted the survey after the USA Freedom Act, which pulled back the government's ability to collect bulk communications data, was passed by Congress and signed into law by President Barack Obama. Among those identifying as liberal, 48 percent said government efforts violate civil liberties, compared with 41 percent of moderates and 38 percent of conservatives. On a partisan level, 40 percent of Democrats and leaners said those efforts run roughshod over their rights, compared with 42 percent of Republicans and leaners. The results stand in contrast to those from January 2002, just four months after the 9/11 attacks. Even then, however, Americans were at most split over how the federal government should stop future attacks. At that time, 47 percent of Americans said that government should prioritize anti-terrorism efforts, compared with 49 percent who still showed a greater concern for civil liberties. A year after 9/11, Gallup found that 56 percent felt the government should not violate civil liberties in pursuit of anti-terror efforts, and public opinion has remained mostly stable in that direction in the dozen years' since. The poll was conducted June 2-7 among 1,527 adults nationwide, featuring an overall margin of error of plus-or-minus 3 percentage points.

The public has consistently prioritized personal liberty interests over security interests – statistical analysis

Jones 15 (Jeffrey M. Jones, Hoover Institution assistant director and research fellow, published on Gallup, an American research-based consulting company known for universal public opinion polls, "Americans Still Say Liberties Should Trump Anti-Terrorism,"

<http://www.gallup.com/poll/183548/americans-say-liberties-trump-anti-terrorism.aspx>) aj

PRINCETON, N.J. -- The federal government's recent actions to limit the scope of what it can do to prevent terrorism are consistent with Americans' preference to prioritize civil liberties over anti-terrorism efforts when the two come into conflict. Sixty-five percent of Americans say the government should take steps to prevent terrorism but not violate civil liberties, while 30% think any steps to prevent terrorism are justified, even if they violate liberties. In the first few months after 9/11, Americans were more divided on the issue. The latest results are based on a June 2-7 Gallup poll, conducted after Congress passed and President Barack Obama signed into law the USA Freedom Act, designed to replace the expiring and controversial Patriot Act that was passed after the Sept. 11, 2001, terrorist attacks. These laws help define the scope of government efforts to prevent terrorist attacks against the U.S. Notably, the new law does not authorize the government to collect data on citizens' electronic communications, a secret program that was exposed by former government contractor and now U.S. exile Edward Snowden. However, the government can still obtain those records from the phone companies if it has a warrant. In January 2002, four months after the 9/11 attacks and with concerns about terrorism still high, 47% of Americans said the government should take all necessary steps to prevent terrorism, even those that violated individual civil liberties, while 49% said anti-terror efforts should stop short of violating civil liberties. A year after the attacks, in September 2002, Americans showed a greater concern for civil liberties, with 62% saying anti-terror efforts should not violate civil liberties and 33% giving anti-terror efforts the higher priority. Since then, opinion has not fundamentally changed, although the 65% who currently prioritize protecting civil liberties is down slightly from 71% in 2011.

In the short and medium run, there is no reason to create laws that compromise civil liberties – only with certainty that non-state groups have the means to attack should we create legal change

Fearon 3 (James D. Fearon, the Theodore and Francis Geballe Professor of Political Science at Stanford University, 10/9/3, "Catastrophic terrorism and civil liberties in the short and long run*", <https://web.stanford.edu/group/fearon-research/cgi-bin/wordpress/wp-content/uploads/2013/10/Catastrophic-terrorism-and-civil-liberties-in-the-short-and-long-run.pdf>) aj

In the short and medium run, it remains quite difficult for individuals or non-state groups to develop or acquire nuclear weapons, and virtually impossible to do so without the active assistance of a state. States, moreover, may have strong incentives not to let nuclear materials out of their own control. (Nonetheless, I am terrified that North Korea's leadership might sell nuclear bombs to the highest bidder, and the fact that something is not in the interest of a state

overall doesn't mean that it will be smart or competent enough to prevent it from happening.) Weapons-grade anthrax is hard to make and hard to deliver in such a way as to kill thousands (although we have seen that it may not be necessary to kill thousands to have a big negative impact on society). This appears to be true as well for a variety of other biological and chemical weapons that have been mentioned as horrible terrorist dangers. This means that in the short run there is simply no good reason to rush into changing the laws in ways that greatly compromise civil liberties. If you face a fundamentally long-run problem, it makes more sense to think about the best feasible long-run outcome and then work backwards to draw out implications for what to do now. How best to change the law and law enforcement to respond to the threat of catastrophic terrorism is a great candidate, I would argue, for analysis and recommendations by a presidential commission composed of constitutional lawyers, congressmen, and law enforcement experts empowered to make recommendations to relevant congressional committees. This would be far better than the current approach, in which, after each major terrorist attack on U.S. soil, our representatives compete with each other in proposing legal changes to "get tough" on terrorism, the effect of which has been to run roughshod over the Constitution. There is no thinking here about the long-run problem, only the frenzied passing of "position taking" bills, whose actual positive impact on preventing terrorist attacks is often dubious.

Middle ground between privacy and security key

Dragu 11 (Tiberiu Dragu, Assistant Professor in the Department of Politics at NYU, holds a PhD in Political Science from Stanford, "Is There a Trade-off between Security and Liberty? Executive Bias, Privacy Protections, and Terrorism Prevention," ARTICLE in AMERICAN POLITICAL SCIENCE REVIEW · JANUARY 2011,

http://www.researchgate.net/profile/Tiberiu_Dragu/publication/231746561_Is_There_a_Trade-off_between_Security_and_Liberty_Executive_Bias_Privacy_Protections_and_Terrorism_Prevention/links/02e7e52c84ffd738fc000000.pdf) aj

Almost everyone -citizens, policymakers, political pundits, and scholars- approaches the formulation of counterterrorism policies as a balancing act between the allegedly competing values of privacy and security (Waldron 2003). Intuitively, this would seem to be the right way to evaluate policies designed to increase national security from terrorism. In the face of a potential large-scale terrorist attack, after all, it is unthinkable that citizens would dismiss security concerns and thus forbid all government surveillance directed at potential terrorists, just as it is unthinkable that they would dismiss all privacy concerns and give the government unlimited surveillance powers. Other than in the case of these two extremes, democratic societies and their governments face inevitable tradeoffs.

"Temporary" reductions in civil liberties during times of emergency often end up being exploited by power-hungry government officials

Dragu 11 (Tiberiu Dragu, Assistant Professor in the Department of Politics at NYU, holds a PhD in Political Science from Stanford, "Is There a Trade-off between Security and Liberty? Executive Bias, Privacy Protections, and Terrorism Prevention," ARTICLE in AMERICAN POLITICAL SCIENCE REVIEW · JANUARY 2011,

http://www.researchgate.net/profile/Tiberiu_Dragu/publication/231746561_Is_There_a_Trade-off_between_Security_and_Liberty_Executive_Bias_Privacy_Protections_and_Terrorism_Prevention/links/02e7e52c84ffd738fc000000.pdf aj

The result regarding the strategic bias of the executive agencies in charge of terrorism prevention contributes to a general understanding of the relationship between government powers and civil liberties in times of emergencies (Rossiter 1948; Rehnquist 2000; Ackerman 2004; Ferejohn and Pasquino 2004; Gross and Aolain 2006; Posner and Vermule 2007; Manin 2008). The very definition of emergency powers implies that when the emergency subsides, and a serious threat no longer exists, the powers will be terminated and rights will be restored. However, the analysis shows that governmental enforcement agencies lack incentive to relinquish their newly acquired powers once the emergency diminishes. To the contrary, because they are always worse off when civil liberties are expanded, and always better off when they are reduced, agencies seek to make the emergency reductions in civil liberties permanent.

Decreasing privacy protections makes for an increased risk of terrorism

Dragu 11 (Tiberiu Dragu, Assistant Professor in the Department of Politics at NYU, holds a PhD in Political Science from Stanford, "Is There a Trade-off between Security and Liberty? Executive Bias, Privacy Protections, and Terrorism Prevention," ARTICLE in AMERICAN POLITICAL SCIENCE REVIEW · JANUARY 2011,

http://www.researchgate.net/profile/Tiberiu_Dragu/publication/231746561_Is_There_a_Trade-off_between_Security_and_Liberty_Executive_Bias_Privacy_Protections_and_Terrorism_Prevention/links/02e7e52c84ffd738fc000000.pdf aj

Reducing privacy protections, so goes the argument, has a chilling effect on terrorism-related activities. Reducing privacy protections might not deter true fanatics such as suicide bombers but it deters donors, fundraisers, facilitators, recruiters, and foot soldiers. That is, it raises the perceived costs of being associated with a terrorist group for individuals who would otherwise willingly provide various kinds of support. In turn, the terrorist support and logistical infrastructure is negatively affected: there are fewer supporters to disseminate propaganda, recruit operatives, raise money, and, if the terrorist organization wants to plan an attack, facilitate immigration, procure supplies, transfer money, forge false identities, facilitate travel, and provide safe houses. Support and logistical networks are essential for terrorist organizations to plan and execute large-scale attacks (Gunaratna 2004). Reducing the level of privacy protections thus increases the terrorist organization's costs for terrorist activities. In a liberal democracy, the tactical advantage is seemingly conceded to terrorists, who are free to exploit privacy protections, while the authorities are constrained in their efforts to prevent terrorist attacks by those very privacy protections. Consequently, the intuition behind the security rationale for reducing privacy protections seems simple. Because reducing privacy protections decreases the anti-terrorist agencies' cost of counterterrorism intelligence efforts and increases the terrorist organization's cost of terrorist activities, reducing privacy protections increases security from terrorism. However, even if we accept the premises of the security rationale, I argue that, when the anti-terrorist agency and terrorist organizations act strategically, reducing

privacy protections can lead to less security from terrorism while the anti-terrorism agency prefers reducing privacy even if such a reduction leads to less security from terrorism.

rollback

ratchet effect

With each new attack, more invasive security measures are created. Disad turns the case.

Balko 14 – Radley Balko, senior writer and investigative reporter at the Huffington Post, graduate of Indiana University, and policy analyst at the Cato Institute, 2014 (“Was the police response to the Boston bombing really appropriate?,” Washington Post, April 22nd , Available Online at <http://www.washingtonpost.com/news/the-watch/wp/2014/04/22/the-police-response-to-the-boston-marathon-bombing/> , Accessed June 17th 2015, J.L.)

The economist and historian Robert Higgs has written prolifically over the years about what he calls the “ratchet effect.” In times of crisis, governments tend to expand, usually at the expense of civil liberties. When the crisis abates, government power does, too, but never completely back to where it was before. With each subsequent crisis, government encroaches a bit more. Higgs has documented the effect through major wars, depressions and other national emergencies. But the effect may be particularly pronounced and dangerous with respect to the war on terror, because as crises go, terrorism can never completely be defeated. We’re now more than a year out from the Boston Marathon bombing of 2013. The studies, reviews, and after-action reports have been written. Politicians and other public officials have held hearings, cast blame and pontificated on the lessons they have learned. There have been calls for more monitoring of foreign travelers; better information-sharing among federal, state and local government police agencies; and the inevitable demands for more security, more surveillance and generally more government power to prevent similar attacks in the future. We instinctively put our faith in government to protect us in times of crisis, even when those crises are the result of the government’s failure to protect us. We regret it later. Shortly after the Sept. 11, 2001, attacks, Gallup polling found that 47 percent of the public was willing to sacrifice its civil liberties for security. Within two years, that figure was down to 33 percent, and by 2012, it was at 25 percent. Those figures show why it’s dangerous to pass new policies when the public is fearful and emotional, and why politicians are particularly eager to do exactly that. (See the Patriot Act.) The danger here is that the Boston response tightens the ratchet and becomes the default response to similar crises in the future. For example, we’ve already seen other examples of wanton, indiscriminate gunfire from cops during manhunts for fugitives suspected of killing cops,

Plan rollback – interest groups favored by changes preserve the status quo.

Bainbridge 13 – Stephen Bainbridge, Joseph Flom Visiting Professor of Law and Business at Harvard law School and author of The New Corporate Governance in Theory and Practice, 2013 (“The Global Ware on Terror & the Ratchet Effect,” Stephen Bainbridge’s Journal of Law, Politics, and Culture, May 27th, Available online at <http://www.professorbainbridge.com/professorbainbridgecom/2013/05/the-global-ware-on-terror-and-the-ratchet-effect.html>, accessed 6/19/15, J.L.)

Robert Higgs demonstrated that wars and other major crises typically trigger a dramatic growth in the size of government, accompanied by higher taxes, greater regulation, and loss of civil liberties. Once the crisis ends, government may shrink somewhat in size and power, but rarely back to pre-crisis levels. Just as a ratchet wrench works only in one direction, the size and scope of government tends to move in only one direction—upwards—because the interest groups that favored the changes now have an incentive to preserve the new status quo, as do the bureaucrats who gained new powers and prestige. Hence, each crisis has the effect of ratcheting up the long-term size and scope of government. There's a slew of domestic restrictions on our liberties that came into place after 9/11. The TSA's security theater apparatus at airports is just the most noticeable. As Jonathan Turley has noted: For civil libertarians, the legacy of bin Laden is most troubling because it shows how the greatest injuries from terror are often self-inflicted. Bin Laden's twisted notion of success was not the bringing down of two buildings in New York or the partial destruction of the Pentagon. It was how the response to those attacks by the United States resulted in our abandonment of core principles and values in the "war on terror." Many of the most lasting impacts of this ill-defined war were felt domestically, not internationally. Starting with George W. Bush, the 9/11 attacks were used to justify the creation of a massive counterterrorism system with growing personnel and budgets designed to find terrorists in the heartland. Laws were rewritten to prevent citizens from challenging searches and expanding surveillance of citizens. Leaders from both parties acquiesced as the Bush administration launched programs of warrantless surveillance, sweeping arrests of Muslim citizens and the creation of a torture program. What has been most chilling is that the elimination of Saddam and now bin Laden has little impact on this system, which seems to continue like a perpetual motion machine of surveillance and searches.

Disad turns the case – effective anti-terror laws now mean obstacles to reversing.

Givens 13 – Austen D. Givens, a PhD student in the Department of Political Economy at King's College London, 2013 ("The NSA Surveillance Controversy, How the Ratchet Effect can Impact Anti-Terrorism Laws," Harvard Law School National Security Journal, July 2nd, available online at <http://harvardnsj.org/2013/07/the-nsa-surveillance-controversy-how-the-ratchet-effect-can-impact-anti-terrorism-laws/>, accessed 6/19/15, J.L.)

note: short reading, long reading

The list of causes below is not meant to be exhaustive, but to show how a constellation of variables can help to cement anti-terrorism laws in place. The ratchet effect can occur because: anti-terrorism laws are effective. Anti-terrorism laws may stick simply because they work. If so, then scaling back or reversing an effective anti-terrorism law would increase a nation's vulnerability to terrorism, pulling it back toward a condition that existed before the law initially

went into effect. This goes against national security interests, so it makes sense to leave these laws on the books. The ratchet effect can occur because **anti-terrorism laws may address multiple threats**. Anti-terrorism laws may come about because of a particular terrorist group or incident. But that does not necessarily mean the laws will work only for that group, or apply only to similar types of terrorist attacks. Al-Qaeda's attack on 9/11 spurred the creation of the USA PATRIOT Act. Yet today the Act's provisions can also impede domestic terrorist organizations like the Animal Liberation Front (ALF) and Earth Liberation Front (ELF) by facilitating intelligence sharing for law enforcement purposes. The ratchet effect can occur because **it is challenging to repeal laws in democracies**. Absent "sunset" provisions, which force certain portions of a law to expire after a pre-determined amount of time, it can be difficult to repeal a law under normal circumstances—let alone when that law concerns something as serious as terrorism. It requires careful political maneuvering to reverse **an anti-terrorism law** because the law itself **may enjoy popular support**, be **seen as effective**, or be **linked to vested economic interests**. **These obstacles can promote a legal inertia that resists efforts to scale back or reverse the law**. The ratchet effect can occur because **elected officials do not want to risk repealing anti-terrorism laws**. Here is a political nightmare: for whatever reason, a legislator or government executive spearheads an effort to reverse an anti-terrorism law. The anti-terrorism law is repealed. Within a week, a terrorist attack occurs. **Being wrong about terrorism** can carry devastating political consequences for incumbents. But being specifically identified as the one who "turned off the alarm system" **is a political death sentence**. Under this scenario, even if there is no direct causal link between the law's repeal and the attack, the two are easily correlated because of their temporal proximity to each other. It makes no sense for an elected official to open herself to the possibility of this scenario without a clear, compelling reason—and, even then, scaling back an anti-terrorism law may still be too politically risky a proposition to entertain seriously. For these reasons, anti-terrorism laws can remain in effect beyond the end of the crisis that brought them into existence. The ratchet effect can occur because **there is increased public deference to government during crises**. Legal scholars and political scientists have explored the effect of terrorism on public deference to democratic governments.[10] While the specific reasons for this vary, the research overwhelmingly points toward increased trust in government authorities in the immediate wake of terrorist attacks, though this can wane over time. **Popular support can provide the political capital** necessary for legislators and executives **to quickly craft and implement anti-terrorism laws**. **Over time**, despite some slippage, **public approval** of these laws **can continue—particularly when the crisis that prompted the laws' creation continues**. The ratchet effect can occur because **anti-terrorism laws create a new security paradigm**. An aggressive anti-terrorism law can fundamentally alter societal approaches to terrorism. Surveillance may increase. Police powers can expand. Intelligence efforts may grow. Public expectations of privacy can diminish. In the aggregate, these types of changes can represent a drastic change in a government's approach to terrorism, and effectively create a "new normal" level of security. Because this "new normal" is linked to the law itself, reversing the law begins to dismantle the new security paradigm. From the public's perspective, this might be an unacceptable option because it may increase societal vulnerability to terrorism. Government agencies also risk losing resources—personnel, money, and political support—by returning to the status quo ante.

Austen D. Givens is a PhD student in the Department of Political Economy at King's College London. His forthcoming book with Nathan E. Busch, *The Business of Counterterrorism: Public-Private Partnerships in Homeland Security*, will be published by Peter Lang. "The NSA Surveillance Controversy: How the Ratchet Effect Can Impact Anti-Terrorism Laws" – Harvard Law School: National Security Journal - July 2, 2013 - <http://harvardnsj.org/2013/07/the-nsa-surveillance-controversy-how-the-ratchet-effect-can-impact-anti-terrorism-laws/>

Second, policymakers should beware of reflexive legislation. Terror attacks create conditions in which emotions can run high; feelings of terror, anger, sadness, confusion, and frustration are natural consequences of these circumstances. Behavioral psychology teaches us that human beings' higher-order thinking skills (e.g. logic, reasoning, analysis, reflection) are poorly integrated with baser, emotionally-rooted thinking (e.g. irrational prejudices, unreasonable fears, self-destructive desires).[11] One researcher has gone so far as to say that the amygdala—the portion of the brain that controls reactive emotion—can hijack the higher-order parts of the brain, impeding effective decision-making in crises.[12] Considering this, it is reasonable to suggest that laws passed in the immediate aftermath of terrorist attacks may be rooted more in baser, emotionally-driven thinking than in careful, analytical, higher-order thinking. In other words, they may be mostly reflexive, not reflective. This is not to say that all laws passed after terrorist attacks are emotionally-driven. Nor is it the case that all laws created in these circumstances are somehow "bad" laws. But during and after terrorist attacks, leaders' judgment of what may or may not be good law can become clouded by emotion. Similarly, terrorist attacks can drive public support for reflexive anti-terrorism legislation. And this is not an instinct that can be somehow "shut off" or "tuned out." Legislators and citizens should be aware of this potential, and must walk a fine line between meeting immediate post-crisis needs and championing laws that will remain effective for the long haul. Third, "sunset" provisions are prudent and reasonable. Given that anti-terrorism laws passed in the wake of terrorist attacks may be partly driven by emotion and that initial laws may prove difficult to undo, it is wise for government leaders to include "sunset" provisions in new anti-terrorism laws. Generally "sunset" provisions allow portions of a law to expire if not renewed by a pre-determined date. In a sense, democracies must deliver a new mandate for the law—or at least part of the law—to avoid this expiration. With "sunset" provisions in place, unwise, irrelevant, or ineffective components of a law can be allowed to wither and die when necessary. Letting these provisions lapse requires virtually no political capital from government leaders, unlike actively changing or removing a law, which can require a great deal. For elected officials, this means that letting part of an anti-terrorism law expire is relatively easy. Re-examining and pruning anti-terrorism laws in this way is a healthy practice. It can head off potential abuses of particularly aggressive anti-terrorism measures and forces a continual re-thinking of anti-terrorism laws as circumstances change over time. The recent NSA surveillance controversy highlights the relevance of the ratchet effect to broader discussions of anti-terrorism laws. The ratchet effect can affect anti-

terrorism laws generally, entrenching and expanding them over time and potentially leading to those laws being interpreted in unexpected and undesirable ways. The USA PATRIOT Act, developed in the aftermath of the 9/11 terrorist attacks, has been difficult to scale back since then, and has now been interpreted in a way that at least one of the Act's authors did not intend. This unintended interpretation of the Act led, in part, to today's NSA surveillance controversy. Scholars can benefit from future explorations of the ratchet effect, which may help illuminate further why anti-terrorism laws remain in place and how their influence can expand in unanticipated ways.

The September 11 attacks were a vivid demonstration of the need for detailed information about the activities of potential terrorists. This was so for several reasons. First, some information, which could have been useful, was not collected and other information, which could have helped to prevent the attacks, was not shared among departments. Second, the scale of damage that 21st-century terrorists can inflict is far greater than anything that their predecessors could have imagined. We are no longer dealing with threats from firearms and conventional explosives, but with the possibility of weapons of mass destruction, including nuclear devices and biological and chemical agents. The damage that such attacks could inflict on the nation, measured in terms of loss of life, economic and social disruption, and the consequent sacrifice of civil liberties, is extraordinary. The events of September 11 brought this home with crystal clarity. Third, 21st-century terrorists operate within a global communications network that enables them both to hide their existence from outsiders and to communicate with one another across continents at the speed of light. Effective safeguards against terrorist attacks require the technological capacity to ferret out such communications in an international communications grid. Fourth, many of the international terrorists that the United States and other nations confront today cannot realistically be deterred by the fear of punishment. The conventional means of preventing criminal conduct—the fear of capture and subsequent punishment—has relatively little role to play in combating some contemporary terrorists. Unlike the situation during the Cold War, in which the Soviet Union was deterred from launching a nuclear strike against the United States in part by its fear of a retaliatory counterattack, the terrorist enemy in the 21st-century is not a nation state against which the United States and its allies can retaliate with the same effectiveness. In such circumstances, detection in advance is

essential in any effort to “provide for the common defence.” Fifth, the threat of massive terrorist attacks involving

War Powers

Obama has sweeping executive power now

Cruz 15 – United States Senator from Texas, served as the Solicitor General of Texas from 2003-2008 (Ted Cruz, Winter 2015, "THE OBAMA ADMINISTRATION'S UNPRECEDENTED LAWLESSNESS," Harvard Journal of Law and Public Policy, Lexis)//twontwon

IV. THE OBAMA ADMINISTRATION'S UNPRECEDENTED NONENFORCEMENT OF FEDERAL LAW Unlike the presidential actions explained above, President Obama has categorically disregarded entire domestic policy statutes without any colorable constitutional objection.²²¹ There is no basis in history for this sweeping view of executive power. Reasonable constitutional objections formed the basis for Lincoln's suspension of habeas corpus, Johnson's objections to removal restrictions, Roosevelt's objections to removal restrictions and legislative veto provisions, and refusals to abide by the War Powers Resolution. While Truman's seizure of the steel mills, Reagan's arms sales, and Bush's memorandum instructing Texas to obey the International Court of Justice may have been examples of a President disregarding federal law due to policy differences, those three instances were isolated outliers in American history and all involved foreign affairs. In contrast, President Obama has repeatedly ignored domestic policy statutes because he disagrees with them as a policy matter.²²² This nonenforcement usurps Congress's legislative power and sets a dangerous precedent that allows future Presidents to disregard the duty to take care that the laws be faithfully executed. Imagine if a future Republican President were to disregard financial regulation like Sarbanes-Oxley or DoddFrank, or campaign finance regulation like McCain-Feingold, or environmental laws, because the President disagreed with the underlying policy. Democrats would be furious, and rightfully so. Yet the following examples of President Obama's disregard of federal law establish a pattern of suspending laws based on the policy prerogatives of this Administration. A. Obamacare President Obama's strategic nonenforcement of Obamacare—his "signature legislative achievement"—is the most egregious example of this Administration's failure to take care that the laws be faithfully executed.²²³ In at least six major ways, the Obama Administration has ignored and contravened the express text of the Affordable Care Act, even though there are no colorable constitutional rationales for doing so. First, without statutory authority, the Obama Administration unilaterally delayed the health insurance requirements imposed by Obamacare. Obamacare establishes the types of plans health insurance companies can offer consumers.²²⁴ These stringent requirements led to "at least 4.7 million" health plans being cancelled as of December 2013.²²⁵ These cancellations occurred, of course, despite the President's repeated assurances that "if you like your health care plan, you keep your health care plan" after the passage of Obamacare.²²⁶ Perhaps because the President saw that the devastating effects of Obamacare's requirements were not aligning with his promises, his administration unilaterally declared that individuals could continue purchasing health care plans in 2014 even if those plans violate the express requirements of the Affordable Care Act and its regulations.²²⁷ Months later, following Obamacare's disastrous rollout, the Administration extended this delay to 2016, past the mid-term elections.²²⁸ The Act, however, was required by statute to take effect on January 1, 2014.²²⁹ To make matters worse, the President remarkably threatened to veto any legislation that codified this lawless exemption that the Administration unilaterally imposed.²³⁰ That is the opposite of taking care that the laws be faithfully executed; that is usurping Congress's legislative power while then blocking Congress from enacting the precise policy supported by the President. Second, President Obama effectively delayed Obamacare's individual mandate for two years by massively expanding existing exemptions from the individual mandate to allow anyone claiming hardship an exemption. The individual mandate is a statutory command that imposes monetary penalties on most people who fail to maintain health insurance coverage required by Obamacare.²³¹ This was "Congress's solution" to "prevent[] costshifting by those who would otherwise go without [health insurance]" and "force [] into the insurance risk pool more healthy individuals."²³² After Obamacare's failed rollout, the Administration said it would allow people to opt out of the individual mandate for two years if they simply filled out a form attesting that the Obamacare health insurance exchange plans were too expensive.²³³ Strikingly, just months earlier, the President and Senate Democrats chose to force a government shutdown instead of accepting a one-year delay of the individual mandate.²³⁴ So just like President Obama's threat to veto legislation implementing his unilateral waiver of Obamacare's health insurance requirements, here again the President and Democrats blocked legislation that would have achieved the same policy objective that the President unlawfully imposed through executive fiat. Third, the Obama Administration has decreed that Obamacare's out-of-pocket caps will not apply in 2014. Obamacare caps the amount of out-of-pocket costs that people have to spend on their own health insurance.²³⁵ So according to federal law, starting in 2014, individuals and families would have to spend no more than \$6,350 and \$12,700, respectively.²³⁶ But just like it delayed the health insurance requirements, the Obama Administration unilaterally delayed enforcement of the out-of-pocket caps—burying the announcement of the delay in one of 137 Affordable Care Act FAQs found on the Department of Labor's website.²³⁷ Fourth, this Administration ignored the plain text of Obamacare when it delayed the employer mandate—twice. Obamacare penalizes employers who employ over fifty "full-time" employees if they do not offer health care coverage that the government deems to be "affordable," and the employee consequently receives a federal subsidy to purchase an insurance plan in a state health insurance exchange.²³⁸ Yet the Obama Administration announced, in a blog post, that it would not enforce the employer mandate in 2014.²³⁹ Months later, it delayed the employer mandate for medium-sized employers until 2016.²⁴⁰ Fifth, the Administration drastically expanded the individual and employer mandates and is sending billions of dollars in subsidies to insurance companies beyond what the text of Obamacare allows by granting federal subsidies to buy health insurance in all states instead of only in those states that create health insurance exchanges. According to the statute, the employer mandate is only supposed to be assessed if at least one full-time employee is enrolled in a health insurance exchange for which a federal tax credit subsidy is available.²⁴¹ These federal subsidies are available only when an individual purchases a health plan "through an Exchange established by the State."²⁴² According to Obamacare's text, the subsidies are not available if the health plan is purchased through an exchange not established by a state, such as a federally established exchange. Consequently, no federal subsidies should be available in the 36 states that have refused to create health insurance exchanges.²⁴³ A three-judge panel of the D.C. Circuit has already affirmed this plain text reading of Obamacare.²⁴⁴ Although the Fourth Circuit refused to enforce the statutory text, that decision has been appealed to the Supreme Court, and the case will be decided this Term.²⁴⁵ If subsidies are not available in states that do not form exchanges, the individual mandate will apply to significantly fewer people in those states—because the individual mandate applies only if the annual cost of the least expensive coverage minus subsidies exceeds 8% of projected household income.²⁴⁶ But instead of following the plain text of Obamacare, the Administration is granting federal subsidies in every state, including those that have not created state health insurance exchanges.²⁴⁷ The Administration lawlessly interpreted "Exchange established by the State" to include federally established exchanges.²⁴⁸ Sixth, the Obama Administration ignored the text of Obamacare to grant subsidies to members of Congress and their congressional staff. Obamacare and other federal statutes contain explicit language requiring members and their staff to get their health insurance through exchanges without subsidies.²⁴⁹ Specifically, members and most congressional staff are required, by Obamacare, to purchase individual health plans from exchanges just like millions of Americans.²⁵⁰ But the federal subsidies for health insurance that members and staff have received in the past are only available if their plans were "group insurance policies," to quote a federal statute.²⁵¹ The ACA makes no provision for the government to continue to pay premiums on behalf of members and their congressional staff.²⁵² Yet, because that requirement is onerous, the Administration granted the request from Senate Democrat Majority Leader Harry Reid to disregard the plain language of the statute.²⁵³ According to the Administration, the individual health plans Members and staff bought through health exchanges qualify as "group" plans, enabling the Administration to give these subsidies to Members and staff unlawfully.²⁵⁴ All of these refusals to enforce the plain text of Obamacare share a crucial element in common: The President is categorically suspending statutory text without believing that the statute is unconstitutional. Rather, as President Obama's politically-appointed Assistant Secretary for Tax Policy explained,²⁵⁵ the Administration's refusal to enforce Obamacare is rooted in policy considerations of "adaptation[]" and "flexibility[]," as well as "concerns about the complexity of the requirements and the need for more time to implement them effectively."²⁵⁶ These failures to enforce Obamacare may prove beneficial to those Congress intended to regulate, and they may also prove more convenient for the administrative agencies who failed to promulgate appropriate regulations according to statutorily established timelines.²⁵⁷ The Administration has argued that prosecutorial discretion justifies the failure to enforce Obamacare. But prosecutorial discretion does not allow wholesale suspension of statutory provisions, which is precisely what this Administration has done in lawlessly implementing its signature legislative achievement. The Constitution does not recognize convenience and political expediency as reasons for executive suspension of laws. To the contrary, the Take Care Clause requires faithful enforcement of all laws—even laws the President wishes he did not have to enforce. B. Immigration Obamacare is not the only statute that President Obama has ignored on policy grounds. He has also ignored immigration law. President Obama recently announced that he would unilaterally grant amnesty to around five million illegal immigrants.²⁵⁸ This prompted Professor Turley, a noted liberal, to observe, "What the President is suggesting is tearing at the very fabric of the Constitution."²⁵⁹ In fact, years earlier, the President expressly acknowledged he had no authority to do this. In March 2011, he said, "With respect to the notion that I can just suspend deportations through

executive order, that's just not the case, because there are laws on the books that Congress has passed."²⁶⁰ Moreover, President Obama remarked that if he granted any additional amnesty, "I would be ignoring the law in a way that I think would be very difficult to defend legally."²⁶¹ The President's November 2014 amnesty did much more than just "prioritize" resources for removing illegal immigrants-it purported to affirmatively grant work authorizations for the millions of illegal immigrants covered by the edict. Prosecutorial discretion, of course, cannot justify the Administration's affirmative act to try to grant work authorizations, as prosecutorial discretion only deals with government inaction based on the individual facts and circumstances of a particular case. In anticipation of this objection, the Administration's Office of Legal Counsel (OLC) released a memo that unsuccessfully tries to justify these work authorizations on the basis that the Immigration and Nationality Act delegated the President this authority.²⁶² The memo misreads 8 U.S.C. § 1324a(h)(3) in a manner that would give the President carte blanche to grant work authorization to any alien who is in the United States illegally. Section 1324a(h)(3)-entitled "Definition of unauthorized alien"- a subsection of the federal prohibition on hiring illegal immigrants, and it defines which illegal immigrants count as "unauthorized alien[s]" who cannot be hired. It provides, in full: As used in this section, the term 'unauthorized alien' means, with respect to the employment of an alien at a particular time, that the alien is not at that time either (A) an alien lawfully admitted for permanent residence, or (B) authorized to be so employed by this chapter or by the Attorney General [now the Secretary of Homeland Security]. The OLC memo interprets this definitional subsection not as a mere definition, but as an independent source of power for the DHS Secretary to grant work authorizations to any class of aliens.²⁶³ Under this reading, when § 1324a(h)(3) says "unauthorized alien[s]" are those who are not "authorized to be so employed ... by the Attorney General," that subsection is implicitly giving the Administration power to grant every single alien an authorization to work. Under that reading, there is no limit on the Administration's unilateral power to grant any illegal alien-including illegal immigrants not covered by the November 2014 amnesty-work authorizations. The OLC memo's interpretation of § 1324a(h)(3) is flawed in at least two interrelated ways. First, that subsection is merely a definition of which aliens count as "unauthorized" for work, and it does not purport to grant the Administration any additional power. Second, other provisions of the Immigration and Nationality Act already delineate narrow circumstances when the Administration "may grant work authorization to aliens lacking lawful immigration status"²⁶⁴-to quote the OLC memo itself-yet those provisions would be rendered superfluous under the OLC memo's reading of § 1324a(h)(3). In short, Congress never delegated to the executive branch complete discretion to grant work authorizations to any and all illegal immigrants. Instead, Congress created specific statutory provisions that cabined the Administration's power to do so, and the OLC memo ignores these structural limits by erroneously construing a definitional subsection, § 1324a(h)(3), to grant the Administration sweeping powers. The November 2014 amnesty was not the first time the Obama Administration ignored immigration law. Congress rejected-at least ten times since 2001-the Development, Relief, and Education for Alien Minors Act (DREAM Act),²⁶⁵ which would have allowed certain illegal immigrants a path to citizenship if they arrived in the United States illegally when they were fifteen years old or younger and met other requirements.²⁶⁶ Nevertheless, in January 2011, President Obama essentially implemented the DREAM Act through executive fiat. An Obama Administration Department of Homeland Security memorandum declared that "in the absence of Comprehensive Immigration Reform, USCIS can extend benefits and/or protections to many individuals and groups by... exercising discretion with regard to ... deferred action"-that is, "an exercise of prosecutorial discretion not to pursue removal from the U.S. of a particular individual for a specific period of time."²⁶⁷ Over a year later, on June 15, 2012, DHS instituted a "deferred action" program, currently known as the Deferred Action for Childhood Arrivals program (DACA).²⁶⁸ DACA includes a list of eligibility criteria that closely tracks the failed DREAM Act's criteria including that the individual must have arrived before turning sixteen, and DACA is purportedly based on "an exercise of prosecutorial discretion."²⁶⁹ Although the DACA order couches itself in terms of prosecutorial discretion used "on an individual basis," its instructions describe a broad-ranging program that preemptively applies to a wide scope of individuals who are not yet subject to any kind of removal order.²⁷⁰ Rather than clarifying a legitimate use of a prosecutor's discretion to bring or modify charges in a particular case, the order creates a wide-ranging policy framework with instructions to affirmatively apply it to an indeterminate group of people that have yet to be identified. The Obama Administration has invoked the doctrine of prosecutorial discretion to support its various rounds of immigration amnesty, most recently in the November 2014 OLC memo.²⁷¹ But the November 2014 amnesty and DACA are far from legitimate uses of prosecutorial discretion. Simply saying the words "resource allocation," "individual basis," and "prosecutorial discretion" does not let the President wave a magic wand and make the Take Care Clause disappear. For example, DACA's criteria are general, "applying to every member of a class of perhaps 1.76 million people on the basis of a limited number of common characteristics. It requires no searching, [and no] individualized evaluation of the merits of particular applicants. All who possess the designated characteristics will qualify."²⁷² And as Justice Scalia has noted, "The husbanding of scarce enforcement resources ... can hardly be the justification for this [policy], since the considerable administrative cost of conducting as many as 1.4 million background checks, and ruling on the biennial requests for dispensation that the nonenforcement program envisions, will necessarily be deducted from immigration enforcement."²⁷³ Recall former Obama Administration official Professor Cass Sunstein's words: "[T]here is a distinction" between "setting] enforcement priorities" and "allocat[ing] resources" versus "refusing to carry out the obligations that Congress has imposed on the executive."²⁷⁴ By rejecting the DREAM Act over ten times, Congress imposed on the President the command that he had to follow existing immigration statutes instead of the amendments contained in the DREAM Act. The Administration's November 2014 amnesty and its administrative implementation of the DREAM Act through DACA are not programs where the government decides in certain facts and circumstances not to enforce immigration laws because specific offices need to allocate resources differently. The November 2014 amnesty and DACA are blanket executive decrees that the President will not enforce this law "which it disapproves."²⁷⁵ Those decrees and their implementation violate the Take Care Clause. C. Drugs The federal Controlled Substances Act assigns mandatory minimum sentences for certain drug crimes.²⁷⁶ Obama Administration Attorney General Eric Holder, nevertheless, has said the Department Of Justice "will no longer pursue mandatory minimum sentences for certain low-level, nonviolent drug offenders."²⁷⁷ That does not mean the Obama Administration will seek sentences greater than the mandatory minimums for these crimes. Rather, it means these crimes will not be prosecuted at all. Reasonable minds can disagree about whether mandatory minimum sentences are too harsh for certain drug crimes. In fact, I have cosponsored the Smarter Sentencing Act, which would reduce mandatory minimum sentences for certain low-level, nonviolent drug offenses.²⁷⁸ But that is the constitutionally permissible way to address this situation-by amending the existing statutes in Congress, rather than the President dispensing with these drug laws. While the executive's prosecutorial discretion lets it allocate enforcement resources, as explained above, this discretion does not allow categorical reprieves from federal statutes. Yet the Attorney General has announced that for an entire set of drug crimes, categorically and prospectively, the Obama Administration will not enforce duly enacted criminal laws.²⁷⁹ A proper exercise of prosecutorial discretion would allow the President to not prosecute outlier cases. But prosecutorial discretion cannot properly be used on a categorical basis, for this violates the Take Care Clause. Once again, the Obama Administration has distorted the separation of powers, usurped Congress's legislative power, and failed to take care that the laws be faithfully executed.

D. Welfare In 1996, President Clinton signed into law the Personal Responsibility and Work Opportunity Reconciliation Act, which created the Temporary Assistance for Needy Families (TANF) program.²⁸⁰ TANF sought to discourage dependency and encourage employment by placing restrictions on welfare allocations. TANF gave states grants²⁸¹ and provided that individuals could only receive benefits for up to five years.²⁸² It also mandated that recipients engage in work within two years of receiving benefits,²⁸³ and this provision was heralded as the reason TANF succeeded.²⁸⁴ Welfare reform was a tremendous policy success, helping millions stand on their own feet and achieve the American dream. Welfare rolls were decreased by half and the poverty rate for African-American children reached its lowest point in U.S. history.²⁸⁵ The Obama Administration, in an HHS memorandum full of legalese, declared that states no longer had to follow TANF's work requirements and could dispense welfare even if recipients did not meet the TANF statutory standards.²⁸⁶ In the 1996 Act, however, Congress already provided a list of which statutory provisions the federal

government could waive.²⁸⁷ The only part of TANF that was included in that list of waivable provisions was Section 402, which dealt with reporting requirements obligating states to tell HHS that they are complying with TANF.²⁸⁸ TANF's work requirements in Section 407 were not listed as waivable. Nevertheless, the Obama Administration's HHS memorandum claims that because the federal government can waive TANF's reporting requirements in Section 402, it also has the authority to waive the substantive work requirements in Section 407.²⁸⁹ In the sixteen years since the 1996 Act was passed, no Administration had ever asserted this authority,²⁹⁰ because the statute's clear text forbids waiving TANF's work requirements. Although the Administration couches its argument as a dispute about statutory construction, this

outlandish interpretation is just another example of President Obama ignoring duly enacted congressional laws. V. CONCLUSION President **Obama's lawlessness is unprecedented in American history**. Unlike any President before, President Obama has **brazenly disregarded** duly enacted **statutes passed by Congress in a categorical, sweeping manner without raising** any constitutional **objections**. The Take Care Clause was explicitly included in the Constitution to prevent the President from wielding the suspension and dispensation powers that had been abused by English kings. Not all Presidents in our history have acted in accordance with federal law. But of the most notable examples of Presidents fighting with Congress, most of these involved legitimate constitutional arguments about whether the executive or legislature had certain powers. Lincoln's suspension of habeas corpus, Johnson's objections to removal restrictions, Roosevelt's objections to removal restrictions and legislative veto provisions, and refusals to abide by the War Powers Resolution were reasonable constitutional disputes between the branches. Foreign affairs concerns were present in the other examples—Truman's seizure of the steel mills, Reagan's arms sales, and Bush's memorandum to Texas to obey the International Court of Justice. In contrast, President Obama has pretended that various domestic policy statutes do not exist when he disagrees with them based on his own policy preferences. As a United States Senator, Barack Obama had the power to introduce legislation and be part of Congress wielding its Article I legislative power. But as President, **Obama** does not have the power to legislate. He does not have the power to refuse enforcement of laws based simply on policy concerns. His repeated **assertions of this power to suspend and dispense with duly-enacted laws** violate the Take Care Clause and represent a profound threat to our constitutional checks and balances and, ultimately, to individual liberty.

Curtailing domestic surveillance undermines the sole organ doctrine – which underpins every facet of presidential power

Wood and Webb 11 – Department of Political Science at Texas A&M University, presented to the faculty at Vanderbilt University (B Dan Wood, Clayton Webb, 10/17/11, "EXPLAINING PRESIDENTIAL SABER RATTLING," http://www.vanderbilt.edu/csdi/events/Wood_Presidential_Saber_Rattling_112111.pdf)/twon twon

The courts affirmed early on **that** as sovereign leaders, **presidents are the nation's chief foreign policy representative**. Future Supreme Court Justice John Marshall stated in 1800 when he served in the U.S. House of Representatives —The President is **the sole organ of the nation in its external relations**, and its sole representative with foreign nations.¹ (10 Annals of Congress 613) Relying on Marshall's —sole organ doctrine, Supreme Court Justice George Sutherland wrote in 1937 (United States vs. Curtiss-Wright Export Corp , 299 U.S. 319) —In this vast external realm [foreign policy], with its important, complicated, delicate and manifold problems, **the President alone has the power to speak** or listen **as a representative of the nation**.¹ **While the plenary nature** of executive authority in foreign relations **is not universally accepted (e.g., see the persuasive arguments by Fisher 2006, 2007a, 2007b, 2007c, 2007d, 2007e, 2008a, 2008b), ***FOOTNOTE BEGINS***** . 2007d. "Statement by Louis Fisher appearing before the House Committee on the Judiciary, "Constitutional **Limitations on Domestic Surveillance**." ed. L. L. o. Congress. *****FOOTNOTE ENDS*** the modern chief executive relies extensively on the —sole organ doctrine to define presidential power broadly, and it is now commonly assumed that presidents are the sole representatives of the nation** to the outside world.

Congressional war authority is ineffective – executive war powers key to combating a litany of transnational threats – combating terror, rogue states, and proliferate all require a flexible executive

Yoo 7 (John is a professor of law at the Boalt Hall School of Law at the University of California, Berkeley, and visiting scholar at the American Enterprise Institute. He has also served as general counsel for the Senate Judiciary Committee; as a law clerk to Justice Clarence Thomas and Judge Laurence H. Silberman; and, from 2001 to 2003, as a Deputy Assistant Attorney General in the Office of Legal Counsel of the U.S. Department of Justice. 4/18, "Exercising Wartime Powers," <http://hir.harvard.edu/archives/1369//dtang>

Proponents of congressional war power often argue that the executive branch is unduly prone to war. In this view, if the president and Congress have to agree on waging war, the nation will enter fewer wars and wars that do occur will arise only after sufficient deliberation. But it is far from clear that outcomes would be better if Congress alone had the power to begin wars. First, congressional deliberation does not necessarily ensure consensus. Congressional authorization may represent only a bare majority of Congress or an unwillingness to challenge the President's institutional and political strengths, regardless of the merits of the war. And even if it does represent consensus, it is no guarantee of consensus after combat begins. The Vietnam War, which was initially approved by Congress, did not meet with a consensus over the long term but instead provoked some of the most divisive politics in US history. It is also difficult to claim that congressional authorizations to use force in Iraq, either in 1991 or 2002, reflected a deep consensus over the merits of the wars there. The 1991 authorization barely survived the Senate, and the 2002 authorization received significant negative votes and has become a deeply divisive issue in national politics. It is also not clear that the absence of congressional approval has led the nation into wars it should not have waged. The experience of the Cold War, which provides the best examples of military hostilities conducted without congressional support, does not clearly come down on the side of a link between institutional deliberation and better conflict selection. Wars were fought throughout the world by the two superpowers and their proxies, such as in Korea, Vietnam, and Afghanistan, during this period. Yet the only war arguably authorized by Congress--and this point is debatable--was the Vietnam War. Aside from bitter controversy over Vietnam, there appeared to be significant bipartisan consensus on the overall strategy of containment, as well as the overarching goal of defeating the Soviet Union. The United States did not win the four-decade Cold War by declarations of war; rather, it prevailed through the steady presidential application of the strategy of containment, supported by congressional funding of the necessary military forces. On the other hand, congressional action has led to undesirable outcomes. Congress led the United States into two "bad" wars, the 1798 quasi-war with France and the War of 1812. Excessive congressional control can also prevent the United States from entering into conflicts that are in the national interest. Most would agree now that congressional isolationism before World War II harmed US interests and that the United States and the world would have been far better off if President Franklin Roosevelt could have brought the United States into the conflict much earlier. Congressional participation does not automatically or even consistently produce desirable results in war decision making. Critics of presidential war powers exaggerate the benefits of declarations or authorizations of war. What also often goes unexamined are the potential costs of congressional participation: delay, inflexibility, and lack of secrecy. In the post-Cold War era, the United States is confronting the growth in proliferation of WMDs, the emergence of rogue nations, and the rise of international terrorism. Each of these threats may require pre-emptive action best undertaken by the President and approved by Congress only afterward. Take the threat posed by the Al Qaeda terrorist organization. Terrorist attacks are more difficult to detect and prevent than conventional ones. Terrorists blend into civilian populations and use the channels of open societies to transport personnel, material, and money. Although terrorists generally have no territory or regular armed forces from which to detect signs of an impending attack, WMDs allow them to inflict devastation that once could have been achievable only by a nation-state. To defend itself from this threat, the United States may have

to use force earlier and more often than when nation-states generated the primary threats to US national security. **The executive branch needs the flexibility to act quickly,** possibly in situations wherein congressional consent cannot be obtained in time to act on the intelligence. By acting earlier, the executive branch might also be able to engage in a **more limited, more precisely targeted, use of force.** Similarly, the least dangerous way to prevent rogue nations from acquiring WMDs may depend on **secret intelligence gathering and covert action** rather than open military intervention. **Delay** for a congressional debate could **render useless any time-critical intelligence or windows of opportunity.** The Constitution creates a presidency that is uniquely structured to act forcefully and independently to repel serious threats to the nation. Instead of specifying a legalistic process to begin war, the Framers wisely created a fluid political process in which legislators would use their appropriations power to control war. As the United States confronts terrorism, rogue nations, and WMD proliferation, we should look skeptically at claims that radical changes in the way we make war would solve our problems, even those stemming from poor judgment, unforeseen circumstances, and bad luck.

UQ

2nc – uniqueness

Status quo statues are structurally incapable of inhibiting the president

Pildes 12 – Sulder Family Professor of Constitutional Law @ NYU School of Law and Co-Director at the NYU Center on Law and Security (Richard H. Pildes, April 2012, “Law and the President,” 125 Harv. L. Rev. 1381, Lexis)//twontwon

The general outlines of this history are familiar. But in a bracing new book, *The Executive Unbound*, Professors Eric Posner and Adrian Vermeule want to take this story to a different quantum level. Posner and Vermeule insist not just that presidential powers have expanded dramatically in recent decades but that these powers are not effectively constrained by law. The stark reality of presidential power, as they put it, is that “law does little to constrain the modern executive” (p. 15). This is true, they assert, not just in exceptional circumstances, such as times of crisis or emergency, but in general in the modern state. This unconstrained power allegedly exists not just with respect to limited substantive arenas, such as foreign affairs or military matters, but across the board, with respect to domestic matters as well. 18 Thus, while some have long argued that *inter arma enim silent leges* (in times of war, the laws are silent), 19 Posner and Vermeule argue that the laws [*1386] are always silent, in effect, when it comes to presidential power. Finally, they contend that this proposition is not just true with respect to some sources of potential legal constraint, such as the Constitution; it is central to their argument that statutes that purport to regulate presidential conduct are also largely ineffective. As they say, “the basic aspiration of liberal legalism to constrain the executive through statutory law has largely failed” (p. 112). Thus, when Congress does impose legislative constraints, Posner and Vermeule assert, the laws are typically vague, leaving ample room for executive discretion. Statutes “have a **Potemkin quality**: they stand about in the landscape, providing an impressive facade of legal constraint on the executive, but actually blocking very little action that presidents care about” (p. 88). Those legal constraints that do exist, whether constitutional or statutory, are not aggressively enforced by courts - first, because American courts stay out of many controversies concerning presidential power, and second, because when courts do play a role, they defer substantially to executive action and interpretation (pp. 52-58). Indeed, presidents can act directly in the face of even clear law and can force other institutions, such as Congress and the courts, to try to stop them. Much of the time, these other institutions will be unable or unwilling to do so. *The Executive Unbound* thus invites a general inquiry into the relationship between law and presidential power, rather than the more traditional, narrowly focused debates about presidential power during “emergencies,” or presidential control over military and foreign affairs. 20 As a more general matter, Posner and Vermeule insist we should abandon as naive, self-deluded, and anachronistic the image and rhetoric of a President bound by law - an image they call that of “liberal legalism” or the “Madisonian framework” (p. 15). The imperial presidency, they suggest, is simply a fact: we need to become mature enough to accept it. And we should be clear about what the imperial presidency entails: presidential action that law does not meaningfully constrain. Posner and Vermeule, however, urge us not to be anxious or worried about this state of affairs. We should not obsessively fear that we live, effectively, in a constitutional dictatorship. The alternative to a legally constrained President is not a President unconstrained altogether. [*1387] Instead, Posner and Vermeule suggest that a variety of other constraints on presidential action have emerged as effective substitutes for the legal constraints that were originally envisioned in the Madisonian constitutional design or that “liberal legalist” proponents wish for today. Generally put, Posner and Vermeule call these alternative constraints “politics and public opinion” (p. 15), which are said to work effectively to cabin executive power to an appropriate extent. Much of their book is devoted to explaining in a systematic fashion how these nonlegal constraints purportedly work. Indeed, the combination that Posner and Vermeule both describe and celebrate of presidential discretion and nonlegal constraints on executive power yields a better functioning governmental system (presumably in utilitarian terms) than would a presidency seriously constrained by law. First, they argue, a President unbound can produce better outcomes than a President bound to follow preexisting legislation: laws (constitutions and statutes) are always written in a specific context in the past, but technology, the economy, international dynamics, and other circumstances that characterize the modern age are exceptionally fluid

and constantly shifting. Better to have presidents make their best judgment, all things considered, about the right action in the actual, immediate circumstances at hand than to have them be bound by laws that could not have contemplated these precise circumstances. Second, and central to Posner and Vermeule's analysis, presidents do remain constrained - not by law, but by politics and the political judgment of others. As scholars since Richard Neustadt, if not earlier, have recognized, the actual, effective powers of a President (as opposed to the formal powers of the office) are directly rooted in, and limited by, his or her ongoing credibility. 21 Presidents want the capacity to exercise their best judgment as contexts arise.

Broad executive powers are low – but war powers are uniquely protected

Benen 15 – (Steve Benen, 2/13/15, “GOP flips the script, endorses executive overreach,” <http://www.msnbc.com/rachel-maddow-show/gop-flips-the-script-endorses-executive-overreach//twemchen>)

The good news is, six months after President Obama launched a military offensive against ISIS targets in the Middle East, Congress is starting to debate the U.S. mission. The bad news is, the debate is off to a ridiculous start. President Barack Obama should be asking for more power to wage war against Islamic State extremists, some Republicans on the U.S. House Foreign Affairs committee said. [...] While Republicans have repeatedly accused Obama of executive overreach in areas such as immigration, several lawmakers at the hearing questioned why he wasn't seeking broader authority this time. You've probably heard that the GOP is outraged by the White House's proposed Authorization for the Use of Military Force (AUMF), but it's important to understand why. About a year ago, the Republican condemnation of President Obama shifted – “he doesn't lead enough” was out, “he leads too much” was in. The more Obama's policy agenda succeeded in practical terms, the more the GOP argued the president is a lawless, out-of-control tyrannical dictator, hell bent on limitless power without regard for the Constitution. This week, however, Republicans are disgusted by Obama's lack of executive overreach. GOP lawmakers are suddenly convinced [Obama] the tyrannical dictator needs even more sweeping powers to act unilaterally in matters of life and death. House Speaker John Boehner (R-Ohio), who occasionally pretends to believe his party's talking points, expressed dismay yesterday that the president's AUMF would “tie his hands even further.” Congress' top lawmaker apparently hopes for a more diminished role for Congress. This isn't so much an example of Republicans temporarily putting aside their principles for the sake of convenience. Rather, it's fresh evidence that the principles themselves have always been a mirage. Republicans think Obama must stop acting like a dictator and start working with Congress as the Constitution intended – unless we're talking about wars, in which case Obama should go ahead and circumvent Congress as much as possible. Republicans think higher deficits are an economic scourge – unless deficit financing advances conservative policy goals, in which case budget shortfalls are better left ignored. Republicans think government spending is inherently wasteful and counter-productive – unless the investments are directed at their state and/or their policy priorities, in which case government spending is great. Republicans think the big federal government shouldn't interfere with local decision making – unless the residents of the District of Columbia make a decision the right disagrees with.

2nc – uniqueness – inherent powers

Congress is barred from infringing on the president's inherent powers in the squo – only durable fiat triggers the impact

Gormley 6 – Associate Prof. of Constitutional Law at Duquesne University School of Law (Ken Gormley, 2/28/6, "U.S. SENATOR ARLEN SPECTER (R-PA) HOLDS A HEARING ON THE NSA'S SURVEILLANCE AUTHORITY," Political Transcript Wire, Lexis)//twontwon

GORMLEY: I think the confrontation is between the president's powers under the executive power clause and commander in chief clause and the Fourth Amendment. I don't think Congress can narrow the Fourth Amendment. I don't think Congress can take away the president's independent powers. I think that the Fourth Amendment does allow at least some domestic surveillance when you're talking about people the president believes are foreign terrorists. I don't doubt that will mean some injustice or some innocent people will be listened to. But the president makes all sorts of decisions in terms of targeting decisions that kill innocent people around the world, because that's the nature of war. It's unfortunate, but I don't think FISA can really play in this game when you're talking about major constitutional powers.

2nc – uniqueness – powers now

War powers soaring now

Sullivan 14 – staff writer @ The Hill (Peter Sullivan, 9/11/14, “Ex-Bush official rips Obama’s ‘breathhtaking’ expansion of war powers,” <http://thehill.com/blogs/blog-briefing-room/217405-former-bush-official-rips-obamas-breathhtaking-expansion-of-war>)/twontwon

A former Bush administration lawyer slammed President Obama on Thursday for "an astonishing legacy of expanding presidential war powers." Jack Goldsmith, an assistant attorney general under President George W. Bush, criticized Obama's declaration Wednesday night that he already has the authority to hit the Islamic State of Syria and Iraq (ISIS). "The president's gambit is, at bottom, presidential unilateralism masquerading as implausible statutory interpretation," Goldsmith wrote in Time. Obama in his speech said he would "welcome congressional support" for taking on ISIS, but administration officials say he already has the authority under a force resolution passed by Congress in the aftermath of the Sept. 11 attacks. A senior U.S. official emailed to The Guardian the reasoning that ISIS "is the true inheritor of Usama bin Laden's legacy." Goldsmith takes issue with that argument, saying it amounts to authority for endless war. "If this remarkably loose affiliation with al Qaeda brings a terrorist organization under the 2001 law, then Congress has authorized the president to use force endlessly against practically any ambitious jihadist terrorist group that fights against the United States," he wrote. Goldsmith also took issue with Obama's past actions, including airstrikes to protect members of the Yazidi sect trapped on a mountain in Iraq last month. "Although he backed down from his threat to invade Syria last summer, President Obama proclaimed then the power to use unilateral force for purely humanitarian ends without congressional or United Nations or NATO support," he writes. "This novel theory, which removed all practical limits on presidential humanitarian intervention, became a reality in last month's military strikes to protect civilians trapped on Mount Sinjar and in the town of Amiri." Goldsmith traces the theme back to 2011 strikes in Libya, as well. "His lawyers argued beyond precedent that the large-scale air attacks did not amount to 'War' that required congressional approval," he writes. "They also blew a large hole in the War Powers Resolution based on the unconvincing claim that the Libya strikes were not 'hostilities' that would have required compliance with the law."

Obama has sweeping executive power now

Cruz 15 – United States Senator from Texas, served as the Solicitor General of Texas from 2003-2008 (Ted Cruz, Winter 2015, “THE OBAMA ADMINISTRATION'S UNPRECEDENTED LAWLESSNESS,” Harvard Journal of Law and Public Policy, Lexis)/twontwon

IV. THE OBAMA ADMINISTRATION'S UNPRECEDENTED NONENFORCEMENT OF FEDERAL LAW Unlike the presidential actions explained above, President Obama has categorically disregarded entire domestic policy statutes without any colorable constitutional objection.²²¹ There is no basis in history for this sweeping view of executive power. Reasonable constitutional objections formed the basis for Lincoln's suspension of habeas corpus, Johnson's objections to removal restrictions, Roosevelt's objections to removal restrictions and legislative veto provisions, and refusals to abide by the War Powers Resolution. While Truman's seizure of the steel mills, Reagan's arms sales, and Bush's memorandum instructing Texas to obey the International Court of Justice may have been examples of a President disregarding federal law due to policy differences, those three instances were isolated outliers in American history and all involved foreign affairs. In contrast, President Obama has repeatedly ignored domestic policy statutes because he disagrees with them as a policy matter.²²² This nonenforcement usurps Congress's legislative power and sets a dangerous precedent that allows future Presidents to disregard the duty to take care that the laws be faithfully executed. Imagine if a future Republican President were to disregard financial regulation like Sarbanes-Oxley or DoddFrank, or campaign finance regulation like McCain-Feingold, or environmental laws, because the President disagreed with the underlying policy. Democrats would be furious,

and rightfully so. Yet the following examples of President Obama's disregard of federal law establish a pattern of suspending laws based on the policy prerogatives of this Administration. A. Obamacare President **Obama's strategic nonenforcement of Obamacare**

-his "signature legislative achievement"-is the most egregious example of this Administration's failure to take care that the laws be faithfully executed.²²³ In at least six major ways, the Obama Administration has ignored and contravened the express text of the Affordable Care Act, even though there are no colorable constitutional rationales for doing so. First, without statutory authority, the Obama Administration unilaterally delayed the health insurance requirements imposed by Obamacare. Obamacare establishes the types of plans health insurance companies can offer consumers.²²⁴ These stringent requirements led to "at least 4.7 million" health plans being cancelled as of December 2013.²²⁵ These cancellations occurred, of course, despite the President's repeated assurances that "if you like your health care plan, you keep your health care plan" after the passage of Obamacare.²²⁶ Perhaps because the President saw that the devastating effects of Obamacare's requirements were not aligning with his promises, his administration unilaterally declared that individuals could continue purchasing health care plans in 2014 even if those plans violate the express requirements of the Affordable Care Act and its regulations.²²⁷ Months later, following Obamacare's disastrous rollout, the Administration extended this delay to 2016, past the mid-term elections.²²⁸ The Act, however, was required by statute to take effect on January 1, 2014.²²⁹ To make matters worse, the President remarkably threatened to veto any legislation that codified this lawless exemption that the Administration unilaterally imposed.²³⁰ That is the opposite of taking care that the laws be faithfully executed; that is usurping Congress's legislative power while then blocking Congress from enacting the precise policy supported by the President. Second, President Obama effectively delayed Obamacare's individual mandate for two years by massively expanding existing exemptions from the individual mandate to allow anyone claiming hardship an exemption. The individual mandate is a statutory command that imposes monetary penalties on most people who fail to maintain health insurance coverage required by Obamacare.²³¹ This was "Congress's solution" to "prevent[] costshifting by those who would otherwise go without [health insurance]" and "force [] into the insurance risk pool more healthy individuals."²³² After Obamacare's failed rollout, the Administration said it would allow people to opt out of the individual mandate for two years if they simply filled out a form attesting that the Obamacare health insurance exchange plans were too expensive.²³³ Strikingly, just months earlier, the President and Senate Democrats chose to force a government shutdown instead of accepting a one-year delay of the individual mandate.²³⁴ So just like President Obama's threat to veto legislation implementing his unilateral waiver of Obamacare's health insurance requirements, here again the President and Democrats blocked legislation that would have achieved the same policy objective that the President unlawfully imposed through executive fiat. Third, the Obama Administration has decreed that Obamacare's out-of-pocket caps will not apply in 2014. Obamacare caps the amount of out-of-pocket costs that people have to spend on their own health insurance.²³⁵ So according to federal law, starting in 2014, individuals and families would have to spend no more than \$6,350 and \$12,700, respectively.²³⁶ But just like it delayed the health insurance requirements, the Obama Administration unilaterally delayed enforcement of the out-of-pocket caps-burying the announcement of the delay in one of 137 Affordable Care Act FAQs found on the Department of Labor's website.²³⁷ Fourth, this Administration ignored the plain text of Obamacare when it delayed the employer mandate-twice. Obamacare penalizes employers who employ over fifty "full-time" employees if they do not offer health care coverage that the government deems to be "affordable," and the employee consequently receives a federal subsidy to purchase an insurance plan in a state health insurance exchange.²³⁸ Yet the Obama Administration announced, in a blog post, that it would not enforce the employer mandate in 2014.²³⁹ Months later, it delayed the employer mandate for medium-sized employers until 2016.²⁴⁰ Fifth, the Administration drastically expanded the individual and employer mandates and is sending billions of dollars in subsidies to insurance companies beyond what the text of Obamacare allows by granting federal subsidies to buy health insurance in all states instead of only in those states that create health insurance exchanges. According to the statute, the employer mandate is only supposed to be assessed if at least one full-time employee is enrolled in a health insurance exchange for which a federal tax credit subsidy is available.²⁴¹ These federal subsidies are available only when an individual purchases a health plan "through an Exchange established by the State."²⁴² According to Obamacare's text, the subsidies are not available if the health plan is purchased through an exchange not established by a state, such as a federally established exchange. Consequently, no federal subsidies should be available in the 36 states that have refused to create health insurance exchanges.²⁴³ A three-judge panel of the D.C. Circuit has already affirmed this plain text reading of Obamacare.²⁴⁴ Although the Fourth Circuit refused to enforce the statutory text, that decision has been appealed to the Supreme Court, and the case will be decided this Term.²⁴⁵ If subsidies are not available in states that do not form exchanges, the individual mandate will apply to significantly fewer people in those states-because the individual mandate applies only if the annual cost of the least expensive coverage minus subsidies exceeds 8% of projected household income.²⁴⁶ But instead of following the plain text of Obamacare, the Administration is granting federal subsidies in every state, including those that have not created state health insurance exchanges.²⁴⁷ The Administration lawlessly interpreted "Exchange established by the State" to include federally established exchanges.²⁴⁸ Sixth, the Obama Administration ignored the text of Obamacare to grant subsidies to members of Congress and their congressional staff. Obamacare and other federal statutes contain explicit language requiring members and their staff to get their health insurance through exchanges without subsidies.²⁴⁹ Specifically, members and most congressional staff are required, by Obamacare, to purchase individual health plans from exchanges just like millions of Americans.²⁵⁰ But the federal subsidies for health insurance that members and staff have received in the past are only available if their plans were "group insurance policies," to quote a federal statute.²⁵¹ The ACA makes no provision for the government to continue to pay premiums on behalf of members and their congressional staff.²⁵² Yet, because that requirement is onerous, the Administration granted the request from Senate Democrat Majority Leader Harry Reid to disregard the plain language of the statute.²⁵³ According to the Administration, the individual health plans Members and staff bought through health exchanges qualify as "group" plans, enabling the Administration to give these subsidies to Members and staff unlawfully.²⁵⁴ All of these refusals to enforce the plain text of Obamacare share a crucial element in common: The President is categorically suspending statutory text without believing that the statute is unconstitutional. Rather, as President Obama's politically-appointed Assistant Secretary for Tax Policy explained,²⁵⁵ the Administration's refusal to enforce Obamacare is rooted in policy considerations of "adaptation]" and "flexibility]," as well as "concerns about the complexity of the requirements and the need for more time to implement them effectively."²⁵⁶ These failures to enforce Obamacare may prove beneficial to those Congress intended to regulate, and they may also prove more convenient for the administrative agencies who failed to promulgate appropriate regulations according to statutorily established timelines.²⁵⁷ The Administration has argued that prosecutorial discretion justifies the failure to enforce Obamacare. But prosecutorial discretion does not allow wholesale suspension of statutory provisions, which is precisely what this Administration has done in lawlessly implementing its signature legislative achievement. The Constitution does not recognize convenience and political expediency as reasons for executive suspension of laws. To the contrary, the Take Care Clause requires faithful enforcement of all laws-even laws the President wishes he did not have to enforce. B. Immigration Obamacare is not the only

statute that President **Obama** has ignored on policy grounds. He has **also ignored immigration law**. President Obama recently announced that he would **unilaterally grant amnesty to** around five million **illegal immigrants**.²⁵⁸ This prompted Professor Turley, a noted liberal, to observe, "What the President is suggesting is **tearing at the very fabric of the Constitution**."²⁵⁹ In fact, **years earlier, the President** expressly acknowledged he **had no authority** to do this. In March 2011, he said, "With respect to the notion that I can just suspend deportations through executive order, that's just not the case, because there are laws on the books that Congress has passed."²⁶⁰ Moreover, President Obama remarked that if he granted any additional amnesty, "I would be ignoring the law in a way that I think would be very difficult to defend legally."²⁶¹ The President's November 2014 amnesty did much more than just "prioritize" resources for removing illegal immigrants-it purported to affirmatively grant work authorizations for the millions of illegal immigrants covered by the edict. Prosecutorial discretion, of course, cannot justify the Administration's affirmative act to try to grant work authorizations, as prosecutorial discretion only deals with government inaction based on the individual facts and circumstances of a particular case. In anticipation of this objection, the Administration's Office of Legal Counsel (OLC) released a memo that unsuccessfully tries to justify these work authorizations on the basis that the Immigration and Nationality Act delegated the President this authority.²⁶² The **memo** misreads 8 U.S.C. § 1324a(h)(3) in a manner that would **give the President carte blanche to grant work authorization to any alien** who is in the United States illegally. Section 1324a(h)(3)-entitled "Definition of unauthorized alien"- a subsection of the federal prohibition on hiring illegal immigrants, and it defines which illegal immigrants count as "unauthorized alien[s]" who cannot be hired. It provides, in full: As used in this section, the term 'unauthorized alien' means, with respect to the employment of an alien at a particular time, that the alien is not at that time either (A) an alien lawfully admitted for permanent residence, or (B) authorized to be so employed by this chapter or by the Attorney General [now the Secretary of Homeland Security]. The OLC memo interprets this definitional subsection not as a mere definition, but as an independent source of power for the DHS Secretary to grant work authorizations to any class of aliens.²⁶³ Under this reading, when § 1324a(h)(3) says "unauthorized alien[s]" are those who are not "authorized to be so employed ... by the Attorney General," that subsection is implicitly giving the Administration power to grant every single alien an authorization to work. Under that reading, there is no limit on the Administration's unilateral power to grant any illegal alien-including illegal immigrants not covered by the November 2014 amnesty-work authorizations. The OLC memo's interpretation of § 1324a(h)(3) is flawed in at least two interrelated ways. First, that subsection is merely a definition of which aliens count as "unauthorized" for work, and it does not purport to grant the Administration any additional power. Second, other provisions of the Immigration and Nationality Act already delineate narrow circumstances when the Administration "may grant work authorization to aliens lacking lawful immigration status"²⁶⁴-to quote the

OLC memo itself-yet those provisions would be rendered superfluous under the OLC memo's reading of § 1324a(h)(3). In short,

Congress never delegated to the executive branch complete discretion to grant work authorizations to any and all illegal immigrants. Instead, Congress created specific statutory provisions that cabined the Administration's power to do so, and the OLC memo ignores these structural limits by erroneously construing a definitional subsection, § 1324a(h)(3), to grant the Administration sweeping powers. The November 2014 amnesty was not the first time the Obama Administration ignored immigration law. Congress rejected-at least ten times since 2001-the Development, Relief, and Education for Alien Minors Act (DREAM Act),²⁶⁵ which would have allowed certain illegal immigrants a path to citizenship if they arrived in the United States illegally when they were fifteen years old or younger and met other requirements.²⁶⁶ Nevertheless, in January 2011, President Obama essentially implemented the DREAM Act through executive fiat. An Obama Administration Department of Homeland Security memorandum declared that "in the absence of Comprehensive Immigration Reform, USCIS can extend benefits and/or protections to many individuals and groups by... exercising discretion with regard to ... deferred action"-that is, "an exercise of prosecutorial discretion not to pursue removal from the U.S. of a particular individual for a specific period of time."²⁶⁷ Over a year later, on June 15, 2012, DHS instituted a "deferred action" program, currently known as the Deferred Action for Childhood Arrivals program (DACA).²⁶⁸ DACA includes a list of eligibility criteria that closely tracks the failed DREAM Act's criteria including that the individual must have arrived before turning sixteen, and DACA is purportedly based on "an exercise of prosecutorial discretion."²⁶⁹ Although the DACA order couches itself in terms of prosecutorial discretion used "on an individual basis," its instructions describe a broadranging program that preemptively applies to a wide scope of individuals who are not yet subject to any kind of removal order.²⁷⁰ Rather than clarifying a legitimate use of a prosecutor's discretion to bring or modify charges in a particular case, the order creates a wide-ranging policy framework with instructions to affirmatively apply it to an indeterminate group of people that have yet to be identified. The Obama Administration has invoked the doctrine of prosecutorial discretion to support its various rounds of immigration amnesty, most recently in the November 2014 OLC memo.²⁷¹ But the November 2014 amnesty and DACA are far from legitimate uses of prosecutorial discretion. Simply saying the words "resource allocation," "individual basis," and "prosecutorial discretion" does not let the President wave a magic wand and make the Take Care Clause disappear. For example, DACA's criteria are general, "applying to every member of a class of perhaps 1.76 million people on the basis of a limited number of common characteristics. It requires no searching, [and no] individualized evaluation of the merits of particular applicants. All who possess the designated characteristics will qualify."²⁷² And as Justice Scalia has noted, "The husbanding of scarce enforcement resources ... can hardly be the justification for this [policy], since the considerable administrative cost of conducting as many as 1.4 million background checks, and ruling on the biennial requests for dispensation that the nonenforcement program envisions, will necessarily be deducted from immigration enforcement."²⁷³ Recall former Obama Administration official Professor Cass Sunstein's words: "[T]here is a distinction" between "setting] enforcement priorities" and "allocat[ing] resources" versus "refusing to carry out the obligations that Congress has imposed on the executive."²⁷⁴ By rejecting the DREAM Act over ten times, Congress imposed on the President the command that he had to follow existing immigration statutes instead of the amendments contained in the DREAM Act. The Administration's November 2014 amnesty and its administrative implementation of the DREAM Act through DACA are not programs where the government decides in certain facts and circumstances not to enforce immigration laws because specific offices need to allocate resources differently. The November 2014

amnesty and DACA are blanket executive decrees that the President will not enforce this law "which it disapproves."²⁷⁵ Those decrees and their implementation violate the Take Care Clause. C. Drugs **The federal Controlled Substances Act assigns mandatory minimum sentences** for certain drug crimes.²⁷⁶

Obama Administration Attorney General Eric **Holder**, nevertheless, has **said the Department of Justice "will no longer pursue mandatory minimum sentences** for certain low-level, nonviolent drug offenders."²⁷⁷ That does not mean the Obama Administration will seek sentences greater than the mandatory minimums for these crimes. Rather, it means these **crimes will not be prosecuted at all**. Reasonable minds can disagree about whether mandatory minimum sentences are too harsh for certain drug crimes. In fact, I have cosponsored the Smarter Sentencing Act, which would reduce mandatory minimum sentences for certain low-level, nonviolent drug offenses.²⁷⁸ But that is the constitutionally permissible way to address this situation-by amending the existing statutes in Congress, rather than the President dispensing with these drug laws. While the executive's prosecutorial discretion lets it allocate enforcement resources, as explained above, this discretion does not allow categorical reprieves from federal statutes. Yet the Attorney General has announced that for an entire set of drug crimes, categorically and prospectively, the Obama Administration will not enforce duly enacted criminal laws.²⁷⁹ A proper exercise of prosecutorial discretion would allow the President to not prosecute outlier cases. But prosecutorial discretion cannot properly be used on a categorical basis, for **this violates the Take Care Clause**. Once again, the **Obama Administration has distorted the separation of powers, usurped Congress's legislative power, and failed to take care that the laws be faithfully executed**.

D. Welfare In 1996, President Clinton signed into law the Personal Responsibility and Work Opportunity Reconciliation Act, which created the Temporary Assistance for Needy Families (TANF) program.²⁸⁰ TANF sought to discourage dependency and encourage employment by placing restrictions on welfare allocations. TANF gave states grants²⁸¹ and provided that individuals could only receive benefits for up to five years.²⁸² It also mandated that recipients engage in work within two years of receiving benefits,²⁸³ and this provision was heralded as the reason TANF succeeded.²⁸⁴ Welfare reform was a tremendous policy success, helping millions stand on their own feet and achieve the American dream. Welfare rolls were decreased by half and the poverty rate for African-American children reached its lowest point in U.S. history.²⁸⁵ The Obama Administration, in an HHS memorandum full of legalese, declared that states no longer had to follow TANF's work requirements and could dispense welfare even if recipients did not meet the TANF statutory standards.²⁸⁶ In the 1996 Act, however, Congress already provided a list of which statutory provisions the federal government could waive.²⁸⁷ The only part of TANF that was included in that list of waivable provisions was Section 402, which dealt with reporting requirements obligating states to tell HHS that they are complying with TANF.²⁸⁸ TANF's work requirements-in Section 407-were not listed as waivable. Nevertheless, the Obama Administration's HHS memorandum claims that because the federal government can waive TANF's reporting requirements in Section 402, it also has the authority to waive the substantive work requirements in Section 407.²⁸⁹ In the sixteen years since the 1996 Act was passed, no Administration had ever asserted this authority,²⁹⁰ because the statute's clear text forbids waiving TANF's work requirements. Although the Administration couches its argument as a dispute about statutory construction, this

outlandish interpretation is just another example of President Obama ignoring duly enacted congressional laws. V. CONCLUSION President **Obama's lawlessness is unprecedented in American history**. Unlike any President before, President Obama has **brazenly disregarded** duly enacted **statutes passed by Congress in a categorical, sweeping manner without raising** any constitutional **objections**. The Take Care Clause was explicitly included in the Constitution to prevent the President from wielding the suspension and dispensation powers that had been abused by English kings. Not all Presidents in our history have acted in accordance with federal law. But of the most notable examples of Presidents fighting with Congress, most of these involved legitimate constitutional arguments about whether the executive or legislature had certain powers. Lincoln's suspension of habeas corpus, Johnson's objections to removal restrictions, Roosevelt's objections to removal restrictions and legislative veto provisions, and refusals to abide by the War Powers Resolution were reasonable constitutional disputes between the branches. Foreign affairs concerns were present in the other examples-Truman's seizure of the steel mills, Reagan's arms sales, and Bush's memorandum to Texas to obey the International Court of Justice. In contrast, President Obama has pretended that various domestic policy statutes do not exist when he disagrees with them based on his own policy preferences. As a United States Senator, Barack Obama had the power to introduce legislation and be part of Congress wielding its Article I legislative power. But as President, **Obama** does not have the power to legislate. He does not have the power to refuse enforcement of laws based simply on policy concerns. His repeated **assertions of this power to suspend and dispense with duly-enacted laws** violate the Take Care Clause and represent a profound threat to our constitutional checks and balances and, ultimately, to individual liberty.

Congress used the war powers resolution to grant authority over surveillance – limits are too ambiguous to limit the executive

SNS 6 – States News Service, citing Sen. Reid (States News Service, 1/24/6, “REVISIONIST HISTORY DOES NOT EXCUSE BREAKING LAW,” States News Service, Lexis)//twontwon

Senator Feingold: Congress owns the war power. But by this resolution, Congress loans it to the President in this emergency. In so doing, we demonstrate our respect and confidence in both our Commander in Chief and our Constitution by this resolution, Congress vouchsafes the legitimacy of a struggle that must have the continuing approval of the representatives of the people. It is the framework for a continuing consensus and communicates support to our President in this emergency. We acknowledge that this legitimate emergency permits the President to act unilaterally without turning our back on who wields the war power under the Constitution, and we trust that if he does, he will turn to Congress to legitimize his actions as appropriate. [9/14/01] Senator Snowe: This resolution, consistent with the War Powers Resolution, is precisely the right course for the Congress to take at this momentous juncture in American history. [Congressional Record, 9/14/01] NOW: Nonpartisan Report Refutes President Bush's Claim that AUMF Gives Him the Legal Authority to Conduct Warrantless Surveillance and the Former Senate Democratic Leader Contradicts the Administration A January 5, 2006 analysis by the nonpartisan Congressional Research Service found that [F]rom the foregoing analysis, it appears unlikely that a court would hold that Congress has expressly or impliedly authorized the NSA electronic surveillance operations here under discussion the Supreme Court has stated that Congress does indeed have the power to regulate domestic surveillance, and has not ruled on the extent to which Congress can act with respect to electronic surveillance to collect foreign intelligence information. Given such uncertainty, the Administration's legal justification, as presented in the summary analysis from the Office of Legislative Affairs, does not seem to be as well-grounded as the tenor of that letter suggests. [Congressional Research Service, Presidential Authority to Conduct Warrantless Electronic Surveillance to Gather Foreign Intelligence Information, 1/5/06]

2nc – uniqueness – boundaries vague now

Vague boundaries allow for executive flexibility

Wuerth 7 – Prof Law at Vanderbilt Law School (Ingrid Brunk Wuerth, 10/18/7, “INTERNATIONAL LAW AND CONSTITUTIONAL INTERPRETATION: THE COMMANDER IN CHIEF CLAUSE RECONSIDERED,” Michigan Law Review, ABI/INFORM, Lexis)//twontwon

The Commander in Chief Clause is widely understood as a particularly difficult area of constitutional interpretation.¹ Congress is vested with several powers related to the initiation and prosecution of war, and the relationship between these powers and those of the president as commander in chief remains contested. For decades, debate has centered on the president's independent power to initiate hostilities in light of Congress's power under the Declare War Clause. This issue generated both the War Powers Resolution and a massive corpus of academic writing.² Today, however, in the wake of September 11, 2001, the money question is the scope of the president's power to prosecute war. The Bush administration has relied heavily on the Commander in Chief Clause as the constitutional basis for a host of controversial actions.³ Indeed, the initial legal response to September 11 was apparently predicated on the president's unilateral wartime authority, which envisioned little role for Congress.⁴ Since then, the Supreme Court has reaffirmed a strong role for Congress in setting the scope of the president's powers and analyzed issues related to congressional authorization in great detail.⁵ But even where the Court has struck down the president's actions as inconsistent with-or beyond - such authorization, it has largely eschewed general discussions of how the president's war powers are to be distinguished from those of Congress. The June 2006 decision in *Hamdan v. Rumsfeld* is just the most recent example. And in most cases, the Supreme Court does not reach these issues at all, because it upholds the president's actions as consistent with authorization provided by Congress. As a result, it is unclear even what methodological approach the Court would use to demarcate the president's power from that of Congress. Questions about the president's war prosecution power thus remain unanswered. Current examples include whether the president is bound by the McCain Amendment governing the treatment of detainees, whether Congress could limit the president's use of cluster bombs, and whether the president could convene military commissions in emergency situations without the sanction of Congress.⁹

2nc – generic

The president has authority to conduct electronic surveillance

Haplerin and Kris 6 – Director of US Advocacy for the Open Society Institute AND Senior Vice President of Time Warner (Morton Halperin, David Kris, 3/28/06, “HEARING OF THE SENATE JUDICIARY COMMITTEE SUBJECT: NSA III: WARTIME EXECUTIVE POWERS AND THE FISA COURT CHAIRED BY: SENATOR ARLEN SPECTER (R-PA),” Federal News Service, Lexis)//twontwon

There is a second issue as to whether the president has inherent authority, as commander in chief war powers, to conduct the electronic surveillance. That, as I see it, would require knowing what the program is. It may well be that the program is within the president's inherent authority, but it seems to me that that determination has to be made in accordance with the tradition in America by a court, by a judicial review.

Congressional legislation can hamper war powers

Dempsey 6 – Policy Director at the Center for Democracy and Technology (Jim Dempsey, 7/26/06, “U.S. SENATOR ARLEN SPECTER (R-PA) HOLDS A HEARING ON FOREIGN INTELLIGENCE SURVEILLANCE ACT REFORM,” Political Transcript Wire, Lexis)//twontwon

I mean, here we are in the middle of a war against terrorism. We have a bill that has been -- a FISA statute -- that has been approved by every court that has reviewed it. Evidence from FISA surveillances has been introduced in hundreds of criminal cases and never been rejected. And here we are, proposing to cast that aside and allow the president to carry out wiretaps outside of that. What if they find a real terrorist? What if the evidence is rejected in court? It's a very risky approach to cast aside what, in my view, the Supreme Court has held is appropriate. That is, Congress has war powers; the president has war powers. Congress, in its exercise of its war powers, under the necessary and proper clause, under its authority to regulate the armed forces, can adopt legislation that limits the president's inherent power.

2nc – link uniqueness/internal link

Congressional authority is zero sum with presidential – they're toeing the line now, but resolving their issues with cooperation – the plan's fiat breaks the balance

Kyl 6 – Senator from Arizona (John Kyl, 2/28/06, “HEARING OF THE SENATE JUDICIARY COMMITTEE SUBJECT: WARTIME EXECUTIVE POWER AND THE NSA'S SURVEILLANCE AUTHORITY (PART II),” The Federal News Service, Lexis)//twontwon

It seems to me that this is almost a classic case, like the war powers debate, where it is not arguable that both Congress and the executive have authority. It is to some extent competing, to some extent overlapping, and it is very difficult to sort out in the abstract. It is the classic case where the court on political questions has avoided sometimes getting involved in the debate, and where both parties -- both the executive and the president -- march right up to the brink and have backed away and resolved the issues. I mean, the president still says, I don't have to follow the War Powers Act. Congress says, yes you do. And yet we both go on about our business warily working with each other in a way that doesn't set that conflict up because we understand there are larger, more important things than necessarily having a fight that's going to try to force a court to resolve an issue where in fact the founding fathers in the Constitution does not provide a crystal clear answer for every situation.

2nc – congress precedent link

Congressional limits on surveillance spill over to justify broader congressional encroachment on national security issues – congressional deference is high now

Donohue 11 – Associate Prof of Law at Georgetown Law (Laura Donohue, Fall 2011, “SYMPOSIUM: MOVING TARGETS: ISSUES AT THE INTERSECTION OF NATIONAL SECURITY & AMERICAN CRIMINAL LAW: ARTICLE: THE LIMITS OF NATIONAL SECURITY,” 48 Am. Crim. L. Rev. 1573, Lexis)//twontwon

From the inside, such blatant opportunism may appear harmless. In light of limited bandwidth, the way to get attention is to make an issue appear larger than perhaps it really is. But the effects of these provisions are not harmless. They carry significant structural implications. As a constitutional matter, the shift to the national security discourse diminishes the role that Congress performs through its oversight function. The number of committees responsible for "national security" has rapidly proliferated to include [*1754] nearly every Senate and House committee. 1292 This means that no single committee has a complete picture of national security. Nor is any single committee held responsible, to the electorate, for such oversight. Overlapping responsibilities allow legislators to take credit for keeping the country safe, and apportion blame for any failures. For those committees given authority to oversee discreet executive actions, strong political pressures demand that the legislators not hamstring the executive branch on issues of security. 1293 Even where the executive acts outside the law, congressional oversight is limited. The National Security Agency's illegal wiretapping serves as a clear example. Despite the Bush Administration's disregard for legislative restrictions on the wiretapping of U.S. citizens, 1294 Congress retroactively legalized the Administration's actions on grounds that it involved sensitive issues. 1295 ***FOOTNOTE BEGINS*** See Charlie Savage & James Risen, Federal Judge Finds N.S.A. Wiretaps Were Illegal, N.Y. TIMES (Mar. 31, 2010), <http://www.nytimes.com/2010/04/01/us/01nsa.html> ("The 2005 disclosure of the existence of [Bush's authorization of illegal wiretapping] set off a national debate over the limits of executive power and the balance between national security and civil liberties. The arguments continued over the next three years, as Congress sought to forge a new legal framework for domestic surveillance . . . Congress overhauled the Foreign Intelligence Surveillance Act to bring federal statutes into closer alignment with what the Bush administration had been secretly doing. The legislation essentially legalized certain aspects of the program."). ***FOOTNOTE ENDS*** National security, for that matter, entails a significant amount of secrecy, such that Congress may not even be aware of what is happening. When Congress is aware of executive actions, legislators may be prevented from bringing certain information to light via classification, which is itself an executive decision. Congress's ability to act with regard to authorization, at the outset, is similarly narrow. The burden rests on those opposing national security measures to demonstrate that failing to enact such measures will not undermine the country's safety—a nearly impossible burden of proof. For those measures with a significant impact on civil rights, there may be an effort to include a sunset provision, essentially providing an expiration date. But temporary powers rarely turn out to be so limited; instead, they become a baseline on which further authorities are [*1755] built. 1296 Similar concerns accompany the legislature's ability to withstand the drive to expansion via appropriations. The judiciary, in turn, is unsuited for playing a stronger role in the area of national security. The political question doctrine, which permeates foreign affairs, becomes all the more ubiquitous with the expansion of national security and the increasingly blurred lines between the different risks faced by the country. Claims to judicial institutional incompetence, often pushed by an executive branch eager to protect its interests, find sympathetic ears in a judiciary loath to make determinations on matters involving the security of the United States. Judges, who lack bureaucratic support, resources, information, and training in the area, are reluctant to second-guess the executive branch. The state secrets doctrine further restricts private citizens' ability to gain access to the executive's actions, as exceptions to the Freedom of Information Act specifically carve out national security matters. 1297 The executive branch's continued expansion of its national security portfolio is concerning in light of the political nature of such structures. Shortly before he died in 1954, Justice Robert Jackson, having served as Attorney General during the great expansion of the FBI's purview into national security in the third epoch, wrote:

This also sets court precedent

Bradley 9 – Richard A. Horvitz Professor of Law and Professor of Public Policy Studies, Duke Law School (Curtis A. Bradley, 2009 (last date cited), “Clear Statement Rules and Executive War Powers,” Harvard Journal of Law and Public Policy, Vol 33, p. 139, [//twontwon](http://scholarship.law.duke.edu/cgi/viewcontent.cgi?article=2730&context=faculty_scholarship)

The scope of the President’s independent war powers is notoriously unclear, and courts are understandably reluctant to issue constitutional rulings that might deprive the federal government as a whole of the flexibility needed to respond to crises. As a result, courts often look for signs that Congress has either supported or opposed the President’s actions and rest their decisions on statutory grounds. This is essentially the approach outlined by Justice Jackson in his concurrence in *Youngstown*. 1

2nc – congress link

Congressional restrictions spill over and eviscerate broader war powers

Heder 10 – J.D., magna cum laude, J. Reuben Clark Law School (Adam Heder, 2010, “THE POWER TO END WAR: THE EXTENT AND LIMITS OF CONGRESSIONAL POWER,” St. Mary’s Law Journal Vol. 41 No. 3, <http://www.stmaryslawjournal.org/pdfs/Hederreadytogo.pdf>)/twontwon

This constitutional silence invokes Justice Rehnquist’s oftquoted language from the landmark “political question” case, *Goldwater v. Carter*.¹²¹ In *Goldwater*, a group of senators challenged President Carter’s termination, without Senate approval, of the United States’ Mutual Defense Treaty with Taiwan.¹²² A plurality of the Court held, 123 in an opinion authored by Justice Rehnquist, that this was a nonjusticiable political question.¹²⁴ He wrote: “In light of the absence of any constitutional provision governing the termination of a treaty, . . . the instant case in my view also ‘must surely be controlled by political standards.’”¹²⁵ Notably, Justice Rehnquist relied on the fact that there was no constitutional provision on point. Likewise, there is no constitutional provision on whether Congress has the legislative power to limit, end, or otherwise redefine the scope of a war. Though Justice Powell argues in *Goldwater* that the Treaty Clause and Article VI of the Constitution “add support to the view that the text of the Constitution does not unquestionably commit the power to terminate treaties to the President alone,”¹²⁶ the same cannot be said about Congress’s legislative authority to terminate or limit a war in a way that goes beyond its explicitly enumerated powers. There are no such similar provisions that would suggest Congress may decline to exercise its appropriation power but nonetheless legally order the President to cease all military operations. Thus, the case for deference to the political branches on this issue is even greater than it was in the *Goldwater* context. Finally, the Constitution does not imply any additional powers for Congress to end, limit, or redefine a war. The textual and historical evidence suggests the Framers purposefully declined to grant Congress such powers. And as this Article argues, granting Congress this power would be inconsistent with the general war powers structure of the Constitution. Such a reading of the Constitution would unnecessarily empower Congress and tilt the scales heavily in its favor. More over, it would strip the President of his Commander in Chief authority to direct the movement of troops at a time when the Executive’s expertise is needed.¹²⁷ And fears that the President will grow too powerful are unfounded, given the reasons noted above.¹²⁸ In short, the Constitution does not impliedly afford Congress any authority to prematurely terminate a war above what it explicitly grants.¹²⁹ Declaring these issues nonjusticiable political questions would be the most practical means of balancing the textual and historical demands, the structural demands, and the practical demands that complex modern warfare brings. Adjudicating these matters would only lead the courts to engage in impermissible line drawing — lines that would both confuse the issue and add layers to the text of the Constitution in an area where the Framers themselves declined to give such guidance.

Oversight has zero chance of working but still substantially undermines executive secrecy – decimating war powers

Posner and Vermeule 10 [Eric, professor of law at the University of Chicago AND Adrian, professor of law at Harvard, *The Executive Unbound*, p. 25-29]

Many institutional factors hamper effective legislative monitoring of executive discretion for legal compliance. Consider the following problems. Information Asymmetries Monitoring the executive requires expertise in the area being monitored. In many cases, Congress lacks the information necessary to monitor discretionary policy choices by the executive. Although the committee system has the effect, among others, of generating legislative information and expertise,¹⁸ and although Congress has a large internal staff, there are domains in which no amount of legislative expertise suffices for effective oversight. Prime among these are areas of foreign policy and national security. Here the relative lack of legislative expertise is only part of the problem; what makes it worse is that the legislature lacks the raw information that experts need to make assessments. The problem would disappear if legislators could cheaply acquire information from the president, but they cannot. One obstacle is a suite of legal doctrines protecting

executive secrecy and creating deliberative privileges— doctrines that may or may not be justified from some higher-order systemic point of view as means for producing optimal deliberation within the executive branch. Although such privileges are waivable, the executive often fears to set a bad institutional precedent. Another obstacle is the standard executive claim that Congress leaks like a sieve, so that sharing secret information with legislators will result in public disclosure. The problem becomes most acute when, as in the recent controversy over surveillance by the National Security Agency, the executive claims that the very scope or rationale of a program cannot be discussed with Congress, because to do so would violate the very secrecy that makes the program possible and beneficial. In any particular case the claim might be right or wrong; legislators have no real way to judge, and they know that the claim might be made either by a well-motivated executive or by an ill-motivated executive, albeit for very different reasons. Collective Action Problems Part of what drives executive reluctance to share information is that, even on select intelligence committees, some legislator or staffer is bound to leak and it will be difficult to pinpoint the source. Aware of the relative safety that the numbers give them, legislative leakers are all the more bold. This is an example of a larger problem, arising from the fact that there are many more legislators than top-level executive officials. Compared to the executive branch, Congress finds it more costly to coordinate and to undertake collective action (such as the detection and punishment of leakers). To be sure, the executive too is a “they,” not an “it.” Much of what presidents do is arbitrate internal conflicts among executive departments and try to aggregate competing views into coherent policy over time. As a strictly comparative matter, however, the contrast is striking: the executive can act with much greater unity, force, and dispatch than can Congress, which is chronically hampered by the need for debate and consensus among large numbers. This comparative advantage is a principal reason why Congress enacts broad delegating statutes in the first place, especially in domains touching on foreign policy and national security. In these domains, and elsewhere, the very conditions that make delegation attractive also hamper congressional monitoring of executive discretion under the delegation. There may or may not be offsetting advantages to Congress’s large numbers. Perhaps the very size and heterogeneity of Congress make it a superior deliberator, whereas the executive branch is prone to suffer from various forms of groupthink. But there are clear disadvantages to large numbers, insofar as monitoring executive discretion is at issue. From the standpoint of individual legislators, monitoring is a collective good. If rational and self-interested, each legislator will attempt to free ride on the production of this good, and monitoring will be inefficiently underproduced. More broadly, the institutional prerogatives of Congress are also a collective good. Individual legislators may or may not be interested in protecting the institution of Congress or the separation of legislative from executive power; much depends on legislators’ time horizons or discount rate, the expected longevity of a legislative career, and so forth. But it is clear that protection of legislative prerogatives will be much less emphasized in an institution composed of hundreds of legislators coming and going than if Congress were a single person. “Separation of Parties, not Powers” Congress is, among other things, a partisan institution.¹⁹ Political scientists debate whether it is principally a partisan institution, or even exclusively so. But Madison arguably did not envision partisanship in anything like its modern sense. Partisanship undermines the separation of powers during periods of unified government. When the same party controls both the executive branch and Congress, real monitoring of executive discretion rarely occurs, at any rate far less than in an ideal Madisonian system. This appears to have a marked effect in the domain of war powers and foreign affairs, where a recent study by political scientists William Howell and Jon Pevehouse shows that congressional oversight of presidential war powers differs markedly depending upon the partisan composition of Congress.²⁰ When Congress is a co-partisan of the president, oversight is minimal; when parties differ across branches, oversight is more vigorous. Partisanship can enhance monitoring during periods of divided government,²¹ but this is cold comfort for liberal legalists. From the standpoint of liberal legalism, monitoring is most necessary during periods of unified government, because Congress is most likely to enact broad delegations when the president holds similar views; and in such periods monitoring is least likely to occur. The Congress of one period may partially compensate by creating institutions to ensure bipartisan oversight in future periods— consider the statute that gives a minority of certain congressional committees power to subpoena documents from the executive²²—but these are palliatives. Under unified government, congressional leaders of the same party as the president have tremendous power to frustrate effective oversight by the minority party. The Limits of Congressional Organization Congress as a collective body has attempted, in part, to overcome these problems through internal institutional arrangements. Committees and subcommittees specialize in a portion of the policy space, such as the armed forces or homeland security, thereby relieving members of the costs of acquiring and processing information (at least if the committee itself maintains a reputation for credibility). Intelligence committees hold closed sessions and police their members to deter leaks (although the

sanctions that members of Congress can apply to one another are not as strong as the sanctions a president can apply to a leaker in the executive branch). Large staffs, both for committees and members, add expertise and monitoring capacity. And interest groups can sometimes be counted upon to sound an alarm when the executive harms their interests. Overall, however, these arrangements are not fully adequate, especially in domains of foreign policy and national security, where the scale of executive operations is orders of magnitude larger than the scale of congressional operations. Congress's whole staff, which must (with the help of interest groups) monitor all issues, runs to some 30,000 persons.²³ The executive branch has some 2 million civilian employees, in addition to almost 1.4 million in the active armed forces.²⁴ The sheer mismatch between the scale of executive operations and the congressional capacity for oversight, even aided by interest groups or by leakers within the bureaucracy, is daunting. Probably Congress is already at or near the limits of its monitoring capacity at its current size and budget.

Intelligence gathering is a crucial part of the President's warfighting capabilities – congressional checks and FISA restrictions on executive authority to surveil are unconstitutional

Paulsen 6 (Michael, Department of Justice in the Criminal Division Honors Program, and has also served as staff counsel for the Center for Law & Religious Freedom in Washington, D.C. and as an attorney-advisor in the Office of Legal Counsel. "Presidential Powers in Time of War", http://www.law.umn.edu/uploads/wE/aa/wEaa1g7XB6j0QyoOhoFpYw/Presidential_Powers_exchange_Paulsen_Kitrosser_Carpenter.pdf)//dtang

THE KEY PROBLEM with my colleagues' extraordinarily thoughtful points about the NSA communications interception program is this: They read the Sept. 18, 2001, AUMF as if it were any old statute passed by Congress. If (as I believe), the AUMF is in legal effect a Declaration of War, then arguments that "repeals by implication are disfavored," or that "the AUMF does not specifically mention surveillance," or that "Congress did not have this in mind" (or, in its weakest form, that former Senator Tom Daschle was not thinking about this specific question), or that the president might have been able to obtain FISA authorization, are almost entirely irrelevant. If war has been authorized, then the commander in chief power to wage war against enemy forces has been unleashed in its entirety. That power is a fearful and formidable one, but properly so. Where war is declared or authorized, the president possesses the full military and executive power of the nation with respect to waging that war. The president determines matters of military strategy and tactics; the rules of engagement with the enemy; the means and methods to be employed; how resources are to be deployed; and whether, when, and under what circumstances hostilities will be terminated. Where the commander in chief power is brought into play, it is the president's power alone. No statute of Congress may limit it. As Alexander Hamilton put it in Federalist #74: "Of all the cares or concerns of government, the direction of war most peculiarly demands those qualities which distinguish the exercise of power by a single hand. The direction of war implies the direction of the common strength; and the power of directing and employing the common strength forms a usual and essential part in the definition of the executive authority." Here is the crucial point: Whatever the scope of the president's constitutional power as commander in chief in time of authorized war, no statute of Congress constitutionally may limit it. This is basic Marbury v. Madison: If the Constitution provides one thing, Congress may not pass a statute altering it. Congress has the choice whether or not to trigger the commander in chief power of the president in time of war; but if it chooses to do so, it may not control the exercise of that power with collateral statutory restrictions. Put simply: When war is declared, the commander in chief chooses how to conduct it. Nowhere is this more clear than in the Sept. 18, 2001 AUMF, which sweepingly gives the president power to use "all necessary and appropriate force" against those nations, organizations, or persons he finds to be connected to the events of Sept. 11, 2001. If the interception of communications of persons in contact with the enemy is a legitimate part of the commander in chief's conduct of war—and I think this almost impossible to deny—then no act of Congress may impair it. If FISA, designed as peacetime authorization for covert surveillance of suspected foreign agents, limits

the commander in chief power in time of war, it is to that extent unconstitutional. That's the endpoint of the game, when push comes to shove. Professor Kitrosser's arguments about how to read FISA are excellent ones; but in the end if FISA cannot be construed in a manner consistent with the president's overarching power as commander in chief in time of war, then it is the FISA statute that must yield, not the president's constitutional power as commander in chief. Professor Carpenter's argument that Congress's power to make "Rules for the Government and Regulation of the Land and Naval Forces" trumps the president's power as commander in chief is, I think, unsound—and dangerous. Congress's power to prescribe general rules for regulating our armed forces surely cannot be read as a power to dictate rules for how military and defensive efforts are to be conducted by the president. That would effectively read the commander in chief clause out of the Constitution! The same cannot be said the other way round: Congress's power to regulate the military still has content, as a general proposition; it is simply limited by the president's power to direct and conduct offensive and defensive operations—to command—in wartime. The alternative is to run war operations by committee—by Congress. That was one of the grave defects of the Articles of Confederation that the framers of the Constitution (including General George Washington) sought to remedy by making "a single hand," the president, the commander in chief of the armed forces, and of the militia, when called into actual service.

Congressional oversight on the president's surveillance war powers renders fighting terrorism ineffective

Yoo 9 (John is a law professor at the University of California, Berkeley. He was an official in the Justice Department from 2001-03 and is a visiting scholar at the American Enterprise Institute. 7-16-09, Wall Street Journal, "Why We Endorsed Warrantless Wiretaps," http://online.wsj.com/article/SB124770304290648701.html#mod=rss_opinion_main)/dtang

It was instantly clear after Sept. 11, 2001, that our security agencies knew little about al Qaeda's inner workings, could not detect its operatives' entry into the country, nor predict where it might strike next. Suppose an al Qaeda cell in New York, Chicago or Los Angeles was planning a second attack using small arms, conventional explosives or even biological, chemical or nuclear weapons. Our intelligence and law enforcement agencies faced a near impossible task locating them. Now suppose the National Security Agency (NSA), which collects signals intelligence, threw up a virtual net to intercept all electronic communications leaving and entering Osama bin Laden's Afghanistan headquarters. What better way of detecting followup attacks? And what president -- of either political party -- wouldn't immediately order the NSA to start, so as to find and stop the attackers? Evidently, none of the inspectors general of the five leading national security agencies would approve. In a report issued last week, they suggested that President George W. Bush might have violated the 1978 Foreign Intelligence Surveillance Act (FISA) by ordering the interception of international communications of terrorists without a judicial warrant. The report also suggests that "other" intelligence measures -- still classified only because they are yet to be reported on the front page of the New York Times -- similarly lacked approval from other branches of government. It is absurd to think that a law like FISA should restrict live military operations against potential attacks on the United States. Congress enacted FISA during the waning days of the Cold War. As the 9/11 Commission found, FISA's wall between domestic law enforcement and foreign intelligence proved dysfunctional and contributed to our government's failure to prevent the 9/11 attacks. Under FISA, to obtain a judicial wiretapping warrant the government is supposed to show probable cause that a specified target is a foreign agent. Unlike, say, Soviet spies working under diplomatic cover, terrorists are hard to identify. Yet they are vastly more dangerous. Monitoring their likely communications channels is the best way to track and stop them. Building evidence to prove past crimes, as in the civilian criminal system, is entirely beside the point. The best way to find an al Qaeda operative is to look at all email, text and phone traffic between Afghanistan and Pakistan and the U.S. This might involve the filtering of innocent traffic, just as roadblocks and airport screenings do. In FISA, President Bush and his advisers faced an obsolete law not written with live war with an international terrorist organization in mind. It was to meet such emergency circumstances that the Founders designed the presidency. As John Locke first observed, foreign threats "are much less capable to be directed by antecedent, standing, positive laws." Legislatures are too slow and their members too numerous

to respond effectively to unforeseen situations. Only the executive can act to protect the "security and interest of the public."

2nc – generic link/igr stuff

The plan causes war powers disputes – decks IGR

Smith 7 – graduated from the Valparaiso Univ School of Law in 2006, licensed to practice in Illinois, worked for the City of Chicago Law Department in the Municipal Prosecution Division (R. Andrew Smith, Summer 2007, “SYMPOSIUM ON ELECTRONIC PRIVACY IN THE INFORMATION AGE: BREAKING THE STALEMATE: THE JUDICIARY’S CONSTITUTIONAL ROLE IN DISPUTES OVER THE WAR POWERS,” 41 Val. U.L. Rev. 1517, Lexis)//twontwon

Historically, the goal of the three-part American government structure is to separate and balance the power to govern. 1 Separation prevents any branch of the government from straying from its intended purpose and in turn, fosters democratic values as a result. 2 Ideally, this prevents one branch of government from over-exercising its power over the others. However, language in the Constitution gives little guidance on when one branch of the government may be acting outside the sphere of its authority. Constitutional ambiguities and overlapping powers result in struggles between different arms of the government. The purpose of this Article is to explore the role of the judiciary in mediating the power struggles between the legislative and executive branches of government. Justiciability restrictions, such as the political question doctrine, can make the Court's role in such disputes unclear. Recently, the disclosure of President Bush's warrantless electronic surveillance program 3 and subsequent lawsuit challenging the constitutionality of the program 4 have thrown these intra-governmental tensions into sharp relief by questioning the breadth of the executive war power 5 juxtaposed to the legislative war power. 6 In this Article, President Bush's warrantless domestic surveillance program provides a focal point for analysis of separation of powers in general and the problem of overlapping constitutional grants of authority.

Coordination and balance are essential

Shouldis 10 – instructor at the Graduate School at St. Joseph’s University in Philadelphia, the National Fire Academy, and the Emergency Management Institute, former deputy chief, Philadelphia Fire Department, former field commander, department safety officer, director of training, and hazardous materials task force leader, M.A. public safety (William Shouldis, “The Emergency Operations Center: A Vital Preparedness Tool,” Fire Engineering, 163(5), 5-1-2010, <http://www.fireengineering.com/articles/print/volume-163/issue-5/Features/the-emergency-operations-center-a-vital-preparedness-tool.html>)//twontwon

The emergency operations center (EOC) is a generic tool for coordinating on-scene operations during low-frequency and high-risk incidents. Every community, large and small, faces the likelihood of an overwhelming emergency event. Often, these incidents will lack a common operating picture and can transcend political jurisdictional boundaries. The ability of a community to acquire and allocate necessary resources hinges on being prepared. The roots of a community’s “all-hazard” preparedness program involve intergovernmental relations and a detailed planning process that includes mutual-aid assistance agreements. Emphasis must be on technical information based on an accurate assessment of risk, vulnerability, and capabilities. Resources will be scarce during a large-scale incident, and the EOC can identify and obtain additional assets that are not always available to the on-scene incident commander (IC).¶ The EOC mobilizes people and equipment to handle incidents that are outside the ability of any single agency to resolve. The purpose of the EOC is to ensure that departmental response capabilities are maintained and authoritative information is disseminated to the general public. Capturing important incident-related information at an EOC will provide senior officials with data to set strategic directions; establish priorities; allocate resources; and, under extreme circumstances, declare a disaster. These actions allow field commanders to focus on the incident objectives while the EOC handles supportive endeavors.

Extinction

Kolasky 11 – assistant director, Risk Governance and Support Division, Office of Risk Management and Analysis, U.S. Department of Homeland Security, responsibilities include analyzing risks to the nation and the methods by which those risks are analyzed (Bob Kolasky, “Integrated Risk Management at the Department of Homeland Security,” Global Association of Risk Professionals, October 2011, [//twontwon](http://www.garp.org/risk-news-and-resources/2011/october/integrated-risk-management-at-the-department-of-homeland-security.aspx?altTemplate=PrintStory))

Since the terrorist attacks of September 11, 2001, the United States has recognized how remote threats and distant trouble can pose near and present dangers to our shores. We have learned as a nation that **we must maintain a constant, capable and vigilant posture to protect ourselves against new threats and evolving hazards**. Examples of these threats and hazards include high-consequence weapons of mass destruction being employed in the United States; al Qaeda and global violent extremism; high-consequence and/or wide-scale cyber attacks, intrusions, disruptions and exploitations; pandemics, major accidents and natural hazards; illicit trafficking and related transnational crime; and smaller-scale terrorism. Each of these present a risk to the nation and our people, economy and way of life. Over the past 10 years, **we have made great strides in managing these risks through efforts to secure our nation against a large attack or disaster, to protect critical infrastructure and cyber networks, and to engage a broader range of Americans in the shared responsibility for security**. We are also a **more prepared and resilient nation, able to bounce back and rebuild stronger after a major crisis or disaster**. The U.S. Department of Homeland Security (DHS) is charged with helping to build a safe, secure, resilient place where the American way of life can thrive. That means more than preventing terrorist attacks from being carried out. It also means ensuring that the liberties of all Americans are assured, privacy is protected and the means by which we interchange with the world - through travel, lawful immigration, trade, commerce and exchange -- are secured. Ultimately, homeland security is about effectively managing risks to the nation's security. Because of this reality, the Department must rely on innovative approaches to managing risks in an enterprise manner. DHS' Risk Management Imperative DHS is the third-largest Cabinet department in the United States. It employs well over 200,000 people and has an annual budget in excess of \$40 billion. The Department has five key missions: preventing terrorism and enhancing security; securing and managing our borders; enforcing and administering our immigration laws; safeguarding and securing cyberspace; and ensuring resilience to disasters. The Department also provides essential support to national and economic security. To accomplish those missions, DHS leaders have recognized that **homeland security is fundamentally a risk management challenge**. As a Department, **we need to work collectively, in our mission areas of focus, to reduce the likelihood of bad things happening, and to minimize the consequence of those things that do occur**. Viewed from this lens, reducing risk - defined by the DHS Risk Lexicon as decreasing "the potential for an unwanted outcome, resulting from an incident, event or occurrence, as determined by its likelihood and the associated consequences - is one of the Department's principal objectives.

2nc – link – prism

Rolling back XO 12333 functionally invalidates the president's inherent constitutional authority to disrupt attacks

Maharrey 14 – Communications director for the Tenth Amendment Center (Mike Maharrey, 10/2/14, "PRESIDENT CLAIMS SPYING AUTHORITY PART OF WAR POWERS AND CONGRESS CAN'T INTERFERE,"

[//twontwon">http://www.offnow.org/president_claims_spying_authority_part_of_war_powers_and_congress_can_t_interfere">//twontwon](http://www.offnow.org/president_claims_spying_authority_part_of_war_powers_and_congress_can_t_interfere)

While NSA reform efforts tend to focus on congressional action, documents obtained by the ACLU confirm suspicions that the agency justifies much of its warrantless spying on executive orders. This raises concerns in and of itself, but becomes even more disturbing knowing that by combining executive orders with the Authorization for Use of Military Force passed after 9/11, the president claims virtually unlimited authority to spy on you, and actually contends any attempt by Congress to regulate its surveillance program is unconstitutional. ACLU obtained documents relating to Pres. Reagan's **Executive Order 12333** from the NSA, the Defense Intelligence Agency and others agencies through a Freedom of Information Act request. The ACLU says the documents prove that the presidential EO "governs most of the **NSA's spying**." According to an ACLU report by Alex Abdo, the documents make it clear that the NSA collects data from Americans "about much more than just terrorist threats," and operates with little to no oversight. "Because the executive branch issued and now implements the executive order all on its own, the programs operating under the order are subject to essentially no oversight from Congress or the courts," Abdo wrote. "We've already seen that the NSA has taken a 'collect it all' mentality even with the authorities that are overseen by Congress and the courts. If that history is any lesson, we should expect — and, indeed, we have seen glimpses of — even more out-of-control spying under EO 12333." The documents also reveal the NSA word games know as "vocabulary of misdirection — a language that allows [it] to say one thing while meaning quite another." Using redefined terms, the agency stretches its surveillance activities far beyond what directives appear to allow. For instance, the NSA does not consider data "collected" until somebody actually reads it. In other words, the NSA gathers massive amounts of private information and stores it, but then tells Americans with a straight face that it does not "collect" data without a warrant. Under both Presidents Bush and Obama, the executive branch has combined executive orders with the 2001 AUMF to claim the authority to conduct virtually unlimited information gathering without a warrant. Simply put, according to the executive branch, the commander-in-chief possess the authority to spy at will as part of his constitutional war powers, and Congress can't interfere, short of revoking the AUMF. The 1970 Foreign Intelligence Surveillance Act sets up the statutory authority for foreign intelligence gathering. Even the Department of Justice acknowledges that its restrictions limit executive power in peacetime. A 2004 memo on the STELLAR WIND program summarizes foreign intelligence gathering authority. Generally speaking, FISA provides what purports to be, according to the terms of the statute, the exclusive means for intercepting the content of communications in the United States for foreign intelligence purposes... FISA expressly makes it a felony offense for any person intentionally to conduct electronic surveillance under color of law except as provided by statute. This provision is complimented by an interlocking provision in Title III — the portion of the criminal code that provides the mechanism for obtaining wire taps for law enforcement purposes. That would seem to preclude the president, or other players in the executive branch, from unilaterally engaging in surveillance. It also indicates that Congress could place additional restrictions on the NSA through reform of FISA and other congressional acts relating to spying. But the DoJ claims war powers unleashed by the AUMF voids the exclusivity of statutory authority. In fact, the executive branch claims any restriction on the president's spy authority is unconstitutional. We conclude that in the circumstances of the current armed conflict with al Qaeda, the restrictions set out in FISA, as applied to targeted efforts to intercept the communications of the enemy in order to prevent further armed attacks on the United States, would be an unconstitutional infringement on the constitutionally assigned powers of the President. The President has inherent constitutional authority as Commander in Chief and sole organ for the nation in foreign affairs to conduct warrantless surveillance of enemy forces for intelligence purposes to detect and disrupt armed attacks on the United States. Congress does not have the power to restrict the President's exercise of this authority. This means that even in the unlikely event

Congress passes significant legislation to reform FISA and the Patriot Act to protect privacy and limit

warrantless spying, it will have little practical effect as long as the president claims virtually unlimited authority to spy on us under the AUMF. With no end in sight to the "War on Terror," this falls into the category of wishful thinking. Depending on the courts to limit presidential authority will also likely prove disappointing. Federal courts historically rubber-stamp federal powers, no matter how broadly interpreted, when exercised in the name of "national security."

2nc – surveillance spills over

Curtailing domestic surveillance undermines the sole organ doctrine – which underpins every facet of presidential power

Wood and Webb 11 – Department of Political Science at Texas A&M University, presented to the faculty at Vanderbilt University (B Dan Wood, Clayton Webb, 10/17/11, “EXPLAINING PRESIDENTIAL SABER RATTLING,”
http://www.vanderbilt.edu/csdi/events/Wood_Presidential_Saber_Rattling_112111.pdf)/twon
twon

The courts affirmed early on that as sovereign leaders, presidents are the nation’s chief foreign policy representative. Future Supreme Court Justice John Marshall stated in 1800 when he served in the U.S. House of Representatives —The President is the sole organ of the nation in its external relations, and its sole representative with foreign nations.¶ (10 Annals of Congress 613) Relying on Marshall’s —sole organ¶ doctrine, Supreme Court Justice George Sutherland wrote in 1937 (United States vs. Curtiss-Wright Export Corp , 299 U.S. 319) —In this vast external realm [foreign policy], with its important, complicated, delicate and manifold problems, the President alone has the power to speak or listen as a representative of the nation.¶ While the plenary nature of executive authority in foreign relations is not universally accepted (e.g., see the persuasive arguments by Fisher 2006, 2007a, 2007b, 2007c, 2007d, 2007e, 2008a, 2008b), ***FOOTNOTE BEGINS*** . 2007d. "Statement by Louis Fisher appearing before the House Committee on the Judiciary, "Constitutional **Limitations on Domestic Surveillance**"." ed. L. L. o. Congress. ***FOOTNOTE ENDS*** the modern chief executive relies extensively on the —sole organ¶ doctrine to define presidential power broadly, and it is now commonly assumed that presidents are the sole representatives of the nation to the outside world.

2nc – at: prez ignores courts

The prez complies with court decisions

Green 11 – Professor of Law, Temple University Beasley School of Law, John Edwin Pomfret Fellowship, Princeton University, J.D. Yale Law School (Craig Green, Summer 2011, “ENDING THE KOREMATSU ERA: AN EARLY VIEW FROM THE WAR ON TERROR CASES,” 105 Nw. U.L. Rev. 983, Lexis)//twontwon

Jackson's hard-nosed analysis may seem intellectually bracing, but it understates the real-world power of judicial precedent to **shape what is politically possible**.³⁰⁶ Although presidential speeches occasionally declare a willingness to disobey Supreme Court rulings, actual disobedience of this sort is rare and would carry grave political consequences.³⁰⁷ Even President [*1037] Bush's losses in the GWOT cases did not spur serious consideration of noncompliance despite broad support from a Republican Congress.³⁰⁸ Likewise, from the perspective of strengthening presidential power, Korematsu-era decisions emboldened President Bush in his twenty-first-century choices about Guantanamo and military commissions.³⁰⁹ Thus, the modern historical record shows that judicial precedent can both expand and restrict the political sphere of presidential action.

2nc – warrants link

Requiring warrants restricts war powers

Shane 14 – Chair in Law, Moritz College of Law, OSU (Peter Shane, 2014, “FOREWORD: THE NSA AND THE LEGAL REGIME FOR FOREIGN INTELLIGENCE SURVEILLANCE,”

[//twontwon](http://thedailyjournalist.com/wp-content/uploads/2014/01/nsa-symposium.pdf)

After the warrantless surveillance of electronic communications content was divulged in The New York Times, President Bush acknowledged in a December 17, 2005 radio address what the Administration called the Terrorist Surveillance Program.⁷² In addition, the Administration prepared two public full presentations of its legal position. The more extensive of these was a January 19, 2006 Justice Department memorandum of unattributed authorship, entitled, “Legal Authorities Supporting the Activities of the National Security Agency Described by the President.”⁷³ In this memorandum, as in an earlier letter from Assistant Attorney General William Moscella to the leadership of the House and Senate Select Committees on Intelligence,⁷⁴ the Administration’s legal stance rested to two essential propositions. The first is that warrantless electronic surveillance directed at al Qaeda and its supporters fell within the President’s inherent war powers, as confirmed by the Authorization to Use Military Force in Afghanistan, or the AUMF,⁷⁵ enacted by Congress on September 12, 2001.⁷⁶ The second was that the President has inherent constitutional power to conduct the TSP no matter what the AUMF says and, if FISA is read to preclude this particular program of foreign intelligence surveillance, then FISA is unconstitutional.⁷⁷

2nc – ambiguity link

Any resolution of ambiguity eviscerates executive flexibility – squo reforms fail – but the plan’s durable fiat ensure the plan severely restricts the executive

Mitchell 9 – Assistant Prof. Law at George Mason University School of Law (Jonathan Mitchell, Summer 2009, “ARTICLE: LEGISLATING CLEAR-STATEMENT REGIMES IN NATIONAL-SECURITY LAW,” 43 Ga. L. Rev. 1059, Lexis)//twontwon

In like manner, a future executive might claim that a generic Authorization to Use Military Force implicitly repeals Senator Specter's proposed funding restrictions under the last-in-time rule, so long as it can concoct some argument that legislators are aware (or should be aware) that warrantless surveillance of the enemy is a "fundamental incident of the use of military force." 180 Or the President might claim that annual appropriations bills for the intelligence agencies implicitly repeal the earlier-enacted funding restrictions if legislators are aware of the President's warrantless surveillance activities but fail to expressly reaffirm FISA's restrictions. Proposals that would add funding restrictions to the War Powers Resolution are similarly incapable of withstanding the executive-branch lawyers' broad theories of implied repeal. Those funding restrictions, like § 8(a)(1) of the War Powers Resolution, would be brushed aside whenever implicit congressional "authorization" might be found in later-enacted statutory language. **The challenge for these efforts to strengthen the War Powers Resolution and FISA is that any future ambiguous statute will provide rope for executive-branch lawyers to concoct congressional "authorization" for the President's actions, no matter what restrictions or interpretive instructions Congress provides in framework legislation. None of these proposed reforms will disable [*1104] the executive from using its expansive theories of constitutional avoidance and implied repeal to provide a veneer of legality for the President's actions, and minimize the prospect of future criminal sanctions and political reprisals against executive-branch employees.**

2nc – nsa/fisa link

The aff drastically limits war powers

Mitchell 9 – Assistant Prof. Law at George Mason University School of Law (Jonathan Mitchell, Summer 2009, “ARTICLE: LEGISLATING CLEAR-STATEMENT REGIMES IN NATIONAL-SECURITY LAW,” 43 Ga. L. Rev. 1059, Lexis)//twontwon

Numerous proposals to strengthen the clear-statement regimes in Congress's national-security legislation have focused on imposing more narrow clear-statement requirements or adding funding restrictions to the framework legislation. Consider, for example, Senator Specter's proposal in the 109th Congress to reform FISA. The Specter bill reiterates that FISA (along with chapters 119, 121, and 206 of title 18, United States Code) shall be "the exclusive means by which electronic surveillance may be conducted" in the United States, but adds the phrase "[n]otwithstanding any other provision of law." 168 The Specter proposal further states that no provision of law may repeal or modify FISA unless it "expressly amends or otherwise specifically cites this title." 169 Congress failed [*1101] to enact Senator Specter's proposal, but it did enact a provision in the 2008 FISA Amendments that specifies that "[o]nly an express statutory authorization for electronic surveillance" may authorize electronic surveillance outside of FISA's procedures. 170 This new statute attempts to foreclose the Bush Administration's argument that FISA's "**exclusive means**" provision was insufficiently "clear" to affect the meaning of the later-enacted AUME. 171 Congress also imposed a very narrow clear-statement requirement in the McCain Amendment to the 2005 Detainee Treatment Act, providing that its prohibition on certain forms of cruel, inhuman, or degrading treatment "shall not be superseded, except by a provision of law enacted after December 30, 2005, which specifically repeals, modifies, or supersedes the provisions of this section." 172 This clear- statement requirement is more narrow than those in the War Powers Resolution and FISA, as it entrenches the McCain Amendment against any type of implied repeal. There have also been numerous proposals to add funding restrictions to Congress's national-security legislation. Senator Specter's proposed FISA amendments, for example, provide that "no funds appropriated or otherwise made available by any Act" may be expended for electronic surveillance conducted outside of FISA and Chapters 119, 121, and 206 of Title 18 of the U.S. Code. 173 Professor John Hart Ely proposed a similar amendment to the War Powers Resolution that withholds funding from military ventures that Congress has not specifically authorized. 174 Other commentators have endorsed similar proposals. 175 But none of these proposed [*1102] reforms is likely to prevent the executive branch from continuing to infer congressional authorization from ambiguous later-enacted statutes, nor are they likely to prevent future Congresses from acquiescing to this practice. The first problem is that these new statutes and proposals fail to counter the aggressive interpretive doctrines that executive-branch lawyers use to infer congressional authorization from legislation that lacks the required clear statement. The Clinton Administration's Kosovo memo already provides a roadmap for the executive branch to evade the clear-statement rule in the 2008 FISA Amendments, which insists that "[o]nly an express statutory authorization for electronic surveillance" may authorize electronic surveillance outside of FISA's procedures. 176 The OLC Kosovo memo characterizes the express-reference requirement in § 8(a)(1) of the War Powers Resolution as an invalid attempt to "bind" future Congresses, and converts it into a standard-like "background principle" that applies only when future legislation is "entirely ambiguous" as to whether it authorizes military hostilities. 177 There is little reason to think that future executives will treat FISA's new express-language requirement any differently if they anticipate that Congress is likely to acquiesce. Executive-branch lawyers can also invoke the Clinton and Bush Administration's broad theories of implied repeal if they find language in a later-enacted statute that might be read to authorize warrantless surveillance. The more narrow clear-statement requirements in Senator Specter's proposed FISA reforms and the recently enacted McCain Amendment would fare no better. Even though they purport to entrench themselves against implied repeal, the executive branch can assert, as it did during the Kosovo and NSA surveillance controversies, that this partial entrenchment unlawfully "binds" future Congresses and proceed with its broad theories of implied repeal. The proposals to add funding restrictions to FISA and the War Powers Resolution are equally vulnerable to expansive executive [*1103] branch theories of implied repeal. Recall that the OLC Kosovo memo asserts that the 1999 Emergency Supplemental Appropriations Act implicitly repealed restrictions in the War Powers Resolution, even though the Appropriations Act never earmarked funds for military operations in Kosovo, nor specifically authorized military operations in Kosovo beyond the WPR's sixty-day window. 178 According to OLC, it was enough that some members of Congress thought that the President might continue the Kosovo hostilities beyond sixty days and that the appropriations legislation did not expressly withhold funds for that purpose. 179 In like manner, a future executive might claim that a generic Authorization to Use Military Force implicitly repeals Senator Specter's proposed funding restrictions under the last-in-time rule, so long as it can concoct some argument that legislators are aware (or should be aware) that warrantless surveillance of the enemy is a "fundamental incident of the use of military force." 180 Or the President might claim that annual appropriations bills for the intelligence agencies implicitly repeal the earlier-enacted funding

restrictions if legislators are aware of the President's warrantless surveillance activities but fail to expressly reaffirm FISA's restrictions. Proposals that would add funding restrictions to the War Powers Resolution are similarly incapable of withstanding the executive-branch lawyers' broad theories of implied repeal. Those funding restrictions, like § 8(a)(1) of the War Powers Resolution, would be brushed aside whenever implicit congressional "authorization" might be found in later-enacted statutory language. The challenge for these efforts to strengthen the War Powers Resolution and FISA is that any future ambiguous statute will provide rope for executive-branch lawyers to concoct congressional "authorization" for the President's actions, no matter what restrictions or interpretive instructions Congress provides in framework legislation. None of these proposed reforms will disable [*1104] the executive from using its expansive theories of constitutional avoidance and implied repeal to provide a veneer of legality for the President's actions, and minimize the prospect of future criminal sanctions and political reprisals against executive-branch employees.

2nc – link – surveillance

Surveillance capabilities are integral to presidential war powers – allows effective terrorism deterrence

Yoo 14 (John is professor of law at the Boalt Hall School of Law at the University of California, Berkeley, and visiting scholar at the American Enterprise Institute. He has also served as general counsel for the Senate Judiciary Committee; as a law clerk to Justice Clarence Thomas and Judge Laurence H. Silberman; and, from 2001 to 2003, as a Deputy Assistant Attorney General in the Office of Legal Counsel of the U.S. Department of Justice. October 3, “Surveillance and executive power”, <http://blog.constitutioncenter.org/2014/10/surveillance-and-executive-power/>)/dtang

As Commander-in-Chief, the President has the constitutional power and the responsibility to wage war in response to a direct attack against the United States. In the Civil War, President Lincoln undertook several actions—raised an army, withdrew money from the treasury, launched a blockade—on his own authority in response to the Confederate attack on Fort Sumter, moves that Congress and the Supreme Court later approved. During World War II, the Supreme Court similarly recognized that once war began, the President’s authority as Commander-in-Chief and Chief Executive gave him the tools necessary to effectively wage war. In the wake of the September 11 attacks, Congress agreed that “the President has authority under the Constitution to take action to deter and prevent acts of international terrorism against the United States,” which recognizes the President’s authority to use force to respond to al Qaeda, and any powers necessary and proper to that end. Even legal scholars who argue against this historical practice concede that once the United States has been attacked, the President can respond immediately with force. John Yoo and Stewart Baker will debate Alex Abdo and Elizabeth Wydra at the National Constitution Center on October 7—reserve your tickets NOW! **The ability to collect intelligence is intrinsic to the use of military force.** It is inconceivable that the Constitution would vest in the President the powers of Commander-in-Chief and Chief Executive, give him the responsibility to protect the nation from attack, but then disable him from gathering intelligence to use the military most effectively to defeat the enemy. Every evidence of the Framers’ understanding of the Constitution is that the government would have every ability to meet a foreign danger. As James Madison wrote in *The Federalist*, “security against foreign danger is one of the primitive objects of civil society.” Therefore, the “powers requisite for attaining it must be effectually confided to the federal councils.” After World War II, the Supreme Court declared, “this grant of war power includes all that is necessary and proper for carrying these powers into execution.” Covert operations and electronic surveillance are clearly part of this authority. During the writing of the Constitution, some Framers believed that the President alone should manage intelligence because only he could keep secrets. Several Supreme Court cases have recognized that the President’s role as Commander-in-Chief and the sole organ of the nation in its foreign relations must include the power to collect intelligence. These authorities agree that intelligence rests with the President because its structure allows it to act with unity, secrecy, and speed. Presidents have long ordered electronic surveillance without any judicial or congressional participation. More than a year before the Pearl Harbor attacks, but with war clearly looming with the Axis powers, President Franklin Roosevelt authorized the FBI to intercept any communications, whether wholly inside the country or international, of persons “suspected of subversive activities against the Government of the United States, including suspected spies.” FDR was concerned that “fifth columns” could wreak havoc with the war effort. “It is too late to do anything about it after sabotage, assassinations and ‘fifth column’ activities are completed,” FDR wrote in his order. FDR ordered the surveillance even though a federal law at the time prohibited electronic surveillance without a warrant. Presidents continued to monitor the communications of national security threats on their own authority, even in peacetime. If Presidents in times of peace could order surveillance of spies and terrorists, executive authority is only the greater now, as hostilities continue against al Qaeda.

AT: Link turns

Congress doesn't enhance cred – political infighting make us look unsure

Yoo 4 - Emanuel S. Heller Professor of Law at UC-Berkeley, visiting scholar at the American Enterprise Institute, former Fulbright Distinguished Chair in Law at the University of Trento, served as a deputy assistant attorney general in the Office of Legal Council at the U.S. Department of Justice between 2001 and 2003, received his J.D. from Yale and his undergraduate degree from Harvard (John, "War, Responsibility, and the Age of Terrorism," UC-Berkeley Public Law and Legal Theory Research Paper Series, November 2004, <http://works.bepress.com/cgi/viewcontent.cgi?article=1015&context=johnyoo>) //AD

It is also not obvious that congressional deliberation ensures consensus. Legislative authorization might reflect ex ante consensus before military hostilities, but it also might merely represent a bare majority of Congress or an unwillingness to challenge the President's institutional and political strengths regardless of the merits of the war. It is also no guarantee of an ex post consensus after combat begins. Thus, the Vietnam War, which Ely and others admit satisfied their constitutional requirements for congressional approval, did not meet with a consensus over the long term but instead provoked some of the most divisive politics in American history. It is also difficult to claim that the congressional authorizations to use force in Iraq, of either the 1991 or 2002 varieties, reflected a deep consensus over the merits of war there. Indeed, the 1991 authorization barely survived the Senate and the 2002 one received significant negative votes and has become an increasingly divisive issue in national political and the 2004 presidential election. Congress's authorization for the use of force in Iraq in 2003 has not served as a guarantee of political consensus. ¶ Conversely, a process without congressional declarations of war does not necessarily result in less deliberation or consensus. Nor does it seem to inexorably lead to poor or unnecessary war goals. Perhaps the most important example, although many might consider it a "war," is the conflict between the United States and the Soviet Union from 1946 through 1991. War was fought throughout the world by the superpowers and their proxies during this period. Yet the only war arguably authorized by Congress – and even this is a debated point – was Vietnam. The United States waged war against Soviet proxies in Korea and Vietnam, the Soviet Union fought in Afghanistan, and the two almost came into direct conflict during the Cuban Missile Crisis. Despite the division over Vietnam, there appeared to be a significant bipartisan consensus on the overall strategy (containment) and goal (defeat of the Soviet Union, protection of Europe and Japan), and Congress consistently devoted significant resources to the creation of a standing military to achieve them. Different conflicts during this period that did not benefit from congressional authorization, such as conflicts in Korea, Grenada, Panama, and Kosovo, did not suffer from a severe lack of consensus, at least at the outset. Korea initially received the support of the nation's political leadership, and it seems that support declined only once battlefield reverses had occurred. Grenada and Panama did not seem to suffer from any serious political challenge, and while Kosovo met with some political resistance, it does not appear to have been significant.

Congressional checks don't boost resolve

Waxman 13 - Professor of Law at Columbia and Adjunct Senior Fellow for Law and Foreign Policy at CFR (Matthew, "The Constitutional Power to Threaten War," Yale Law Journal, vol. 123, 8-25-13) //AD

The credibility-enhancing effects of legislative constraints on threats are subject to dispute. Some studies question the assumptions underpinning theories of audience costs – specifically the idea that democratic leaders suffer domestic political costs to failing to make good on their threats, and therefore that their threats are especially credible^{e171} – and others question whether the empirical data

supports claims that democracies have credibility advantages in making threats.¹⁷² Other scholars dispute the likelihood that leaders will really be punished politically for backing down, especially if the threat was not explicit and unambiguous or if they have good policy reasons for doing so.¹⁷³ Additionally, even if transparency in democratic institutions allows domestic dissent from threats of force to be visible to foreign audiences, it is not clear that adversaries would interpret these mechanisms as political scientists expect in their models of strategic interaction, in light of various common problems of misperception in international relations.¹⁷⁴ These disputes are not just between competing theoretical models but also over the links between any of the models and real-world political behavior by states. At this point there remains a dearth of good historical evidence as to how foreign leaders interpret political maneuvers within Congress regarding threatened force.

Impact

4th gen warfare

Executive control of warmaking is key to combating 4th generation threats

Li 9 (Zheyao, J.D. candidate, Georgetown University Law Center, 2009; B.A., political science and history, Yale University, "War Powers for the Fourth Generation: Constitutional Interpretation in the Age of Asymmetric Warfare," 7 Geo. J.L. & Pub. Pol'y 373 2009 WAR POWERS IN THE FOURTH GENERATION OF WARFARE)//dtang

A. The Emergence of Non-State Actors Even as the quantity of nation-states in the world has increased dramatically since the end of World War II, the institution of the nation-state has been in decline over the past few decades. Much of this decline is the direct result of the waning of major interstate war, which primarily resulted from the introduction of nuclear weapons.¹²² The proliferation of nuclear weapons, and their immense capacity for absolute destruction, has ensured that conventional wars remain limited in scope and duration. Hence, "both the size of the armed forces and the quantity of weapons at their disposal has declined quite sharply" since 1945.¹²³ At the same time, concurrent with the decline of the nation-state in the second half of the twentieth century, non-state actors have increasingly been willing and able to use force to advance their causes. In contrast to nation-states, who adhere to the Clausewitzian distinction between the ends of policy and the means of war to achieve those ends, non-state actors do not necessarily fight as a mere means of advancing any coherent policy. Rather, they see their fight as a life-and-death struggle, wherein the ordinary terminology of war as an instrument of policy breaks down because of this blending of means and ends.¹²⁴ It is the existential nature of this struggle and the disappearance of the Clausewitzian distinction between war and policy that has given rise to a new generation of warfare. The concept of fourth-generational warfare was first articulated in an influential article in the Marine Corps Gazette in 1989, which has proven highly prescient. In describing what they saw as the modern trend toward a new phase of warfighting, the authors argued that: In broad terms, fourth generation warfare seems likely to be widely dispersed and largely undefined; the distinction between war and peace will be blurred to the vanishing point. It will be nonlinear, possibly to the point of having no definable battlefields or fronts. The distinction between "civilian" and "military" may disappear. Actions will occur concurrently throughout all participants' depth, including their society as a cultural, not just a physical, entity. Major military facilities, such as airfields, fixed communications sites, and large headquarters will become rarities because of their vulnerability; the same may be true of civilian equivalents, such as seats of government, power plants, and industrial sites (including knowledge as well as manufacturing industries).¹²⁵ It is precisely this blurring of peace and war and the demise of traditionally definable battlefields that provides the impetus for the formulation of a new theory of war powers. As evidenced by Part M, supra, the constitutional allocation of war powers, and the Framers' commitment of the war power to two co-equal branches, was not designed to cope with the current international system, one that is characterized by the persistent machinations of international terrorist organizations, the rise of multilateral alliances, the emergence of rogue states, and the potentially wide proliferation of easily deployable weapons of mass destruction, nuclear and otherwise.

B. The Framers' World vs. Today's World The Framers crafted the Constitution, and the people ratified it, in a time when everyone understood that the state controlled both the raising of armies and their use. Today, however, the threat of terrorism is bringing an end to the era of the nation-state's legal monopoly on violence, and the kind of war that existed before-based on a clear division between government, armed forces, and the people-is on the decline.¹²⁶ As states are caught between their decreasing ability to fight each other due to the existence of nuclear weapons and the increasing threat from non-state actors, it is clear that the Westphalian system of nation-states that informed the Framers' allocation of war powers is no longer the order of the day.¹²⁷ As seen in Part III, supra, the rise of the modern nation-state occurred as a result of its military effectiveness and ability to defend its citizens. If nation-states such as the United States are unable to adapt to the changing circumstances of fourth-generational warfare-that is, if they are unable to adequately defend against low-intensity conflict conducted by non-state actors-"then clearly [the modern state] does not have a future in front of it."¹²⁸ The challenge in formulating a new theory of war powers for fourth-generational warfare that remains legally justifiable lies in the difficulty of adapting to changed circumstances while remaining faithful to the constitutional text and the original meaning.²⁹ To that end, it is crucial to remember that the Framers crafted the Constitution in the context of the Westphalian system of nation-states. The three centuries following the Peace of Westphalia of 1648 witnessed an

international system characterized by wars, which, "through the efforts of governments, assumed a more regular, interconnected character."¹³⁰ That period saw the rise of an independent military class and the stabilization of military institutions. Consequently, "warfare became more regular, better organized, and more attuned to the purpose of war—that is, to its political objective."¹³¹ That era is now over. Today, the stability of the long-existing Westphalian international order has been greatly eroded in recent years with the advent of international terrorist organizations, which care nothing for the traditional norms of the laws of war. This new global environment exposes the limitations inherent in the interpretational methods of originalism and textualism and necessitates the adoption of a new method of constitutional interpretation. While one must always be aware of the text of the Constitution and the original understanding of that text, that very awareness identifies the extent to which fourth-generational warfare epitomizes a phenomenon unforeseen by the Framers, a problem the constitutional resolution of which must rely on the good judgment of the present generation.¹³² Now, to adapt the constitutional warmaking scheme to the new international order characterized by fourth-generational warfare, one must understand the threat it is being adapted to confront. c. The Jihadist Threat The erosion of the Westphalian and Clausewitzian model of warfare and the blurring of the distinction between the means of warfare and the ends of policy, which is one characteristic of fourth-generational warfare, apply to al-Qaeda and other adherents of jihadist ideology who view the United States as an enemy. An excellent analysis of jihadist ideology and its implications for the rest of the world are presented by Professor Mary Habeck.¹³³ Professor Habeck identifies the centrality of the Qur'an, specifically a particular reading of the Qur'an and hadith (traditions about the life of Muhammad), to the jihadist terrorists.¹³⁴ The jihadis believe that the scope of the Qur'an is universal, and "that their interpretation of Islam is also intended for the entire world, which must be brought to recognize this fact peacefully if possible and through violence if not."¹³⁵ Along these lines, the jihadis view the United States and her allies as among the greatest enemies of Islam: they believe "that every element of modern Western liberalism is flawed, wrong, and evil" because the basis of liberalism is secularism.¹³⁶ The jihadis emphasize the superiority of Islam to all other religions, and they believe that "God does not want differing belief systems to coexist."¹³⁷ For this reason, jihadist groups such as al-Qaeda "recognize that the West will not submit without a fight and believe in fact that the Christians, Jews, and liberals have united against Islam in a war that will end in the complete destruction of the unbelievers."¹³⁸ Thus, the adherents of this jihadist ideology, be it al-Qaeda or other groups, will continue to target the United States until she is destroyed. Their ideology demands it.¹³⁹ To effectively combat terrorist groups such as al-Qaeda, it is necessary to understand not only how they think, but also how they operate. Al-Qaeda is a transnational organization capable of simultaneously managing multiple operations all over the world.¹⁴⁰ It is both centralized and decentralized: al-Qaeda is centralized in the sense that Osama bin Laden is the unquestioned leader, but it is decentralized in that its operations are carried out locally, by distinct cells.¹⁴¹ Al-Qaeda benefits immensely from this arrangement because it can exercise direct control over high-probability operations, while maintaining a distance from low-probability attacks, only taking the credit for those that succeed. The local terrorist cells benefit by gaining access to al-Qaeda's "worldwide network of assets, people, and expertise."¹⁴² Post-September 11 events have highlighted al-Qaeda's resilience. Even as the United States and her allies fought back, inflicting heavy casualties on al-Qaeda in Afghanistan and destroying dozens of cells worldwide, al-Qaeda's networked nature allowed it to absorb the damage and remain a threat.¹⁴³ This is a far cry from earlier generations of warfare, where the decimation of the enemy's military forces would generally bring an end to the conflict. d. The Need for Rapid Reaction and Expanded Presidential War Power By now it should be clear just how different this conflict against the extremist terrorists is from the type of warfare that occupied the minds of the Framers at the time of the Founding. Rather than maintaining the geographical and political isolation desired by the Framers for the new country, today's United States is an international power targeted by individuals and groups that will not rest until seeing her demise. The Global War on Terrorism is not truly a war within the Framers' eighteenth-century conception of the term, and the normal constitutional provisions regulating the division of war powers between Congress and the President do not apply. Instead, this "war" is a struggle for survival and dominance against forces that threaten to destroy the United States and her allies, and the fourth-generational nature of the conflict, highlighted by an indiscernible distinction between wartime and peacetime, necessitates an evolution of America's traditional constitutional warmaking scheme. As first illustrated by the military strategist Colonel John Boyd, Constitutional decision-making in the realm of war powers in the fourth generation should consider the implications of the OODA Loop: Observe, Orient, Decide, and Act.¹⁴⁴ In the era of fourth-generational warfare, quick reactions, proceeding through the OODA Loop rapidly, and disrupting the enemy's OODA loop are the keys to victory. In order to win," Colonel Boyd suggested, "we should operate at a faster tempo or rhythm than our adversaries."¹⁴⁵ In the words of Professor Crevel, "[b]oth organizationally and in terms of the equipment at their disposal, the armed forces of the world will have to adjust themselves to this situation by changing their doctrine, doing away with much of their heavy equipment and becoming more like police."¹⁴⁶ Unfortunately, the existing constitutional understanding, which diffuses war power between two branches of government, necessarily (by the Framers' design) slows down decision-making. In circumstances where war is undesirable (which is, admittedly, most of the time, especially against other nation-states), the deliberativeness of the existing decision-making process is a positive attribute. In America's current situation, however, in the midst of the conflict with al-Qaeda and other international terrorist organizations, the existing process of

constitutional decision-making in warfare may prove a fatal hindrance to achieving the initiative necessary for victory. As a slow-acting, deliberative body, Congress does not have the ability to adequately deal with fast-emerging situations in fourth-generational warfare. Thus, in order to combat transnational threats such as al-Qaeda, the executive branch must have the ability to operate by taking offensive military action even without congressional authorization, because only the executive branch is capable of the swift decision-making and action necessary to prevail in fourth-generational conflicts against fourthgenerational opponents.

Fourth gen warfare is coming and will escalate – strong exec key

Singh 10 (S.B., Dy. Commandant, CRPF Academy, “FOURTH GENERATION WARFARE”, Endeavour, Vol 1, Issue 1, p. 12-14,
https://recomposition.files.wordpress.com/2012/11/academy_journal_endeavour_vol_1.pdf
//dtang

The fourth generation warfare will be highly dispersed in nature. The battlefield would expand to include the enemy's whole society. The battlefield itself would be difficult to define or delineate. Expansion of battlefield from land to sea to air, will now go into the realms of ideologies, culture and values of the target society. Psychological manipulation will assume primacy. The lines dividing the combatants and civilians will get further blurred. In fact the combatants would not be the traditional soldiers. They may well be civilians with specific areas of expertise which will extend beyond conventional military matters. These would be applied for comprehensive disruption, degradation and destruction of enemy society. Nations are defined not only by their geographic boundaries, but because of their culture, traditions and ideological cohesiveness. The quest to target the vulnerabilities of the adversary will prompt the warriors of the next generation of warfare to destroy the very fundamentals of enemy's nationality. The target would be its society, unity, national spirit and identity. The ultimate goal would be to create such conditions that the adversary's society will cease to exist as a coherent entity. All the rules and norms of traditional war fighting will disappear, to the extent that it may be difficult to call it war. Consequently the intelligentsia will be forced to coin new terms to define such acts. Since the basic characteristic of this generation of warfare is its lack of form or boundaries, such definitions and terms will appear confusing, imprecise and inaccurate. Terrorism, militancy, insurgency, asymmetric warfare and a large number of other terms, with overlapping scopes, will come into being. Delegation of executive powers will lead to operations being undertaken by small teams or individuals operating alone, making identification and targeting difficult. Fourth generation warfare will be fought in multiple strata, in different forms and methods, seemingly without a robust command and control architecture. It will also use tactics and techniques from earlier generations of warfare. The indefinable nature of battlefield, highly dispersed, specialized teams/ individuals and defiance of all norms will lead to ostensible chaos. As the stress of earlier warfare has shifted from manpower to fire power to maneuver, it will now further shift to this “apparent chaos”. This will be the strength of the fourth generation warrior, since it will make it difficult to identify its centre of gravity and target it. The “quest for profit” will drive the proponents of fourth generation warfare also. The goals would be money, territory, power or could go beyond to amalgamation of entire societies into own cultural / religious folds or its destruction to eliminate a perceived threat to own existence. International aversion to war, economic concerns and huge losses of lives will make the prospects of waging war more and more impractical to states. Intelligent methods of war fighting like war by proxy and by stateless actors will replace wars waged by nation states. The fourth generation warfare will use technology as a tool to wage an efficient and effective war with a wide reach, while exploiting the technological dependence of the target society to create mayhem. Having analysed the drivers and likely contours of the fourth generation warfare, certain basic questions need to be answered to further clarify fourth generation warfare.

Conflict escalation

Executive authority is a conflict dampener---prevents escalation of their impacts

Royal 11 (John-Paul, Institute of World Politics, Class of 2011 Valedictorian, "War Powers and the Age of Terrorism," http://www.thepresidency.org/storage/Fellows2011/Royal-Final_Paper.pdf)//dtang

The international system itself and national security challenges to the United States in particular, underwent rapid and significant change in the first decade of the twenty-first century. War can no longer be thought about strictly in the terms of the system and tradition created by the Treaty of Westphalia over three and a half centuries ago. Non-state actors now possess a level of destructiveness formerly enjoyed only by nation states. Global terrorism, coupled with the threat of weapons of mass destruction developed organically or obtained from rogue regimes, presents new challenges to U.S. national security and place innovative demands on the Constitution's system of making war. In the past, as summarized in the 9/11 Commission Report, threats emerged due to hostile actions taken by enemy states and their ability to muster large enough forces to wage war: "Threats emerged slowly, often visibly, as weapons were forged, armies conscripted, and units trained and moved into place. Because large states were more powerful, they also had more to lose. They could be deterred" (National Commission 2004, 362). This mindset assumed that peace was the default state for American national security. Today however, we know that threats can emerge quickly. Terrorist organizations half-way around the world are able to wield weapons of unparalleled destructive power. These attacks are more difficult to detect and deter due to their unconventional and asymmetrical nature. In light of these new asymmetric threats and the resultant changes to the international system, peace can no longer be considered the default state of American national security. Many have argued that the Constitution permits the president to use unilateral action only in response to an imminent direct attack on the United States. In the emerging security environment described above, pre-emptive action taken by the executive branch may be needed more often than when nation-states were the principal threat to American national interests. Here again, the 9/11 Commission Report is instructive as it considers the possibility of pre-emptive force utilized over large geographic areas due to the diffuse nature of terrorist networks: In this sense, 9/11 has taught us that terrorism against American interests "over there" should be regarded just as we regard terrorism against America "over here." In this sense, the American homeland is the planet (National Commission 2004, 362). Furthermore, the report explicitly describes the global nature of the threat and the global mission that must take place to address it. Its first strategic policy recommendation against terrorism states that the: U.S. government must identify and prioritize actual or potential terrorist sanctuaries. For each, it should have a realistic strategy to keep possible terrorists insecure and on the run, using all elements of national power (National Commission 2004, 367). Thus, fighting continues against terrorists in Afghanistan, Yemen, Iraq, Pakistan, the Philippines, and beyond, as we approach the tenth anniversary of the September 11, 2001 attacks. Proliferation of weapons of mass destruction (WMD), especially nuclear weapons, into the hands of these terrorists is the most dangerous threat to the United States. We know from the 9/11 Commission Report that Al Qaeda has attempted to make and obtain nuclear weapons for at least the past fifteen years. Al Qaeda considers the acquisition of weapons of mass destruction to be a religious obligation while "more than two dozen other terrorist groups are pursuing CBRN [chemical, biological, radiological, and nuclear] materials" (National Commission 2004, 397). Considering these statements, rogue regimes that are openly hostile to the United States and have or seek to develop nuclear weapons capability such as North Korea and Iran, or extremely unstable nuclear countries such as Pakistan, pose a special threat to American national security interests. These nations were not necessarily a direct threat to the United States in the past. Now, however, due to proliferation of nuclear weapons and missile technology, they can inflict damage at considerably higher levels and magnitudes than in the past. In addition, these regimes may pursue proliferation of nuclear weapons and missile technology to other nations and to allied terrorist organizations. The

United States must pursue condign punishment and appropriate, rapid action against hostile terrorist organizations, rogue nation states, and nuclear weapons proliferation threats in order to protect American interests both at home and abroad. Combating these threats are the “top national security priority for the United States...with the full support of Congress, both major political parties, the media, and the American people” (National Commission 2004, 361). Operations may take the form of pre-emptive and sustained action against those who have expressed hostility or declared war on the United States. Only the executive branch can effectively execute this mission, authorized by the 2001 AUMF. If the national consensus or the nature of the threat changes, Congress possesses the intrinsic power to rescind and limit these powers.

Key to winning all future conflicts

Johson 6 (Karlton, Army War College, “Temporal and Scalar Mechanics of Conflict Strategic Implications of Speed and Time on the American Way of War,” <http://www.dtic.mil/dtic/tr/fulltext/u2/a449394.pdf>)//dtang

The U.S. Army War College uses the acronym “VUCA” to describe the volatile, uncertain, chaotic and ambiguous environment in which strategy is made.⁴ If the present is any indication of the future, then it is reasonable to assume that the world will become increasingly dangerous as long as that strategic environment exists. Many long-range assessments predict that global tensions will continue to rise as resources become even more constrained and as transnational threats endanger international security.⁵ Future leaders and planners can expect to see weak and failed states persisting to dominate U.S. foreign policy agendas. Terrorism will remain a vital interest, and the use of American military strength will remain focused on the dissuasion, deterrence, and, where necessary, the preemption of strategic conflict. Enemies will work aggressively to offset U.S. military superiority by seeking out technologies that will offer some level of asymmetric advantage, and the challenging asymmetric nature of future conflicts will add deeper complexity to both war planning and the development of national security strategy.⁶ The “National Defense Strategy of the United States,” published in March 2005, addressed the unconventional nature of the future. It argued that enemies are increasingly likely to pose asymmetric threats resulting in irregular, catastrophic and disruptive challenges.⁷ This means that, in some cases, non-state actors will choose to attack the United States using forms of irregular warfare that may include the use of Weapons of Mass Destruction. These actors may also seek new and innovative ways to negate traditional U.S. strengths to their advantage.⁸ In fact, one author theorizes that “speed of light engagements” will be the norm by the year 2025, and America may lose its monopoly on technological advances as hostile nations close the gap between technological “haves” and “have nots.”⁹ This type of warfare lends itself to engagements of varying speed and temporal geometry.¹⁰ Therefore, in conflicts of the future, time and speed will matter. Consequently, it is necessary to analyze these elements with rigor and discipline in order to understand their far-reaching implications.

Credibility

Executive weakness destroys credibility—that emboldens adversaries and risks flashpoint escalation

Howell 7 (William, professor of political science at U-Chicago, and Jon C. Pevehouse, professor of Political Science UW-Madison, “While Dangers Gather : Congressional Checks on Presidential War Powers,” 2007 ed.)

SIGNALING RESOLVE To the extent that congressional discontent signals domestic irresolution to other nations, the job of resolving a foreign crisis is made all the more difficult. As Kenneth Schultz shows, an "opposition party can undermine the credibility of some challenges by publicly opposing them. Since this strategy threatens to increase the probability of resistance from the rival state, it forces the government to be more selective about making threats"—and, concomitantly, more cautious about actually using military force.⁴ When members of Congress openly object to a planned military operation, would-be adversaries of the United States may feel emboldened, believing that the president lacks the domestic support required to see a military venture through. Such nations, it stands to reason, will be more willing to enter conflict, and if convinced that the United States will back down once the costs of conflict are revealed, they may fight longer and make fewer concessions. Domestic political strife, as it were, weakens the ability of presidents to bargain effectively with foreign states, while increasing the chances that military entanglements abroad will become protracted and unwieldy. A large body of work within the field of international relations supports the contention that a nation's ability to achieve strategic military objectives in short order depends, in part, on the head of state's credibility in conveying political resolve. Indeed, a substantial game theoretic literature underscores the importance of domestic political institutions and public opinion as state leaders attempt to credibly commit to war,⁷⁵ Confronting widespread and vocal domestic opposition, the president may have a difficult time signaling his willingness to see a military campaign to its end. While congressional opposition may embolden foreign enemies, the perception on the part of allies that the president lacks support may make them wary of committing any troops at all.

Lack of Obama credibility prevents effective multilateralism and causes global hotspot escalation

Coes 11 –Visiting Fellow at Harvard University’s John F. Kennedy School of Government, degree from Columbia University, received the prestigious Bennett Cerf Memorial Prize (Ben, “The disease of a weak president”, The Daily Caller, 9-30-11, <http://dailycaller.com/2011/09/30/the-disease-of-a-weak-president/>) //AD

The disease of a weak president usually begins with the Achilles' heel all politicians are born with — the desire to be popular. It leads to pandering to different audiences, people and countries and creates a sloppy, incoherent set of policies. Ironically, it ultimately results in that very politician losing the trust and respect of friends and foes alike. In the case of Israel, those of us who are strong supporters can at least take comfort in the knowledge that Tel Aviv will do whatever is necessary to protect itself from potential threats from its unfriendly neighbors. While it would be preferable for the Israelis to be able to count on the United States, in both word and deed, the fact is right now they stand alone. Obama and his foreign policy team have undercut the Israelis in a multitude of ways. Despite this, I wouldn't bet against the soldiers of Shin Bet, Shayetet 13 and the Israeli Defense Forces. But Obama's weakness could — in other places — have implications far, far worse than anything that

might ultimately occur in Israel. The triangular plot of land that connects Pakistan, India and China is held together with much more fragility and is built upon a truly foreboding foundation of religious hatreds, radicalism, resource envy and nuclear weapons. If you can only worry about preventing one foreign policy disaster, worry about this one. Here are a few unsettling facts to think about: First, Pakistan and India have fought three wars since the British de-colonized and left the region in 1947. All three wars occurred before the two countries had nuclear weapons. Both countries now possess hundreds of nuclear weapons, enough to wipe each other off the map many times over. Second, Pakistan is 97% Muslim. It is a question of when — not if — Pakistan elects a radical Islamist in the mold of Ayatollah Khomeini as its president. Make no mistake, it will happen, and when it does the world will have a far greater concern than Ali Khamenei or Mahmoud Ahmadinejad and a single nuclear device. Third, China sits at the northern border of both India and Pakistan. China is strategically aligned with Pakistan. Most concerning, China covets India's natural resources. Over the years, it has slowly inched its way into the northern tier of India-controlled Kashmir Territory, appropriating land and resources and drawing little notice from the outside world. In my book, *Coup D'Etat*, I consider this tinderbox of colliding forces in Pakistan, India and China as a thriller writer. But thriller writers have the luxury of solving problems by imagining solutions on the page. In my book, when Pakistan elects a radical Islamist who then starts a war with India and introduces nuclear weapons to the theater, America steps in and removes the Pakistani leader through a coup d'état. I wish it was that simple. The more complicated and difficult truth is that we, as Americans, must take sides. We must be willing to be unpopular in certain places. Most important, we must be ready and willing to threaten our military might on behalf of our allies. And our allies are Israel and India. There are many threats out there — Islamic radicalism, Chinese technology espionage, global debt and half a dozen other things that smarter people than me are no doubt worrying about. But the single greatest threat to America is none of these. The single greatest threat facing America and our allies is a weak U.S. president. It doesn't have to be this way. President Obama could — if he chose — develop a backbone and lead. Alternatively, America could elect a new president. It has to be one or the other. The status quo is simply not an option.

Congress opposition to warfighting destroys international perception of U.S. credibility

Waxman 13 - Professor of Law at Columbia and Adjunct Senior Fellow for Law and Foreign Policy at CFR (Matthew, "The Constitutional Power to Threaten War," Yale Law Journal, vol. 123, 8-25-13) //AD

When members of Congress vocally oppose a use of force, they undermine the president's ability to convince foreign states that he will see a fight through to the end. Sensing hesitation on the part of the United States, allies may be reluctant to contribute to a military campaign, and adversaries are likely to fight harder and longer when conflict erupts— thereby raising the costs of the military campaign, decreasing the president's ability to negotiate a satisfactory resolution, and increasing the probability that American lives are lost along the way. Facing a limited band of allies willing to participate in a military venture and an enemy emboldened by domestic critics, presidents may choose to curtail, and even abandon, those military operations that do not involve vital strategic interests.¹⁴⁵

Deterrence

Legality of threats alone is sufficient to deter conflict

Waxman 14 (Matthew, Professor of Law, Columbia Law School; Adjunct Senior Fellow for Law and Foreign Policy, Council on Foreign Relations. April, “The Power to Threaten War”, Yale Law Journal, Vol. 123, No. 6, 1626 – 2133)//dtang

Existing war powers scholarship focuses overwhelmingly on the President’s power to initiate military operations abroad and the extent to which that power is constrained by Congress. It ignores the allocation of legal power to threaten military force or war, even though threats—to coerce or deter enemies and to reassure allies—are one of the most important ways in which the United States government wields its military might. This paper fills that scholarly void, and draws on recent political science and historical scholarship to construct a richer and more accurate account of the modern presidency’s powers to shape American security policy. The swelling scope of the President’s practice in wielding threatened force largely tracks the standard historical narrative of war powers shifting from Congress to the President. Indeed, adding threats of force to that story might suggest that this shift in powers of war and peace has been even more dramatic than usually supposed. This Article shows, however, that congressional influence operates more robustly—and in different ways—than usually supposed in legal debates about war powers to shape strategic decision-making. In turn, these mechanisms of congressional influence can enhance the potency of threatened force. By refocusing the debate on threatened force and its credibility requirements, this Article also calls into question many orthodoxies of the policy advantages and risks attendant to various allocations of legal war powers. Instead of proposing a policy-optimal solution, the Article concludes that the allocation of constitutional war powers is—and should be—geopolitically and strategically contingent. The actual and effective balance between presidential and congressional powers over war and peace in practice necessarily depends on shifting assumptions and policy choices about how best to secure U.S. interests against potential threats.

Framing issue – uq actually controls the link – only a risk that a decline in executive war powers kills effective deterrence – none of their ev assumes perception

Waxman 14 (Matthew, Professor of Law, Columbia Law School; Adjunct Senior Fellow for Law and Foreign Policy, Council on Foreign Relations. April, “The Power to Threaten War”, Yale Law Journal, Vol. 123, No. 6, 1626 – 2133)//dtang

The main data set for analyzing these questions is, not surprisingly, actual wars and other hostile engagements of U.S. forces abroad. In ascertaining and describing the patterns of executive behavior and congressional responses, legal scholars look at armed conflicts and combat operations of the pas. Legal debates heat up during or following wars, especially major ones that go badly, or military combat that extends longer than expected. Proposed solutions focus on the commencement of armed hostilities—military engagement with the enemy—and what, if any, inter-branch actions must precede or accompany it. There is a major disconnect here, though, between legal scholarship on constitutional war powers—specifically, its predominant focus on actual military engagements—and the way the United States wields its military might, especially since the onset of the Cold War and extending into the twenty-first century. Oftentimes the most important policy tool derived from U.S. military power is not waging war, but threatening war or force. The power to threaten war is closely related to, but analytically distinct from, the power to make it. By “threats” in this Article, I mean communications of the will and capability to use military force that are employed as a means to induce other actors to change behavior—whether to do something or to not do something.¹² During major periods of American history, including the present one, U.S. strategy has relied heavily on perceptions of U.S. military might and willingness to use it; that is, it has relied on the manipulation of risk to deter aggression or other actions by adversaries, to coerce or compel certain actions by other states

or international actors, to reassure allies, and to pursue other political designs in the shadow of armed threats.¹³ The primary purpose to which U.S. military might has been directed since World War II has generally been to prevent wars or deter them. When war or large-scale force was actually used, it was because a prior policy or strategy had failed—for instance, threats were insufficiently credible, crises involving U.S. threats of force escalated in ways difficult to control, and so on—rather than because making war was intended as the best approach to a danger or, sometimes, even recognized as a likely result. In this regard, most of the time that U.S. military power is “used”—and often when it is most successful—it does not manifest as a war or major military engagement at all. There is a basic paradox at work here: if threats of force work, force does not have to be used. Other things being equal, the greater the credibility of the threat, the less likely it will be necessary to make good on it. Because this argument is about wars that don’t happen, though, it is difficult to develop empirical evidence to support it. Accordingly, statesmen cannot be so sure of its validity and constitutional lawyers tend to overlook it entirely. There is a close parallel in international law to this disconnect between legal discourse and security strategy. Article 2(4) of the United Nations Charter prohibits “the threat or use of force against the territorial integrity or political independence of any state.”¹⁴ However, beyond prohibiting the most blatantly aggressive threats, international legal doctrine in this area is not at all well developed,¹⁵ and the regulation of threats of force is not well theorized in international legal scholarship.¹⁶ As with the domestic law of American war powers, the threat element has mostly disappeared from discussion, even though international relations scholars recognize that threatened force is doing so much work.¹⁷ This Article is not a doctrinal argument. It is an argument about framing and method, intended to fill an analytical gap and therefore to inform understanding of the functional advantages and disadvantages of legal formulas for allocating war powers.¹⁸ Specifically, Part I of this Article contends that understanding the evolution in constitutional war powers and the merits or dangers of these developments requires both widening the data set and investigative lens to include threats of force and incorporating the insights of the past several decades of analysis by political scientists, historians, and theorists of American grand strategy. Doing so reveals aspects of the war powers story obscured by legal discourse and method focused predominantly on actual uses of force, and it alters and refines the orthodox functional arguments usually relied on by both sides—presidentialist (favoring vast unilateral executive authority to use force) and congressionalist (favoring tight legislative checks on that authority)—of the war powers debate. In game-theoretic terms, the debate between presidentialist and congressionalist legal scholars about functional advantages looks only at the final stage of a decision tree; but the President’s ability to threaten force is critically important at earlier stages in determining whether that final stage will occur at all, as well as the payoffs associated with choices.

A legal decline in war powers directly impacts the President’s ability to threaten force

Waxman 14 (Matthew, Professor of Law, Columbia Law School; Adjunct Senior Fellow for Law and Foreign Policy, Council on Foreign Relations. April, “The Power to Threaten War”, Yale Law Journal, Vol. 123, No. 6, 1626 – 2133)//dtang

The President’s power to threaten force is almost certainly at least as broad as his power to use it.

One way to think about it is that the power to threaten force is a lesser-included element of presidential war powers; the power to threaten to use force is simply a secondary question, the answer to which is bounded by the primary issue of the scope of presidential power to actually use it. If one interprets the President’s defensive war powers very broadly, to include dealing with aggression against not only U.S. territories but also its distant interests and allies,⁴⁹ then it is easy to conclude that the President can also therefore take steps that stop short of actual armed intervention to deter or prevent such aggression. If, however, one interprets the President’s powers narrowly—for example, to include only limited unilateral authority to repel attacks against U.S. territory⁵⁰—then one might extend objections to excessive presidential power to include the President’s unilateral threats of armed intervention. Another way of looking at it is that, depending on how a particular threat is communicated, threats of war or force may fall within even quite narrow interpretations of the President’s inherent foreign relations powers to conduct diplomacy or his express Commander-in-Chief power to control U.S. military forces—or some combination of the two. A President’s verbal warning, ultimatum, or declared intention to use military force, for instance, could be justified as merely exercising his role as the “sole organ” of U.S. foreign diplomacy, conveying externally information about U.S. capabilities and intentions.⁵¹ A President’s movement of U.S. troops or warships to a crisis region or elevation of their alert level could be justified as merely exercising his day-to-day tactical control over forces under his command.⁵² Generally, nobody seriously argues that the exercise of these powers alone could so affect the likelihood of hostilities or war as to intrude on Congress’s powers over war and peace.⁵³ But we know from historical examples that such unilateral military moves, even those that are ostensibly defensive ones, can provoke wars—take, for example, President Polk’s movement of U.S. forces to the contested border with Mexico in 1846, and the resulting skirmishes that led Congress to declare war.⁵⁴

Laundry list

New restrictions collapse executive response – that causes terrorism, rogue state lashout, and rapid prolif

Yoo 13 - Emanuel S. Heller Professor of Law at UC-Berkeley Law, visiting scholar at the American Enterprise Institute, former Fulbright Distinguished Chair in Law at the University of Trento, served as a deputy assistant attorney general in the Office of Legal Council at the U.S. Department of Justice between 2001 and 2003, J.D. from Yale and degree from Harvard (John, "Like it or not, Constitution allows Obama to strike Syria without Congressional approval," Fox News, 8-30-13, <http://www.foxnews.com/opinion/2013/08/30/constitution-allows-obama-to-strike-syria-without-congressional-approval/>) //AD

The most important of the president's powers are commander-in-chief and chief executive. ¶ As Alexander Hamilton wrote in Federalist 74, "The direction of war implies the direction of the common strength, and the power of directing and employing the common strength forms a usual and essential part in the definition of the executive authority." ¶ Presidents should conduct war, he wrote, because they could act with "decision, activity, secrecy, and dispatch." In perhaps his most famous words, Hamilton wrote: "Energy in the executive is a leading character in the definition of good government. . . It is essential to the protection of the community against foreign attacks." ¶ The Framers realized the obvious. Foreign affairs are unpredictable and involve the highest of stakes, making them unsuitable to regulation by pre-existing legislation. Instead, they can demand swift, decisive action, sometimes under pressured or even emergency circumstances, that are best carried out by a branch of government that does not suffer from multiple vetoes or is delayed by disagreements. ¶ Congress is too large and unwieldy to take the swift and decisive action required in wartime. ¶ Our Framers replaced the Articles of Confederation, which had failed in the management of foreign relations because it had no single executive, with the Constitution's single president for precisely this reason. Even when it has access to the same intelligence as the executive branch, Congress's loose, decentralized structure would paralyze American policy while foreign threats grow. ¶ Congress has no political incentive to mount and see through its own wartime policy. Members of Congress, who are interested in keeping their seats at the next election, do not want to take stands on controversial issues where the future is uncertain. They will avoid like the plague any vote that will anger large segments of the electorate. They prefer that the president take the political risks and be held accountable for failure. ¶ Congress's track record when it has opposed presidential leadership has not been a happy one. ¶ Perhaps the most telling example was the Senate's rejection of the Treaty of Versailles at the end of World War I. Congress's isolationist urge kept the United States out of Europe at a time when democracies fell and fascism grew in their place. Even as Europe and Asia plunged into war, Congress passed Neutrality Acts designed to keep the United States out of the conflict. ¶ President Franklin Roosevelt violated those laws to help the Allies and draw the nation into war against the Axis. While pro-Congress critics worry about a president's foreign adventurism, the real threat to our national security may come from inaction and isolationism. ¶ Many point to the Vietnam War as an example of the faults of the "imperial presidency." Vietnam, however, could not have continued without the consistent support of Congress in raising a large military and paying for hostilities. And Vietnam ushered in a period of congressional dominance that witnessed American setbacks in the Cold War, and the passage of the ineffectual War Powers Resolution. Congress passed the Resolution in 1973 over President Nixon's veto, and no president, Republican or Democrat, George W. Bush or Obama, has ever accepted the constitutionality of its 60-day limit on the use of troops abroad. No federal court has ever upheld the resolution. Even Congress has never enforced it. ¶ Despite the record of practice and the Constitution's institutional design, critics nevertheless argue for a radical remaking of the American way of war. They typically base their claim on Article I, Section 8, of the Constitution, which gives Congress the power to "declare War." But these observers read the eighteenth-century constitutional text through a modern lens by interpreting "declare War" to mean "start war." ¶ When the Constitution was written, however, a declaration of war served diplomatic notice about a change in legal relations between nations. It had little to do with launching hostilities. In the century before the Constitution, for example, Great Britain – where the Framers got the idea of the declare-war power – fought numerous

major conflicts but declared war only once beforehand.¶ Our Constitution sets out specific procedures for passing laws, appointing officers, and making treaties. There are none for waging war, because the Framers expected the president and Congress to struggle over war through the national political process.¶ In fact, other parts of the Constitution, properly read, support this reading. Article I, Section 10, for example, declares that the states shall not “engage” in war “without the consent of Congress” unless “actually invaded, or in such imminent Danger as will not admit of delay.” ¶ This provision creates exactly the limits desired by anti-war critics, complete with an exception for self-defense. If the Framers had wanted to require congressional permission before the president could wage war, they simply could have repeated this provision and applied it to the executive.¶ Presidents, of course, do not have complete freedom to take the nation to war. Congress has ample powers to control presidential policy, if it wants to. ¶ Only Congress can raise the military, which gives it the power to block, delay, or modify war plans.¶ Before 1945, for example, the United States had such a small peacetime military that presidents who started a war would have to go hat in hand to Congress to build an army to fight it. ¶ Since World War II, it has been Congress that has authorized and funded our large standing military, one primarily designed to conduct offensive, not defensive, operations (as we learned all too tragically on 9/11) and to swiftly project power worldwide. ¶ If Congress wanted to discourage presidential initiative in war, it could build a smaller, less offensive-minded military.¶ Congress’s check on the presidency lies not just in the long-term raising of the military. It can also block any immediate armed conflict through the power of the purse.¶ If Congress feels it has been misled in authorizing war, or it disagrees with the president's decisions, all it need do is cut off funds, either all at once or gradually.¶ It can reduce the size of the military, shrink or eliminate units, or freeze supplies. Using the power of the purse does not even require affirmative congressional action.¶ Congress can just sit on its hands and refuse to pass a law funding the latest presidential adventure, and the war will end quickly. ¶ Even the Kosovo war, which lasted little more than two months and involved no ground troops, required special funding legislation.¶ The Framers expected Congress's power of the purse to serve as the primary check on presidential war. During the 1788 Virginia ratifying convention, Patrick Henry attacked the Constitution for failing to limit executive militarism. James Madison responded: “The sword is in the hands of the British king; the purse is in the hands of the Parliament. It is so in America, as far as any analogy can exist.” Congress ended America’s involvement in Vietnam by cutting off all funds for the war.¶ Our Constitution has succeeded because it favors swift presidential action in war, later checked by Congress’s funding power. If a president continues to wage war without congressional authorization, as in Libya, Kosovo, or Korea, it is only because Congress has chosen not to exercise its easy check.¶ We should not confuse a desire to escape political responsibility for a defect in the Constitution. A radical change in the system for making war might appease critics of presidential power. But it could also seriously threaten American national security.¶ In order to forestall another 9/11 attack, or to take advantage of a window of opportunity to strike terrorists or rogue nations, the executive branch needs flexibility.¶ It is not hard to think of situations where congressional consent cannot be obtained in time to act. Time for congressional deliberation, which leads only to passivity and isolation and not smarter decisions, will come at the price of speed and secrecy.¶ The Constitution creates a presidency that can respond forcefully to prevent serious threats to our national security.¶ Presidents can take the initiative and Congress can use its funding power to check them. Instead of demanding a legalistic process to begin war, the Framers left war to politics.¶ As we confront the new challenges of terrorism, rogue nations and WMD proliferation, now is not the time to introduce sweeping, untested changes in the way we make war.

Congressional war authority is ineffective – executive war powers key to combating a litany of transnational threats – combating terror, rogue states, and proliferate all require a flexible executive

Yoo 7 (John is a professor of law at the Boalt Hall School of Law at the University of California, Berkeley, and visiting scholar at the American Enterprise Institute. He has also served as general counsel for the Senate Judiciary Committee; as a law clerk to Justice Clarence Thomas and Judge Laurence H. Silberman; and, from 2001 to 2003, as a Deputy Assistant Attorney General in the Office of Legal Counsel of the U.S. Department of Justice. 4/18, “Exercising Wartime Powers,” <http://hir.harvard.edu/archives/1369//dtang>

Proponents of congressional war power often argue that the executive branch is unduly prone to war. In this view, if the president and Congress have to agree on warring, the nation will enter fewer wars and wars that do occur will arise only after sufficient deliberation. But it is far from clear that outcomes would be better if Congress alone had the power to begin wars. First, congressional deliberation does not necessarily ensure consensus. Congressional authorization may represent only a bare majority of Congress or an unwillingness to challenge the President's institutional and political strengths, regardless of the merits of the war. And even if it does represent consensus, it is no guarantee of consensus after combat begins. The Vietnam War, which was initially approved by Congress, did not meet with a consensus over the long term but instead provoked some of the most divisive politics in US history. It is also difficult to claim that congressional authorizations to use force in Iraq, either in 1991 or 2002, reflected a deep consensus over the merits of the wars there. The 1991 authorization barely survived the Senate, and the 2002 authorization received significant negative votes and has become a deeply divisive issue in national politics. It is also not clear that the absence of congressional approval has led the nation into wars it should not have waged. The experience of the Cold War, which provides the best examples of military hostilities conducted without congressional support, does not clearly come down on the side of a link between institutional deliberation and better conflict selection. Wars were fought throughout the world by the two superpowers and their proxies, such as in Korea, Vietnam, and Afghanistan, during this period. Yet the only war arguably authorized by Congress--and this point is debatable--was the Vietnam War. Aside from bitter controversy over Vietnam, there appeared to be significant bipartisan consensus on the overall strategy of containment, as well as the overarching goal of defeating the Soviet Union. The United States did not win the four-decade Cold War by declarations of war; rather, it prevailed through the steady presidential application of the strategy of containment, supported by congressional funding of the necessary military forces. On the other hand, congressional action has led to undesirable outcomes. Congress led the United States into two "bad" wars, the 1798 quasi-war with France and the War of 1812. Excessive congressional control can also prevent the United States from entering into conflicts that are in the national interest. Most would agree now that congressional isolationism before World War II harmed US interests and that the United States and the world would have been far better off if President Franklin Roosevelt could have brought the United States into the conflict much earlier. Congressional participation does not automatically or even consistently produce desirable results in war decision making. Critics of presidential war powers exaggerate the benefits of declarations or authorizations of war. What also often goes unexamined are the potential costs of congressional participation: delay, inflexibility, and lack of secrecy. In the post-Cold War era, the United States is confronting the growth in proliferation of WMDs, the emergence of rogue nations, and the rise of international terrorism. Each of these threats may require pre-emptive action best undertaken by the President and approved by Congress only afterward. Take the threat posed by the Al Qaeda terrorist organization. Terrorist attacks are more difficult to detect and prevent than conventional ones. Terrorists blend into civilian populations and use the channels of open societies to transport personnel, material, and money. Although terrorists generally have no territory or regular armed forces from which to detect signs of an impending attack, WMDs allow them to inflict devastation that once could have been achievable only by a nation-state. To defend itself from this threat, the United States may have to use force earlier and more often than when nation-states generated the primary threats to US national security. The executive branch needs the flexibility to act quickly, possibly in situations wherein congressional consent cannot be obtained in time to act on the intelligence. By acting earlier, the executive branch might also be able to engage in a more limited, more precisely targeted, use of force. Similarly, the least dangerous way to prevent rogue nations from acquiring WMDs may depend on secret intelligence gathering and covert action rather than open military intervention. Delay for a congressional debate could render useless any time-critical intelligence or windows of opportunity. The Constitution creates a presidency that is uniquely structured to act forcefully and independently to repel serious threats to the nation. Instead of specifying a legalistic process to begin war, the Framers wisely created a fluid political process in which legislators would use their appropriations power to control war. As the United States confronts terrorism, rogue

nations, and WMD proliferation, we should look skeptically at claims that radical changes in the way we make war would solve our problems, even those stemming from poor judgment, unforeseen circumstances, and bad luck.

Leadership

A weak executive is the greatest threat to US leadership - only strong presidential power will hedge against inconsistent tendencies of Congress

Mallaby 2k (Sebastian, Member of the Washington Post's Editorial Board, Foreign Affairs, January/February, lexis)

Finally, some will object that the weakness of the presidency as an institution is not the main explanation for the inadequacies of American diplomacy, even if it is a secondary one. The ad hominem school of thought argues instead that Bill Clinton and his advisers have simply been incompetent. Others make various sociological claims that isolationism or multiculturalism lies at the root of America's diplomatic troubles. All of these arguments may have merit. But the evidence cited by both camps can be better explained by the structural weakness of the presidency. Take, for example, one celebrated error: President Clinton's declaration at the start of the Kosovo war that the Serbs need not fear NATO ground troops. This announcement almost certainly cost lives by encouraging the Serbs to believe that America was not serious about stopping ethnic cleansing. The ad hominem school sees in this example proof of Clinton's incompetence; the sociological school sees in it proof of isolationist pressure, which made the option of ground troops untenable. But a third explanation, offered privately by a top architect of the Kosovo policy, is more plausible. According to this official, the president knew that pundits and Congress would criticize whichever policy he chose. Clinton therefore preemptively took ground troops off the table, aware that his critics would then urge him on to a ground war -- and also aware that these urgings would convince Belgrade that Washington's resolve would stiffen with time, rather than weaken. The president's stand against ground troops was therefore the logical, tactical move of a leader feeling vulnerable to his critics. Other failings of American diplomacy can likewise be accounted for by the advent of the nonexecutive presidency. Several commentators, notably Samuel Huntington and Garry Wills in these pages, have attacked the arrogance of America's presumption to offer moral leadership to the world. But American leaders resort to moral rhetoric largely out of weakness. They fear that their policy will be blocked unless they generate moral momentum powerful enough to overcome domestic opponents. Likewise, critics point to the hypocrisy of the United States on the world stage. America seeks U.N. endorsement when convenient but is slow to pay its U.N. dues; America practices legal abortion at home but denies funds to organizations that do the same abroad. Again, this hypocrisy has everything to do with the weak executive. the president has a favored policy but is powerless to make Congress follow it. Still other critics decry American diplomacy as a rag-bag of narrow agendas: Boeing lobbies for China trade while Cuban-Americans demand sanctions on Cuba. Here, too, presidential power is the issue. A strong presidency might see to it that America pursues its broader national interest, but a weak one cannot. This is why Clinton signed the Helms-Burton sanctions on Cuba even though he knew that these would do disproportionate harm to U.S. relations with Canada and Europe. What if America's nonexecutive presidency is indeed at the root of its diplomatic inadequacy? First, it follows that it is too optimistic to blame America's foreign policy drift on the weak character of the current president. The institution of the presidency itself is weak, and we would be unwise to assume that a President Gore or Bradley or Bush will perform much better. But it also follows that it is too pessimistic to blame America's foreign policy drift on cultural forces that nobody can change, such as isolationism or multiculturalism. We are dealing with an institutional problem, so it will take institutional reform to improve matters. America must explore ways of arresting the erosion of executive power, by streamlining the confirmation process, by reversing the Supreme Court's Clinton v. Jones decision in order to limit the executive's vulnerability to legal assault, and by avoiding legislated mandates in foreign policy. Since the republic's founding, Americans have been suspicious of concentrated power. This suspicion has now gone too far. There are worse things to fear than a powerful president -- such as a country or a world adrift. This big nation and the small world it inhabits desperately need a strong chief executive to guide them.

Multilat

Presidential power strengthens U.S. commitment to credible multilateralism

Patrick 2 (Stewart, Research Associate @ the Center on International Cooperation, NYU, Multilateralism and US Foreign Policy edited by Patrick and Forman, p. 18-19)//dtang

Still, the deflation of presidential power can complicate U.S. commitment to credible multilateralism. For one thing, it increases the chance that the executive branch will agree to assume international obligations that the legislature either opposes or has no intention of fulfilling. This predicament is likely to be most acute when different parties control the two branches, as was the case for most of the past decade. During the 1990s, Congress used the power of the purse to reduce foreign aid, cut IMF and World Bank funding, withhold UN assessments, and impose budgetary retrenchment and bureaucratic consolidation on the State Department complex. Following the 1994 elections, a prolonged interbranch struggle produced disarray in U.S. foreign policy, including the stalling of a dozen multilateral conventions. During the Cold War, the United States' foreign partners could take comfort in the bipartisan U.S. consensus on international engagement and the relative orderliness and transparency of policymaking in Washington. Changing strategic and domestic circumstances, however, have cast doubt on the credibility of U.S. commitments to multilateral institutions. To begin with, there is no domestic agreement today about the composition, scope, and ranking of U.S. national interests, the resources needed to pursue them, or the global commitments they warrant. Moreover, the first post-Cold War decade saw a marked erosion of the longstanding bipartisan internationalist consensus in Congress. Many stalwarts of constructive internationalism in both parties were replaced by colleagues preoccupied with domestic concerns or suspicious that global regimes and organizations infringe on U.S. sovereignty, thwart U.S. interests and values, or place unacceptable checks on U.S. options. Foreign policy was increasingly the subject of partisan squabbling, and ideological disagreement. In an inversion of the old adage, as Sarah Sewall observes, "partisanship seemed to grow stronger at the water's edge." The politicization of foreign affairs has been reinforced by the growing salience of "inter-mestic" issues, like trade and immigration, which blur the boundary between foreign and domestic policy and tend to divide rather than unite Americans. Within Congress, moreover, the making of foreign policy has become increasingly decentralized and atomized with the decline in party discipline and the proliferation of committees touching on foreign policy matters. This development allows individual legislators to establish independent foreign policy platforms. This activism is troubling, argues Lee Hamilton, former chair of the House Foreign (now International) Affairs Committee, because members have little incentive and are poorly organized to engage in multilateral diplomacy. It has resulted in "a bias toward unilateralism in foreign policy," making it "harder to manage alliances, institutions, and long-term policies across regions and topics in a highly interconnected and complex world."

Prolif

Ability for the executive to respond rapidly to conflict checks proliferate and regional instability

Bohnenmann 2 (Edward, Major, US Army, "Rapid, Decisive Operations: The Execution of Operational Art by a Standing Joint Task Force," <http://www.dtic.mil/cgi-bin/GetTRDoc?AD=ADA403628%26Location=U2%26doc=GetTRDoc.pdf>)//dtang

Modern campaigns, such as OPERATION DESERT STORM conducted by the United States and its allies; nineteenth century campaigns conducted by Napoleon in Europe; or the ancient campaigns conducted by the Romans or the Mongols have all sought to apply an asymmetrical advantage to the battlefield. The great captains have continuously struggled to find an advantage possessed by their forces and developed ways in which to leverage that advantage against an opponent. Lightning campaigns such as OPERATION DESERT STORM, were the result of the application of asymmetrical advantages such as: superior mobility, speed, intelligence, synchronization, and training of friendly forces. These advantages and superior technology shocked opponents and often led to the rapid conclusion of the conflict.⁸¹ As the United States enters the twenty-first century as the lone superpower, it must develop ways in which to harness the tremendous capabilities the joint forces bring to a confrontation and apply those joint capabilities in a manner consistent with the characteristics of operational art. The asymmetrical advantages currently enjoyed by the United States over potential adversaries must focus on placing him in a reactionary mode, while creating too many dilemmas for him to deal with at a particular time and space. September 11, 2001 significantly changed the way America views the world. With the attacks on the World Trade Centers and the Pentagon, the post-Cold War era ended violently and was replaced by an era of uncertainty. The forces of terror that had previously operated on distant shores now brought their violence home to Americans with the killing of innocent civilians within the borders of the United States. This single act of violence, along with the emergence of other regional powers and the proliferation of weapons of mass destruction has set the stage for the future operational environment; with it comes the military requirement to possess the capability to respond rapidly and decisively. With the need to respond rapidly and decisively to worldwide contingencies, the United States can no longer afford a system within the military that is essentially unprepared for action at the onset of each crisis. The ad hoc JTFs previously examined lacked the inherent capabilities demanded in modern crises, with rapidly unfolding situations, taking place in obscure areas around the world. All three of the examined JTFs lacked critical personnel needed to plan courses of action during the initial phases of the operation, causing problems during the execution phases. The one-dimensional approach to the crisis in Kosovo was reminiscent of the singular focus LANTCOM had before OPERATION URGENT FURY. Humanitarian aid operations, as well as other stability and support operations also require a command and control system in place to enable a rapid and effective response.

Quick threat proliferation makes nuclear escalation inevitable absent executive flexibility

Paul 98 (Joel, Professor, University of Connecticut School of Law, "The Geopolitical Constitution: Executive Expediency and Executive Agreements" July, 1998, 86 Calif. L. Rev. 671 **Footnote 137-139 added)//dtang

Whatever the complexity of causes that led to the Cold War - ideology, economics, power politics, Stalin's personality, Soviet intrigue, or American ineptitude - the tension of the bipolar order seemed real, immutable, and threatening to the U.S. public. ⁿ¹³⁵ The broad consensus of U.S. leadership held that the immediacy of the nuclear threat, the need for covert operations and intelligence

gathering, and the complexity of U.S. relations with both democracies and dictatorships made it impractical to engage in congressional debate and oversight of foreign policy-making. n136 The eighteenth-century Constitution did not permit a rapid response to twentieth-century foreign aggression. The reality of transcontinental ballistic missiles collapsed the real time for decision-making to a matter of minutes. Faced with the apparent choice between the risk of nuclear annihilation or amending the constitutional process for policy-making, the preference for a powerful executive was clear. n137 Early in the Cold War one skeptic of executive power, C.C. Rossiter, acknowledged that the steady increase in executive power is unquestionably a cause for worry, but so, too, is the steady increase in the magnitude and complexity of the problems the president has been called upon by the American people to solve in their behalf. They still have more to fear from the ravages of depression, rebellion, and especially atomic war than they do from whatever decisive actions may issue from the White House in an attempt to put any such future crises to rout....It is not too much to say that the destiny of this nation in the Atomic Age will rest in the [*700] capacity of the Presidency as an institution of constitutional dictatorship. n138 n137. President Truman warned that we live in an age when hostilities begin without polite exchanges of diplomatic notes. There are no longer sharp distinctions between combatants and noncombatants, between military targets and the sanctuary of civilian areas. Nor can we separate the economic facts from the problems of defense and security. [The] President, who is Comander in Chief and who represents the interests of all the people, must be able to act at all times to meet any sudden threat to the nation's security. 2 Harry S. Truman, *Memoirs: Years of Trial and Hope* 478 (1956) (commenting on the Court's decision in the Steel Seizure Case). n138. Rossiter, *supra* note 54, at 308-09. n139. President Truman warned that upon the functioning of a strong executive "depends the survival of each of us and also on that depends the survival of the free world." *The Powers of the Presidency* 114 (Robert S. Hirschfield ed., 1968). See also, e.g., Speech by John F. Kennedy delivered to the National Press Club (Jan. 14, 1960), in Hirschfield, *supra*, at 129-31; Congress, the President, and the War Powers: Hearings Before the Subcomm. on Nat'l Sec. Policy and Scientific Developments of the House Comm. on Foreign Affairs, 91st Cong. 12-13 (1970) (statement of McGeorge Bundy, President, Ford Foundation); Congressional Oversight of Executive Agreements: Hearings on S. 3475 Before the Subcomm. on Separation of Powers of the Senate Comm. of the Judiciary, 92d Cong. 237-40 (1972) (statement of Nicholas Katzenbach, Former Attorney General and Former Undersecretary of State).

SCS

Maintaining warfighting capabilities key to deter Chinese invasion of the South China Seas

Glaser 12, CSIS Freeman Chair in China Studies

(Bonnie, Pivot to Asia: Prepare for Unintended Consequences,
http://csis.org/files/publication/120413_gf_glaser.pdf)

Under the current administration, the pendulum in U.S. policy toward China has swung from attempting to cooperate with China on global problems to pushing back against Chinese assertiveness and challenges to international laws and norms. Getting tougher with Beijing was necessary, but it has also created unintended consequences that the next administration, either a second Obama team or a Republican lineup, will have to contend with. The Obama administration's initial policy in 2009 raised fears in many Asian capitals of a G2 condominium that would make decisions over the heads of others. Those concerns were unwarranted and short lived. Beijing interpreted the U.S. approach as weakness, which, along with China's economic success and America's struggles, led to a year of Chinese hubris that manifested itself in a series of intimidating actions in China's neighborhood. Subsequent entreaties by regional states to counterbalance China increased U.S. attention to the Asia-Pacific region. Now, the U.S. Asia "pivot" has prompted Chinese anxiety about U.S. containment and heightened regional worries about intensified U.S.-China strategic competition. In the run-up to the leadership transition that will take place at China's 18th Party Congress this fall, Beijing is inwardly focused and unlikely to act on its fears. However, 2013 could see a shift in Chinese foreign policy based on the new leadership's judgment that it must respond to a U.S. strategy that seeks to prevent China's reemergence as a great power. Signs of a potential harsh reaction are already detectable. The U.S. Asia pivot has triggered an outpouring of anti-American sentiment in China that will increase pressure on China's incoming leadership to stand up to the United States. Nationalistic voices are calling for military countermeasures to the bolstering of America's military posture in the region and the new U.S. defense strategic guidelines. For example, an article published in China's Global Times, a jingoistic newspaper owned by the Communist Party mouthpiece People's Daily, called for China to strengthen its long-range strike capabilities. Deng Xiaoping's guideline to keep a low profile in the international arena, designed more than two decades ago to cope with uncertainty produced by the collapse of the Soviet bloc, is increasingly seen by China's elite and public as irrelevant and even harmful to the task of defending Chinese ever-expanding "core interests." Some voices are calling for closer alignment with Moscow and promoting the BRICS grouping (Brazil, Russia, India, and China) as a new "pole" in the international arena to strengthen the emerging powers against the West. Xi Jinping, who will assume the helm as China's new leader later this year, will be under pressure from many domestic constituencies to more forcefully defend Chinese interests in the international arena. Seeking to quickly consolidate his power and enhance the legitimacy of the Communist Party, Xi and his newly installed Politburo Standing Committee colleagues may be more willing than their predecessors to test drive a policy that is more confrontational. The U.S. response to a more muscular Chinese foreign and military policy, should it appear, will have to be carefully calibrated. Ignoring greater Chinese assertiveness would fuel the belief—already emerging in China and elsewhere—that the United States is in inexorable decline. History shows that when great powers falter, China does not hesitate to seize the opportunity to advance its interests, especially in the South China Sea. As American forces withdrew from Vietnam in the mid-1970s, the Chinese grabbed the Paracel Islands from Saigon. Similarly, when the Soviet Union withdrew from Vietnam's Cam Ranh Bay and the United States terminated its base agreement with the Philippines, China quietly occupied Mischief Reef to the dismay of Manila. Yet a hostile and overbearing U.S. response would confirm Chinese suspicions that the United States seeks to contain its rise, which could cement the emergence of a U.S.-China Cold War. In addition, it would further alarm regional states who seek at all costs to avoid having to choose between the United States and China. U.S. policy will need to combine firmness with subtlety. A strategy will need to be shaped that protects regional

stability and reassures China's neighbors, but also avoids greater U.S.- China strategic competition and the classic security dilemma, wherein each side believes that growing capabilities reflect hostile intent and responds by producing that reality. Sustained attention and commitment of sufficient resources to the Asia- Pacific region will be key to assuaging the doubts of regional friends and allies about U.S. staying power. The United States also will need to maintain the military capabilities necessary to deter Chinese aggression.

Terror

Terrorism is a threat now – presidential flexibility key to solve

Castle 15 (William S., Chief Counsel in the Office of the Senate)

President Pro Tempore for Senator Orrin G. Hatch., Harvard Journal of Law and Public Policy, 2015, “THE ARGUMENT FOR A NEW AND FLEXIBLE AUTHORIZATION FOR THE USE OF MILITARY FORCE”, http://www.harvard-jlpp.com/wp-content/uploads/2015/05/Castle_Final.pdf///dtang

With the murder of American citizens, the unraveling of opportunities provided by our service members to the people of Iraq, and the potential destabilization of the Middle East, few will argue that the terrorist organization known as the Islamic State (IS) does not pose “a clear and present danger to the national security of the United States.”¹ Accordingly, President Obama has committed his Administration to the objective of “degrade[ing] and ultimately destroy[ing]” IS.² However, this raises the central legal question that occurs whenever our forces are committed to combat: Under what legal authority can the President use military force? I agree with President Obama’s assertion that he has the constitutional authority to conduct military operations against IS. In addition to this Article II power, President Obama was appropriate in invoking the 2001 Authorization for the Use of Military Force (2001 AUMF) and the 2002 Authorization for Use of Military Force Against Iraq Resolution (2002 AUMF) as additional bases for using force against IS.⁴ Nevertheless, the President continues to insist on limiting the types of strategies and tactics that can be utilized by our forces against this new enemy.⁵ The Administration’s initial policy was to prohibit “boots on the ground” in Iraq and Syria.⁶ With the publication of the President’s AUMF proposal, this position appears to have been modified so as to prohibit “the use of the United States Armed Forces in enduring offensive ground combat operations.”⁷ Additionally, the President’s proposal would cap the new authorization at three years.⁸ The importance of maintaining legal flexibility for the possible use of additional military capabilities against IS was underscored by former Defense Secretary Robert Gates’s recent warning that “there will be boots on the ground if there is to be any hope of success in the strategy.”⁹ This point was echoed by General David Petraeus in his admonition that defeating IS will take “months and years, not days or weeks.” Accordingly, this Article argues for the adoption of a third AUMF, but for one unencumbered by the shortcomings of the President’s draft sent to Congress on February 11. Instead, Congress should enact the 113th Congress’s Senate Joint Resolution 43 (S.J. Res. 43),¹⁵ which complements but does not replace the 2001 and 2002 AUMFs. Though the President has ample war powers to confront IS without a new authorization, adoption of S.J. Res. 43 will eliminate any ambiguity as to the nation’s resolve to conduct operations against IS.¹⁶ Equally important, the adoption of either piece of legislation will preclude any politically-motivated legal restrictions regarding “time, geography, and type of forces,” which unnecessarily jeopardize the goal of eliminating IS and needlessly add to the risks faced by the U.S. Armed Forces.¹⁷ Part I of this Article describes the constitutional and statutory history of the President’s war powers and the benefits of an AUMF. Part II discusses the ambiguity caused by the Administration’s continuing policy revisions regarding the 2001 and 2002 AUMFs. Part III argues for the enactment of a third AUMF and prescribes both the structure and necessary elements of such legislation. As part of the discussion of what components should be part of the new AUMF, this article argues that S.J. Res. 43, rather than the President’s draft, meets the requirements of what provisions should be included in this third authorization.

Surveillance capabilities are integral to presidential war powers – allows effective terrorism deterrence

Yoo 14 (John is professor of law at the Boalt Hall School of Law at the University of California, Berkeley, and visiting scholar at the American Enterprise Institute. He has also served as general counsel for the Senate Judiciary Committee; as a law clerk to Justice Clarence Thomas and Judge Laurence H. Silberman; and, from 2001 to 2003, as a Deputy Assistant Attorney General in the Office of Legal Counsel of the U.S. Department of Justice. October 3, “Surveillance and executive power”, <http://blog.constitutioncenter.org/2014/10/surveillance-and-executive-power/>///dtang

As Commander-in-Chief, the President has the constitutional power and the responsibility to wage war in response to a direct attack against the United States. In the Civil War, President Lincoln undertook several actions—raised an army, withdrew money from the treasury, launched a blockade—on his own authority in response to the Confederate attack on Fort Sumter, moves that Congress and the Supreme Court later approved. During World War II, the Supreme Court similarly recognized that once war began, the President’s authority as Commander-in-Chief and Chief Executive gave him the tools necessary to effectively wage war. In the wake of the September 11 attacks, Congress agreed that the President has authority under the Constitution to take action to deter and prevent acts of international terrorism against the United States,¹ which recognizes the President’s authority to use

force to respond to al Qaeda, and any powers necessary and proper to that end. Even legal scholars who argue against this historical practice concede that once the United States has been attacked, the President can respond immediately with force. John Yoo and Stewart Baker will debate Alex Abdo and Elizabeth Wydra at the National Constitution Center on October 7—reserve your tickets NOW! **The ability to collect intelligence is intrinsic to the use of military force.** It is inconceivable that the Constitution would vest in the President the powers of Commander-in-Chief and Chief Executive, give him the responsibility to protect the nation from attack, **but then disable him from gathering intelligence to use the military most effectively to defeat the enemy.** Every evidence of the Framers' understanding of the Constitution is that the government would have every ability to meet a foreign danger. As James Madison wrote in *The Federalist*, "security against foreign danger is one of the primitive objects of civil society." Therefore, the "powers requisite for attaining it must be effectually confided to the federal councils." After World War II, the Supreme Court declared, "this **grant of war power includes all that is necessary and proper for carrying these powers into execution.**" **Covert operations and electronic surveillance are clearly part of this authority.** During the writing of the Constitution, some Framers believed that the President alone should manage intelligence because only he could keep secrets. Several Supreme Court cases have recognized that the President's role as Commander-in-Chief and the sole organ of the nation in its foreign relations must include the power to collect intelligence. These authorities agree that **intelligence rests with the President because its structure allows it to act with unity, secrecy, and speed. Presidents have long ordered electronic surveillance without any judicial or congressional participation.** More than a year before the Pearl Harbor attacks, but with war clearly looming with the Axis powers, President Franklin Roosevelt authorized the FBI to intercept any communications, whether wholly inside the country or international, of persons "suspected of subversive activities against the Government of the United States, including suspected spies." FDR was concerned that "fifth columns" could wreak havoc with the war effort. "It is too late to do anything about it after sabotage, assassinations and 'fifth column' activities are completed," FDR wrote in his order. FDR ordered the surveillance even though a federal law at the time prohibited electronic surveillance without a warrant. **Presidents continued to monitor the communications of national security threats on their own authority, even in peacetime.** If Presidents in times of peace could order surveillance of spies and terrorists, **executive authority is only the greater now, as hostilities continue against al Qaeda.**

ISIS generating millions from oil sales

Charles Lister, Brookings Doha Center, December 2014, *Profiling the Islamic State*, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

While more sustainable, income earned through extortion pales in comparison to the underground sale of Syrian and Iraqi oil. **Illicit oil sales are not new for IS—by 2010, the group was thought to have been "siphoning off a share of Iraq's oil wealth, opening gas stations in the north, smuggling oil and extorting money from industry contractors."**⁵⁶ **But by late August 2014, energy analysts estimated that the group was selling as much as 70,000 barrels of oil daily from Syria and Iraq (at \$26-\$35 per barrel of heavy oil and \$60 per barrel of light crude) to internal black market customers and external buyers in Iraq, Lebanon, Turkey, and Kurdistan.**⁵⁷ These calculations result in a daily income of \$1-3 million, which over 12 months amounts to \$365 million-1.1 billion.⁵⁸ The targeting of IS-linked oil facilities in Syria since late-September, however, will have significantly eroded this prospect.

ISIS raises money through kidnappings

Charles Lister, Brookings Doha Center, December 2014, *Profiling the Islamic State*, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_lister.pdf?la=en DOA: 3-1-15

IS's finances have been heavily reliant on oil and gas, but other resources are also being exploited, including agriculture, cotton, water, and electricity. The group is also known to operate an efficient kidnap-for-ransom operation, with four foreign nationals—two young Italian women, a Dane, and a Japanese national—all confirmed kidnapped by IS in August 2014 alone.⁵⁹ While such hostage taking has proven a powerful weapon in recent months through the public execution of American and British nationals, it may also be in the hope of securing ransoms for other captives. Despite a French denial, unnamed NATO sources in Brussels, for example, have claimed that IS was paid \$18 million in April 2014 in exchange for four French hostages.⁶⁰

ISIS makes \$ selling antiquities

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_liste.pdf?la=en DOA: 3-1-15

Even in areas not under its complete control, IS still maintains extortion networks and protection rackets. IS units have also allegedly stolen antiques and sold them onto the black market. For example, one Iraqi intelligence official claimed the group had earned \$36 million after selling 8,000 year-old items from al-Nabk, north of Damascus, in early 2014.

ISIS financial resources enable easy expansion

Charles Lister, Brookings Doha Center, December 2014, Profiling the Islamic State, http://www.brookings.edu/~media/Research/Files/Reports/2014/11/profiling-islamic-state-lister/en_web_liste.pdf?la=en DOA: 3-1-15

While IS fighters have long imposed shadow taxation (and extortion) within areas under their control or influence, more official taxation systems have begun to be introduced since the proclamation of the caliphate. For example, IS has introduced a customs tax upon the trucking business on the main highways of western Iraq. This organized taxation system targets trucks transporting food and electronics from Syria and Jordan via Iraq's al-Waleed and al-Tanif crossings. As of September 2014, rates were placed at \$300 per truck of foodstuffs and \$400 per load of electronic goods, with an occasional \$800 flat rate for trucks in general. The system itself is surprisingly professional, as Mitchell Prothero explained: "Not only does IS offer protection from bandits, but its tax collectors also provide traders with paperwork that shows they've paid IS taxes as well as counterfeit government tax receipts that truckers can show to Iraqi Army checkpoints, which allow them to pass without further payments."⁶²

In addition to shielding IS from traditional financial counterterrorism measures, such independent financial capacities have also provided a source of social leverage, whether through incentives to induce tribal loyalty or by funding food provision and fuel subsidies to encourage popular support. For example, during its offensive in Deir Ezzor in May-June 2014, IS "spread \$2 million in the area to entice tribes and leaders to permit their presence," thereby securing several strategic surrenders and pledges of allegiance.⁶³

IS's ability to present an image of wealth and success has strengthened its recruitment of new fighters locally as well as from abroad. As one moderate commander based in Aleppo, speaking

on condition of anonymity, said in June 2014, "Syrians join ISIS for money, simply because they can afford to pay salaries."⁶⁴ An Islamic Front political official, who also requested anonymity, put it similarly bluntly: "ISIS is definitely expanding—it has a lot of money and right now, Syrians are so poor. Money changes everything—people will turn to and support extremism out of desperation."⁶⁵

Terrorism -Georgia

1NC – Terrorism DA

Terrorist threats are real and rising but metadata prevents attacks

Carafano et al 15 [James Jay, Ph.D., Charles "Cully" Stimson, Steven P. Bucci, Ph.D., John Malcolm and Paul Rosenzweig, Backgrounder #3018 on National Security and Defense, Heritage Foundation May 21, 2015, Section 215 of the PATRIOT Act and Metadata Collection: Responsible Options for the Way Forward]

The threat of international terrorism is real and on the rise The United States remains in a state of armed conflict against non-state actors: al-Qaeda, the Afghan Taliban, ISIS, and associated forces. Winning this armed conflict requires a coordinated, sophisticated, and comprehensive strategy that harnesses all aspects of America's national power. For decades, over many armed conflicts, the United States has relied on and utilized the fruits of lawful signals intelligence to disrupt, degrade, detect, and ultimately defeat the enemies of the United States. Today, because of stunning advances in technology, we have the ability to search through billions of anonymous bits of telephone call data and draw connections among known and suspected foreign terrorists about whom we otherwise might never have known. Those connections and the connections made possible by other aspects of national power enable those who defend our freedoms to keep us safe.

Metadata is vital to counter-terrorism intelligence – empirically stops attacks and can't be replaced with other surveillance methods

Young 14 [Mark D., Senior Vice President and Chief Strategy Officer of National Security Partners, LLC. Previously he served as the Executive Director for the Directorate of Plans and Policy at United States Cyber Command, the Special Counsel for Defense Intelligence for the House Permanent Select Committee on Intelligence, and as a senior leader at the National Security Agency. 2014 I/S: A Journal of Law & Policy for the Information Society, 10 ISJLP 367, "NSA SURVEILLANCE: ISSUES OF SECURITY, PRIVACY AND CIVIL LIBERTY: ARTICLE: National Insecurity: The Impacts of Illegal Disclosures of Classified Information"]

Current examples of the NSA's contributions to national security are difficult to find because of the sensitivity of the agency's mission. In recent congressional testimony, however, the DNI said that SIGINT is the primary contributor to counterterrorism intelligence and that multiple empirical studies have shown that signal intelligence, provided by the NSA, is the major contributor to answering the hardest intelligence challenges faced by the U.S. ^{n33¶} Although the claims in these books are unconfirmed, publications such as Counter Strike: The Untold Story of America's Secret Campaign Against Al Qaeda by Eric Schmitt and Thom Shanker and Operation Dark Heart: Spycraft and Special Ops on the Frontlines of Afghanistan--and the Path to Victory by Lieutenant Colonel Anthony Shaffer suggest that the NSA may have prevented significant terrorist attacks and provided critical intelligence during U.S. military operations. [¶] These books, together with the claims of senior intelligence officials before Congress, strongly suggest that the NSA's efforts are the most effective shield against the acts of violence that harm U.S. and allied military members, Americans, and our national security interests. In response to apparent disclosures of NSA activities, President Obama directed the declassification of sensitive NSA collection conducted under the Foreign Intelligence Surveillance Act (FISA). In September 2013, multiple documents concerning "bulk telephony metadata" collection under Section 501 of FISA were declassified and publically released by the ODN. ⁿ³⁴ These disclosures included a Foreign Intelligence Surveillance Court finding of reasonable grounds that the call records were relevant to an authorized terrorism investigation. ⁿ³⁵ The same order required the [*376] NSA to establish "mandatory procedures strictly to control access to and use of the archived data collected pursuant to [the court's] order." ⁿ³⁶ Additionally, the order mandated that the NSA's General Counsel monitor the designation of those with access to the data and act as an approval authority for the actual queries analysts wished to make of the data. ^{n37¶} In late October 2013, the ODN released a number of additional documents related to the NSA's alleged collection programs. These documents include a 2009 NSA congressional notification describing the

failure to comply with a Foreign Intelligence Surveillance Court order, n38 and a March 2009 Internal NSA Memorandum of Understanding required for access and query privileges of data collected through the NSA's bulk telephony metadata program. n39 These documents describe the legal justifications for and technical detail about how the NSA collects and uses intelligence.¶ This information was declassified and publically released to inform the public about what data was collected and analyzed by the NSA, to balance inaccurate speculations by the media about the NSA, and to facilitate the debate about U.S. Intelligence Community operations. When examined together, the information disclosed by Snowden and the declassified information released by the ODNI present a positive picture of prudent measures for national security. If the information about programs such as PRISM, FAIRVIEW, or OAKSTAR is accurate, then it appears as if the Intelligence Community has not only adjusted well to global technical advancements in telecommunications, but also learned significant lessons from the September 11, 2001 terrorist attacks.¶ [*377] It was known in early 2001 that the NSA's effectiveness was challenged by the "multiplicity of new types of communications links, by the widespread availability of low-cost encryption systems, and by changes in the international environment in which dangerous security threats can come from small, but well organized, terrorist groups as well as hostile nation states." n40 Any challenge about the value of an intelligence program must address the importance of data quantity and quality. First, **since intelligence analysis depends on having access to relevant information, logic dictates that more data is always better.** As noted by Mark Lowenthal:¶ The issue then becomes how to extract the intelligence from the mountain of information. One answer would be to increase the number of analysts who deal with the incoming intelligence, but that raises further demands on the budget. Another possible response, even less palatable, would be to collect less. But, even then, there would be no assurance that the "wheat" remained in the smaller volume still being collected. n41¶ Thus, quantity has an intelligence quality all its own. In addition, the type of information needed by the Intelligence Community is also important. Given the priorities noted in the National Security Strategy, the importance of NSA collection and analysis as noted in congressional testimony and the ever-present threats by terrorist groups and hostile nations the American public should vigorously endorse the type of programs viewed by Snowden as oppressive. It is troubling to see the disclosure of techniques allegedly used by the NSA to obtain "cryptographic details of commercial cryptographic information security systems through industry relationships," n42 and the rampant speculation about the monitoring of the mobile phones of the heads of state from Europe.¶ **It is not only logic that leads one to believe in the value of NSA collection, but also testimony by intelligence professionals.** For example, according to the House Intelligence Committee, **NSA activities have "been integral in preventing multiple terrorist attacks, [*378] including a plot to attack [sic] the New York Stock Exchange in 2009."** n43 **The PRISM program, a program reported to provide the NSA access to information from some of the largest technology companies, provided "critical leads" to disrupt more than fifty potential terrorist events in more than twenty countries.** According to officials, the FISA authority--the congressional authorization to target communications of foreign persons who are located abroad for foreign intelligence purposes--contributed to more than ninety percent of these disruptions. n44¶ The Deputy Attorney General has noted that the FBI benefited from the NSA's Section 702 collection in the fall of 2009. Using Section 702 collection and "while monitoring the activities of [al-Qaeda] terrorists in Pakistan, the [NSA] noted contact from an individual in the U.S. that the [FBI] subsequently identified as Colorado-based Najibulla Zazi. The U.S. Intelligence Community, including the FBI and NSA, worked in concert to determine his relationship with [al-Qaeda], as well as identify any foreign or domestic terrorist links." n45¶ The FBI tracked Zazi as he traveled to New York to meet with co-conspirators, where they were planning to conduct a terrorist attack. Zazi and his co-conspirators were subsequently arrested. Zazi, upon indictment, pled guilty to conspiring to bomb the NYC subway system. Compelled collection (authorized under Foreign Intelligence Surveillance Act, FISA, Section 702) against foreign terrorists was critical to the discovery and disruption of this threat against the U.S. n46¶ Regardless of the accuracy of the information released by Snowden, the types of programs described by the material appear to directly contribute to national security; its release, regardless of its validity, will negatively impact U.S. security.¶ **Homegrown Violent Extremists n47 continue to be inspired by global jihadist propaganda and the perceived success of plots such as the November 2009 attack at Fort Hood, Texas and the March 2012 attacks by an al-Qaeda-inspired extremist in Toulouse, France.** n48 **The threat from terror groups remains constant, urgent,** and of great concern to the U.S. Intelligence Community. The revelations concerning the NSA's counterterrorism successes will motivate terror groups to reexamine how they communicate, plan, and execute these attacks.¶ Despite these publically acknowledged examples of the value of the bulk metadata program, multiple reports and a federal district court opinion have denied its efficacy. The Privacy and Civil Liberties Oversight Board n49 recommends discontinuing the program. The board noted, "an intelligence-gathering tool with significant ramifications for privacy and civil liberties cannot be regarded as justified merely because it provides some value in protecting the nation from terrorism." n50¶ A panel of advisors that included former government officials such as Richard Clarke (former National Coordinator for Security, Infrastructure Protection, and Counterterrorism), Michael J. Morell (former deputy director of the CIA), and Cass Sunstein (former head of the Office of Information and Regulatory Affairs in the Obama

[*380] White House) did not recommend the cessation of the bulk metadata program. In an unreleased report, commissioned by the president in August, the panel "went further than some of the agency's backers in Congress, who would make only cosmetic changes to it, but stopped short of calling for the program to be shut down, as its critics have urged." ⁿ⁵¹ They did, however question its value: "The [NSA] uses the telephone data to search for links between people in an effort to identify hidden associates of terrorism suspects, but the report says it 'was not essential to preventing attacks.'" ⁿ⁵² The panel's report was provided to the president three days after a federal judge determined, in a case seeking an injunction to stop the NSA program, that the Government failed to cite a "single instance in which the analysis of the NSA's bulk metadata collection actually stopped an imminent attack or otherwise aided the government in achieving any objective that was time-sensitive in nature." ⁿ⁵³ United States District Judge Richard J. Leon came to a dramatically different conclusion than United States District Judge William Pauley in similar cases dealing with the same program. ⁿ⁵⁴ In this volume, Mueller and Stewart claim that "the achievements of [the bulk metadata program] do seem to be decidedly underwhelming," despite acknowledging that in at least four cases, analysis of the metadata contributed to the arrest or locating of known terrorists or facilitators. ⁿ⁵⁵ Their analysis is flawed in the same way as is Judge Leon's and the Privacy and Civil Liberties Board. The **comments made by critics of the program appear to be motivated more by ideology** than dispassionate assessment of analytical tradecraft. The complexities, technology, and ambiguity of the modern security environment make it unlikely that any single intelligence source or program will provide a "smoking gun" on a national security threat. ⁿ⁵⁶ The Intelligence Community has sharpened its techniques since September 11, 2001 with this new reality in mind. The complexity of the international system, incomplete and inconsistent information, and the "inherent limitations of the human mind" are perennial problems for intelligence professionals. ⁿ⁵⁷ To overcome these realities, the Intelligence Community must apply a dizzying set of analytic techniques and mental discipline to review key assumptions about their operational tasks, validate the quality of the information collected and available to them, identify indicators of actualized threats, and continually strive to anticipate the thinking of those who seek to harm U.S. citizens or the security interests of the United States and our allies. This is no small task and it requires a mosaic of information, to include bulk metadata. Judge Leon at least acknowledged his unfamiliarity with the complexities of any conversation about bulk metadata collection and analysis. By staying his order to discontinue the program, he concedes that the data may be of critical importance to national security: "[I]n light of the significant national security interests at stake in this case and the novelty of the constitutional issues, I will stay my order pending appeal." ⁿ⁵⁸ Examples of the efficacy of the program are provided below, yet the public should keep in mind the unsatisfying fact that intelligence analysis is a laborious process that requires reason and passion. The author concedes that none of these examples provides an irrefutable defense of the accessing of bulk **metadata**. The program **does**, however, **provide a valuable link in the national security chain**. Although frustrating to the intelligence professionals who devote a large portion of their professional lives to the protection of the security, and civil liberties, of all U.S. citizens the debate is welcome, yet certainly not new.

Terrorism goes nuclear---high risk of theft and attacks escalate

Dvorkin 12 (Vladimir Z., Major General (retired), doctor of technical sciences, professor, and senior fellow at the Center for International Security of the Institute of World Economy and International Relations of the Russian Academy of Sciences. The Center participates in the working group of the U.S.-Russia Initiative to Prevent Nuclear Terrorism, 9/21/12, "What Can Destroy Strategic Stability: Nuclear Terrorism is a Real Threat," belfercenter.ksg.harvard.edu/publication/22333/what_can_destroy_strategic_stability.html)

Hundreds of scientific papers and reports have been published on nuclear terrorism. International conferences have been held on this threat with participation of Russian organizations, including IMEMO and the Institute of U.S. and Canadian Studies. Recommendations on how to combat the threat have been issued by the International Luxembourg Forum on Preventing Nuclear Catastrophe, Pugwash Conferences on Science and World Affairs, Russian-American Elbe Group, and other organizations. The UN

General Assembly adopted the International Convention for the Suppression of Acts of Nuclear Terrorism in 2005 and cooperation among intelligence services of leading states in this sphere is developing. ¶ At the same time, **these efforts fall short for a number of reasons, partly because various acts of nuclear terrorism are possible.** Dispersal of radioactive material by detonation of conventional explosives (“dirty bombs”) is a method that is most accessible for terrorists. With the wide spread of radioactive sources, raw materials for such attacks have become much more accessible than weapons-useable nuclear material or nuclear weapons. The use of “dirty bombs” will not cause many immediate casualties, but it will result into long-term radioactive contamination, **contributing to the spread of panic and socio-economic destabilization.** ¶ Severe consequences can be **caused by sabotaging nuclear power plants, research reactors, and radioactive materials storage facilities.** Large cities are especially vulnerable to such attacks. A large city may host dozens of research reactors with a nuclear power plant or a couple of spent nuclear fuel storage facilities and dozens of large radioactive materials storage facilities located nearby. The past few years have seen significant efforts made to enhance organizational and physical aspects of security at facilities, especially at nuclear power plants. Efforts have also been made to improve security culture. But these efforts do not preclude the possibility that **well-trained terrorists may be able to penetrate nuclear facilities.** ¶ Some estimates show that sabotage of a research reactor in a metropolis may expose hundreds of thousands to high doses of radiation. A formidable part of the city would become uninhabitable for a long time. ¶ Of all the scenarios, it is building an improvised nuclear device by terrorists that poses the maximum risk. **There are no engineering problems that cannot be solved if terrorists decide to build a simple “gun-type” nuclear device.** Information on the design of such devices, as well as implosion-type devices, is available in the public domain. It is the acquisition of weapons-grade uranium that presents the sole serious obstacle. Despite numerous preventive measures taken, we cannot rule out the possibility that **such materials can be bought on the black market. Theft of weapons-grade uranium is also possible.** Research reactor fuel is considered to be particularly vulnerable to theft, as it is scattered at sites in dozens of countries. There are about 100 research reactors in the world that run on weapons-grade uranium fuel, according to the International Atomic Energy Agency (IAEA). ¶ **A terrorist “gun-type” uranium bomb can have a yield of least 10-15 kt, which is comparable to the yield of the bomb dropped on Hiroshima.** The explosion of such a bomb in a modern metropolis can kill and wound hundreds of thousands and cause serious economic damage. There will also be long-term sociopsychological and political consequences. ¶ The vast majority of states have introduced unprecedented security and surveillance measures at transportation and other large-scale public facilities after the terrorist attacks in the United States, Great Britain, Italy, and other countries. These measures have proved burdensome for the countries’ populations, but the public has accepted them as necessary. **A nuclear terrorist attack will make the public accept further measures meant to enhance control even if these measures significantly restrict the democratic liberties they are accustomed to. Authoritarian states could be expected to adopt even more restrictive measures.** ¶ If a nuclear terrorist act occurs, **nations will delegate tens of thousands of their secret services’ best personnel to investigate and attribute the attack. Radical Islamist groups are among those capable of such an act.** We can imagine what would happen if they do so, given the anti-Muslim sentiments and resentment that conventional terrorist attacks by Islamists have generated in developed democratic countries. **Mass deportation of the non-indigenous population and severe sanctions would follow such an attack in what will cause violent protests in the Muslim world. Series of armed clashing terrorist attacks may follow.** The prediction that

Samuel Huntington has made in his book “The Clash of Civilizations and the Remaking of World Order” may come true.

Huntington’s book clearly demonstrates that it is not Islamic extremists that are the cause of the Western world’s problems. Rather there is a deep, intractable conflict that is rooted in the fault lines that run between Islam and Christianity. This is especially dangerous for Russia because these fault lines run across its territory. To sum it up, the political leadership of Russia has every reason to revise its list of factors that could undermine strategic stability. BMD does not deserve to be even last on that list because its effectiveness in repelling massive missile strikes will be extremely low. BMD systems can prove useful only if deployed to defend against launches of individual ballistic missiles or groups of such missiles. Prioritization of other destabilizing factors—that could affect global and regional stability—merits a separate study or studies. But even without them I can conclude that nuclear terrorism should be placed on top of the list. **The threat of**

nuclear terrorism is real, and a successful nuclear terrorist attack would lead to a radical

transformation of the global order.

All of the threats on the revised list must become a subject of thorough studies by experts. States need to work hard to forge a common understanding of these threats and develop a strategy to combat them.

****Uniqueness****

UQ – Yes Terror Threat

Terrorist attacks on the rise – surveillance is key to prevent the next attack

Zuckerman, Bucci and Carafano 13 (Jessica, Policy Analyst, Western Hemisphere, Heritage Foundation, Steven P., Director of the Center for Foreign and National Security Policy at the Heritage Foundation, and James Jay, PhD, Vice President for the Institute for National Security and Foreign Policy, "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism")

Strengthening the Domestic Counterterrorism Enterprise¶ Three months after the attack at the Boston Marathon, the pendulum of awareness of the terrorist threat has already begun to swing back, just as it did after 9/11. Due to the resilience of the nation and its people, for most, life has returned to business as usual. The threat of terrorism against the United States, however, remains.¶ Expecting to stop each and every threat that reaches a country's borders is unreasonable, particularly in a free society committed to individual liberty. Nevertheless, there are important steps that America's leaders can take to strengthen the U.S. domestic counterterrorism enterprise and continue to make the U.S. a harder target. Congress and the Administration should:¶ Ensure a proactive approach to preventing terrorist attacks. Despite the persistent threat of terrorism, the Obama Administration continues to focus on reactive policies and prosecuting terrorists rather than on proactive efforts to enhance intelligence tools and thwart terrorist attempts. This strategy fails to recognize the pervasive nature of the threat posed by terrorist groups such as al-Qaeda and homegrown extremism. The Administration, and the nation as a whole, should continue to keep in place a robust, enduring, and proactive counterterrorism framework in order to identify and thwart terrorist threats long before the public is in danger.¶ Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sunset provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.¶ Break down the silos of information. Washington should emphasize continued cooperation and information sharing among federal, state, and local law enforcement agencies to prevent terrorists from slipping through the cracks between the various jurisdictions. In particular, the FBI should make a more concerted effort to share information more broadly with state and local law enforcement. State and local law enforcement agencies are the front lines of the U.S. national security strategy. As a result, local authorities are able to recognize potential danger and identify patterns that the federal authorities may miss. They also take the lead in community outreach, which is crucial to identifying and stopping "lone wolf" actors and other homegrown extremists. Federal law enforcement, on the other hand, is not designed to fight against this kind of threat; it is built to battle cells, groups, and organizations, not individuals.¶ Streamline the domestic counterterrorism system. The domestic counterterrorism enterprise should base future improvements on the reality that governments at all levels are fiscally in crisis. Rather than add additional components to the system, law enforcement officials should streamline the domestic counterterrorism enterprise by improving current capabilities, leveraging state and local law enforcement resources and authorities, and, in some cases, reducing components where the terrorist threat is not high and the financial support is too thin or could be allocated more effectively. For example, the Department of Homeland Security should dramatically reduce the number of fusion centers, many of which exist in low-risk areas or areas where similar capabilities exist. An easy way to reduce the number of fusion centers is to eliminate funding to those that are located outside the 31 urban areas designated as the highest risk.¶ Fully implement a strategy to counter violent extremism. Countering violent extremism is an important complementary effort to an effective counterterrorism strategy. In August 2011, the U.S. government released a strategic plan called "Empowering Local Partners to Prevent Violent Extremism in the United States." [209] The plan focuses on outlining how federal agencies can assist local officials, groups, and private organizations in preventing violent extremism. It includes strengthening law enforcement cooperation and helping communities understand how to counter extremist propaganda (particularly online). Sadly, this plan is not a true

strategy. It fails to assign responsibilities and does not direct action or resource investments. More direction and leadership must be applied to transform a laundry list of good ideas into an effective program to support communities in protecting and strengthening civil society. ¶ Vigilance Is Not Optional ¶ In a political environment of sequestration on the one hand and privacy concerns on the other, there are those on both sides of the aisle who argue that counterterrorism spending should be cut and U.S. intelligence agencies reigned in. As the above list indicates however, the long war on terrorism is far from over. Most disturbingly, an increasing number of Islamist-inspired terrorist attacks are originating within America's borders. The rise of homegrown extremism is the next front in the fight against terrorism and should be taken seriously by the Administration. ¶ While there has not been another successful attack on the homeland on the scale of 9/11, the bombings in Boston reminded the country that the threat of terrorism is real and that continued vigilance is critical to keeping America safe. Congress and the Administration must continue to upgrade and improve the counterterrorism capabilities of law enforcement and intelligence agencies as well exercise proper oversight of these capabilities. The American people are resilient, but the lesson of Boston is that the government can and should do more to prevent future terror attacks.

The threat is rising --- NSA surveillance disrupts attacks

Bolton 15. [John R., Formerly served as the U.S. permanent representative to the United Nations, and under secretary of state for arms control and international security. At AEI, Ambassador Bolton's area of research is U.S. foreign and national security policy. 4/28/ "NSA activities key to terrorism fight," American Enterprise Institute, <https://www.aei.org/publication/nsa-activities-key-to-terrorism-fight/>.

Congress is poised to decide whether to re-authorize programs run by the National Security Agency that assess patterns of domestic and international telephone calls and emails to uncover linkages with known terrorists. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, **have played a vital role** in protecting America and our citizens around the world from the still-metastasizing terrorist threat. ¶ The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural protections to prevent spying on U.S. citizens. ¶ Nonetheless, critics from the right and left have attacked the NSA for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics, hoping to score political points with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail." ¶ The ill-informed nature of the debate has facilitated scare-mongering, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And there is an important asymmetry at work here as well. The critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond. By definition, the programs' success rests on the secrecy fundamental to all intelligence activities. Frequently, therefore, explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists and others, in turn, could use to stymie future detection efforts. ¶ After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since

his approach to foreign and defense issues has consistently reflected near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces.¶ In fact, just in the year since Congress last considered the NSA programs, the global terrorist threat has dramatically increased. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. Boko Haram is expanding beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016.¶ This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Terrorist threats are high now –intel is key

Collins 15 (Eliza, wirtter for Politico, 5/10, "Mike McCaul Warns of Growing Us Terrorist Threat")

More people are being recruited by terrorist groups than the FBI estimates, the chairman of the House Homeland Security Committee said on Sunday.¶ FBI Director James Comey said last week that hundreds, maybe thousands of people, are being recruited on encrypted websites that the FBI can't penetrate to carry out attacks in the U.S.¶ "We have this phenomenon in the United States where they can be activated by the Internet. Really, terrorism has gone viral," Rep. Mike McCaul (R-Texas) said on "Fox News Sunday."¶ The Texas shooting was a textbook case of law enforcement intercepting a threat, McCaul said, but homegrown terrorism is nonetheless difficult to stop.¶ Late last week, the U.S. raised the threat level at all U.S. military bases.¶ "This threat is like finding a needle in the haystack sometimes - and it's going to get worse, not better," McCaul warned.

The threat is increasing – recruiting levels

VOA News 15 (Homeland Security Chief: Global Terror Threat Has Entered 'New Phase'" 5/11)

Appearing on the Fox News Sunday broadcast from Paris, Congressman Michael McCaul, chairman of the House Homeland Security Committee, said there has been an uptick in threat streams against local police and military bases.¶ "We're seeing these on an almost daily basis. It's very concerning. I'm over here with the French counter-terrorism experts on the Charlie Hebdo case, how we can stop foreign fighters coming out of Iraq and Syria to Europe. But then, we have this phenomenon in the United States where they (terrorists) can be activated by the Internet. And, really, terrorism has gone viral," said McCaul.¶ McCaul said the potential terror threat may even be greater than the FBI has outlined. He said the United States faces two threats: one from fighters coming out of the Middle East and the other from thousands at home who will take up the call to arms when the IS group sends out an Internet message. He warned the threat will only get worse, largely because of the existence of so many failed states in the Middle East and North Africa.

Lone wolf risk is growing

Zenko 15 (Micah, 5/19, Council on Foreign Relations, "Is US Foreign Policy Ignoring Homegrown Terrorists?")

On February 12, National Counterterrorism Center Director Nicholas Rasmussen told the Senate Select Committee on Intelligence:¶ "We face a much greater, more frequent, recurring threat from lone offenders and probably loose networks of individuals. Measured in terms of frequency and numbers, it is attacks from those sources that are increasingly the most noteworthy..."¶ On February 26, during the annual worldwide threats hearing, Director of National Intelligence James Clapper warned:¶ "Home-grown violent extremists continue to pose the most likely threat to the homeland."¶ Last Friday, Secretary of Homeland Security Jeh Johnson stated on MSNBC:¶ "We're in a new phase...in the global terrorist threat where, because of effective use of social media, the Internet, by ISIL, al-Qaeda, we have to be concerned about the independent actor who is here in the homeland who may strike with little or no warning..."¶ Finally, yesterday, former CIA deputy director Michael Morell described the messaging efforts of jihadist groups generally and the self-declared Islamic State (IS) more specifically:¶ "Their narrative is pretty powerful: The West, the United States, the modern world, is a significant threat to their religion. Their answer to that is to establish a caliphate. And they are being attacked by the U.S. and other Western nations, and by these apostate regimes in the region. Because they are being attacked they need support in two ways; people coming to fight for them, and people coming to stand up and attack coalition nations in their home."¶ In summary, the most likely—though not most lethal—terror threats to Americans come from individuals living within the United States who are partially motivated to undertake self-directed attacks based upon their perception that the United States and the West are at war with the Muslim world.

Al-Qaeda planning attacks now – surveillance is key

Wall Street Journal 15. Cassell Bryan-Low. "U.K. MI5 Chief Andrew Parker Warns of Threat of al Qaeda Attack in West," <http://www.wsj.com/articles/u-k-mi5-chief-andrew-parker-warns-of-threat-of-al-qaeda-attack-in-west-1420757705>.

LONDON—The head of the U.K.'s domestic intelligence agency said Thursday that al Qaeda continued to pose an immediate threat and was planning large-scale attacks against the West.¶ In a rare public speech, MI5 chief Andrew Parker said "a group of core al Qaeda terrorists in Syria is planning mass casualty attacks against the West," without elaborating on how advanced such planning was. The comments underscore that the terrorist threat remains diverse despite the recent focus on Islamic State, which has gained territory in Syria and Iraq.¶ The comments, made at MI5's London headquarters, come on the heels of Wednesday's shooting attack in Paris, which left 12 people dead. While authorities haven't yet confirmed any possible connections of the perpetrators to terrorist organizations, intelligence officials have said that links to al Qaeda were a possibility.¶ In his remarks, Mr. Parker briefly addressed the Paris attack. "It is too early for us to come to judgments about the precise details or origin of the attack, but it is a terrible reminder of the intentions of those who wish us harm," Mr. Parker said.¶ Speaking more generally, Mr. Parker said, "we face a very serious level of threat that is complex to combat and unlikely to abate significantly for some time." He added that in recent months, authorities have prevented three U.K. terrorist plots that "would certainly" have resulted in deaths.¶ Mr. Parker said there had been an increase in the number of "crude but potentially deadly plots" and cited last year's attacks in Canada and Australia as examples. "Such attacks are inherently harder for intelligence agencies to detect," he said. "They are often the work of volatile individuals, motivated by terrorist propaganda rather than working as part of sophisticated networks. They often act spontaneously or after very short periods of prior training."¶ He focused in particular on the threat stemming from the conflict in Syria. There have been more than 20 terrorist plots outside of Syria and Iraq that were either directed or

provoked by extremist groups in Syria, including those in Canada, Australia, Belgium and France, according to Mr. Parker.¶ Britain's security agencies in August raised the assessment of the threat from international terrorism to "severe" from "substantial," the second-highest level on its five-point scale, primarily because of the threat of Islamist militants in Syria. The change, which triggered a step-up in security measures such as visible police patrols, reflects an assessment that an attack is highly likely but that there isn't intelligence to suggest an imminent terror strike.¶ The MI5 chief said some 600 extremists now had traveled from Britain to Syria and that a "significant proportion" of those had joined Islamic State, also known as ISIL.¶ He also talked about the stiff challenges intelligence agencies face, ranging from the difficulty in collecting intelligence in Syria, where the U.K. has no partner agency to work with to technological challenges more broadly.¶ As the terrorism threat is increasing, intelligence agencies are finding their ability to counter them is decreasing, he said. The reasons include the increased availability—and use—of encryption that makes it harder for intelligence agencies to intercept communications.¶ "Changes in the technology that people are using to communicate are making it harder for the agencies to maintain the capability to intercept the communications of terrorists," he said. "The further reduction of this capability will seriously harm our ability to investigate and disrupt such threats in the future."¶ Mr. Parker also waded into Britain's feud with Internet companies over how much they should help in combating terrorist activity. British authorities say they remain frustrated that U.S. Internet companies don't feel obliged to comply with U.K. warrants requesting information about users.¶ He said intelligence agents need to be able to access communication among terrorists if they are to do their job, which means including the assistance of companies which hold relevant data. "Currently this picture is patchy," he said.¶ He also defended the communications-data gathering work by intelligence agencies, which has come under criticism following the disclosure of mass-surveillance techniques by former U.S. National Security Agency contractor Edward Snowden.¶ "MI5 does not browse through the private lives of the population at large," he said. "We need to have powerful capabilities that enable us to range widely, with the potential to reach anyone who might threaten national security—but with our efforts always concentrated on the tiniest minority who actually present threats."

AT: NSA Reform Thumper

New NSA reforms allow metadata

Lake 5-20 (Eli, Bloomberg View, "Congress Falls out of Love with the Surveillance State")

There is urgency to act. The Patriot Act provision on NSA bulk metadata collection expires June 1.¶ Nunes told us the chances of just reauthorizing section 215 of the Patriot Act when an alternative bill was on the floor were slim. He said he reluctantly endorsed the slimmed-down approach to data collection: "Do you want to keep something and hope the changes can work, or risk the whole program going dark?"¶ **To be sure, the new bill still allows the FBI and NSA to search the numbers dialed and times and dates of phone calls to find the confederates of terrorists in the United States.** But no longer would the NSA be allowed to store those records. Eventually, President Obama made it known that he favors the changes as well. Nunes told us Obama met with the chairmen and ranking members of the House and Senate intelligence committees last Monday and said he supported the new legislation.

NSA still has sufficient surveillance authority

Salon, 6-1 [Marcy Wheeler. "Reports of the Patriot Act's death are greatly exaggerated," [http://www.salon.com/2015/06/01/reports_of_the_patriot_acts_death_are_greatly_exaggerated/.](http://www.salon.com/2015/06/01/reports_of_the_patriot_acts_death_are_greatly_exaggerated/)]

The PATRIOT Act-authorized phone dragnet expired last night. For the first time since 2006, the NSA won't receive records of the phone calls you make within the United States.¶ But that doesn't mean spying on Americans has stopped. The NSA still obtains records of calls — potentially all calls — you make with people overseas. It still tracks Americans' Internet communications using metadata obtained overseas. The FBI can still access the content of any communications Americans have with foreigners targeted under PRISM without a warrant or even any evidence of wrong doing. FBI can still, and indeed does, obtain phone records of individuals in conjunction with national security investigations without any court review.¶ Not even the spying conducted under Section 215 — the authority that had been used to collect all of Americans' phone records, but which is also used to collect certain kinds of Internet data — or the two other expiring provisions will stop. Because they're tied to more focused investigations (though the Internet collection is probably not targeted at one individual), they will probably continue under a grandfather clause allowing ongoing investigations using those authorities to continue.

Metadata is an essential counter terrorism tool – key to intel and tracking

Fleitz 15 [Fred, senior vice president for policy and programs for the Center for Security Policy. He worked in national-security positions for 25 years with the CIA, the State Department, and the House Intelligence Committee, “NSA Data Collection: Necessary, or Unconstitutional?”

<http://www.nationalreview.com/article/418207/nsa-data-collection-necessary-or-unconstitutional-fred-fleitz>

While its detractors refuse to admit it, the 215 program has been a successful tool in stopping terrorist attacks. It has been strongly defended by many intelligence officials and members of Congress, including Senator Dianne Feinstein (D., Calif.), vice chairman of the Senate Intelligence Committee, who said during a January 14, 2014, Judiciary Committee hearing that this program had helped stop terrorist plots to bomb the New York City subways, the New York stock exchange, and a Danish newspaper. ¶ Former deputy CIA director Michael Morell said in a December 27, 2013, Washington Post op-ed: “Had the [metadata] program been in place more than a decade ago, it would likely have prevented 9/11. And it has the potential to prevent the next 9/11.” ¶ Although 35 of 38 court decisions have found the 215 program to be constitutional, its opponents like to quote a December 2013 opinion by D.C. District Court Judge Richard Leon, which questioned its constitutionality. Instead of shutting down the program, however, Leon stayed his decision pending a government appeal. When this appeal was heard by a D.C. Circuit Court of Appeals panel last November, the judges did not accept the challengers’ contentions that the 215 program violated the Fourth Amendment’s protection against unreasonable searches. Opponents of the 215 program are now praising a decision on May 7 by a New York Court of Appeals panel that found that the program was not authorized by the Patriot Act. However, this decision fell far short of what the ACLU was seeking in the case, since the court did not order the 215 program halted, noting that the debate in Congress could render the issue moot. The court also did not find the 215 program to be unconstitutional or a violation of privacy rights, although it said it could revisit these issues if Congress passes new legislation to reauthorize the program. Indeed, if the 215 program continues, legal challenges to it are likely to be eventually decided by the Supreme Court. Despite the continuing need for the 215 program, it is in trouble because Republicans are sharply divided on it. RELATED: Republicans and the Patriot Act Much of the opposition from both sides of the political spectrum is a result of the deluge of Snowden leaks. The release of so much information out of context led to a media frenzy and wild claims that American intelligence is illegally spying on Americans. Both intelligence officials and the White House did a poor job at defending the program, and conspiracy theories flourished. And, of course, there also is in America a venerable history of suspicion of government and government secrecy. Senator Rand Paul (R., Ky.) has said that America’s Founding Fathers would be “appalled” at the 215 program. Actually, Senator Paul is probably right, if only because the Founding Fathers lived in the era of wooden ships and simple firearms and had no notion of modern warfare and weapons of mass destruction. I suspect they would be appalled at many aspects of modern society. If Senator Lee is really worried about privacy threats, he should focus on the unregulated gathering of such data on Americans by technology companies. In an April 25 National Review article, Senator Mike Lee (R., Utah) made a similar argument when he expressed his concerns about the U.S. governments gathering data “to paint a fairly complete picture of the private lives of every person in this country.” In fact, although there is no evidence that the NSA has ever done or ever intended to do such a thing, it is being done, and on a huge scale, by Google, Facebook, other social-media sites, and data brokers. According to a March 9, 2014, 60 Minutes report, Acxiom, a data broker, claims that it has on average 1,500 pieces of information each on more than 200 million Americans. If Senator Lee is really worried about privacy threats, he should focus on the unregulated gathering of such data on Americans by technology companies. From what people have told me as I’ve traveled around the country giving talks on this topic, I know that a major factor driving Republicans to oppose the 215 program is Obama-administration policies and scandals. These abuses include the effort by the IRS to discriminate against conservative groups, and the Justice Department’s seizing the phone records and e-mails of Fox News correspondent James Rosen and his parents. Many Republicans complain that they have been repeatedly lied to by the Obama administration — about Obamacare, the 2012 attacks on the U.S. consulate in Benghazi, the Iran nuclear talks, and other issues. MORE NSA RAND PAUL’S FAUX-LIBERTARIAN OPPOSITION TO THE PATRIOT ACT WHY WE SHOULDN’T TRUST THE NSA WITH OUR METADATA WHY RAND’S SECOND FILIBUSTER FLOPPED As a result, some Republican members of Congress are loath to extend an intelligence program that they fear could be used by the Obama administration against its political enemies. Although I understand this concern, the realities are that the 215 program is subject to intense oversight and has been an effective counterterrorism tool. Abuse of this program is purely theoretical. Shutting it down because of the Obama administration’s scandals and failings makes no sense. At the other end of the political spectrum, the metadata program has been broadly opposed by the Left and by electronic-privacy advocates. However, this opposition goes beyond the metadata program: These groups are also pushing for granting privacy rights to foreign citizens on foreign soil (which President Obama tacitly supports), negotiating international treaties banning Internet spying, and

preventing the NSA from exploiting software vulnerabilities. President Obama has struggled to deal with controversy sparked by the Snowden leaks. In August 2013, he named a panel to look at reforming NSA collection, though he eventually ignored most of its recommendations, probably because they were so radical and naive. These included recommendations similar to those by the Left mentioned above, such as extending the Privacy Act of 1974 to non-U.S. persons; calling for U.S. electronic surveillance to be guided by Article 12 of the Universal Declaration of Human Rights and Article 17 of the International Covenant on Civil and Political Rights; codes of conduct between intelligence agencies on electronic surveillance against foreign citizens, and barring U.S. intelligence agencies from cracking Internet encryption methods and penetrating computer software. People who make such recommendations are oblivious to the reality that we need aggressive intelligence collection to keep our nation safe in a dangerous world. They also do not understand that adopting such standards would severely undermine or shut down many crucial intelligence-collection programs but would be completely ignored by America's enemies and adversaries. President Obama also instructed intelligence officials to defend the 215 program and work to block legislative language that would overly restrict it. This led Jeb Bush to remark last month, "I would say the best part of the Obama administration has been his continuance of the protections of the homeland using the big metadata programs, the NSA being enhanced." However, Bush may need to retract this statement. According to a House Intelligence Committee source, the White House gave up on defending the metadata program late last year in response to its supporters on the left, especially deep-pocketed Democratic contributors in Silicon Valley. Congress also has struggled with NSA reform. Last May, the House passed the 2014 USA Freedom Act, which would put significant restrictions on the 215 program, including a mandate that metadata be retained by the phone companies, not the NSA. Although I viewed this as a bad bill, I endorsed it in a June 23, 2014, National Review article because I believed that, regardless of the merits and capabilities of the metadata program, it has been so damaged by fear-mongering attacks by the press and some politicians that it could not continue in its current form. Unfortunately, the House version of the USA Freedom Act was made substantially worse by Patrick Leahy, then-chairman of the Senate Judiciary Committee, who added restrictions that would effectively kill the metadata program and interfere with the operation of the Foreign Intelligence Surveillance Court. Because of Leahy's changes to the House version of the 2014 USA Freedom Act, it did not garner a filibuster-proof majority last November, and the Senate failed to pass it. The top members of the Senate Intelligence Committee – then-chairman Feinstein and Saxby Chambliss — said Leahy's bill went too far. Former CIA director Michael Hayden and former attorney general Michael Mukasey condemned the bill in a November 17, 2014, Wall Street Journal op-ed titled "NSA Reform That Only ISIS Could Love." The challenge for Congress now is to pass legislation to extend the metadata program before it expires at the end of this month. Members of Congress and staff have been working over the past three months to devise a 2015 version of the USA Freedom Act. On April 30, the House Judiciary Committee approved this bill by a vote of 25 to 2. An identical version has been sponsored in the Senate by Senators Leahy and Lee. The House's 2015 USA Freedom Act is slightly better than the 2014 Senate version. The metadata program would continue, although the data would be held by phone companies. NSA searches of metadata databases would be narrowed. The bill also would create a panel of experts to advise the Foreign Intelligence Surveillance Court on privacy, civil liberties, and technological matters. Significant FISC decisions would be declassified. The bill includes concessions to the House Intelligence Committee, such as allowing the NSA authority to conduct surveillance for 72 hours without obtaining a warrant on foreign targets who enter the United States, and to monitor domestic targets on whom it has a probable-cause warrant when they travel overseas. The NSA will also be allowed to use the Patriot Act to collect data domestically in an emergency. The Left and privacy groups are split over the 2015 version of the USA Freedom Act. Some have endorsed it, because they believe that it is the best they can get and that it will open the door to greater reform down the road. These groups are pressuring Congress to remove the concessions made to the House Intelligence Committee. Several of these groups have stepped up their efforts to amend the bill in the light of the May 7 New York Court of Appeals decision. Others on the left, such as the ACLU and the New York Times, do not support the 2015 USA Freedom Act, since they would prefer that the electronic-surveillance provisions of the Patriot Act be allowed to expire. Senator McConnell has enlisted freshman Senator Tom Cotton (R., Ark.) to help push a clean reauthorization of the Patriot Act, which would retain the 215 program in its current form. Cotton, who now serves on the Senate Intelligence Committee and who supported the House version of the USA Freedom Act when he was a member of that body last year, has become a rising star in the Senate because of his outspoken opposition to the Obama administration's nuclear diplomacy with Iran. He reportedly is holding classified meetings with other Republican senators to explain the metadata program and to dispel the misinformation about it spread by its opponents. The shock of the Snowden leaks is fading, and the grandstanding against the NSA by Senator Paul, other libertarians, and the Left is becoming tiresome. Senators Richard Burr (R., N.C.), Jeff Sessions (R., Ala.), and Marco Rubio (R., Fla.) have also spoken out in defense of the NSA and in support of McConnell's Patriot Act bill. Rubio suggested during a May 7 floor speech that if the 215 program isn't reauthorized and there is then another terrorist attack within the United States, Congress will be under fire to explain whether the program could have helped prevent such an attack. With three GOP senators already running for president, the 215 program has become an issue in the presidential campaign. Senator Paul has criticized Rubio and Bush for supporting the program and opposes the 2015 USA Freedom Act, preferring that the Patriot Act be repealed. Senator Ted Cruz (R., Tex.) also opposes the metadata program but supports the USA Freedom Act. Senator Burr, the chairman of the Senate Intelligence Committee, has criticized Paul and Cruz for their attacks on the 215 program as weakening their standing on national defense; Burr claims that their position "tells me that they don't want to learn what bulk data collection is." Security-minded Republicans therefore must work to strengthen the House bill and fend off efforts by Democrats and libertarians to weaken it. We may hope that growing concerns about future ISIS terrorism in the United States will allow Republican congressional leaders to limit the damage to the metadata program from the House bill and move it in McConnell's direction. McConnell's bill, which I strongly support, is unlikely to pass. The Snowden leaks and anti-NSA hysteria have done too much damage to the 215 program for it to continue without substantial changes. Moreover, support for the House bill is probably too strong to allow the McConnell version to become law. ¶ Passage of the 2015 USA Freedom Act is far from an ideal outcome, since this bill would

needlessly undermine an effective counterterrorism tool that is needed to protect our country. But this may be only a short-term setback for American national security: Already the shock of the Snowden leaks is fading, and the grandstanding against the NSA by Senator Paul, other libertarians, and the Left is becoming tiresome. This could mean the metadata program might be revised in a few years under a new Republican president. Unfortunately, before that time comes, **there is a real danger of an ISIS terrorist attack in the United States if Congress seriously weakens the metadata program.** Congress needs to think long and hard about such an outcome as it moves ahead with legislation on this issue this month.

Metadata casts a wide net – alternatives can't fill in

Yoo 15. [John, Emanuel Heller professor of law at the University of California at Berkeley and a Visiting Scholar at the American Enterprise Institute, former official in the Office of Legal Counsel in the U.S. Department of Justice. 5/8/20 "Will Congress reject the dangerous NSA ruling by reauthorizing the Patriot Act?" American Enterprise Institute, <https://www.aei.org/publication/will-congress-reject-todays-dangerous-nsa-ruling-by-reauthorizing-the-patriot-act/>.

Finally, the Court displays a deep misunderstanding of the challenges of counterterrorism policy, which Congress understands far better. As Judge Richard Posner has recognized, an intelligence search "is a search for the needle in a haystack." Rather than pursue suspects who have already committed a crime and whose identity is already known, intelligence agencies must search for clues among millions of potentially innocent connections, communications, and links. "The intelligence services," Posner writes, "must cast a wide net with a fine mesh to catch the clues that may enable the next attack to be prevented." Our government can detect terrorists by examining phone and e-mail communications, as well as evidence of joint travel, shared assets, common histories or families, meetings, and so on. If our intelligence agents locate a lead, they must quickly follow its many possible links to identify cells and the broader network of terrorists. A database of call data would allow a fast search for possible links in the most important place — the United States, where terrorists can inflict the most damage. Most of the calling records may well be innocent (just as most of the financial records of a suspected white-collar criminal may also be innocent), but the more complete the database, the better our intelligence agencies can pursue a lead into the U.S.

Metadata is key to tracking terrorist communication patterns – now is key

McCarthy 15 [Andrew C., policy fellow at the National Review Institute. May 23, "Why National-Security Republicans Lost the Patriot Act Debate" <http://www.nationalreview.com/article/418807/why-national-security-republicans-lost-patriot-act-debate-andrew-c-mccarthy>]

Yet the NSA program's advocates have failed to offer a compelling defense. We have fallen into the trap of arguing the case on the opposition's terms. They claim that the program has not stopped a single terrorist attack. Program advocates counter that it has, but this is not only hard to prove, it's beside the point. First, intelligence doesn't work that way: It is a mosaic drawing on several sources, and it is rare that one piece of it completes the picture. More important, the principal purpose of the program is not to thwart individual attacks but to map terror cells and uncover their support networks.

Consequently, the program could be quite valuable even if it never stopped a single terrorist attack. That is vital at a time when the jihadist threat is intensifying but gaps in our intelligence collection are widening because of wrong-headed Obama policies (e.g., the decrease in interrogations of captured terrorists and the discouragement of focus by our intelligence analysts on jihadist ideology). ¶ Advocates have also been counterproductively guarded in explaining why they need a full dataset: namely (we can infer), so they can run algorithms against it, based on known terrorist communication patterns, and thus discover latent terrorist communications. If this were better understood, most Americans would no more object to the anonymous storage of their phone number's records (which cannot be further accessed without judicial supervision) than they do to the government's possession of phone books that list their names and

addresses (which are regularly accessed with no judicial supervision). Almost all of us would like to help the government identify and stop terrorists, especially if there is no risk to ourselves in doing so. The reluctance to talk openly about intelligence methods is understandable. Whatever the government tells the public it perforce tells the terrorists. But it's not like transcontinental jihadist networks have an option to cease communicating just because they know our government is watching. What does the NSA gain by preserving the secrets of its methodology if the cost is losing the program?

AT: Targeted Surveillance Turn

Metadata is necessary and targeted searches prevent the ability to identify networks and halt terrorist activities

Posner, 8. [Richard A., Judge, United States Court of Appeals for the Seventh Circuit; Senior Lecturer in Law, The University of Chicago. "Privacy, Surveillance, and Law," 75 University of Chicago Law Review 245, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=2808&context=journal_articles.

What is most notable about the amendments, as indeed of the Terrorist Surveillance Program to which they seem addressed, is their backing away from reliance on warrants to prevent abuses of electronic surveillance. The warrant is a poorly designed means for balancing the security and liberty interests involved in counterterrorist surveillance. It is true that instead of requiring probable cause to believe that the target of an interception is a terrorist, FISA could be amended to require merely reasonable suspicion. But even that would be too restrictive from the standpoint of effective counterterrorism; effective surveillance cannot be confined to suspected terrorists when the object is to discover who may be engaged in terrorism or ancillary activities. Further attenuation of FISA's standard for obtaining a warrant might be possible without running afoul of the Fourth Amendment. Conceivably the issuance of a warrant could be authorized on the basis of a showing that while the target was probably not a terrorist, national security required making assurance doubly sure by intercepting some of his electronic communications. A model might be the criterion for issuing a search warrant to the Canadian Security Intelligence Service, where a warrant can be issued on the basis of a factually supported "belief, on reasonable grounds, that [it] ... is required to enable the Service to investigate a threat to the security of Canada." 9 Such a criterion might pass muster under the Fourth Amendment, which requires probable cause for the issuance of a warrant but does not state what it is that there must be probable cause to believe. The Supreme Court has said that there must be probable cause to believe that the search will yield contraband or evidence of crime when the search is part of a criminal investigation." The Constitution binds the government more tightly when it is exerting its powers to convict people of crimes than in other areas of government activity. A search intended not to obtain evidence of crime but to obtain information about terrorism might, as under Canadian law, require only probable cause to believe that the search would yield such information. The lower the standard for getting a warrant, however, the more porous the filter that the requirement of a warrant creates, bearing in mind the ex parte character of a warrant proceeding. If all the application need state is that an interception might yield data having value as intelligence, judges would have no basis for refusing to issue the warrant. Alternatively, reliance on warrants could invite legislation to expand the reach of the criminal laws relating to terrorism in order to make it easier to establish probable cause to believe that a search will reveal evidence of a crime. That expansion could raise issues under the First Amendment, since the natural route for expanding criminal laws against terrorism is to criminalize extremist speech or even attendance at extremist (though peaceful) speeches and rallies, as activities that may be preparatory to or encouraging of terrorism. Warrants that satisfy FISA's standard as traditionally understood should continue to be required for all physical searches, because they are far greater intrusions on privacy than electronic interceptions, and for all electronic surveillance for which FISA's existing probable cause requirement can reasonably be satisfied (mainly cases in which the government wanted to intercept communications of a person who they had probable cause to believe was a terrorist). With these exceptions, civil libertarians' preoccupation with warrants is not only harmful to national security (and possibly to civil liberties if it induces legislation to expand the reach of the criminal law) but also anachronistic. The government's ready access to the vast databases that private and public entities compile for purposes unrelated to national security has enabled it to circumvent much of the protection of privacy that civil libertarians look to warrant requirements to secure. There are a number of possible measures, apart from requiring warrants, that Congress could adopt in order to minimize abuses of domestic surveillance. If all were adopted, the risk of such abuses would be slight. The temporary FISA amendments take tiny steps in this direction. Bolder steps would include the following: 1. Congress could create a steering committee for national security electronic surveillance, composed of the attorney general, the director of national intelligence, the secretary of homeland security, and a retired federal judge or justice appointed by the chief justice of the Supreme Court. The committee would monitor all such surveillance to assure compliance with the Constitution and federal statutes. The requirement in the temporary amendments that the attorney general and the director of national intelligence devise

procedures for a new warrantless surveillance program is one of the tiny steps to which I referred." The other, and legally dubious one, is requiring submission of the procedures for approval by the Foreign Intelligence Surveillance Court; that court becomes in effect the steering committee. 2. The NSA could be required to submit to the steering committee, to departmental inspectors general, to the Privacy and Civil Liberties Oversight Board (a White House agency created by the Intelligence Reform Act), to the congressional intelligence and judiciary committees, and to an independent watchdog agency of Congress modeled on the GAO every six months a list of the names and other identifying information of all persons whose communications had been intercepted in the previous six months without a warrant, with a brief statement of why these persons had been targeted. 3. The responsible officials of the NSA could be required to certify annually to the watchdog groups that there had been no violations of the statute during the preceding year. False certification would be punishable as perjury. But lawsuits challenging the legality of the Terrorist Surveillance Program should be precluded. Such lawsuits would distract officials from their important duties to no purpose if the kind of statute that I am suggesting were enacted. The statute should sunset after five years. 4. The use of intercepted information for any purpose other than investigating threats to national security would be forbidden. Information could not be used as evidence or leads in a prosecution for ordinary crime-this to alleviate concern that wild talk bound to be picked up by electronic surveillance would lead to criminal investigations unrelated to national security. Violations of this provision would be made felonies punishable by substantial prison sentences and heavy fines. But the punishments must not be made too severe lest they cause intelligence officers to steer so far clear of possible illegality that they fail to conduct effective surveillance. The risk of abuses is not great enough to justify savage penalties in order to deter them, because intelligence officers have no interest in assisting in the enforcement of criminal laws unrelated to national security. A neglected point is that violations of privacy and civil liberties tend to emanate from the White House and the top management level of executive branch agencies rather than from the working or middle-management levels. 5. To limit the scope of surveillance, "threats to national security" should be narrowly defined as threats involving a potential for mass deaths or catastrophic damage to property or to the economy. That would exclude, for the time being anyway, ecoterrorism, animal-rights terrorism, and other political violence that, though criminal, does not threaten catastrophic harm (yet). Congressional action is also needed to protect the phone companies that cooperated with the NSA's surveillance program from potentially immense liability for allegedly having violated federal law protecting the privacy of telephone records; a number of suits are pending. The intelligence system is enormously dependent on informal assistance from private companies in communications, banking, and other industries. At times such assistance is made a legal duty, as in the federal law requiring banks to report cash transactions of \$10,000 or more; and this is also a feature of the new amendments to FISA. Were it not for the threat of liability, which the amendments do not address, voluntary assistance would probably as in the past be all the government needed. But if voluntary assistance-even when tendered in a national emergency, as in the wake of the 9/11 terrorist attacks- places companies in legal jeopardy, such assistance will dry up. FISA needs to be amended not only to authorize more extensive domestic surveillance than its anachronistic terms permit but also to insulate from liability conduct that may have violated the Act or some other statute but that would be permitted under the amended regime. Until the temporary amendments were enacted, the type of approach that I am advocating (call it the "nonwarrant" approach) for regularizing domestic surveillance was getting little attention from Congress and the Bush Administration, possibly because the Administration wanted to retain a completely free hand and thought it could fend off the sort of restrictions that I have sketched. (It is remarkable how tepid the public reaction to the Terrorist Surveillance Program has been.) A related possibility is that the Administration's aggressive claims of presidential power prevented it from acknowledging the legitimacy of congressional controls over intelligence and hence of a legislative solution to the controversy over the program. Still another possibility was (and is) that because no one is in charge of domestic intelligence, authority over which is divided among the attorney general, the FBI director, the Department of Homeland Security, and the director of national intelligence (among others), no one is formulating a comprehensive legislative and public relations strategy for ending the controversy over the role of electronic surveillance in such intelligence. (At this writing, the only confirmed senior official in the Justice Department is the solicitor general.) And another possibility is the grip of our legalistic culture, which makes us think that the regulation of national security must be modeled on the regulation of criminal law enforcement. The temporary amendments suggest, however, that the logjam may be breaking, though one of the reasons, it appears, is that the Administration's decision to bring the Terrorist Surveillance Program under FISA resulted in a paper jam at the Foreign Intelligence Surveillance Court as the number of warrant applications soared. **We should be playing to our strengths, and one of the greatest of them is technology. We may not be able to prevail against terrorism with one hand tied behind our back. Critics of surveillance argue that since our enemies know that we monitor electronic communications,**

they will foil us by simply ceasing to use such communications. That is wrong. We know it is wrong because we do intercept terrorist communications. ²⁴ But if it were true that our monitoring caused the terrorists to abandon the telephone and the internet, that would be an enormous victory for counterterrorism, as it is extremely difficult to coordinate and execute a major terrorist attack if all communications among the plotters must be face to face to avoid detection. The greater danger is that encryption and other relatively cheap and simple countermeasures will defeat our surveillance. Opponents of efforts to amend FISA point out that the Foreign Intelligence Surveillance Court has almost never turned down an application for a warrant. In 2005, for example, although more than 2,000 applications were filed, not a single one was denied in whole or in part. ⁵ The inference the critics wish drawn is that FISA is not inhibiting surveillance. The correct inference is that the Justice Department is too conservative in seeking warrants. The analogy is to a person who has never missed a plane in his life because he contrives always to arrive at the airport eight hours before the scheduled departure time. The effect of our legalistic culture is to cause law enforcement agencies, notably the FBI, to avoid not only violating the law but also steering so close to the wind that they might be accused, albeit groundlessly, of violating the law or of being "insensitive" to values that inform the law, even when those values have not been enacted into law.

No replacement for Metadata

Sessions 15 [Jeff, U.S. Senator, May 20, "Why Should Terrorists Be Harder to Investigate than Routine Criminals?" <http://www.nationalreview.com/article/418675/why-should-terrorists-be-harder-investigate-routine-criminals-jeff-sessions>]

The 9/11 attacks exposed the dangerous wall separating the intelligence and law-enforcement communities. In response, Congress developed a number of tools to eliminate those barriers so that critical information could be timely and appropriately shared to address radical Islamic terrorism. Among them was Section 215 of the USA Patriot Act. In 2006, the National Security Agency transitioned the bulk telephone-metadata acquisition program authorized under the president's Terrorist Surveillance Program to the business-records court-order authority of Section 215. Since shortly after 9/11, this program has been helping to keep Americans safe by acquiring non-content call records, i.e., telephone numbers and the date, time, and duration of a call. This program has yielded invaluable intelligence that has helped prevent attacks and uncovered terrorist plots. Nevertheless, the Obama administration has built up unnecessary barriers that sacrifice the fragile operational efficiency of the program without actually accomplishing anything in terms of data security. Meanwhile, the threat level has only increased. On the heels of an ISIS-inspired attack in Texas, the administration has greatly increased security at military bases, airports, railroads, and other potential targets. Just this year, the FBI has so far arrested at least 30 Americans for planning ISIS-inspired attacks in the U.S. FBI director James Comey recently issued this chilling warning: The siren song sits in the pockets, on the mobile phones, of the people who are followers [of ISIS] on Twitter . . . It's almost as if there's a devil sitting on the shoulder, saying "Kill! Kill! Kill! Kill!" all day long. Most people would agree it should not be more difficult to investigate a terrorist plot than check fraud. As the National Academy of Sciences noted in its recent report, Section 215 of the Patriot Act simply "allow[s] the [Foreign Intelligence Surveillance Court] to require production of documents and other tangible things determined relevant to national security investigations, much like other courts do in criminal and grand jury investigations." But unlike in the criminal context, Section 215 is subject to extraordinary oversight by the Executive and Judicial branches, as well as minimization procedures to protect Americans' civil liberties. Moreover, information acquired under Section 215 can be accessed by only a limited number of trained intelligence professionals and only after the government has demonstrated to the court that there is a reasonable, articulable suspicion that a number or identifier is associated with a specific foreign-terrorist organization. Compare this with how a local district attorney can obtain the same type of information in a routine criminal case. He issues a grand-jury subpoena for phone records, which requires only a showing that the records are relevant to an investigation. The subpoena could require the production of much more detailed information than is acquired under Section 215, such as names and addresses of the callers. Indeed, the U.S. Drug Enforcement Agency and Internal Revenue Service can obtain telephone call records and bank records with an administrative subpoena without even a prosecutor's approval, much less approval by a judge. The Supreme Court has long held this process constitutional under the Fourth Amendment because such information is already in the hands of a third-party — the phone

companies — and therefore, a customer has no reasonable expectation of privacy in that information. But legislation known as the USA Freedom Act would prevent our intelligence officers from obtaining information in this manner at all. As former federal judge and attorney general Michael Mukasey said: The bill’s imposition of the warrant requirement on the NSA would be more burdensome than what any assistant U.S. attorney must do to get metadata in a routine criminal case, which is simply to aver that the information is needed in connection with a criminal investigation — period. The bill would also eliminate entirely the database through which the NSA is able to quickly access information to “connect the dots” in order to prevent terror attacks. This is significant because, as the National Academy of Sciences explained, in contrast to domestic law enforcement . . . the world of intelligence analysis has many fewer tools available for investigation. In hostile foreign environments, personal interviews and observations and records review are much more limited. Accordingly, the role of bulk data as a way to understand the significance of past events is important, and the loss of this tool becomes more serious. Instead, the USA Freedom Act relies on a nonexistent, untested system and the hope that private companies will agree to retain records long enough for the NSA to obtain data when it may be critical to preventing an imminent attack. But as the National Academy of Sciences noted, “there is no technological magic . . . that will fully substitute for bulk collection” and service providers “have no incentive to cooperate, even if paid; indeed, their customers may object to such cooperation.” Moreover, requiring the government to obtain a court order every time it seeks to search data held by private companies would significantly delay investigations, giving terrorists a substantial operational advantage. In short, the USA Freedom Act would make it vastly more difficult for the NSA to stop a terrorist than it is to stop a tax cheat. Why make it much harder to investigate terrorists than common criminals?

2NC Link – Perception

The plan is perceived as weakness – invites attacks

Daily Mail 15. “Head of CIA warns that US is at risk of lone wolf terror attack after NSA powers to monitor all phone calls expired – as Isis ‘watch carefully’ for security gaps,” 5-31-2015, <http://www.dailymail.co.uk/news/article-3105089/Senate-makes-ditch-bid-extend-NSA-s-bulk-collection-phone-records-Rand-Paul-swears-block-legislation-let-Patriot-Act-expire.html>.

The head of the CIA has warned that Americans are now at risk after the Senate was unable to extend laws giving authorities special powers to fight terrorists. ¶ Politicians in the upper house were unable to come to an agreement to extend key parts of the Patriot Act - that legalize controversial methods of surveillance by the National Security Agency (NSA) - which expired on Sunday. ¶ Attempts were frustrated by Presidential candidate Rand Paul, who has taken a firm stance against the extension of powers allowing the mass collection of phone records, wire taps and warrants without evidence. ¶ But the Head of the CIA John Brennan claims ordinary Americans, who expect the NSA to do their jobs, have been put at risk by 'political grandstanding and crusading for ideological causes' that fueled the debate. ¶ Speaking on CBS show Face The Nation, he warned that the US - and Europe - is now in danger from technologically 'sophisticated' terrorists who are watching developments carefully and 'looking for the seams to operate' within. ¶ He claimed that the authorities do not abuse the powers, extended in 2011 to help fight lone wolf terror suspects not connected to a specific group, and that without them, it's difficult for the NSA to protect America. ¶ Mr Brennan said: 'I think terrorist elements have **watched very carefully what has happened here** in the United States, whether or not it's disclosures of classified information or **whether it's changes in the law and policies. They are looking for the seams to operate within.** ¶ 'And this is something that we can't afford to do right now, because if you look at the horrific terrorist attacks and violence that is being perpetrated around the globe, we need to keep our country safe. And our oceans are not keeping us safe the way they did a century ago.' ¶ The Patriot Act was passed in 2001 in the wake of the 9/11 terror attacks. Now that the provisions have expired, government agents will need to subpoena phone companies for the records. ¶ The White House previously justified collecting the records because of the Patriot Act's Section 215, which expired on Sunday. ¶ Two other provisions, added in 2011, also expired with it. The first is a 'roving wiretap' provision which allows government agencies to keep tracking suspects as they switch devices. ¶ The second is a 'lone wolf' clause which allows warrants to be granted without any evidence linking a suspect to a foreign power or terrorist group. ¶ Political struggles over the NSA and its data collection have become a national issue since whistleblower Edward Snowden revealed the extent of government programs in 2013. ¶ The senate's efforts to pass a replacement bill were frustrated by Kentucky's junior senator Rand Paul, who has spoken at length against the NSA's activities, which he has excoriated as illegal and unconstitutional. ¶ Paul, a Republican who is running for president, came up against members of his own party, as well as the Obama administration. ¶ With his presidential campaign waning, he has been accused of irresponsible political opportunism by opponents, by fighting a bill on ideological grounds that may put ordinary people at risk. ¶ He was criticized by the White House Sunday night, which called the Patriot Act expiration an 'irresponsible lapse'. ¶ While Brennan didn't mention Paul by name, he said on Face The Nation: 'Unfortunately I think there is a little too much political grandstanding and crusading for ideological causes that have really fuelled the debate on this issue. ¶ He added: 'These are authorities that have been used by the government to make sure that we're able to safeguard Americans. And the sad irony is that most Americans expect the government to protect them. And so although there's a lot of debate that goes on, on the Congress and the Hill on this issue, I think, when you go out to Boise or Tampa or Louisville, Americans are expecting their law enforcement and homeland security and intelligence professionals to do their work. And these authorities are important.' ¶ Paul argued 'there must be another way' but even he agrees that the lapse in these powers are likely to be temporary as politicians work on the USA Freedom Act, which is expected to pass within the next week. ¶ Republican Senate Majority Leader Mitch McConnell called a rare Sunday session to try to pass the replacement law, but was unable to push it through in time. ¶ And although the replacement is set to pass this week, Paul said the expiration was 'a victory no matter how you look at it'. ¶ In a statement, he said: 'It might be short lived, but I hope that it provides a road for a robust debate, which will strengthen our intelligence community, while also respecting our Constitution. ¶ He added: 'The expiration of the NSA's sweeping, all-encompassing and ineffectual powers will not relinquish functions necessary for protecting national security. The expiration will instead do what we should have done all along - rely on the Constitution for these powers.' ¶ According to a top lawmaker, as of 8pm Sunday no NSA employee could access their enormous phone records database, which holds metadata on millions of phone conversations handed over by telecoms companies like Verizon and AT&T. ¶ Senate Intelligence Committee chairman Richard Burr said on Sunday: 'There is no way to get any type of agreement tonight -- either an extension or

passage of a bill. So at 8pm tonight, NSA employees can not query the database'. ¶ In a statement issued Sunday night, Obama's press secretary Josh Earnest, urged action to pass the USA Freedom Act as quickly as possible. ¶ He said: 'The Senate took an important - if late - step forward tonight. We call on the Senate to ensure this irresponsible lapse in authorities is as short-lived as possible. ¶ 'On a matter as critical as our national security, individual Senators must put aside their partisan motivations and act swiftly. The American people deserve nothing less.' ¶ Some lawmakers have said the lapse raises alarming questions about how US authorities can keep the homeland safe with a diminished security toolbox. ¶ 'I think it's very very unfortunate that we're in this position,' said Senator Mike Lee, a conservative Republican who supports the reform bill. ¶ 'We've known this date was coming for four years. Four years. And I think it's inexcusable that we adjourned' for a weeklong break last week without resolving the issue. ¶ Lee, too, conceded that the reform bill would most likely pass in the coming week. ¶ With the clock ticking, CIA chief John Brennan warned Sunday that allowing vital surveillance programs to lapse could increase terror threats, and argued that the phone metadata dragnet has not abused civil liberties and only serves to safeguard citizens. ¶ 'This is something that we can't afford to do right now,' Brennan said of allowing the counterterrorism provisions to expire. ¶ 'Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,' he said on CBS talk show Face the Nation. ¶ Brennan added that online threats from groups like Isis would continue to grow over the next five to ten years. ¶ He said: 'Isis has been very sophisticated and adept at using the Internet to propagate its message and reach out to individuals. We see what is happening as far as thousands upon thousands of individuals, including many thousands from the West, that have traveled into Syria and Iraq. And a number of these individuals are traveling back.' ¶ 'And what we see, they're also using the Internet as a way to incite and encourage individuals to carry out acts of violence. ¶ 'So as the director of FBI says, you know, this use of these websites and their Internet capabilities is something of great concern. So yes, I think ISIS is a threat not just in the Middle East and South Asia and African regions but also to Europe as well as to the United States.'

2NC Link – Courts

Judicial deference is critical to effective counter-terrorism operations – secrecy and expertise

Posner 12 (Eric A. – Kirkland & Ellis Professor, University of Chicago Law School, “DEFERENCE TO THE EXECUTIVE IN THE UNITED STATES AFTER SEPTEMBER 11: CONGRESS, THE COURTS, AND THE OFFICE OF LEGAL COUNSEL”, 1/11, Harvard Journal of Law & Public Policy, <http://www.harvard-jlpp.com/wp-content/uploads/2012/01/PosnerFinal.pdf>)

The deference thesis states that during emergencies the legislature and judiciary should defer to the executive. 8 It assumes that the executive is controlled by the President, but to the extent that the President could be bound by agents within the executive, the deference thesis also holds that those agents should follow the President’s orders, not the other way around. In normal times, the three branches of government share power. For example, if the executive believes that a new, dangerous drug has become available, but possession of the drug is not yet illegal, the executive may not act on its own to detain and prosecute those who deal and use the drug. The legislature must first enact a statute that outlaws the drug. The executive also depends on the legislature for financial appropriations and other forms of support. The executive also faces constraints from the courts. If the executive arrests drug dealers and seeks to imprison them, it must first obtain the approval of courts. The courts ensure that the executive does not go beyond the bounds of the new law, does not violate earlier-enacted laws that have not been superseded by the new law, and does not violate the Constitution. In emergencies, the executive often will contemplate actions that do not have clear legislative authority and might be constitutionally dubious. For example, after September 11, the U.S. government engaged in immigration sweeps, detained people without charges, used coercive interrogation, and engaged in warrantless wiretapping of American citizens. 9 Many, if not all, of these actions would have been considered violations of the law and the U.S. Constitution if they had been undertaken against normal criminal suspects the day before the attacks. After September 11, both the legislature and the courts gave the executive some deference. The legislature gave explicit authorities to the executive that it had initially lacked; 10 the courts did not block actions that they would have blocked during normal times. 11 But neither body was entirely passive. Congress objected to coercive interrogation and did not give the executive all the authorities that it requested. 12 After a slow start, the courts also resisted some of the assertions the executive made. There is some dispute about whether this resistance was meaningful and caused the executive to change policy or merely reacted to the same stimuli that caused the executive to moderate certain policies independently. 13 In any event, no one disputes that the courts gave the executive a nearly free pass over at least the first five to seven years of the conflict with al Qaeda. The deference thesis, then, can be strong-form or weak-form. This ambiguity has had unfortunate consequences for debates about post-September 11 legal policies. Few people believe that the courts should impose exactly the same restrictions on the executive during an emergency as during normal times. Indeed, doctrine itself instructs courts to balance the security value of a course of action and its cost to civil liberties, implying that certain actions might be legally justified to counter high-stakes threats but not to counter low-stakes threats. 14 Nor does anyone believe that the executive should be completely unconstrained. The debate is best understood in the context of the U.S. government’s post-September 11 policies. Defenders of these policies frequently invoked the deference thesis—not so much as a way of justifying any particular policy, but as a way of insisting that the executive should be given the benefit of the doubt, at least in the short term. 15 The deference thesis rests on basic intuitions about institutional competence: that the executive can act more decisively and with greater secrecy than Congress or the courts because it is a hierarchical body and commands forces that are trained and experienced in countering security threats. The other branches lack expertise. Although they may have good ideas from time to time, and are free to volunteer them, the ability of the executive to respond to security threats would be unacceptably hampered if Congress and the courts had the power to block it to any significant degree. Secrecy is an important part of the argument. Policymaking depends on information, and information during emergencies often must be kept secret. Congress and the courts are by nature and tradition open bodies; if they were to act in secret, their value would be diminished. Meanwhile, the argument continues, the fear of an out-of-control executive who would engage in abuses unless it was constrained by the other branches is exaggerated. The President has strong electoral and other political incentives to act in

the public interest (at least, in the United States). Even if the executive can conceal various “inputs” into counterterrorism policy, it cannot conceal the “output”—the existence, or not, of terrorist attacks that kill civilians. Thus, it was possible for defenders of the Bush Administration’s counterterrorism policies to express discomfort with certain policy choices, while arguing nonetheless that Congress and the courts should not try to block executive policymaking or the duration of the emergency—at least not as a matter of presumption. Critics of the Bush Administration argued that deference was not warranted—or at least not more than a limited amount of deference was warranted, although again these subtleties often were lost in the debate—for a variety of reasons. I now turn to these arguments.

Surveillance programs are state secrets – case law proves

Bazze 12 (Tom – J.D., Georgetown University Law Center, 2011, “Shutting the Courthouse Doors: Invoking the State Secrets Privilege to Thwart Judicial Review in the Age of Terror”, 2012, 23 Geo. Mason U. Civ. Rts. L.J. 29, lexis)

A. No Harm, No Judicial Review: State Secrets and the Terrorist Surveillance Wiretapping Program Revelations in late 2005 and early 2006 about the TSP - a secret terrorist surveillance wiretapping program operated by the NSA without judicial supervision, ⁿ⁶⁶ whose existence the Bush Administration later confirmed ⁿ⁶⁷ - triggered numerous lawsuits against telecommunications providers for violations of subscribers’ constitutional and statutory rights. ⁿ⁶⁸ These lawsuits were not the first legal challenges to government wiretapping, nor were they the first time the government had invoked state secrets to thwart judicial inquiry of wiretapping challenges. ⁿ⁶⁹

Rather than revisit that history, this Article instead focuses only on post-9/11 circuit court decisions to consider the extent [^{*41}] to which courts have acquiesced to government assertions of the state secrets privilege. While circuit courts have tended to recognize state secrets claims in these cases, it is significant that many of these decisions actually reversed district court decisions that had rejected the state secrets claims. Perhaps the most thorough treatment of whether the state secrets privilege precludes judicial review of the terrorist surveillance program occurred in *Hepting v. AT&T Corp.*, where the plaintiffs argued that AT&T’s alleged warrantless wiretapping of its communications violated their First and Fourth Amendment rights. ⁿ⁷⁰ The Bush Administration intervened, moving for dismissal on state secrets grounds. ⁿ⁷¹ After reviewing the purportedly secret evidence in camera, ⁿ⁷² the District Court for the Northern District of California denied the government’s motion to dismiss, ruling that discovery should commence because the state secrets claim was inapplicable in light of the government’s repeated admissions about the existence of the program. ⁿ⁷³ The district court’s thoughtful opinion offers a framework for review of state secrets claims in the war-on-terror context.

The district court’s threshold inquiry in resolving the state secrets claim was determining whether the NSA surveillance program that gave rise to the suit actually qualified as a “secret.”

ⁿ⁷⁴ Because the government had disclosed the existence of the program and AT&T admitted to assisting the government in classified matters when asked, the court concluded that state secrets did not foreclose discovery. ⁿ⁷⁵ While the state secrets privilege did not support pre-discovery dismissal of the case, the court found that there was sufficient ambiguity about the extent of AT&T’s involvement in the program, and the contents of any communication records surveyed, so as to permit AT&T to not disclose the extent of its participation in the TSP. ⁿ⁷⁶ The court [^{*42}] made clear, however, that if information about AT&T’s role in supporting the TSP became public during the course of the litigation, the government could no longer invoke state secrets to resist disclosing this information. ⁿ⁷⁷

Surveillance information is classified as a state secret – the plan must circumvent the doctrine

Bazze 12 (Tom – J.D., Georgetown University Law Center, 2011, “Shutting the Courthouse Doors: Invoking the State Secrets Privilege to Thwart Judicial Review in the Age of Terror”, 2012, 23 Geo. Mason U. Civ. Rts. L.J. 29, lexis)

The war on terror has led to an increased use of the state secrets privilege by the Executive Branch - to dismiss legal challenges to widely publicized and controversial government actions - ostensibly aimed at protecting national security from terrorist threats. ⁿ¹ Faced with complaints that allege indiscriminate and warrantless surveillance, ⁿ² tortious detention, and torture that flouts domestic and international law, ⁿ³ courts have had to reconcile impassioned appeals for private justice with the government’s unyielding

insistence on protecting national security. Courts, almost unanimously, have cast their lot with national security, granting considerable deference to government assertions of the state secrets principle. This deference to state secrets shows no signs of abating; indeed, the growing trend is for courts to dismiss these legal challenges pre-discovery, n4 even before the private litigants have had the chance to present actual, non-secret evidence to meet their burden of proof. Although many looked optimistically at President Obama's inauguration as a chance to break decisively from the Bush Administration's aggressive application of the state secrets [*30] privilege, n5 the Obama Administration has largely disappointed on the state-secrets front, asserting the privilege with just as much fervor - if not as much regularity n6 - as its predecessor. n7

Courts are normally minimalist – the aff collapses executive independence – key to counter terrorism

Keynes 10 -- Professor of Political Science at Pennsylvania State University, University of Wisconsin Ph.D. (Edward, 2010, "Undeclared War: Twilight Zone of Constitutional Power," p. 83)

While the constitutional separation of powers does not preclude judicial review of war-powers controversies or require absolute deference to congressional and presidential judgment that the political-question doctrine sometimes suggests, the separation of powers provides a broad standard for judicial intervention in the vast, complex, and uncertain realm of foreign affairs. When the courts intervene in boundary disputes in order to protect an individual's constitutional rights or society's interest in constitutional government, they should not impair the performance of legislative or executive functions that are essential to protecting national-security interests.¹²⁶ Although the courts do not owe Congress or the President absolute deference in defining the boundaries of legislative and executive power, the principle of comity suggests that the judiciary should search for formulas that least restrict each branch in the performance of its functions, i.e., formulas that maximize each department's independence. As Robert Nagel recommends, when the courts challenge the exercise of legislative or executive power, they should pause to examine the effect of their decisions on the other department's operation. In cases that involve conflicting claims of power, the courts should first determine how broadly and deeply their decisions cut into another department's functions before marching into the political thicket.¹²⁶

****Impact****

2NC Impact Framing

Causes extinction – draws in Russia through miscalc

Barrett et al. 13—PhD in Engineering and Public Policy from Carnegie Mellon University, Fellow in the RAND Stanton Nuclear Security Fellows Program, and Director of Research at Global Catastrophic Risk Institute—AND Seth Baum, PhD in Geography from Pennsylvania State University, Research Scientist at the Blue Marble Space Institute of Science, and Executive Director of Global Catastrophic Risk Institute—AND Kelly Hostetler, BS in Political Science from Columbia and Research Assistant at Global Catastrophic Risk Institute (Anthony, 24 June 2013, “Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia,” *Science & Global Security: The Technical Basis for Arms Control, Disarmament, and Nonproliferation Initiatives*, Volume 21, Issue 2, Taylor & Francis)

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, could have **globally catastrophic effects** such as severely **reducing food production** for years, ¹ potentially **leading to collapse of modern civilization worldwide, and even the extinction of humanity.** ² Nuclear war between the United States and Russia could occur by various routes, including **accidental** or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or **unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders.** In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack. ³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches. ⁴) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, and numerous measures also were taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counter-attack. However, concerns about the extreme disruptions that a first attack would cause in the other side's forces and command-and-control capabilities led to both sides' development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack. ⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced. ⁶ **However**, it also has been argued that inadvertent nuclear war between the United States and Russia has continued to present a **substantial risk.** ⁷ While the United States and Russia are not actively threatening each other with war, they have **remained ready to launch nuclear missiles** in response to indications of attack. ⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time. ⁹ Second, **terrorist groups** or other actors might **cause attacks** on either the United States or Russia that **resemble some kind of nuclear attack by the other nation** by actions such as **exploding a stolen or improvised nuclear bomb**, ¹⁰ especially if such an event occurs during a crisis between the United States and Russia. ¹¹ A variety of nuclear terrorism scenarios are possible. ¹² Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States. ¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security. ¹⁴ It has long been argued that the probability of inadvertent nuclear war is significantly higher during U.S.–Russian crisis conditions, ¹⁵ with the Cuban Missile Crisis being a prime historical example. It is possible that U.S.–Russian relations will significantly deteriorate in the future, increasing nuclear tensions. There are a variety of ways for a third party to raise tensions between the United States and Russia, making one or both nations more likely to misinterpret events as attacks. ¹⁶

It's the only scenario – deterrence solves all their impacts

Gable 11 (William, US Army War College, "An Era of Persistent Conflict?,"

<http://www.dtic.mil/cgi-bin/GetTRDoc?AD=ADA560155>)

Exceptional individuals are key contributors to the turmoil the U.S. experienced in the last decade through the present, and their objectives could portend continued conflict. While the existence of these exceptional individuals alone does not necessarily assure conflict, the ideologies they espouse are underpinned by religion adding a **nondeterrable dimension** to their struggle. The actual or **perceived preponderance** of U.S. power will not diminish the likelihood of future attacks. In fact, such attacks will only serve to enhance these organizations' status and power, fueling every aspect of their operations from recruiting to financing operations. Consequently, threats from non-state actors will continue. Depending on the potential destruction inflicted by any terrorist attack, the attacker's sanctuary, and the threat posed to the aforementioned governments, the U.S. may be compelled to fight wars similar to the war in Afghanistan. Conflict with another state is possible, though **less likely**. Although the relative decline of U.S. economic power in relation to China appears to constitute a potential —window or threat to peace, both governments are aware of the **risks** and are **working to mitigate** them. Moreover, the U.S., China, and Russia represent **detractable nuclear powers**, states dissuaded from conflict with each other due to the potential costs of a nuclear exchange. Conflict between these states appears unlikely. However, existing theory suggests **problems with nondeterrable states** that are not responsive to punishment or are willing to take risks that prompt conflict. North Korea and Iran seem to fit this description. Their efforts to develop, acquire, and possibly proliferate nuclear weapons, combined with the potential threat posed by a **non-state actor** acquiring such weapons, form conditions that indicate a strong possibility of war. In particular, Iran's nuclear program presents a potentially ominous window. Should diplomacy, sanctions, and cyber attacks fail to sidetrack Iran's nuclear program, the U.S. will be presented with an ever-narrowing window to act with force to deny Iran this capability. This could result in conflict with Iran. While false optimism is a potent and pervasive cause of war, recent experience with war and the nature of these and likely future conflicts will diminish leaders support for initiating war. Similarly, the current economic conditions and concern over the national debt will dampen leaders' enthusiasm for wars. But existing theories that discuss these factors fail to consider the impact of non-state actors. Thus, **conflict is still possible despite them**. Overall, the combination of factors seems to indicate continuing conflict with nonstate actors and potential conflict with states over development and **proliferation** of nuclear weapons. These factors identify specific circumstances where U.S. involvement in war is likely, and represent the **primary drivers** for concluding that the current era will be one **of** persistent **conflict**. The U.S. government should use all of the elements of power to focus on these factors to prevent what history and theory suggest the inevitability of war.

Turns Human Rights

Terrorism turns civil liberties and human rights

Gorman 6 (Lindsey Gorman; “The Terrorist Threat: Its Impact on American Civil Liberties and Democracy”; Atlantic International Studies Organization; Volume 3, Spring 2006; <http://atlismta.org/online-journals/0607-journal-development-challenges/the-terrorist-threat/>)

Within the international system, terrorist attacks threaten the security of their target states.

Terrorism can be defined “as the threat or use of violence to spread fear to lead to political change.”^[1] However, state responses to terrorist threats differ according to its political system. For authoritarian regimes, the responses are virtually limitless. Appropriate responses become inherently more complex for a liberal democracy that guarantees its citizens a certain level of civil and human rights. **In fact, the strategy used by terrorists “is to force the liberal government to reveal its true, authoritarian nature...through restrictions on civil liberties as would be imposed in a crisis or state of siege.”**^[2] A paradox ensues, in which a state can clamp down on civil liberties and human rights in order to defeat and capture terrorists, ending the democratic regime. Alternatively, states that do not react in this manner ensure civil liberties are protected but leave their citizens vulnerable to security threats.^[3] As Michael Ignatieff points out, “A terrorist emergency is precisely a case where allowing individual liberty – to plan, to plot, to evade detection—may threaten a vital majority interest that is national security.”^[4] This is the “catch-22” of the liberal democratic state response to terrorism.

Turns Tech Leadership

Terrorism guts tech leadership and competitiveness

Koh 7 (Winston T.H., Professor of Economics and Associate Dean – Singapore Management University, “Terrorism and its Impact on Economic Growth and Technological Innovation”, Technological Forecasting and Social Change, 74(2), February, ScienceDirect)

3. Terrorism's impact on R&D and innovation

How will the war against global terrorism affect the trajectory of R&D and the pace of innovation? In the past, wartime tends to stimulate innovation of all kinds. Military conflict engenders innovation, and is changed by it [16]. During World War II, technologies that were developed include

the radar, jet engines, radio electronics and nuclear power. As a result, World War II turned out to be a different war compared with World War I; airpower, which played a minor role in World War I, played a decisive role in winning World War II for the Allies. Spurred by the current war on terrorism, innovations in intelligence gathering and decision support, sensors, monitoring are generating greater interest. Since the 9-11 attacks, there is an increase in demand for inspection technologies to screen individuals, packages, vehicles, and containers for weapons, explosives, chemical agents, and nuclear materials. There is also demand for advanced bomb resistant waste receptacles to increase public safety as well as a variety of fully confined containment containers for safely storing, transporting, or detonating detected contraband. 3.1. New technologies in the war on terrorism Clearly, the development of the homeland security industry going forward will be shaped by the changing attitudes and perception of people towards the threat of terrorism. In the United Kingdom, a pilot scheme was announced in 2004 to launch 10,000 identity cards on a volunteer basis, incorporating biometric features. In Singapore, all passports would eventually incorporate biometric features. By scanning personal characteristics such as fingerprints and iris features onto a computer chip that can only be read by a high-tech reader, these biometric passports make it difficult to forge documents to enter a country illegally. Many countries are also spending on technology to link the land, sea and air checkpoints electronically, thereby tightening the first-line defense against the entry of terrorist elements into their homeland. Looking into the future, new technologies that allow us to generate forward-looking intelligence would be critical in the war against terrorism. The greatest value of intelligence is to anticipate terrorist actions and to translate that information into an effective response. Improvements in technology will provide us with improved computer-based data fusion capabilities, modeling and simulation to better understand possible scenarios and responses. Advanced language translation software will be developed to better track terrorist communication as a source of intelligence. Besides intelligence, detection is another area which would spur innovations in the fight against terrorism. The future of sensors lies in biomimetics—biological and chemical sensors. For instance, technologies that are being developed include those that mimic the sniffing capabilities of a dog or the heat-seeking abilities of a viper to detect concealed bombs or weapons. In addition, technologies that allow for more accurate and timely detection of viral and bacterial pathogens will drive advancements in sensors—with the ultimate goal of combining chemical and biological threat detection into a suite of sensors. Sensors of the future will be deployed by highly mobile, reliable and affordable robotics. 3.2. Competition for R&D talents and resources Between the end of World War II and the current war on terrorism, the principal focus of technological innovation was the commercial markets. For instance, in the late 1960s, computer technology was being applied to offices as well as the manufacturing shopfloor. In the 1970s, the market for handheld calculators, electronic watches and clocks was driving development in the semiconductor technology. By the 1990s, it was the Internet, the cell phone, the DVD player, the PDA, and the personal computer and other commercial and consumer items that governed developments. Besides military usage, global positioning satellite systems were sold to consumers for hunting expeditions or for mapping or keeping track of the fleet of trucks for shipping and courier

companies. While the war on terrorism may spur innovation, as was the case during the Second World War, there could be an opposite effect. There are concerns that the war on terrorism may draw talented engineers and scientists to work on terrorism-related initiatives, and draw a high proportion of the research talent away from the industrial sector to work on what are essentially non-economic projects. It

was suggested that the huge scientific effort in the 1960s to put a man on the moon during the Cold War of the 1960s was one of the contributing causes to the decline in US competitiveness in the 1970s and 1980s, relative to Japan and other European countries. Moreover, when the Cold War was in full bloom, advanced fighter planes, better radar systems, smarter tanks and artillery were all in development in addition to the race to space. The United States was beaten in launching first orbiting satellite, but they were not going to lose the race to the moon. Some commentators have argued that the civilian spin offs of the space exploration were in fact quite modest, and in any event vastly less than those that would have been generated if the people involved had been working in private industry.

Except for products aimed at the consumer electronics market—principally television—virtually all new products were produced with the military and aerospace industry customer in mind. Moreover, performing standards were set to meet the demanding requirements of these military and aerospace customers. It is feared that the current war on terrorism may result in similar effects on the United States global economy. Even if there is no crowding out effect on private sector R&D, several effects on the rate and scope of technological innovation can be discerned as attention has focused on the fight against terrorism.

Firstly, the development of some types of technologies will be stimulated, or greatly speeded up as resources are invested [17]. As we discussed earlier in this section, the obvious examples are those related to surveillance, satellite imaging, security recognition systems, interception of radio and telephone signals, disaster recovery, etc. However, there is some concern although there is some commercialization potential in the technologies that are being developed in the wake of the 9-11 attacks, the spin off effect into the civilian economy may turn out to be not as much. There will be some civilian uses for these technologies (better security systems in large office buildings, and improved satellite imaging for oil exploration, for example) but much of the new technology will be highly specialized, and in any event may be kept secret to avoid tipping off potential adversaries. 3.3. Government funding of venture capital Another interesting effect of the war on terrorism is that governments are working more closely with venture capitalists since the late 1990s. A good example of such collaboration was the establishment by the CIA of In-Q-Tel in 1999 [18]. This small US\$30 million fund operates in the Silicon Valley to co-invest with other venture partners in technologies (particularly information technologies) that have potential application to governmental projects, particularly in the area of intelligence. The fund will not be an exclusive founder of a startup but will seek to make the companies in which it is invested aware of markets for their products and technology that are parallel to their commercial applications. In other countries, such as Singapore, government recognizes the need to develop new technologies systems that respond to terrorist threats and is taking the lead to set up venture capital funding for technologies have applications to the war on terrorism. Many countries have set up similar government-funded venture funds that offer early-stage venture capital funding and introductions to capabilities that will serve to address terrorist activities. 4. The future What does the future hold?

Attacks on an even broader scale than the 9-11 attacks may occur. For instance, the risk of a nuclear device bearing explosive force of 20 000 tons of TNT denoting over Manhattan is real. Such a device would destroy everything within three

square miles (see Stern [19]). The whole Wall Street and financial district would be destroyed and hundreds of thousands of lives would be lost. It would leave most of the metropolitan area uninhabitable for years, and would reduce the country's production potential substantially, with the brunt borne by the financial industry, which represents the bulk of New York City's economy. Wall Street would be closed for a long period of time and the recovery of financial transactions would depend on the availability of back-up facilities and data duplication. There would be severe disruption to the transportation system, including the port and airports. It is not only New York that faces such a threat. Other financial centers such as London, Tokyo, and Singapore are potential targets as well. Another possible scenario is that terrorists could attempt to explode a nuclear device or release contagious viruses in a populous metropolitan area [19]. In fact, within weeks of the 9-11 attacks, lethal anthrax spores were found to have contaminated mail in the United States. There are also concerns that terrorists could use the SARS virus, avian flu virus, and even the eradicated smallpox virus for future biological terrorist acts. In light of these potential future scenarios, technology will play a far greater role in preventing future terrorist acts. On balance, the development of a number of technologies relating to surveillance and related areas will be speeded up. However, as we noted in the paper, there is also the risk that the diversion of resources to develop anti-terror technologies may slow down innovation in society as a whole, by drawing talented people from more economically productive areas, by crowding out investment dollars, and by creating a climate of intolerance that will impede innovation. That, in turn, may well play a role in reducing economic growth in the long term.

Turns Economy

Large-scale terror attack collapses the U.S. and global economies

Rogoff 4 (Kenneth, Professor of Economics and Public Policy – Harvard University, “The Cost of Living Dangerously: Can the Global Economy Absorb the Expenses of Fighting Terrorism?; Argument”, Foreign Policy, 11-1, Lexis)

As this article is being written, the threat of a horrific pre-election terrorist assault against the United States has yet to materialize. Unfortunately, the news this summer that al Qaeda operatives have painstakingly targeted major U.S. and international financial institutions only underscores the likelihood of more attacks. Politicians, economists, and ordinary citizens rightfully worry that terrorism--beyond the tragic human costs--could derail economic growth in the United States and around the world. What also worries me, however, is the potential economic impact of antiterrorism efforts. Forget the long lines at airports. The global economy has become so dependent on the free flow of goods and people across borders that even a little additional security can have a greater impact than most might think. Consider, for example, the likely consequence of enhanced security at shipping ports worldwide to monitor for biological or nuclear weapons material, a precaution many experts consider inevitable. Currently, only about 2 percent of all cargo reaching U.S. shores is subject to inspection. The July 2004 report of the U.S. 9/11 Commission noted that, until better technologies become available, authorities should improve methods of "identifying and tracking the high-risk containers, operators, and facilities that require added scrutiny." But what if such added scrutiny means that the level of cargo inspected jumps to, say, 50 percent? Today's slowest customs lines--in countries such as Japan that already use port delays as veiled forms of trade protectionism--would start to seem like express lanes, and the costs of many consumer goods would skyrocket. Worse yet, as trade in goods and the flow of people slows, so too will the breathless pace of product innovation that many individuals now take for granted. Any abatement of the competitive pressures of globalization or any reduction in the free movement of people and ideas would surely undercut growth--not to mention raise prices sharply at your local Wal-Mart. Think about what is happening already. Despite introducing relatively limited antiterrorist restrictions thus far, the United States will likely register slower economic growth in a few years due to post-9/11 visa restrictions alone. Few Americans appreciate the extent to which scientists, engineers, and businesspeople from other countries contribute to U.S. economic growth. Historically, the United States has attracted legions of enterprising foreign-born workers; today about 2.5 million foreigners with advanced degrees work in the United States, and many hold leading positions in science and industry and serve as key transnational links for the increasingly globalized U.S. economy. More than 30 percent of all Ph.D. recipients in U.S. science and mathematics programs are foreigners on student visas. In engineering, almost half of all graduates have come to the United States on foreign visas; many of them stay in the country upon completing their degrees. The U.S. economy grows in no small part by skimming the cream off the rest of the world's workforce. Unfortunately, U.S. companies today often shy away from hiring U.S.-educated foreigners. The price tag on the visa application process has soared, and companies never know if and when work permits will be approved or precisely when a new foreign employee can come on board. And yes, workers from Muslim countries are particularly hard hit, but the difficulties have worsened for everyone. Even obtaining visas to attend academic or policy conferences in the United States is now an ordeal. Little surprise that international applications to U.S. graduate programs have declined by roughly a third in the last year. Added security won't come cheap, either, and raising the necessary taxes will prove painful, especially with the United States and Europe facing the costs of aging populations and shrinking workforces. The United States estimates its 2005 homeland security budget at about \$40 billion, a sum that could easily double in a few years. But these direct costs of increased security reveal only a limited picture. Perhaps the greatest danger is that increased security will distort and accentuate government taxation and regulation. Orwellian 1984 scenarios aside, suppose governments were able to keep much closer tabs on citizens? Just like individuals, economies need a bit of privacy to function efficiently. Idiomatic government rules and regulations abound, and citizens must have ways to evade the worse of them. The reason why roughly one fifth of Italy's economy is "underground" is not just high tax rates or the Sicilian Mafia. The real explanation is more prosaic: Ordinary people need to hire painters, plumbers, and carpenters to fix their houses, or nannies to care for their children, without wasting endless hours tangled in red tape. Germany--hardly famous for its mafia--has an underground economy approaching one sixth of its national income. More severe security measures are probably necessary and inevitable, even from a narrow economic perspective. Another atrocity on the scale of September 11 would wreak havoc on energy prices, stock markets, and consumer confidence, slamming the brakes on today's global economic recovery. But just like other desirable government initiatives (such as environmental regulations or workplace safety laws), antiterrorism measures can work at far less cost when they are flexible and market-friendly. For example, just as some countries provide fast-track airport security lines to high-paying business travelers, shipper sought to be able to pay higher fees to move more quickly to the head of the customs queue. Similarly, higher fees should help accelerate visa applications. No doubt, such measures may offend some people's sense of egalitarianism, but these policies and others like them are essential. The benefits of today's interconnected market economies won't survive under a vast and inflexible command-and-control security arrangement.

Turns Court Advantages

Terror turns the Court advantage – causes judicial conservatism and deference to political branches

Epstein 5 (Lee Epstein et. al., law at Washington University, April 2005 (80 N.Y.U.L. Rev. 1, lexis)

In addition, because concerns over institutional legitimacy are constant, the Court must follow precedent established during wartime even after the crisis dissipates. If it does not, it once again may risk undermining its fundamental efficacy. That is so for several reasons, not the least of which is that members of legal and political communities base their future expectations on the belief that others will follow existing rules. Should the Court make a radical change in those rules, the communities may be unable to adapt, resulting in a decision that does not produce a (new) efficacious rule. If a sufficient number of such decisions accumulate over time, the Court will undermine its legitimacy. Hence, the norm of stare decisis can constrain the decisions of all justices, even those who do not believe they should be constrained by past decisions or who dislike extant legal principles.¹³³ From this logic, advocates of the crisis thesis assert that one of two possibilities relating to precedent established during wartime results: (a) “statist ratchets,” sometimes termed “lingering effects,”¹³⁴ or (b) “dosages.”¹³⁵ The first seems to follow from Justice Jackson’s dissent in *Korematsu*, which warns that: [o]nce a judicial opinion rationalizes [a government] order to show that it conforms to the Constitution, or rather rationalizes the Constitution to show that the Constitution sanctions such an order, **the Court for all time has validated [a] principle** . . . [that] then lies about like a loaded weapon ready for the hand of any authority that can bring forward a plausible claim of an urgent need. Every repetition imbeds that principle more deeply in our law and thinking and expands it to new purposes.¹³⁶ In other words, once justices articulate doctrine “accommodating” the crisis, that doctrine “become[s] entrenched over time and thus normalized and made routine.”¹³⁷ Future justices will stick to it, regardless of whether a war is ongoing and regardless of whether they agree with it. This follows from the norm of stare decisis and its role in helping the Court to establish and maintain its legitimacy. Dosages too flow from the norm but take a slightly different form. The idea here—in direct contradistinction to “libertarian ratchets”—is that with every passing war or other international crisis, **the government responds with ever-increasing “dosages” necessary to fend off the threat**. Or, as Gross puts it: What might have been seen as sufficient ‘emergency’ measures in the past (judged against the ordinary situation) **may not be deemed enough for further crises as they arise**. Much like the need to gradually increase the dosage of a heavily used medication in order to experience the same level of relief, so too with respect to emergency powers . . .¹³⁸ **Given the extreme deference the Court must show to the government to retain its legitimacy, it will approve of its ever-extreme measures** and thereby generate even more extreme doctrine that future Courts must follow.

Turns Internet

Large scale terror causes sealed borders and hyper-nationalization – turns their Internet advantage

Ignatieff 4 (Michael, Professor of Human Rights – Harvard University, *The Lesser Evil: Political Ethics in an Age of Terror*, p. 153-154)

It is a commonplace of presidential and prime ministerial rhetoric to insist that their democracies cannot lose in a war on terror. My own analysis thus far has confirmed that no democracy has ever been toppled by a terrorist campaign, unless other factors, like economic collapse or military defeat, were present too. But faced with terrorism that deploys weapons of mass destruction, we cannot be as certain that the historical pattern, argued for in this book, would prevail in the future. In other words, we could lose. What would defeat look like? It would not be like invasion, conquest, or occupation, of course, but rather would entail the disintegration of our institutions and way of life. **A succession of mass casualty attacks, using weapons of mass destruction, would leave behind zones of devastation sealed off for years and a pall of mourning, anger, and fear hanging over our public and private lives.** Such attacks would destroy the existential security on which democracy depends. Recurrent attacks with weapons of mass destruction might not just kill hundreds of thousands of people. **We might find ourselves living with a national security state on permanent alert, with sealed borders, constant identity checks, and permanent detention camps for suspicious aliens** and recalcitrant citizens. **A successful attack would poison the wellsprings of trust among strangers that make the relative liberty of liberal democracy possible.** Our police forces might descend to torturing suspects in order to prevent future attacks, and our secret security forces might engage in direct assassination of perpetrators or mere suspects as well. Our military might itself use weapons of mass destruction against terrorist enemies. If our institutions were unable to stop the attacks, the state's monopoly of force might even break down, as citizens took the law into their own hands seeking to defend themselves against would-be perpetrators. Vigilantes would patrol blighted and deserted streets. This is what the face of defeat might look like. We would survive, but we would no longer recognize ourselves or our institutions. We would exist but lose our identity as free people.

Nuke Terror Causes Extinction

Nuclear terrorism causes extinction – retaliations draws in great powers

Ayson 10 (Robert, Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand – Victoria University of Wellington, “After a Terrorist Nuclear Attack: Envisaging Catalytic Effects”, *Studies in Conflict & Terrorism*, 33(7), July)

A Catalytic Response: Dragging in the Major Nuclear Powers

A terrorist nuclear attack, and even the use of nuclear weapons in response by the country attacked in the first place, would not necessarily represent the worst of the nuclear worlds imaginable. Indeed, there are reasons to wonder whether nuclear terrorism should ever be regarded as belonging in the category of truly existential threats. A contrast can be drawn here with the global catastrophe that would come from a massive nuclear exchange between two or more of the sovereign states that possess these weapons in significant numbers. Even the worst terrorism that the twenty-first century might bring would fade into insignificance alongside considerations of what a general nuclear war would have wrought in the Cold War period. And it must be admitted that as long as the major nuclear weapons states have hundreds and even thousands of nuclear weapons at their disposal, there is always the possibility of a truly awful nuclear exchange taking place precipitated entirely by state possessors themselves. But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today's and tomorrow's terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be “spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from.”⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington's relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington's early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist

group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the "Chechen insurgents' ... long-standing interest in all things nuclear."⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide.

Nuclear terrorism risks extinction --- the threat of an attack is significant.

Hellman 8 (Martin E. Hellman, emeritus prof of engineering @ Stanford, "Risk Analysis of Nuclear Deterrence" SPRING 2008 THE BENT OF TAU BETA PI, <http://www.nuclearrisk.org/paper.pdf>)

The threat of nuclear terrorism looms much larger in the public's mind than the threat of a full-scale nuclear war, yet this article focuses primarily on the latter. An explanation is therefore in order before proceeding. A terrorist attack involving a nuclear weapon would be a catastrophe of immense proportions: "A 10-kiloton bomb detonated at Grand Central Station on a typical work day would likely kill some half a million people, and inflict over a trillion dollars in direct economic damage. America and its way of life would be changed forever." [Bunn 2003, pages viii-ix]. The likelihood of such an attack is also significant. Former Secretary of Defense William Perry has estimated the chance of a nuclear terrorist incident within the next decade to be roughly 50 percent [Bunn 2007, page 15]. David Albright, a former weapons inspector in Iraq, estimates those odds at less than one percent, but notes, "We would never accept a situation where the chance of a major nuclear accident like Chernobyl would be anywhere near 1% A nuclear terrorism attack is a low-probability event, but we can't live in a world where it's anything but extremely low-probability." [Hegland 2005]. In a survey of 85 national security experts, Senator Richard Lugar found a median estimate of 20 percent for the "probability of an attack involving a nuclear explosion occurring somewhere in the world in the next 10 years," with 79 percent of the respondents believing "it more likely to be carried out by terrorists" than by a government [Lugar 2005, pp. 14-15]. I support increased efforts to reduce the threat of nuclear terrorism, but that is not inconsistent with the approach of this article. Because terrorism is one of the potential trigger mechanisms for a full-scale nuclear war, the risk analyses proposed herein will include estimating the risk of nuclear terrorism as one component of the overall risk. If that risk, the overall risk, or both are found to be unacceptable, then the proposed remedies would be directed to reduce which- ever risk(s) warrant attention. Similar remarks apply to a number of other threats (e.g., nuclear war between the U.S. and China over Taiwan). his article would be incomplete if it only dealt with the threat of nuclear terrorism and neglected the threat of full- scale nuclear war. If both risks are unacceptable, an effort to reduce only the terrorist component would leave humanity in great peril. In fact, society's almost total neglect of the threat of full-scale nuclear war makes studying that risk all the more important. The cost of World War iii The danger associated with nuclear deterrence depends on both the cost of a failure and the failure rate.³ This section explores the cost of a failure of nuclear deterrence, and the next section is concerned with the failure rate. While other definitions are possible, this article defines a failure of deterrence to mean a full-scale exchange of all nuclear weapons available to the U.S. and Russia, an event that will be termed World War III. Approximately 20 million people died as a result of the first World War. World War II's fatalities were double or triple that number—chaos prevented a more precise deter- mination. In both cases humanity recovered, and the world today bears few scars that attest to the horror of those two wars. Many people therefore implicitly believe that a third World War would be horrible but survivable, an extrapolation of the effects of the first two global wars. In that view, World War III, while horrible, is something that humanity may just have to face and from which it will then have to recover. In contrast, some of those most qualified to assess the situation hold a very different view. In a 1961 speech to a joint session of the Philippine Congress, General Douglas MacArthur, stated, "Global war has become a Frankenstein to destroy both sides. ... If you lose, you are annihilated. If you win, you stand only to lose. No longer does it possess even the chance of the winner of a duel. It contains now only the germs of double suicide." Former Secretary of Defense Robert McNamara expressed a similar view: "If deterrence fails and conflict develops, the present U.S. and NATO strategy carries with it a high risk that Western civilization will be destroyed" [McNamara 1986, page 6]. More recently, George Shultz, William Perry, Henry Kissinger, and Sam Nunn⁴ echoed those concerns when they quoted President Reagan's belief that nuclear weapons were "totally

irrational, totally inhumane, good for nothing but killing, possibly destructive of life on earth and civilization.” [Shultz 2007] Official studies, while couched in less emotional terms, still convey the horrendous toll that World War III would exact: **“The resulting deaths would be far beyond any precedent.** Executive branch calculations show a range of U.S. deaths from 35 to 77 percent (i.e., 79-160 million dead) ... a change in targeting could kill somewhere between 20 million and 30 million additional people on each side These calculations reflect only deaths during the first 30 days. Additional millions would be injured, and many would eventually die from lack of adequate medical care ... millions of people might starve or freeze during the following winter, but it is not possible to estimate how many. ... further millions ... might eventually die of latent radiation effects.” [OTA 1979, page 8] This OTA report also noted the possibility of serious ecological damage [OTA 1979, page 9], a concern that assumed a new potentiality when the TTAPS report [TTAPS 1983] proposed that the ash and dust from so many nearly simultaneous **nuclear explosions** and their resultant firestorms **could usher in a nuclear winter that might erase homo sapiens from the face of the earth**, much as many scientists now believe the K-T Extinction that wiped out the dinosaurs resulted from an impact winter caused by ash and dust from a large asteroid or comet striking Earth. The TTAPS report produced a heated debate, and there is still no scientific consensus on whether a nuclear winter would follow a full-scale nuclear war. Recent work [Robock 2007, Toon 2007] suggests that **even a limited nuclear exchange** or one between newer nuclear-weapon states, such as India and Pakistan, **could have devastating long-lasting climatic consequences** due to the large volumes of smoke that would be generated by fires in modern megacities. While it is uncertain how destructive World War III would be, prudence dictates that we apply the same engineering conservatism that saved the Golden Gate Bridge from collapsing on its 50th anniversary and assume that **preventing World War III is a necessity—not an option.**

Extinction---equivalent to full-scale nuclear war – prefer our ev because it cites models and experts

Toon 7 (Owen B. Toon, chair of the Department of Atmospheric and Oceanic Sciences at CU-Boulder, et al., April 19, 2007, “Atmospheric effects and societal consequences of regional scale nuclear conflicts and acts of individual nuclear terrorism,” online: <http://climate.envsci.rutgers.edu/pdf/acp-7-1973-2007.pdf>)

To an increasing extent, **people are congregating in the world’s great urban centers, creating megacities with populations exceeding 10 million individuals.** At the same time, **advanced technology has designed nuclear explosives of such small size they can be easily transported in a car,** small plane or boat **to the heart of a city.** We demonstrate here that **a single detonation in the 15 kiloton range can produce urban fatalities approaching one million** in some cases, **and casualties exceeding one million.** Thousands of small weapons still exist in the arsenals of the U.S. and Russia, and there are at least six other countries with substantial nuclear weapons inventories. In all, thirty-three countries control sufficient amounts of highly enriched uranium or plutonium to assemble nuclear explosives. A conflict between any of these countries involving 50-100 weapons with yields of 15 kt has the potential to create fatalities rivaling those of the Second World War. Moreover, **even a single surface nuclear explosion,** or an air burst in rainy conditions, **in a city center is likely to cause the entire metropolitan area to be abandoned at least for decades** owing to infrastructure damage and radioactive contamination. As the aftermath of hurricane Katrina in Louisiana suggests, **the economic consequences of even a localized nuclear catastrophe would most likely have severe national and international economic consequences.** Striking effects result even from relatively small nuclear attacks because low yield detonations are most effective against city centers where business and social activity as well as population are concentrated. Rogue nations and **terrorists would be most likely to strike there.** Accordingly, an organized **attack on the U.S. by a small nuclear state, or terrorists** supported by such a state, **could generate casualties comparable to those once predicted for a full-scale nuclear “counterforce” exchange in a superpower conflict.**

Remarkably, the **estimated quantities of smoke generated by attacks totaling about one megaton of nuclear explosives could lead to significant global climate perturbations** (Robock et al., 2007). While we did not extend our casualty and damage predictions to include potential medical, social or economic impacts following the initial explosions, such analyses have been performed in the past for large-scale nuclear war scenarios (Harwell and Hutchinson, 1985). Such a study should be carried out as well for the present scenarios and physical outcomes.

AT: No Nuclear Terrorism

Risk of nuclear terrorism is real and high now

I. Introduction In 2011, Harvard's Belfer Center for Science and International Affairs and the Russian Academy of Sciences' Institute for U.S. and Canadian Studies published "The U.S. – Russia Joint Threat Assessment on Nuclear Terrorism." The assessment analyzed the means, motives, and access of would-be nuclear terrorists, and concluded that the threat of nuclear terrorism is urgent and real. The Washington and Seoul Nuclear Security Summits in 2010 and 2012 established and demonstrated a consensus among political leaders from around the world that nuclear terrorism poses a serious threat to the peace, security, and prosperity of our planet. For any country, a terrorist attack with a nuclear device would be an immediate and catastrophic disaster, and the negative effects would reverberate around the world far beyond the location and moment of the detonation. Preventing a nuclear terrorist attack requires international cooperation to secure nuclear materials, especially among those states producing nuclear materials and weapons. As the world's two greatest nuclear powers, the United States and Russia have the greatest experience and capabilities in securing nuclear materials and plants and, therefore, share a special responsibility to lead international efforts to prevent terrorists from seizing such materials and plants. The depth of convergence between U.S. and Russian vital national interests on the issue of nuclear security is best illustrated by the fact that bilateral cooperation on this issue has continued uninterrupted for more than two decades, even when relations between the two countries occasionally became frosty, as in the aftermath of the August 2008 war in Georgia. Russia and the United States have strong incentives to forge a close and trusting partnership to prevent nuclear terrorism and have made enormous progress in securing fissile material both at home and in partnership with other countries. However, to meet the evolving threat posed by those individuals intent upon using nuclear weapons for terrorist purposes, the United States and Russia need to deepen and broaden their cooperation. The 2011 "U.S. - Russia Joint Threat Assessment" offered both specific conclusions about the nature of the threat and general observations about how it might be addressed. This report builds on that foundation and analyzes the existing framework for action, cites gaps and deficiencies, and makes specific recommendations for improvement. "The U.S. – Russia Joint Threat Assessment on Nuclear Terrorism" (The 2011 report executive summary): • Nuclear terrorism is a real and urgent threat. Urgent actions are required to reduce the risk. The risk is driven by the rise of terrorists who seek to inflict unlimited damage, many of whom have sought justification for their plans in radical interpretations of Islam; by the spread of information about the decades-old technology of nuclear weapons; by the increased availability of weapons-usable nuclear materials; and by globalization, which makes it easier to move people, technologies, and materials across the world. • Making a crude nuclear bomb

Nuclear terrorism is extremely probable – nuclear scientist coop and unsecure sites

Jaspal 12 (Zafar Nawaz Associate Professor at the School of Politics and International Relations, Quaid-i-Azam University, Islamabad, Pakistan 12, citing: The Fissile Material Working Group, the International Atomic Energy Agency (IAEA), the United Nations Security Council (UNSC), “Nuclear/Radiological Terrorism: Myth or Reality?”, Journal of Political Studies, Vol. 19, Issue - 1, 2012, 91:111)

The misperception, miscalculation and above all ignorance of the ruling elite about security puzzles are perilous for the national security of a state. Indeed, in an age of transnational terrorism and unprecedented dissemination of dual-use nuclear technology, **ignoring nuclear terrorism threat is an imprudent policy choice.** The incapability of terrorist organizations to engineer fissile material does not eliminate completely the possibility of nuclear terrorism. At the same time, the absence of an example or precedent of a nuclear/ radiological terrorism does not qualify the assertion that the nuclear/radiological terrorism ought to be remained a myth. Farsighted rationality obligates that one should not miscalculate transnational terrorist groups – whose behavior suggests that they have a death wish – of acquiring nuclear, radiological, chemical and biological material producing capabilities. In addition, one could be sensible about the published information that huge amount of nuclear material is spread around the globe. According to estimate it is enough to build more than 120,000 Hiroshima-sized nuclear bombs (Fissile Material Working Group, 2010, April 1). The alarming fact is that a few storage sites of nuclear/radiological materials are inadequately secured and continue to be accumulated in unstable regions (Sambaiew, 2010, February). Attempts at stealing fissile material had already been discovered (Din & Zhiwei, 2003: 18). Numerous evidences confirm that terrorist groups had aspired to acquire fissile material for their terrorist acts. Late Osama bin Laden, the founder of al Qaeda stated that acquiring nuclear weapons was a “religious duty” (Yusufzai, 1999, January 11). The IAEA also reported that “al-Qaeda was actively seeking an atomic bomb.” Jamal Ahmad al-Fadl, a dissenter of Al Qaeda, in his trial testimony had “revealed his extensive but unsuccessful efforts to acquire enriched uranium for al-Qaeda” (Allison, 2010, January: 11). On November 9, 2001, Osama bin Laden claimed that “we have chemical and nuclear weapons as a deterrent and if America used them against us we reserve the right to use them (Mir, 2001, November 10).” On May 28, 2010, Sultan Bashiruddin Mahmood, a Pakistani nuclear scientist confessed that he met Osama bin Laden. He claimed that “I met Osama bin Laden before 9/11 not to give him nuclear know-how, but to seek funds for establishing a technical college in Kabul (Syed, 2010, May 29).” He was arrested in 2003 and after extensive interrogation by American and Pakistani intelligence agencies he was released (Syed, 2010, May 29). Agreed, Mr. **Mahmood did not share nuclear know-how with Al Qaeda, but his meeting with Osama establishes the fact that the terrorist organization was in contact with nuclear scientists. Second, the terrorist group has sympathizers in the nuclear scientific bureaucracies.** It also authenticates bin Laden’s Deputy Ayman Zawahiri’s claim which he made in December 2001: “If you have \$30 million, go to the black market in the central Asia, contact any disgruntled Soviet scientist and a lot of dozens of smart briefcase bombs are available (Allison, 2010, January: 2).” The covert meetings between nuclear scientists and al Qaeda members could not be interpreted as idle threats and thereby the threat of nuclear/radiological terrorism is real. The 33Defense Secretary Robert Gates admitted in 2008 that “what keeps every senior government leader awake at night is the thought of a terrorist ending up with a weapon of mass destruction, especially nuclear (Mueller, 2011, August 2).” Indeed, the nuclear deterrence strategy cannot deter the transnational terrorist syndicate from nuclear/radiological terrorist attacks. Daniel Whiteneck pointed out: “Evidence suggests, for example, that al Qaeda might not only use WMD simply to demonstrate the magnitude of its capability but that it might actually welcome the escalation of a strong U.S. response, especially if it included catalytic effects on governments and societies in the Muslim world. An adversary that prefers escalation regardless of the consequences cannot be deterred” (Whiteneck, 2005, Summer: 187) Since taking office, President Obama has been reiterating that “nuclear weapons represent the ‘gravest threat’ to United States and international security.” While realizing that the US could not prevent nuclear/radiological terrorist attacks singlehandedly, he launched 47th international campaign to convince the international community about the increasing threat of nuclear/ radiological terrorism. He stated on April 5, 2009: “Black market trade in nuclear secrets and nuclear materials abound. **The technology to build a bomb has spread. Terrorists are determined to buy, build or steal one.** Our efforts to contain these dangers are centered on a global non-proliferation regime, but as more people and nations break the rules, we could reach the point where the center cannot hold (Remarks by President Barack Obama, 2009, April 5).” He added: “One terrorist with one nuclear weapon could unleash massive destruction. Al Qaeda has said it seeks a bomb and that it would have no problem with using it. And we know that there is unsecured nuclear material across the globe” (Remarks by President Barack Obama, 2009, April 5). In July 2009, at the G-8 Summit, President Obama announced the convening of a Nuclear Security Summit in 2010 to deliberate on the mechanism to “secure nuclear materials, combat nuclear smuggling, and prevent nuclear terrorism” (Luongo, 2009, November 10). President Obama’s nuclear/radiological threat perceptions were also accentuated by the United Nations Security Council (UNSC) Resolution 1887 (2009). The UNSC expressed its

grave concern regarding 'the threat of nuclear terrorism.' It also recognized the need for all States "to take effective measures to prevent nuclear material or technical assistance becoming available to terrorists."

The UNSC Resolution called "for universal adherence to the Convention on Physical Protection of Nuclear Materials and its 2005 Amendment, and the Convention for the Suppression of Acts of Nuclear Terrorism." (UNSC Resolution, 2009) The United States Nuclear Posture Review (NPR) document revealed on April 6, 2010 declared that "terrorism and proliferation are far greater threats to the United States and international stability." (Security of Defence, 2010, April 6: i). The United States declared that it reserved the right to "hold fully accountable" any state or group "that supports or enables terrorist efforts to obtain or use weapons of mass destruction, whether by facilitating,

financing, or providing expertise or safe haven for such efforts (Nuclear Posture Review Report, 2010, April: 12)". This declaration underscores the possibility that terrorist groups could acquire fissile material from the rogue states.

Nuclear terrorism is likely - al Qaeda is opportunistic and has WMD ambitions

Hoffman 13 (February 19, Bruce, Director of the Center for Security Studies and Director of the Security Studies Program at Georgetown, "Interview with Bruce Hoffman on today's Global Terrorism Threat" interview by Bilal Y. Saab, Arms Control and Regional Security for the Middle East, <http://www.middleeast-armscontrol.com/2013/02/19/interview-with-bruce-hoffman-on-todays-global-terrorism-threat/>)

1- Many scholars, analysts, and government officials have viewed the Al Qaeda threat to U.S. interests as waning after the killing and capture of several terrorist leaders including Al Qaeda chief Osama bin Laden. How do you assess the threat today in light of the historic changes in the Middle East? Is it the same? Worse? It is dynamic. What we have seen is the decline of Core al Qaeda, but the rise of al Qaeda-ism. In other words, even while Core al Qaeda has suffered since bin Laden's killing, its ideology and brand have clearly prospered. Today, al Qaeda's affiliates and associates are present in more places than al Qaeda was ten years ago. And, as the French intervention in Northern Mali has again shown: once al Qaeda entrenches itself, Western intervention is invariably required to remove it. In sum, the historic changes in the Middle East and North Africa of the past two years have created new opportunities for the spread of al Qaeda-ism and, potentially, the resurrection of the threat that al Qaeda poses. In this respect, no al Qaeda affiliate or associate has ever remained completely local: all have eventually become regional players and have internationalized in one respect or another—whether by recruiting Westerners (including Americans) into its ranks or aspiring to attack beyond its local and even regional confines. 2- State capacity, specifically in the domain of counterterrorism, has always been a problem in the Middle East and other under-developed regions around the world. As nonproliferation analysts, we are interested in studying the capacity of Middle Eastern states to implement various measures related to WMD counterproliferation, and particularly United Nations Security Council Resolution 1540, which calls for the prevention of the spread of WMD to non-state actors. Do you see progress in that area or have Middle Eastern states lagged even farther behind given the unrest in the region? What can the United States realistically do to bolster the capabilities of states in the region? Iran's continued development of a nuclear capability clearly shows the limits of international counterproliferation efforts in the region. As if that were not bad enough, the threat of Syria's chemical and biological weapons stockpiles falling into the hands of both radical Sunni as well as Shi'a terrorists (mainly, respectively al Qaeda and Hezbollah) is fundamentally alarming. 3- With Syria burning and Al Qaeda elements actively involved in the fight, is the threat of the terrorist organization capturing chemical weapons and other WMD material overblown or very real? Is this the closest example we have in Al Qaeda's history of the organization possibly acquiring WMD? What about any episodes of the jihadists' history in Pakistan? Yes, this is a real and extremely serious threat. Al Qaeda sees Syria generally and its unconventional weapons stockpiles in particular as offering the best chance for it to revive its waning fortunes and once again become as threatening and consequential as it appeared in the aftermath of the September 11th 2001 attacks. Indeed, I would argue that al Qaeda has pinned its faith and hopes to the demise of the Assad regime and, in turn, its acquisition of deadly weapons from that country's vast unconventional weapons arsenal. 4- There seems to be some confusion in the media about the dangers of failed states versus weak states. Which ones are worse in your judgment as far as terrorism formation and which ones are more likely to produce long-term terrorist threats? Can you please give us a brief comparison of the two with some real examples? A failed state is Somalia (or, more accurately, was Somalia). A weak state is Libya, for example, and a failing state is Syria. They all pose dangers of varying kinds and degrees. Failed states have neither the will nor the capacity to police their borders, maintain law and order internally, and fulfill even the most basic requirements of governance. They are generally incapable of receiving international assistance in support. Weak states may perhaps have the will, but not the capacity to discharge these same functions but are often amenable to international assistance and support. Failing states are the most dangerous categories because their only concern is holding onto power at whatever the cost. To survive they must by definition go rogue. Hopefully, as in Libya, the tide of history sweeps along the forces of revolution and reform, who can relatively quickly subdue the existing authorities and begin to establish a new order. Syria, with the external involvement of Iran and Hezbollah, and its stockpiles of chemical and biological weapons and vast conventional arsenal—on a scale that certainly eclipses Libya and likely surpasses Saddam's Iraq—presents perhaps the ultimate nightmare scenario. 5- Overall and in your opinion, are we witnessing a

resurgence of Al Qaeda in the Middle East and North Africa? It seems that every time we pronounce the organization dead it comes back with a vengeance. Is it more about its own capabilities or simply the result of the crisis conditions that have swept the Middle East since the Arab uprisings began? Or is it both? Yes, we are witnessing a resurgence of the al Qaeda ideology and brand across the Middle East and North Africa. It is of course limited to a small number of fanatics but that in essence is the appeal of terrorism: you don't need divisions or brigades to have an impact or arguably even to change the course of history. Rather, a handful of persons can fundamentally do so if they are sufficiently disciplined and able to perpetrate even only one or two dramatic, significant, jarring acts of violence. That is the age-old conceit of terrorists and their driving motivation. What concerns me is that the threat of terrorism seems to have increased rather than diminished in the Maghreb and Levant in particular over the past two years and appears to be growing elsewhere as well. It is nascent today—but far more serious and salient than it was even a year ago. I shudder to think to what extent it may have grown by next year. Both in answer to the second question. Al Qaeda has always been as opportunistic as it is instrumental. That is, capable of taking advantage of whatever available opportunities for intervening in local conflicts and engaging in terrorism. Across the Middle East and North Africa the movement has demonstrated its ability repeatedly to seize and exploit opportunities either to re-entrench or establish itself in a variety of long-favored or new venues, to capitalize on the instability and uncertainty in the region's countries, and create local toe-holds that it hopes to transform into regional foot-holds. Whether it will fail or be successful is the most pressing question today. How the US, the West, and regional governments react will determine the outcome.

2NC Impact – Bioterror

Bioterror causes extinction

Mhyrvold 13 (Nathan, Began college at age 14, BS and Masters from UCLA, Masters and PhD, Princeton “Strategic Terrorism: A Call to Action,” Working Draft, The Lawfare Research Paper Series Research paper NO . 2 – 2013)

As horrible as this would be, such a pandemic is by no means the worst attack one can imagine, for several reasons. First, most of the classic bioweapons are based on 1960s and 1970s technology because the 1972 treaty halted bioweapons development efforts in the United States and most other Western countries. Second, the Russians, although solidly committed to biological weapons long after the treaty deadline, were never on the cutting edge of biological research. Third and most important, the science and technology of molecular biology have made enormous advances, utterly transforming the field in the last few decades. High school biology students routinely perform molecular-biology manipulations that would have been impossible even for the best superpower-funded program back in the heyday of biological-weapons research. The biowarfare methods of the 1960s and 1970s are now as antiquated as the lumbering mainframe computers of that era. Tomorrow’s terrorists will have vastly more deadly bugs to choose from. Consider this sobering development: in 2001, Australian researchers working on mousepox, a nonlethal virus that infects mice (as chickenpox does in humans), accidentally discovered that a simple genetic modification transformed the virus.^{10, 11} Instead of producing mild symptoms, the new virus killed 60% of even those mice already immune to the naturally occurring strains of mousepox. The new virus, moreover, was unaffected by any existing vaccine or antiviral drug. A team of researchers at Saint Louis University led by Mark Buller picked up on that work and, by late 2003, found a way to improve on it: Buller’s variation on mousepox was 100% lethal, although his team of investigators also devised combination vaccine and antiviral therapies that were partially effective in protecting animals from the engineered strain.^{12, 13} Another saving grace is that the genetically altered virus is no longer contagious. Of course, it is quite possible that future tinkering with the virus will change that property, too. Strong reasons exist to believe that the genetic modifications Buller made to mousepox would work for other poxviruses and possibly for other classes of viruses as well. Might the same techniques allow chickenpox or another poxvirus that infects humans to be turned into a 100% lethal bioweapon, perhaps one that is resistant to any known antiviral therapy? I’ve asked this question of experts many times, and no one has yet replied that such a manipulation couldn’t be done. This case is just one example. Many more are pouring out of scientific journals and conferences every year. Just last year, the journal Nature published a controversial study done at the University of Wisconsin–Madison in which virologists enumerated the changes one would need to make to a highly lethal strain of bird flu to make it easily transmitted from one mammal to another.¹⁴ Biotechnology is advancing so rapidly that it is hard to keep track of all the new potential threats. Nor is it clear that anyone is even trying. In addition to lethality and drug resistance, many other parameters can be played with, given that the infectious power of an epidemic depends on many properties, including the length of the latency period during which a person is contagious but asymptomatic. Delaying the onset of serious symptoms allows each new case to spread to more people and thus makes the virus harder to stop. This dynamic is perhaps best illustrated by HIV, which is very difficult to transmit compared with smallpox and many other viruses. Intimate contact is needed, and even then, the infection rate is low. The balancing factor is that HIV can take years to progress to AIDS, which can then take many more years to kill the victim. What makes HIV so dangerous is that infected people have lots of opportunities to infect others. This property has allowed HIV to claim more than 30 million lives so far, and approximately 34 million people are now living with this virus and facing a highly uncertain future.¹⁵ A virus genetically engineered to infect its host quickly, to generate symptoms slowly—say, only after weeks or months—and to spread easily through the air or by casual contact would be vastly more devastating than HIV. It could silently penetrate the population to unleash its deadly effects suddenly. This type of epidemic would be almost impossible to combat because most of the infections would occur before the epidemic became obvious. A technologically sophisticated terrorist group could develop such a virus and kill a large part of humanity with it. Indeed, terrorists may not have to develop it themselves: some scientist may do so first and publish the details. Given the rate at which biologists are making discoveries about viruses and the immune system, at some point in the near future, someone may create artificial pathogens that could drive the human race to extinction.

Indeed, a detailed species-elimination plan of this nature was openly proposed in a scientific journal. The ostensible purpose of that particular research was to suggest a way to extirpate the malaria mosquito, but similar techniques could be directed toward humans.¹⁶ When I've talked to molecular biologists about this method, they are quick to point out that it is slow and easily detectable and could be fought with biotech remedies. If you challenge them to come up with improvements to the suggested attack plan, however, they have plenty of ideas. Modern biotechnology will soon be capable, if it is not already, of bringing about the demise of the human race— or at least of killing a sufficient number of people to end high-tech civilization and set humanity back 1,000 years or more. That terrorist groups could achieve this level of technological sophistication may seem far-fetched, but keep in mind that it takes only a handful of individuals to accomplish these tasks. Never has lethal power of this potency been accessible to so few, so easily. Even more dramatically than nuclear proliferation, modern biological science has frighteningly undermined the correlation between the lethality of a weapon and its cost, a fundamentally stabilizing mechanism throughout history. Access to extremely lethal agents—lethal enough to exterminate Homo sapiens—will be available to anybody with a solid background in biology, terrorists included.

Their defense doesn't assume lone wolves and dual tech

Ellis 14 [Patrick D., WMD/Homeland Security Analyst and Instructor at the U.S. Air Force Counterproliferation Center, Air University, ["Lone Wolf Terrorism and Weapons of Mass Destruction: An Examination of Capabilities and Countermeasures," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

Today, the specters of lone wolves and autonomous cells acquiring and using chemical, biological, radiological, and nuclear (CBRN) weapons of mass destruction, whether in their traditional military forms or the more non-traditional industrial forms, seems less far-fetched. Fortunately, military CBRN agents and weapons are not normally accessible to lone wolves or autonomous cells and are often located in highly secured areas. Therefore, lone wolves and autonomous cells may be drawn to materials similar to CBRN located in less secure areas. These commonplace industrial chemicals, biological contaminants, and radioactive materials could be used to cause disruptions or mass casualties. The dual use nature of these materials and technologies enables them to be turned into weapons and delivered by nonmilitary means. Future "over-the-horizon" threats, such as the proliferation of new biotechnologies and amateur do-it-yourself capabilities, pose a risk that lone wolves could develop weapons at a time when travel, access to knowledge, and dual-use technologies, in the globalizing environment, make lone wolf terrorists more dangerous. Thus, the author explores existing countermeasures, such as laws, strategies, passive and active measures designed to stop these dangerous threats. In particular, capabilities to prevent, protect, respond, and recover from CBRN terrorist acts are examined.

2NC Impact – Lone Wolf

Dispersion of technology enables lone wolf terrorists to access WMD.

Ackerman and Pinson 14 [Gary A. ,Director of the Special Projects Division at the National Consortium for the Study of Terrorism and Responses to Terrorism (START), University of Maryland, Lauren E., Senior Research/Project Manager at START and PhD student at Yale University, “An Army of One: Assessing CBRN Pursuit and Use by Lone Wolves and Autonomous Cells,” *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

The first question to answer is whence the concerns about the nexus between CBRN weapons and isolated actors come and whether these are overblown. The general threat of mass violence posed by lone wolves and small autonomous cells has been detailed in accompanying issue contributions, but the potential use of CBRN weapons by such perpetrators presents some singular features that either amplify or supplement the attributes of the more general case and so are deserving of particular attention. Chief among these is the impact of rapid technological development. Recent and emerging advances in a variety of areas, from synthetic biology³ to nanoscale engineering,⁴ have opened doors not only to new medicines and materials, but also to new possibilities for malefactors to inflict harm on others. What is most relevant in the context of lone actors and small autonomous cells is not so much the pace of new invention, but rather the commercialization and consumerization of CBRN weapons-relevant technologies. This process often entails an increase in the availability and safety of the technology, with a concurrent diminution in the cost, volume, and technical knowledge required to operate it. Thus, for example, whereas fifty years ago producing large quantities of certain chemical weapons might have been a dangerous and inefficient affair requiring a large plant, expensive equipment, and several chemical engineers, with the advent of chemical microreactors,⁵ the same processes might be accomplished far more cheaply and safely on a desktop assemblage, purchased commercially and monitored by a single chemistry graduate student.[¶] The rapid global spread and increased user-friendliness of many technologies thus represents a potentially radical shift from the relatively small scale of harm a single individual or small autonomous group could historically cause.⁶ From the limited reach and killing power of the sword, spear, and bow, to the introduction of dynamite and eventually the use of our own infrastructures against us (as on September 11), the number of people that an individual who was unsupported by a broader political entity could kill with a single action has increased from single digits to thousands. Indeed, it has even been asserted that “over time ... as the leverage provided by technology increases, this threshold will finally reach its culmination—with the ability of one man to declare war on the world and win.”⁷ Nowhere is this trend more perceptible in the current age than in the area of unconventional weapons.[¶] These new technologies do not simply empower users on a purely technical level. Globalization and the expansion of information networks provide new opportunities for disaffected individuals in the farthest corners of the globe to become familiar with core weapon concepts and to purchase equipment—online technical courses and eBay are undoubtedly a boon to would-be purveyors of violence. Furthermore, even the most solipsistic misanthropes, people who would never be able to function socially as part of an operational terrorist group, can find radicalizing influences or legitimation for their beliefs in the maelstrom of virtual identities on the Internet.[¶] All of this can spawn, it is feared, a more deleterious breed of lone actors, what have been referred to in some quarters as “super-empowered individuals.”⁸ Conceptually, super-empowered individuals are atomistic game-changers, i.e., they constitute a single (and often singular) individual who can shock the entire system (whether national, regional, or global) by relying only on their own resources. Their core characteristics are that they have superior intelligence, the capacity to use complex communications or technology systems, and act as an individual or a “lone-wolf.”⁹ The end result, according to the pessimists, is that if one of these individuals chooses to attack the system, “the unprecedented nature of his attack ensures that

no counter-measures are in place to prevent it. And when he strikes, his attack will not only kill massive amounts of people, but also profoundly change the financial, political, and social systems that govern modern life." 10 It almost goes without saying that the same concerns attach to small autonomous cells, whose members' capabilities and resources can be combined without appreciably increasing the operational footprint presented to intelligence and law enforcement agencies seeking to detect such behavior.¶ With the exception of the largest truck or aircraft bombs, the most likely means by which to accomplish this level of system perturbation is through the use of CBRN agents as WMD. On the motivational side, therefore, lone actors and small autonomous cells may ironically be more likely to select CBRN weapons than more established terrorist groups—who are usually more conservative in their tactical orientation—because the extreme asymmetry of these weapons may provide the only subjectively feasible option for such actors to achieve their grandiose aims of deeply affecting the system. The inherent technical challenges presented by CBRN weapons may also make them attractive to self-assured individuals who may have a very different risk tolerance than larger, traditional terrorist organizations that might have to be concerned with a variety of constituencies, from state patrons to prospective recruits. 11 Many other factors beyond a "perceived potential to achieve mass casualties" might play into the decision to pursue CBRN weapons in lieu of conventional explosives, 12 including a fetishistic fascination with these weapons or the perception of direct referents in the would-be perpetrator's belief system.¶ Others are far more sanguine about the capabilities of lone actors (or indeed non-state actors in general) with respect to their potential for using CBRN agents to cause mass fatalities, arguing that the barriers to a successful large-scale CBRN attack remain high, even in today's networked, tech-savvy environment. 13 Dolnik, for example, argues that even though homegrown cells are "less constrained" in motivations, more challenging plots generally have an inverse relationship with capability, 14 while Michael Kenney cautions against making presumptions about the ease with which individuals can learn to produce viable weapons using only the Internet. 15 However, even most of these pundits concede that low-level CBR attacks emanating from this quarter will probably lead to political, social, and economic disruption that extends well beyond the areas immediately affected by the attack. This raises an essential point with respect to CBRN terrorism: irrespective of the harm potential of CBRN weapons or an actor's capability (or lack thereof) to successfully employ them on a catastrophic scale, these weapons invariably exert a stronger psychological impact on audiences—the essence of terrorism—than the traditional gun and bomb. This is surely not lost on those lone actors or autonomous cells who are as interested in getting noticed as in causing casualties.¶ Proven Capability and Intent¶ While legitimate debate can be had as to the level of potential threat posed by lone actors or small autonomous cells wielding CBRN weapons, possibly the best argument for engaging in a substantive examination of the issue is the most concrete one of all—that these actors have already demonstrated the motivation and capability to pursue and use CBRN weapons, in some cases even close to the point of constituting a genuine WMD threat. In the context of bioterrorism, perhaps the most cogent illustration of this is the case of Dr. Bruce Ivins, the perpetrator behind one of the most serious episodes of bioterrorism in living memory, the 2001 "anthrax letters," which employed a highly virulent and sophisticated form of the agent and not only killed five and seriously sickened 17 people, but led to widespread disruption of the U.S. postal services and key government facilities. 16¶ Other historical cases of CBRN pursuit and use by lone actors and small autonomous cells highlight the need for further exploration. Among the many extant examples: 17¶ Thomas Lavy was caught at the Alaska-Canada border in 1993 with 130 grams of 7% pure ricin. It is unclear how Lavy obtained the ricin, what he planned to do with it, and what motivated him.¶ In 1996, Diane Thompson deliberately infected twelve coworkers with shigella dysenteriae type 2. Her motives were unclear.¶ In 1998, Larry Wayne Harris, a white supremacist, was charged with producing and stockpiling a biological agent—bacillus anthracis, the causative agent of anthrax.¶ In 1999, the Justice Department (an autonomous cell sympathetic to the Animal Liberation Front) mailed over 100 razor blades dipped in rat poison to individuals involved in the fur industry.¶ In 2000, Tsiugio Uchinshi was arrested for mailing samples of the mineral monazite with trace amounts of radioactive thorium to several Japanese government agencies to persuade authorities to look into potential uranium being smuggled to North Korea.¶ In 2002, Chen Zhengping put rat poison in a rival snack shop's products and killed 42 people.¶ In 2005, 10 letters containing a radioactive substance were mailed to major organizations in Belgium including the Royal Palace, NATO headquarters, and the U.S. embassy in Brussels. No injuries were reported.¶ In 2011, federal agents arrested four elderly men in Georgia who were plotting to use ricin and explosives to target federal buildings, Justice Department officials, federal judges, and Internal Revenue Service agents.¶ Two recent events may signal an even greater interest in CBRN by lone malefactors. First, based on one assessment of Norway's Anders Breivik's treatise, his references to CBRN weapons a) suggest that CBRN weapons could be used on a

tactical level and b) reveal (to perhaps previously uninformed audiences) that even low-level CBRN weapons could achieve far-reaching impacts driven by fear.¹⁸ Whether or not Breivik would actually have sought or been able to pursue CBRN, he has garnered a following in several (often far-right) extremist circles and his treatise might inspire other lone actors. Second, Al-Qaeda in the Arabian Peninsula (AQAP) released two issues of Inspire magazine in 2012. Articles, on the one hand, call for lone wolf jihad attacks to target non-combatant populations and, on the other, permit the use of chemical and biological weapons. The combination of such directives may very well influence the weapon selection of lone actor jihadists in Western nations.¹⁹

Terrorism –Gonzaga

1NC

An expansive PRISM program is necessary to disrupt terrorist networks—the alternative is safe havens that facilitate acquiring WMD's.

Arquilla, Stanford IR PhD, 2013

(John, "In Defense of PRISM", 6-7, <http://foreignpolicy.com/2013/06/07/in-defense-of-prism/>)

PRISM has just provided a glimpse through the looking glass. Revelations about this monitoring system suggest that living in and moving through the world, even for the most private among us, can be observed closely and for protracted periods by the cold, shy minds of the intelligence community. The reason for this sustained, widespread scrutiny is that, in the long fight against terrorist networks, this is one of the ways in which their cells can sometimes be caught while communicating, their plans disrupted, and, on occasion, their locations determined. The price of the increment of security so provided is the loss of a bit of privacy, despite best efforts of intelligence overseers to make sure that the focus is on "metadata" like the time, date, and originating and terminating points of communications — rather than on specific content. The belief, and the hope, of both the operators of the system and their supervisors — including watchdogs maintaining oversight from their perches in Congress — is that some loss of individual privacy will make for significant gains in national security. As an observer and sometime participant in efforts to ferret out the intentions and locations of the terrorists over more than a decade, I believe that the benefits of this endeavor have clearly outweighed the costs and risks. My timeframe for making this judgment goes back well before the reported start of the PRISM program seven years ago. Indeed, it was just a few months after 9/11 that Adm. John Poindexter, then at the Defense Advanced Research Projects Agency (DARPA), proposed a "total information awareness" initiative that was to use some of the methods now being reported. But TIA, as it was called, had a vaguely Orwellian cast, and Adm. Poindexter's past role in the dark dealings of the Iran-Contra affair didn't help — he had been Ronald Reagan's national security advisor when the secret arms swap caper came to light. Very soon, the "T" was changed from "Total" to "Terrorism," but the re-branding didn't help and Congress defunded the initiative. Still, parts of it lived on — with congressional oversight — under new code names like "Genoa" and "TopSail." These should be seen as some of the antecedents of PRISM, helping to hone the methods that have now become the principal "mining tools" of the big data offensive mounted against the globally dispersed cells of terrorist networks. Prior to TIA, and well before 9/11, there were other ancestors of our current big data efforts. At the National Security Agency, and in other parts of the extensive American intelligence community, search systems known by such evocative names as "Echelon" and "Semantic Forests," among others, were in use, striving relentlessly to detect patterns of communication that might open up golden seams of information from the most secret caches of the world's various malefactors. Often enough, these and other tracking tools did distinguish the pattern from the noise, and national security was well served. And in the early days of the war against al Qaeda, the enemy was still using means of communication that American intelligence had the ability to monitor — including satellite phones and such — leading to several counterterror coups and high-level captures. But the network learned quickly and adjusted, becoming far more elusive, more dispersed, its cells increasingly attuned to operating independently, its nodes and links ever less visible. It was against this shift that something like PRISM had to be mobilized to improve our ability to find the foe whose best, and only real defense against us is his capacity for concealment. Thus, the tantalizing prospect of PRISM, and of the whole "finding effort," is to deny the terrorists the virtual haven that they enjoy throughout the world's telecommunications spaces — indeed, throughout the whole of the "infosphere," which includes cyberspace. The piercing of this veil would mark a true turning point in the war on terror, for al Qaeda and other networks simply cannot function with any kind of cohesion, or at any sort of reasonable operational tempo if their communications become insecure. Cells and nodes would be ripped up, operatives killed or captured, and each loss would no doubt yield information that imperiled the network further. Even if al Qaeda resorted to the drastic measure of moving messages, training, and financial information by courier, operations would be so slowed as to cripple the organization. And even couriers can be flagged on "no fly" lists or caught boarding tramp steamers and such. So for all the furor caused by the PRISM revelations, my simple recommendation is to take a deep breath before crying out in protest. Think first about how the hider/finder dynamic in the war on terror has driven those responsible for our security

to bring to bear the big guns of big data on the problem at hand. Think also about whether a willingness to allow some incursions into our privacy might lead to an improved ability to provide for our security, and where that equilibrium point between privacy and security might be. And last, think about the world as it might be without such a sustained effort to find the hidden — to detect, track, and disrupt the terrorists. That would be a world in which they stay on their feet and fighting, and in which they remain secure enough, for long enough, to acquire true weapons of mass destruction. Those of us in the national security business, who know that networks so armed will be far harder to deter than nations ever were, believe that big data approaches like PRISM and its forebears, have been and remain essential elements in the unrelenting and increasingly urgent effort to find the hidden.

Risk of nuclear terrorism is high and growing – they have the means and motive Kroenig, Associate Professor and IR @ Georgetown, 14

(R. Davis Gibbons and Matthew Kroenig, a Nonresident Senior Fellow at the Brent Scowcroft Center on International Security at The Atlantic Council. “The Next Nuclear War,” http://www.matthewkroenig.com/Kroenig_The%20Next%20Nuclear%20War.pdf)

Since the terrorist attacks on September 11, 2001, scholars, analysts, and politicians have focused on the nexus of nuclear weapons and terrorism. In his closing statement at the 2012 Nuclear Security Summit, President Obama concluded, “We’ve agreed that nuclear terrorism is one of the most urgent and serious threats to global security.”⁸⁸ Though there has been some debate on how seriously this threat should be taken,⁸⁹ evidence indicates that terrorist organizations have both expressed a desire for nuclear weapons and made attempts to buy or seize nuclear material. Declassified documents from the United States suggest Osama bin Laden directed his associates to purchase uranium.⁹⁰ In addition, Chechnya-based separatist groups, Lashkar-e-Taiba in South Asia, and Aum Shinrikyo in Japan have also expressed the desire for nuclear weapons in the past.⁹¹ Most analysts consider it unlikely that a state would knowingly provide a terrorist group with a bomb, but it is conceivable that a group could steal one. This fear is especially acute in the case of Pakistan, where an unstable government with a growing nuclear arsenal exists in an area with many terrorist organizations. The government of Pakistan has taken steps in recent years to allay these fears, yet reason for concern remains.⁹² A second means by which a terrorist group could attain a nuclear capability is by obtaining fissile material and constructing its own crude nuclear bomb. The main challenge for terrorist organizations seeking this capability is finding sufficient fissile material. Approximately 8 kilograms of plutonium or 25 kilograms of highly enriched uranium (HEU) is necessary for a bomb. Since 9/11, the United States, Russia, the IAEA, and other partners have taken on a number of efforts to decrease the risks of terrorists accessing nuclear material. UN Security Council Resolution 1540, the 2005 Amendment to the Convention on the Physical Protection of Nuclear Material, and the 2005 International Convention for the Suppression of Acts of Nuclear Terrorism all seek to increase global cooperation to prevent nuclear terrorism. Overall, the global stocks of HEU and plutonium are decreasing, but the sheer volume of global fissile material makes this an on-going challenge and the U.S. budget for these activities has recently been cut. Unlike nuclear-armed states, it would be relatively difficult to deter terrorists from taking action.⁹³ In other words, if efforts to keep nuclear weapons out of terrorist hands ever fail, we may witness a nuclear 9/11.

Extinction

Barrett, Carnegie Mellon Engineering and Public Policy PhD, 2013

(Anthony, "Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia," Science & Global Security: The Technical Basis for Arms Control, Disarmament, and Nonproliferation Initiatives, Volume 21, Issue 2, Taylor & Francis)

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, could have **globally catastrophic effects** such as severely **reducing food production** for years, ¹ potentially **leading to collapse of modern civilization worldwide, and even the extinction** of humanity. ² Nuclear war between the United States and Russia could occur by various routes, including **accidental** or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack. ³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches. ⁴) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, and numerous measures also were taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counter-attack. However, concerns about the extreme disruptions that a first attack would cause in the other side's forces and command-and-control capabilities led to both sides' development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack. ⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced. ⁶ However, it also has been argued that inadvertent nuclear war between the United States and Russia has continued to present a **substantial risk.** ⁷ While the United States and Russia are not actively threatening each other with war, **they have remained ready to launch nuclear missiles** in response to indications of attack. ⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time. ⁹ Second, **terrorist groups** or other actors might **cause attacks** on either the United States or Russia that **resemble** some kind of **nuclear attack by the other nation** by actions such as exploding a stolen or improvised nuclear bomb, ¹⁰ especially if such an event occurs during a crisis between the United States and Russia. ¹¹ A variety of nuclear terrorism scenarios are **possible.** ¹² Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States. ¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security. ¹⁴ It has long been argued that the probability of inadvertent nuclear war is significantly higher during U.S.–Russian crisis conditions, ¹⁵ with the Cuban Missile Crisis being a prime historical example. It is possible that U.S.–Russian relations will significantly deteriorate in the future, increasing nuclear tensions. There are a variety of ways for a third party to raise tensions between the United States and Russia, making one or both nations more likely to misinterpret events as attacks. ¹⁶

2NC Magnitude

Even a death toll of a 1000 would be enough to trigger massive retaliation by the US.

Conley, ACC chief of Systems Analysis Branch, 2003

(Harry, "Not with Impunity Assessing US Policy for Retaliating to a Chemical or Biological Attack", 3-5, <http://www.airpower.maxwell.af.mil/airchronicles/apj/apj03/spr03/conley.html>)

The number of American casualties suffered due to a WMD attack may well be the most important variable in determining the nature of the US reprisal. A key question here is how many Americans would have to be killed to prompt a massive response by the United States. The bombing of marines in Lebanon, the Oklahoma City bombing, and the downing of Pan Am Flight 103 each resulted in a casualty count of roughly the same magnitude (150–300 deaths). Although these events caused anger and a desire for retaliation among the American public, they prompted no serious call for massive or nuclear retaliation. The body count from a single biological attack could easily be one or two orders of magnitude higher than the casualties caused by these **events. Using the rule of proportionality as a guide, one could justifiably debate whether the United States should use massive force in responding to an event that resulted in only a few thousand deaths.** However, what if the casualty count was around 300,000? Such an unthinkable result from a single CBW incident is not beyond the realm of possibility: "According to the U.S. Congress Office of Technology Assessment, 100 kg of anthrax spores delivered by an efficient aerosol generator on a large urban target would be between two and six times as lethal as a one megaton thermo-nuclear bomb."⁴⁶ **Would the deaths of 300,000 Americans be enough to trigger a nuclear response? In this case, proportionality does not rule out the use of nuclear weapons. Besides simply the total number of casualties, the types of casualties- predominantly military versus civilian- will also affect the nature and scope of the US reprisal action.** Military combat entails known risks, and the emotions resulting from a significant number of military casualties are not likely to be as forceful as they would be if the attack were against civilians. World War II provides perhaps the best examples for the kind of event or circumstance that would have to take place to trigger a nuclear response. **A CBW event that produced a shock and death toll roughly equivalent to those arising from the attack on Pearl Harbor might be sufficient to prompt a nuclear retaliation.** President Harry Truman's decision to drop atomic bombs on Hiroshima and Nagasaki- based upon a calculation that up to one million casualties might be incurred in an invasion of the Japanese homeland⁴⁷- is an example of the kind of thought process that would have to occur prior to a nuclear response to a CBW event. Victor Utgoff suggests that "if **nuclear retaliation is seen at the time to offer the best prospects for suppressing further CB attacks and speeding the defeat of the aggressor, and if the original attacks had caused severe damage that had outraged American or allied publics, nuclear retaliation would be more than just a possibility, whatever promises had been made.**"⁴⁸

Turns Case – Hegemony

Expansive NSA surveillance powers are necessary to maintain hegemony.
Van Cleave, Jack Kemp Foundation principal, 2013

(Michelle, “What It Takes: In Defense of the NSA”, World Affairs, Nov/Dec,
<http://www.worldaffairsjournal.org/article/what-it-takes-defense-nsa>)

The United States has built a global intelligence apparatus because it has global interests and global responsibilities. We have taken seriously the duties of leader of the free world, as two world wars, Korea, Vietnam, Afghanistan, Iraq, and freedom fighters in many parts of the world can attest. **None of these duties in the last sixty years could have been met without the exceptional resources of NSA.** Successive presidents and Congresses, entrusted with preserving and defending our freedom, have judged these investments to be vital to our nation’s security. They have protected the core secrets that enable collection programs to succeed, as have those in US business and industry who have been integral to their success. The unquestioned qualitative edge of US intelligence has been as essential to defending this country and preserving our freedom as have the forces we have built to arm and equip our military. But time has not stood still. China is attacking computer systems throughout the world, stealing information and implanting features to enable future control. China’s prominence in IT commercial markets means that they are in the supply chain, and their market share is growing as part of a purposeful, state-run program for strategic position. A long roll call of spies from Russia, China, Cuba, and other nations have targeted the essential secrets of US intelligence capabilities in order to be able to defeat them. And now they have the Snowdens and the WikiLeaks of the world helping them out. **Interconnected global networks of digital data have become the single most important source of intelligence warning of threats, enabling our defense at home** and the advancement of freedom abroad. To say “hands off,” as some shortsighted privacy advocates have been doing, will not preserve our liberties, it will endanger them. It should be possible for an enlightened citizenry to empower government action in that sphere without forfeiting the very rights that our government exists to secure. That challenge is, at the very least, a part of the continuing experiment that is our democracy.\

Turns Case – Economy

Terrorism collapses the global economy- multiple reasons

Rogoff, Harvard University economics and public policy professor, 2004

(Kenneth, "The Cost of Living Dangerously", Foreign Policy, 11-1, google cache)

As this article is being written, the threat of a horrific preemption terrorist assault against the United States has yet to materialize. Unfortunately, the news this summer that al Qaeda operatives have painstakingly targeted major U.S. and international financial institutions only underscores the likelihood of more attacks. Politicians, economists, and ordinary citizens rightfully worry that terrorism -- beyond the tragic human costs -- could derail economic growth in the United States and around the world. What also worries me, however, is the potential economic impact of antiterrorism efforts. Forget the long lines at airports. The global economy has become so dependent on the free flow of goods and people across borders that even a little additional security can have a greater impact than most might think. Consider, for example, the likely consequence of enhanced security at shipping ports worldwide to monitor for biological or nuclear weapons material, a precaution many experts consider inevitable. Currently, only about 2 percent of all cargo reaching U.S. shores is subject to inspection. The July 2004 report of the U.S. 9/11 Commission noted that, until better technologies become available, authorities should improve methods of "identifying and tracking the high-risk containers, operators, and facilities that require added scrutiny." But what if such added scrutiny means that the level of cargo inspected jumps to, say, 50 percent? Today's slowest customs lines -- in countries such as Japan that already use port delays as veiled forms of trade protectionism -- would start to seem like express lanes, and the costs of many consumer goods would skyrocket. Worse yet, as trade in goods and the flow of people slows, so too will the breathless pace of product innovation that many individuals now take for granted. Any abatement of the competitive pressures of globalization or any reduction in the free movement of people and ideas would surely undercut growth -- not to mention raise prices sharply at your local Wal-Mart. Think about what is happening already. Despite introducing relatively limited antiterrorist restrictions thus far, the United States will likely register slower economic growth in a few years due to post-9/11 visa restrictions alone. Few Americans appreciate the extent to which scientists, engineers, and businesspeople from other countries contribute to U.S. economic growth. Historically, the United States has attracted legions of enterprising foreign-born workers; today about 2.5 million foreigners with advanced degrees work in the United States, and many hold leading positions in science and industry and serve as key transnational links for the increasingly globalized U.S. economy. More than 30 percent of all Ph.D. recipients in U.S. science and mathematics programs are foreigners on student visas. In engineering, almost half of all graduates have come to the United States on foreign visas; many of them stay in the country upon completing their degrees. The U.S. economy grows in no small part by skimming the cream off the rest of the world's workforce. Unfortunately, U.S. companies today often shy away from hiring U.S.-educated foreigners. The price tag on the visa application process has soared, and companies never know if and when work permits will be approved or precisely when a new foreign employee can come on board. And yes, workers from Muslim countries are particularly hard hit, but the difficulties have worsened for everyone. Even obtaining visas to attend academic or policy conferences in the United States is now an ordeal. Little surprise that international applications to U.S. graduate programs have declined by roughly a third in the last year. Added security won't come cheap, either, and raising the necessary taxes will prove painful, especially with the United States and Europe facing the costs of aging populations and shrinking workforces. The United States estimates its 2005 homeland security budget at about \$40 billion, a sum that could easily double in a few years. But these direct costs of increased security reveal only a limited picture. Perhaps the greatest danger is that increased security will distort and accentuate government taxation and regulation. Orwellian 1984 scenarios aside, suppose governments were able to keep much closer tabs on citizens? Just like individuals, economies need a bit of privacy to function efficiently. Idiotic government rules and regulations abound, and citizens must have ways to evade the worse of them. The reason why roughly one fifth of Italy's economy is "underground" is not just high tax rates or the Sicilian Mafia. The real explanation is more prosaic: Ordinary people need to hire painters, plumbers, and carpenters to fix their houses, or nannies to care for their children, without wasting endless hours tangled in red tape. Germany -- hardly famous for its mafia -- has an underground economy approaching one sixth of its national income. More severe security measures are probably necessary and inevitable, even from a narrow economic perspective. Another atrocity on the scale of September 11 would wreak havoc on energy prices, stock markets, and consumer confidence, slamming the brakes on today's global economic recovery. But just like other desirable government initiatives (such as environmental regulations or workplace safety laws), antiterrorism measures can work at far less cost when they are flexible and market-friendly. For example, just as some countries provide fast-track airport security lines to high-paying business travelers, shippers ought to be able to pay higher fees to move more quickly to the head of the customs queue. Similarly, higher fees should help accelerate visa applications. No doubt, such measures may offend some people's sense of egalitarianism, but these policies and others like them are essential. The benefits of today's interconnected market economies won't survive under a vast and inflexible command-and-control security arrangement.

PRISM – 2NC Wall

NSA is the foundation of all US intelligence and terrorist threats are becoming more complicated----rejecting restrictions on NSA flexibility is vital.
McLaughlin, Philip Merrill Center for Strategic Studies Distinguished Practitioner-in-Residence, 2014

(John, “NSA intelligence-gathering programs keep us safe”,

Those who advocate sharply limiting the agency’s activities ought to consider that its work is **the very foundation of U.S. intelligence.** I don’t mean to diminish the role of other intelligence agencies, and I say this as a 30-year veteran of the Central Intelligence Agency who is “CIA” through and through. But in most cases, **the NSA is the starting point for determining what holes need to be filled through other means** of intelligence-collection. **That’s because its information on foreign developments is so comprehensive and generally so reliable. It is the core of intelligence support to U.S. troops in battle. Any efforts to “rein in” the agency must allow for the possibility that change risks serious damage to U.S. security and the country’s ability to navigate in an increasingly uncertain world.** The presumption that the NSA “spies” on Americans should also be challenged. In my experience, **NSA analysts err on the side of caution before touching any data having to do with U.S. citizens.** In 2010, at the request of then-Director of National Intelligence Dennis Blair, I chaired a panel investigating the intelligence community’s failure to be aware of Umar Farouk Abdulmutallab, the “underwear bomber” who tried to blow up a commercial plane over Detroit on Dec. 25, 2009. The overall report remains classified, but I can say that **the government lost vital time because of the extraordinary care the NSA and others took in handling any data involving a “U.S. person.”** (Abdulmutallab, a Ni-ger-ian, was recruited and trained by the late Anwar al-Awlaki, a U.S. citizen based in Yemen.) Regarding outrage over the NSA’s collection of telephone calling records, or metadata, I don’t know why anyone would have greater confidence in this information being held by private companies. And given the perceived threat to privacy, it’s astonishing how little attention has been paid to the Senate commerce committee’s recent report on companies that gather personal information on hundreds of millions of Americans and sell it to marketers, often highlighting people with financial vulnerability. Some companies group the data into categories including “rural and barely making it,” “retiring on empty” and “credit crunched: city families.” The aim is often to sell financially risky products to transient consumers with low incomes, the report found. That’s a real scandal — and a universe away from the NSA’s ethical standards and congressional oversight. The NSA, of course, is not perfect. But it is less a victim of its actions — the independent commission appointed by President Obama found no illegality or abuses — than of the broad distrust of government that has taken root in the United States in recent decades. Studies by Pew and others show distrust of government around 80 percent, an all-time high. This distrust is the only logical explanation I see for fear of data being held by “the government” — and it’s not a circumstance the NSA created. **Although our society lauds, in almost “Stepford Wives”-like fashion, the merits of “transparency,” it lacks a collective, mature understanding of how intelligence works, how it integrates with foreign policy and how it contributes to the national welfare. Meanwhile, prurient interest in the details of leaked intelligence skyrockets, and people devour material that is not evidence of abuse but merely fascinating — and even more fascinating to U.S. adversaries.** So what makes sense going forward? Clearly, the widespread perception that there is at least the “potential for abuse” when the government holds information even as limited as telephone call metadata must be addressed. The recent presidential commission recommended adding a public privacy advocate to the deliberation process of courts that approve warrants — one proposal that would do no harm. But as **the administration contemplates reform, it must reject any ideas that add time and process between the moment the NSA picks up a lead overseas and the time it can cross-check records to determine whether there is a domestic dimension** to overseas plotting. As our debate continues, **the terrorist threat is not receding but transforming.** The core leadership of al-Qaeda

has been degraded and remains under pressure, but robust al-Qaeda affiliates have multiplied. With the decline of central government authority in the Middle East and North Africa in the wake of the Arab Spring and the war in Syria, terrorists have the largest havens and areas for operational planning in a decade. If anything, the atomization of the movement has made the job of intelligence more labor-intensive, more detail-oriented and more demanding. Now is not the time to give up any tool in the counterterrorism arsenal.

PRISM is key to disrupt foreign safe havens.

Dahl, Naval Postgraduate School national security affairs professor, 2013

(Erik, "Discussion Point: It's not Big Data, but Little Data, that Prevents Terrorist Attacks", 7-25, http://calhoun.nps.edu/bitstream/handle/10945/35903/Discussion%20Point_%20It%E2%80%99s%20not%20Big%20Data%2c%20but%20Little%20Data%2c%20that%20Prevents%20Terroris.pdf?sequence=1)

Research I am currently conducting for the National Consortium for the Study of Terrorism and Responses to Terrorism (START), together with my colleagues Martha Crenshaw and Margaret Wilson, can shed some light on how this NSA data may be used. We are studying unsuccessful terrorist plots, in hopes of finding out what tools and techniques are the most useful in preventing attacks. One finding supports the NSA's argument that the data they are collecting can be useful in preventing future attacks. Opponents have suggested that the NSA data might only be useful in tracking down terrorists after the fact; because those haystacks of information are not apparently being looked at in real time, they are unlikely to help prevent future attacks. But the history of terrorist plots and attacks within the United States since 9/11 shows that most plots take a long time to develop. Even terrorist actions involving only one or two people typically take months or even years to plan and attempt. This is good news, because it gives law enforcement time to discover what's going on, and it also gives the NSA time to search those haystacks it's been collecting. But another one of our findings is that the most effective tools in preventing terrorist attacks are relatively simple, old fashioned police methods, such as the use of undercover officers, informants, and tips from the public. This is especially true for domestic plots and attacks: of the 109 failed plots within the United States since 9/11, more than 75 percent were foiled at least in part because of traditional law enforcement methods, and not—from what we can gather—from NSA surveillance. Thus it is not surprising that government officials have said most of the 50 or so plots that have been foiled by the NSA monitoring programs were overseas. In other countries we can't necessarily rely on local authorities, and spying—whether conducted by the NSA or the CIA—is a critical tool for our national security. But here in the U.S., the most important terrorism prevention tool remains the country's 800,000 police officers, deputy sheriffs, and other local law enforcement officials, supported by members of the public who "see something and say something," calling authorities when something doesn't look right. These NSA programs do appear to be important for preventing terrorist attacks, and they make sense from an intelligence perspective. But their greatest value concerns threats overseas, and this is probably a good thing, because it means that if the programs are managed properly, and if our intelligence oversight mechanisms work as they should (which are admittedly big ifs), the NSA collection of big data will have relatively little impact on most Americans' lives.

Program 702 has a track record of success.

Margulies, Roger Williams law professor, 2014

(Peter, "Dynamic Surveillance: Evolving Procedures in Metadata and Foreign Content Collection After Snowden", 9-10, http://papers.ssrn.com/sol3/Papers.cfm?abstract_id=2400809)

According to the President's Review Group, which President Obama commissioned to study surveillance after the Snowden disclosures, § 702 has played a concrete role in keeping the nation safe.⁹¹ The Review Group's report asserted that § 702 was "critical" to the uncovering of the Zazi planned subway attack in New York in 2009 and led to the arrest of Zazi and his accomplices.⁹² **The § 702 program resulted in fifty-three out of fifty-four instances in obtaining information that "contributed in some degree" to a successful outcome regarding thwarted terrorist attacks in the U.S. and other countries.**⁹³ According to the Review Group, § 702 "does in fact play an important role in the nation's effort to prevent terrorist attacks across the globe." The Privacy and Civil Liberties Oversight Board (PCLOB) agreed with this assessment, concluding that collection under § 702 "significantly aids the government's efforts to prevent terrorism... combat weapons proliferation and gather foreign intelligence."⁹⁴

The plan enforces too much of a law enforcement paradigm on the NSA which is not designed to disrupt national security threats.

Yoo, Berkeley law professor, 2013

(John, "The Legality of the National Security Agency's Bulk Data Surveillance Programs", 12-1, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2369192)

The real problem with FISA, and even the Patriot Act, as they existed before the 2008 Amendments, is that they remained rooted in a law enforcement approach to electronic surveillance. They tied the government's counter-terrorism efforts to individualized suspicion. Searches and wiretaps had to target a specific individual already believed to be involved in harmful activity. **But detecting al Qaeda members who have no previous criminal record in the United States, and who are undeterred by the possibility of criminal sanctions, requires the use of more sweeping methods.** To successfully prevent attacks, the government has to devote surveillance resources where there is a reasonable chance that terrorists will appear, or communicate, even if their specific identities remain unknown. What if the government knew that there was a fifty percent chance that terrorists would use a certain communications pipeline, such as e-mails provided by a popular Pakistani ISP, but that most of the communications on that channel would not be linked to terrorism? An approach based on individualized suspicion would prevent computers from searching through that channel for the keywords or names that might suggest terrorist communications, because there are no specific al Qaeda suspects, and thus no probable cause. Rather than individualized suspicion, searching for terrorists depends on playing the probabilities, just as roadblocks or airport screenings do. The private owner of any website has detailed access to information about the individuals who visit the site that he can exploit for his own commercial purposes, such as selling lists of names to spammers, or gathering market data on individuals or groups. Is the government's effort to find violent terrorists a less legitimate use of such data? Individualized suspicion dictates the focus of law enforcement, but war demands that our armed forces defend the country with a broader perspective. Armies do not meet a "probable cause" requirement when they attack a position or fire on enemy troops or intercept enemy communications on a frequency. In the criminal justice system the purpose is to hold a specific person responsible for a discrete crime that has already happened. **It does not make sense when the purpose of intelligence is to take action, such as killing or capturing members of the enemy, to prevent**

future harm to the nation from a foreign threat. FISA should be regarded as a safe harbor that allows the fruits of an authorized search to be used for prosecution. Using FISA sacrifices speed and breadth of information in favor of individualized suspicion, but it provides a path for using evidence in a civilian criminal prosecution. If the President chooses to rely on his constitutional authority alone to conduct warrantless searches, then he should generally only use the information for military purposes. **The primary objective of the NSA program is to “detect and prevent” possible al Qaeda attacks on the United States, whether another attack like September 11; a bomb in apartment buildings, bridges, or transportation hubs such as airports; or a nuclear, biological, or chemical attack. These are not hypotheticals; they are all al Qaeda plots, some of which U.S. intelligence and law enforcement agencies have already stopped.** A President will want to use information gathered by the NSA to deploy military, intelligence, and law enforcement personnel to stop the next attack. The price to pay for speed, however, is foregoing any future criminal prosecution. If the President wants to use the NSA to engage in warrantless searches, he cannot use its fruits in an ordinary criminal prosecution. Al Qaeda has launched a variety of efforts to attack the United States, and it intends to continue them. The primary way to stop those attacks is to find and stop al Qaeda operatives, and the best way to find them is to intercept their electronic communications. Properly understood, the Constitution does not subject the government to unreasonable burdens in carrying out its highest duty of protecting the nation from attack.

Speed is vital to track intelligence leads—the threshold for a burdensome delay is low.

Yoo, Berkeley law professor, 2013

(John, “The Legality of the National Security Agency's Bulk Data Surveillance Programs”, 12-1, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2369192)

As the United States fought the Afghanistan and Iraq wars, and continues to pursue al Qaeda groups in the Middle East and Africa, it captured al Qaeda laptops, cell phones, financial documents, and the other signs of modern high-tech life. This gave intelligence officers the information on dozens or hundreds of e-mail addresses, telephones, bank and credit account numbers, and residential and office addresses used by their network. ³⁵ **To exploit this, U.S. intelligence services must follow those leads as fast as possible, before the network of al Qaeda operatives can migrate to a new leader. An e-mail lead can disappear as fast as it takes someone to open a new e-mail account.** FISA, and the law enforcement mentality it embodies, creates several problems. FISA requires “probable cause” to believe that someone is an agent of a foreign power before one can get a warrant to collect phone calls and e-mails. ³⁶ An al Qaeda leader could have a cell phone with 100 numbers in its memory, 10 of which are in the United States and thus require a warrant. Would a FISA judge have found probable cause to think the users of those 10 numbers are al Qaeda too? Probably not. Would our intelligence agencies even immediately know who was using those numbers at the time of captured al Qaeda leader’s calls? The same is true of his e-mail, as to which it will not be immediately obvious what addresses are held by U.S. residents. In our world of rapidly shifting e-mail addresses, multiple cell phone numbers, and internet communications, FISA imposes slow and cumbersome procedures on our intelligence and law enforcement officers. ³⁷ These laborious checks are based on the assumption that we remain within the criminal justice system, and looking backward at crimes in order to conduct

prosecutions, rather than within the national security system, which looks forward in order to prevent attacks on the American people. ³⁸ FISA requires a lengthy review process, in which special FBI and DOJ lawyers prepare an extensive package of facts and law to present to the FISC. ³⁹ The Attorney General must personally sign the application, and another high-ranking national security officer, such as the President's National Security Advisor or the Director of the FBI, must certify that the information sought is for foreign intelligence.⁴⁰ Creating an existing database of numbers that can be quickly searched can allow the government to take advantage of captured al Qaeda numbers abroad, before the cells within the United States break their contacts.

Collection increases efficiency

Margulies, Roger Williams law professor, 2014

(Peter, "Dynamic Surveillance: Evolving Procedures in Metadata and Foreign Content Collection After Snowden", 9-10, http://papers.ssrn.com/sol3/Papers.cfm?abstract_id=2400809)

Both bulk collection of metadata under § 215 and foreign content collection under §702 served this fiduciary goal. While the metadata program's benefits were more diffuse, it allowed the government to quickly and reliably map out the contacts of known terrorist entities and operatives.²⁸ That capability generated investigative leads, even granting critics' contention that the program did not by itself foil a specific attack.²⁹ Moreover, the program played a useful role in allocating government resources. In chaotic situations such as the aftermath of the Boston Marathon bombing, the program enabled investigators to discern early on that the Tsarnaev brothers acted without foreign help, freeing officials to concentrate on the domestic realm.³⁰ **Even critics of the metadata program have agreed that § 702 has assisted the government in obtaining information "efficiently and effectively about foreign targets overseas."**³

Broad NSA capabilities are key to respond to adaptive threats.

Gjelten, NPR correspondent, 2013

(Tom, "The Case For Surveillance: Keeping Up With Terrorist Tactics", 6-15, <http://www.npr.org/2013/06/15/191694315/high-tech-surveillance-targets-evolving-terrorist-tactics>)

Since public revelations that the National Security Agency is collecting telephone records and reviewing Internet communications in the U.S. and abroad, officials have been making the case that the programs are vital. They argue that the tactics match the new ways terrorists are planning and communicating. There was a time when America's enemies conspired face-to-face, or communicated through couriers, or by leaving messages for each other somewhere. But in the digital age, that has changed. FBI Director Robert Mueller made that point back in 2008, as Congress considered whether to amend the Foreign Intelligence Surveillance Act. "In this day and age, our ability to gain intelligence on the plans, the plots of those who wish to attack us is dependent on us obtaining information relating to cellphones, Internet, email, wire transfers, all of these areas," he said. **If all the action was in that electronic space five years ago, it's even more so today, as intelligence and security officials constantly point out.** Speaking in February, the NSA's general counsel, Rajesh De, threw out some figures on the explosive growth in communication data. "**More data crosses the Internet every second today than existed on the Internet 20 years ago.** Global mobile traffic grew 70 percent last year alone," he said. **Officials say these trends highlight the challenge facing spy agencies: With so much communication now taking place in the digital world, intelligence officers have to be able to follow that communication.** James

Bamford, the author of several books on the NSA, says spies used to focus on getting human sources inside an organization — agents who could report

on what people in the organization were saying and doing. But human sources no longer matter so much, Bamford says. Intelligence officers use new approaches because their adversaries are interacting in new ways. "During the day, they're on cellphones, or they're on email, or they're on social-networking sites. By intercepting that information, you develop patterns and look at who these people might be involved with," he says. To justify the NSA's collection of telephone records and its selective monitoring of online communication overseas, U.S. officials cite these "revolutionary" changes in the information space. John Negroponete was the director of National Intelligence when wiretapping programs were expanded during the Bush administration. He defends the NSA's new emphasis. "I'd say it's a testament to how surveillance methods have kept up with the geometric progression of these communication methods," he says. Congressional critics of the expanded surveillance operations say they're not convinced that these programs have really proved their value in fighting terrorism. They ask whether other types of intelligence gathering might be just as effective. Negroponete, who served as U.S. ambassador to Iraq, says no one method is sufficient. He recalls how in 2006, the combination of different intelligence sources led the U.S. military to the head of al-Qaida in Iraq, Abu Musab al-Zarqawi. "I believe his phone number was detected through human intelligence. Somebody gave us his phone number. Then, that phone number was monitored through signals intelligence. And then his movements were tracked by geo-spatial intelligence — drones and so forth," he says. "So it's actually the integration of these different methodologies that actually give you the best results." The expanded use of telephone and Internet surveillance is in part an adaptation to the information revolution. The NSA, the CIA and other agencies will defend these programs vigorously on that basis, despite concerns that Americans' privacy has been put at risk. But that's not the whole story: **It's also clear that the programs are popular in the spy business simply because they're convenient and efficient. They make intelligence gathering easier.**

PRISM Key to Cyber

PRISM is vital to securing internet communications to disrupt cyber terrorism and foreign espionage.

Dart, CIO and ICT director veteran, 2013

(Martin, "Doing their job: in defence of PRISM", 6-11, <http://www.abc.net.au/news/2013-06-12/dart-in-defence-of-prism/4749108>)

With all developed countries hugely dependent upon electronic communications it is unthinkable to leave these systems unmonitored and undefended, ^Writes Martin Dart. So the NSA monitors the Internet and captures email, phone calls, SMS message and... well whatever else travels over the internet. As soon as the 'news' broke civil libertarians were wailing about what an evil act this was, and wagging their fingers at the NSA as they finally had their proof that the NSA is a... well, a signals interception agency. That spies on things and collects data. Secretly. Oh come on. I can't be the only person longing for a little adult conversation about this. Surely? Don't forget that network monitoring and data gathering is what the NSA has done for over 60 years. Their mission is clearly up there on their website for all to see: Executive Order 12333 delineates the NSA role...to... Collect (including through clandestine means), process, analyze... signals intelligence information and data for foreign intelligence and counterintelligence purposes. (My emphasis - try reading just those words!) Therefore what is the NSA, this publicly professed signals intercept agency, with a published remit to conduct counterintelligence supposed to do - where do you think their field of battle should be? With all developed countries hugely dependent upon electronic communications it is unthinkable to leave these systems unmonitored and undefended. The abuse and destruction that could be unleashed by criminals and foreign intelligence services would be unprecedented and catastrophic, and to have no visibility or functional mitigations against it would be a shocking negligence. Point #1 of my pro-PRISM defence is therefore: The internet is now the most 'critical infrastructure' we have. It must be policed, inspected, and protected. As the NSA is funded precisely to do this, that's what they must do, and up until now they have done so without letting the enemy know that we had the capability to see what they were up to. And this is where you have to really stop and appreciate the next point... Point #2: You know there are dreadful people, doing and planning horrendous things on the internet right? They are 'the enemy' to all of us. The web isn't all about the Twittersverse bragging about the perfect latte or how cuddly their cat is in less than 140 characters. There really are terrorists who seek to use the internet to spread violence and propaganda. There really are organised perverts sharing images of child rape for sexual and financial gain. And there really are agents working for foreign governments who use the web to steal intellectual property or uncover our military and intelligence capabilities. Point #3: This process only works when we ('the good guys') have an unknown capability that they ('the bad guys') don't know about. If our enemies think we have a poor capability, or that our laws prevent us from looking at certain traffic or sites, then guess where they are going to hide their malware, propaganda, and stolen data?

Broad NSA authority is key to network access and the future of cyber security.
Goldsmith, Harvard law professor, 2013

(Jack, "We Need an Invasive NSA", 10-10, <http://www.newrepublic.com/article/115002/invasive-nsa-will-protect-us-cyber-attacks>)

Such cyber-intrusions threaten corporate America and the U.S. government every day. “Relentless assaults on America’s computer networks by China and other foreign governments, hackers and criminals have created an urgent need for safeguards to protect these vital systems.” the Times editorial page noted last year while supporting legislation encouraging the private sector to share cybersecurity information with the government. It cited General Keith Alexander, the director of the NSA, who had noted a 17-fold increase in cyber-intrusions on critical infrastructure from 2009 to 2011 and who described the losses in the United States from cyber-theft as “the greatest transfer of wealth in history.” **If a “catastrophic cyber-attack occurs,” the Times concluded, “Americans will be justified in asking why their lawmakers ... failed to protect them.”** The Times editorial board is quite right about the seriousness of the cyber- threat and the federal government’s responsibility to redress it. **What it does not appear to realize is the connection between the domestic NSA surveillance it detests and the governmental assistance with cybersecurity it cherishes. To keep our computer and telecommunication networks secure, the government will eventually need to monitor and collect intelligence on those networks** using techniques similar to ones the Times and many others find reprehensible when done for counterterrorism ends. The fate of domestic surveillance is today being fought around the topic of whether it is needed to stop Al Qaeda from blowing things up. But the fight tomorrow, and the more important fight, will be about whether it is necessary to protect our ways of life embedded in computer networks. **Anyone anywhere with a connection to the Internet can engage in cyber-operations within the United States. Most truly harmful cyber-operations, however, require group effort and significant skill.** The attacking group or nation must have clever hackers, significant computing power, and the sophisticated software—known as “malware”—that enables the monitoring, exfiltration, or destruction of information inside a computer. **The supply of all of these resources has been growing fast for many years—in governmental labs devoted to developing these tools and on sprawling black markets on the Internet.** Telecommunication networks are the channels through which malware typically travels, often anonymized or encrypted, and buried in the billions of communications that traverse the globe each day. The targets are the communications networks themselves as well as the computers they connect—things like the Times’ servers, the computer systems that monitor nuclear plants, classified documents on computers in the Pentagon, the nasdaq exchange, your local bank, and your social-network providers. **To keep these computers and networks secure, the government needs powerful intelligence capabilities abroad so that it can learn about planned cyber-intrusions.** It also needs to raise defenses at home. An important first step is to correct the market failures that plague cybersecurity. Through law or regulation, the government must improve incentives for individuals to use security software, for private firms to harden their defenses and share information with one another, and for Internet service providers to crack down on the botnets—networks of compromised zombie computers—that underlie many cyber-attacks. More, too, must be done to prevent insider threats like Edward Snowden’s, and to control the stealth introduction of vulnerabilities during the manufacture of computer components—vulnerabilities that can later be used as windows for cyber-attacks. And yet that’s still not enough. The U.S. government can fully monitor air, space, and sea for potential attacks from abroad. But it has limited access to the channels of cyber-attack and cyber-theft, because they are owned by private telecommunication firms, and because Congress strictly limits government access to private communications. “I can’t defend the country until I’m into all the networks,” General Alexander reportedly told senior government officials a few months ago. **For Alexander, being in the network means having government computers scan the content and metadata of Internet communications in the United States and store some of these communications for extended periods.** Such access, he thinks, will give the government a fighting chance to find the needle of known malware in the haystack of communications so that it can block or degrade the attack or exploitation. **It will also allow it to discern patterns of malicious activity in the swarm of communications, even when it doesn’t possess the malware’s signature. And it will better enable the government to trace back an attack’s trajectory so that it can discover the identity and geographical origin of the threat.**

PRISM key to Domestic Terrorism

Key to disrupt homegrown terrorism

Sulmasy, Coast Guard academy law professor, 2013

(Glenn, "Why we need government surveillance", 6-10,
<http://www.cnn.com/2013/06/10/opinion/sulmasy-nsa-snowden/>)

The current threat by al Qaeda and jihadists is one that requires aggressive intelligence collection and efforts. One has to look no further than the disruption of the New York City subway bombers (the one being touted by DNI Clapper) or the Boston Marathon bombers to know that the war on al Qaeda is coming home to us, to our citizens, to our students, to our streets and our subways.

This 21st century war is different and requires new ways and methods of gathering information. As technology has increased, so has our ability to gather valuable, often actionable, intelligence. However, **the move toward "home-grown" terror will necessarily require, by accident or purposefully, collections of U.S. citizens' conversations with potential overseas persons of interest.** An open society, such as the United States, ironically needs to use this technology to protect itself. This truth is naturally uncomfortable for a country with a Constitution that prevents the federal government from conducting "unreasonable searches and seizures." American historical resistance towards such activities is a bedrock of our laws, policies and police procedures. **But what might have been reasonable 10 years ago is not the same any longer. The constant armed struggle against the jihadists has adjusted our beliefs on what we think our government can, and must, do in order to protect its citizens.**

Speed Key

Flexibility is key to quick action and intel Sulmasy, US Coast Guard Academy law faculty, 2009

(Glenn, "Anniversary Contributions: Use of Force: Executive Power: the Last Thirty Year", 30 U. Pa. J. Int'l L. 1355, lexis)

Since the attacks of 9/11, the original concerns noted by Hamilton, Jay, and Madison have been heightened. **Never before** in the young history of the United States **has the need for an energetic executive been more vital to its national security**. The need for quick action in this arena **requires an executive response** particularly when fighting a shadowy enemy like al Qaeda **not the deliberative bodies opining on what and how to conduct warfare** or determining how and when to respond. **The threats from non-state actors**, such as al Qaeda, **make the need for dispatch and rapid response even greater**. Jefferson's concerns about the slow and deliberative institution of **Congress being prone to informational leaks are even more relevant** in the twenty-first century. The advent of the twenty-four hour media only leads to an increased need for retaining enhanced levels of executive [*1362] control of foreign policy. This is particularly true in modern warfare. **In the war on international terror, intelligence is vital to ongoing operations and successful prevention of attacks. Al Qaeda now has both the will and the ability to strike** with the equivalent force and might of a nation's armed forces. **The need to identify these individuals before they can operationalize an attack is vital. Often international terror cells consist of only a small number of individuals making intelligence that much more difficult to obtain and even more vital** than in previous conflicts. The normal movements of tanks, ships, and aircrafts that, in traditional armed conflict are indicia of a pending attack are not the case in the current "fourth generation" war. Thus, the need for intelligence becomes an even greater concern for the commanders in the field as well as the Commander-in-Chief. ¶ Supporting a strong executive in foreign affairs does not necessarily mean the legislature has no role at all. In fact, their dominance in domestic affairs remains strong. Additionally, besides the traditional roles identified in the Constitution for the legislature in foreign affairs - declaring war, ratifying treaties, overseeing appointments of ambassadors, etc. - this growth of executive power now, more than ever, necessitates an enhanced, professional, and apolitical oversight of the executive. An active, aggressive oversight of foreign affairs, and warfare in particular, by the legislature is now critical. Unfortunately, the United States - particularly over the past decade - has witnessed a legislature unable to muster the political will necessary to adequately oversee, let alone check, the executive branch's growing power. Examples are abundant: lack of enforcement of the War Powers Resolution around the executive's unchecked invasions of Grenada, Panama, and Kosovo, and such assertions as the Authorization for the Use of Military Force, the USA Patriot Act, military commissions, and the updated Foreign Intelligence Surveillance Act ("FISA"). There have been numerous grand-standing complaints registered in the media and hearings over most, if not all, of these issues. However, in each case, the legislature has all but abdicated their constitutionally mandated role and allowed the judicial branch to serve as the only real check on alleged excesses of the executive branch. This deference is particularly dangerous and, in the current environment of foreign affairs and warfare, tends to unintentionally politicize the Court. ¶ The Founders clearly intended the political branches to best serve the citizenry by functioning as the dominant forces in [*1363] guiding the nation's foreign affairs. They had anticipated the political branches to struggle over who has primacy in this arena. In doing so, they had hoped neither branch would become too strong. The common theme articulated by Madison, ambition counters ambition, n17 intended foreign affairs to be a "give and take" between the executive and legislative branches. However, inaction by the legislative branch on myriad policy and legal issues surrounding the "war on terror" has forced the judiciary to fulfill the function of questioning, disagreeing, and "checking" the executive in areas such as wartime policy, detentions at Guantanamo Bay, and tactics and strategy of intelligence collection. The unique nature of the conflict against international terror creates many areas where law and policy are mixed. The actions by the Bush administration, in particular, led to outcries from many on the left about his intentions and desire to unconstitutionally increase the power of the Presidency. Yet, the Congress never firmly exercised the "check" on the executive in any formal manner whatsoever. ¶ For example, many policymakers disagreed with the power given to the President within the Authorization to Use Military Force ("AUMF"). n18 Arguably, this legislation was broad in scope, and potentially granted sweeping powers to the President to wage the "war on terror." However, Congress could have amended or withdrawn significant portions of the powers it gave to the executive branch. This lack of withdrawal or amendment may have been understandable when Republicans controlled Congress, but as of November 2006, the Democrats gained control of both houses of the Congress. Still, other than arguing strongly against the President, the legislature did not necessarily or aggressively act on its concerns. Presumably this inaction was out of concern for being labeled "soft on terror" or "weak on national security" and thereby potentially suffering at the ballot box. This virtual paralysis is understandable but again, the political branches were, and remain, the truest voice of the people and provide the means to best represent the country's beliefs, interests, and national will in the arena of foreign affairs. It has been this way in the past but the more recent (certainly over the past thirty years and even more so in the past decade) intrusions of the judicial branch into what [*1364] was intended to be a "tug and pull" between the political branches can properly be labeled as an unintended consequence of the lack of any real legislative oversight of the executive branch. ¶ Unfortunately, now nine unelected, life-tenured justices are deeply involved in wartime policy decision making. Examples of judicial policy involvement in foreign affairs are abundant including Rasul v. Bush; n19 Hamdi v. Rumsfeld; n20 Hamdan v. Rumsfeld; n21 as well as last June's Boumediene v. Bush n22 decision by the Supreme Court, all impacting war policy and interpretation of U. S. treaty obligations. Simply, judges should not presumptively impact warfare operations or policies nor should this become acceptable practice. Without question, over the past thirty years, this is the most dramatic change in executive power. It is not necessarily the strength of the Presidency that is the change we should be concerned about - the institutional search for enhanced power was anticipated by the Founders - but they intended for Congress to check this executive tendency whenever appropriate. Unfortunately, this simply is not occurring in twenty-first century politics. Thus, the danger does not necessarily lie with the natural desire for Presidents to increase their power. The real danger is the judicial branch being forced, or compelled, to fulfill the constitutionally mandated role of the Congress in checking the executive. ¶ 4. PRESIDENT OBAMA AND EXECUTIVE POWER ¶ The Bush presidency was, and continues to be, criticized for having a standing agenda of increasing the power of the executive branch during its eight-year tenure. Numerous articles and books have been dedicated to discussing these allegations. n23 However, as argued earlier, the reality is that it is a natural bureaucratic tendency, and one of the Founders presciently anticipated, that each branch would seek greater powers whenever and wherever possible. **As the world becomes increasingly interdependent, technology and armament become more sophisticated, and with [*1365] the rise of twenty-first century non-state actors, the need for strong executive power is not only preferred, but also necessary. Executive power in the current world dynamic is something, regardless of policy preference or political persuasions, that the new President must maintain** in order to best fulfill his constitutional role of providing for the nation's security. This is simply part of the reality of executive power in the twenty-first century. n24

Speed is key to the strategic advantage key to solve global crises and maintain leadership

Berkowitz, RAND senior analyst, 2008

(Bruce, Strategic Advantage: Challengers, Competitors, And Threats To America's Future, pg 1-4)

THIS BOOK is intended to help readers better understand the national security issues facing the United States today and offer the general outline of a strategy for dealing with them. National security policy—both making it and debating it — is harder today because the issues that are involved are more numerous and varied. The problem of the day can change at a moment's notice. Yesterday, it might have been proliferation; today, terrorism; tomorrow, hostile regional powers. Threats are also more likely to be intertwined—proliferators use the same networks as narco-traffickers, narco-traffickers support terrorists, and terrorists align themselves with regional powers. Yet, as worrisome as these immediate concerns may be, the long-term challenges are even harder to deal with, and the stakes are higher. Whereas the main Cold War threat — the Soviet Union — was brittle, most of the potential adversaries and challengers America now faces are resilient. In at least one dimension where the Soviets were weak (economic efficiency, public morale, or leadership), the new threats are strong. They are going to be with us for a long time. As a result, we need to reconsider how we think about national security. The most important task for U.S. national security today is simply to retain the strategic advantage. This term, from the world of military doctrine, refers to the overall ability of a nation to control, or at least influence, the course of events.¹ When you hold the strategic advantage, situations unfold in your favor, and each round ends so that you are in an advantageous position for the next. When you do not hold the strategic advantage, they do not. As national goals go, “keeping the strategic advantage” may not have the idealistic ring of “making the world safe for democracy” and does not sound as decisively macho as “maintaining American hegemony.” But keeping the strategic advantage is critical, because it is essential for just about everything else America hopes to achieve — promoting freedom, protecting the homeland, defending its values, preserving peace, and so on. The Changing Threat If one needs proof of this new, dynamic environment, consider the recent record. A search of the media during the past fifteen years suggests that there were at least a dozen or so events that were considered at one time or another the most pressing national security problem facing the United States — and thus the organizing concept for U.S. national security. What is most interesting is how varied and different the issues were, and how many different sets of players they involved — and how each was replaced in turn by a different issue and a cast of characters that seemed, at least for the moment, even more pressing. They included, roughly in chronological order, • regional conflicts — like Desert Storm — involving the threat of war between conventional armies; • stabilizing “failed states” like Somalia, where government broke down in toto; • staying economically competitive with Japan; • integrating Russia into the international community after the fall of communism and controlling the nuclear weapons it inherited from the Soviet Union; • dealing with “rogue states” unruly nations like North Korea that engage in trafficking and proliferation as a matter of national policy; • combating international crime, like the scandal involving the Bank of Credit and Commerce International, or imports of illegal drugs; • strengthening international institutions for trade as countries in Asia, Eastern Europe, and Latin America adopted market economies; • responding to ethnic conflicts and civil wars triggered by the reemergence of culture as a political force in the “clash of civilizations”; • providing relief to millions of people affected by natural catastrophes like earthquakes, tsunamis, typhoons, droughts, and the spread of HIV/AIDS and malaria; • combating terrorism driven by sectarian or religious extremism; • grassroots activism on a global scale, ranging from the campaign to ban land mines to antiglobalization hoodlums and environmentalist crazies; • border security and illegal immigration; • the worldwide ripple effects of currency fluctuations and the collapse of confidence in complex financial securities; and • for at least one fleeting moment, the safety of toys imported from China. There is some overlap in this list, and one might want to group some of the events differently or add others. The important point, however, is that when you look at these problems and how they evolved during the past fifteen years, you do not see a single lesson or organizing principle on which to base U.S. strategy. Another way to see the dynamic nature of today's national security challenges is to consider the annual threat briefing the U.S. intelligence community has given Congress during the past decade. These briefings are essentially a snapshot of what U.S. officials worry most about. If one briefing is a snapshot, then several put together back to back provide a movie, showing how views have evolved.² Figure 1 summarizes these assessments for every other year between 1996 and 2006. It shows when a particular threat first appeared, its rise and fall in the rankings, and in some cases how it fell off the chart completely. So, in 1995, when the public briefing first became a regular affair, the threat at the very top of the list was North Korea. This likely reflected the crisis that had occurred the preceding year, when Pyongyang seemed determined to develop nuclear weapons, Bill Clinton's administration seemed ready to use military action to prevent this, and the affair was defused by an agreement brokered by Jimmy Carter. Russia and China ranked high as threats in the early years, but by the end of the decade they sometimes did not even make the list. Proliferation has always been high in the listings, although the particular countries of greatest concern have varied. Terrorism made its first appearance in 1998, rose to first place after the September 11, 2001, terrorist attacks, and remains there today. The Balkans appeared and disappeared in the middle to late 1990s. A few of the entries today seem quaint and overstated. Catastrophic threats to

information systems like an “electronic Pearl Harbor” and the “Y2K problem” entered the list in 1998 but disappeared after 2001. (Apparently, after people saw an airliner crash into a Manhattan skyscraper, the possible loss of their Quicken files seemed a lot less urgent.) Iraq first appeared in the briefing as a regional threat in 1997 and was still high on the list a decade later—though, of course, the Iraqi problem in the early years (suspected weapons of mass destruction) was very different from the later one (an insurgency and internationalized civil war). All this is why the United States needs agility. It not only must be able to refocus its resources repeatedly; it needs to do this faster than an adversary can focus its own resources.

Speed key to solve terrorism-prefer specific evidence

Li, Georgetown JD, 2009

(Zheyao, “NOTE: War Powers for the Fourth Generation: Constitutional Interpretation in the Age of Asymmetric Warfare”, Winter, 7 Geo. J.L. & Pub. Pol’y 373, lexis)

By now it should be clear just how different this conflict against the extremist terrorists is from the type of warfare that occupied the minds of the Framers at the time of the Founding. Rather than maintaining the geographical and political isolation desired by the Framers for the new country, today's United States is an international power targeted by individuals and groups that will not rest until seeing her demise. The Global War on Terrorism is not truly a war within the Framers' eighteenth-century conception of the term, and the normal constitutional provisions regulating the division of war powers between Congress and the President do not apply. Instead, this “war” is a struggle for survival and dominance against forces that threaten to destroy the United States and her allies, and the fourth-generational nature of the conflict, highlighted by an indiscernible distinction between wartime and peacetime, necessitates an evolution of America's traditional constitutional warmaking scheme. As first illustrated by the military strategist Colonel John Boyd, constitutional decision-making in the realm of war powers in the fourth generation should [*399] consider the implications of the OODA Loop: Observe, Orient, Decide, and Act. n144 In the era of fourth-generational warfare, quick reactions, proceeding through the OODA Loop rapidly, and disrupting the enemy's OODA loop are the keys to victory. “In order to win,” Colonel Boyd suggested, “we should operate at a faster tempo or rhythm than our adversaries.” n145 In the words of Professor Creveland, “[b]oth organizationally and in terms of the equipment at their disposal, the armed forces of the world will have to adjust themselves to this situation by changing their doctrine, doing away with much of their heavy equipment and becoming more like police.” n146 Unfortunately, the existing constitutional understanding, which diffuses war power between two branches of government, necessarily (by the Framers' design) slows down decision-making. [*400] In circumstances where war is undesirable (which is, admittedly, most of the time, especially against other nation-states), the deliberativeness of the existing decision-making process is a positive attribute. In America's current situation, however, in the midst of the conflict with al-Qaeda and other international terrorist organizations, the existing process of constitutional decision-making in warfare may prove a fatal hindrance to achieving the initiative necessary for victory. As a slow-acting, deliberative body, Congress does not have the ability to adequately deal with fast-emerging situations in fourth-generational warfare. Thus, in order to combat transnational threats such as al-Qaeda, the executive branch must have the ability to operate by taking offensive military action even without congressional authorization, because only the executive branch is capable of the swift decision-making and action necessary to prevail in fourth-generational conflicts against fourth-generational opponents.

Impacts

AQ Threat High

AQ is alive and planning attacks on the US

Habeck, PhD, Senior Fellow with the Foreign Policy Research Institute, 12-26-14

(Mary, "The Islamic State and al-Qaeda: Possible Directions for 2015,"

<http://news.siteintelgroup.com/blog/index.php/entry/333-the-islamic-state-and-al-qaeda-possible-directions-for-2015-1>)

The entire AQ network, meanwhile, has been growing around the world. The recent assault by the al-Nusra Front on the Syrian opposition, seizure of territory in Idlib and near Damascus, spread of al-Qaeda in the Arabian Peninsula (AQAP), multiplication of AQ-linked groups (and their growing power) in Libya, as well as the creation and attacks by al-Qaeda in the Indian Subcontinent (AQIS), all suggest a group that is aggressively expanding its reach and capabilities. For AQ high command and various branches, at least four possible directions and two terrorist opportunities emerge. As with the aforementioned possibilities for IS, some of these could happen simultaneously. 1) AQ and IS merge into a new organization dominated by AQ's High Command in Afghanistan-Pakistan. 2) Al-Nusra Front, in cooperation with other groups, takes Damascus and declares an Emirate in Syria. 3) AQAP seizes control of Aden and most of southern Yemen, then launches an assault on the capital of Sana'a and the Houthis. 4) As the U.S. draws down in Afghanistan, AQ is able to reestablish a safe haven in that country. The two terrorist possibilities include the most dangerous courses of action in the near-term: 1) AQIS carries out a mass casualty attack on India. 2) **Through the "Khorasan Group," AQ manages to carry out a terrorist attack against the U.S. or Europe.**

ISIS/Al Qaeda competition increases the chances of attack

Phillips, Senior Research Fellow for Middle Eastern Affairs, 1-21-15

(James, @ The Heritage Foundation's Allison Center for Foreign Policy Studies, "ISIS vs. Al Qaeda: The good news and the bad news,"

<http://www.heritage.org/research/commentary/2015/1/isis-vs-al-qaeda-the-good-news-and-the-bad-news>)

The bottom line is that Al Qaeda and ISIS increasingly **are competing** for recruits, funding and leadership of the global Islamist revolution. The good news is that this power struggle may weaken both of them. The bad news is that their rivalry may spark a competition to see who can launch the most spectacular terrorist attacks against Western targets. Moreover, Syria has emerged as a terrorist sanctuary that potentially poses a greater threat to the United States than Afghanistan did before 9/11.

ISIS and Al Qaeda will merge if ISIS grows in strength – they’ll attack the U.S.

Mendelsohn 8/14/14 – Barak, Associate Professor of political science at Haverford College, “ISIS' Gruesome Gamble” <http://www.foreignaffairs.com/articles/141884/barak-mendelsohn/isis-gruesome-gamble>

If the United States decided to step in on behalf of its allies -- as it did -- then ISIS must have believed that it would be able to strengthen its position within the jihadi camp. ISIS could use the bombings as evidence that the United States is waging a war on Islam, and to portray itself as the defender of Muslims from “Crusader” aggression. In other words, ISIS would steal a page right out of al Qaeda’s playbook. And that puts more pressure on al Qaeda. After all, if ISIS wins vast territory in the heart of the Middle East, implements Islamic governance, and battles apostate regimes and their backers, al Qaeda will -- after refusing to do so -- have to give its full support to ISIS. Already, ISIS supporters are calling all jihadi forces to stand behind Omar al-Baghdadi, the leader of ISIS. As a result, the flow of fighters abandoning al Qaeda affiliates to join ISIS, which U.S. intelligence has already observed, is likely to increase. Moreover, leaders of al Qaeda franchises will come under greater pressure to shift allegiance from al Qaeda to ISIS.

A2: No Lashout

Chance of lash out and miscalc are high Ayson, Victoria strategic studies professor, 2010

(Robert, "After a Terrorist Nuclear Attack: Envisaging Catalytic Effects", Studies in Conflict & Terrorism, 33.7, Taylor and Francis)

Other considerations could work in the other direction, reducing the prospect of a nuclear response to nuclear terrorism. If the identity and location of the responsible terrorist group was known with some precision, the use of a nuclear weapon against it could easily exceed the maximum damage required for its destruction or incapacitation. The same objective might well be achievable by the use of conventional weapons (although perhaps not if the group had hidden itself deep underground). But these operational considerations might still miss the point: there could be a strong groundswell of public and elite opinion favoring the use of the ultimate weapon against the group that was thought to have used it in the first place. Concerns about collateral damage—especially if the terrorist group was situated in a heavily populated area—might not be especially pressing in the aftermath of a terrorist attack that had already killed tens of thousands of innocent civilians. There might also be strong pressure for nuclear retaliation simply to be visited on the country that had been so malicious (or foolish or unlucky) to have hosted and/or supported the group. Of course, the terrorist group's known leaders and operatives might well be dispersed, and it would seem especially disproportionate to use multiple nuclear weapons on multiple individual human targets in multiple countries (if of course multiple nuclear use was an option for the country making the response). But there might be situations in which rather than targeting the terrorist group itself with nuclear retaliation, with potential collateral effects for a wider population involving the slaughter of innocents, a deliberate decision might still be taken to launch an inter-state nuclear attack that might still bring with it very wide casualties and damage. If it was felt that the group was supported—and even directly assisted—in its attack by a state sponsor, the leadership, armed forces, and/or territory of that sponsor might be regarded as open to nuclear bombardment.³⁹ (This is one reason why Iran's future leaders might pause before passing any nuclear weapons they may acquire to Hezbollah.) The attacked state might decide it was more important (or practicable) to act coercively against the state sponsor rather than the terrorist group, or that double coercion could apply here if the terrorist group could be held responsible for the retaliation inflicted on its state sponsor. Most of the foregoing arguments for carefully deciding on the extent of the military response to a terrorist nuclear attack assume a fairly cool process of rational calculation where the long-term political consequences of any action are weighed up against the short-term need for something to be done. But it is not certain that the aftermath of a nuclear attack would encourage relatively cool and calm decision-making processes. It is not clear exactly how much public pressure would rise up demanding swift and dramatic action, but it might be wise to assume that this pressure would be very significant. The depth of anger could be considerable and so could a mood of vengeance. Political leaders might not even wait for this mood to emerge, but may anticipate it or be so aggrieved personally and collectively as to decide on decisive action even before the full facts were available. And it is quite likely that leaders could expect to find support for very extreme measures of response if they sought to implement them. That pressure could result in moves to lash out against terrorist groups in particular or in general—in particular against the group (or groups) thought to be responsible for the nuclear attack, or in general against any group known to have threatened the attacked country in recent times or to have been at all sympathetic with the perpetrators. Ironically, because nuclear weapons can have wide-area effects, they might in fact be employed against general areas in which the terrorists were thought to exist (such as some Pakistan–Afghanistan border areas) but where their precise locations was uncertain. Some advantages might be seen in launching a somewhat indiscriminate response to an initially indiscriminate attack (an eye for an eye). State supporters of the terrorist groups might expect a similarly wrathful response to fall on them. Of course, if the sponsor was a known possessor of nuclear weapons a difficult decision would be presented to the retaliating country, although such a situation might also encourage a disarming nuclear attack to remove from the state sponsor the opportunity to use their own nuclear weapons (although the precision required to accomplish such disarmament by force is a rare commodity). A terrorist nuclear attack, and even the use of nuclear weapons in response by the country attacked in the first place, would not necessarily represent the worst of the nuclear worlds imaginable. Indeed, there are reasons to wonder whether nuclear terrorism should ever be regarded as belonging in the category of truly existential threats. A contrast can be drawn here with the global catastrophe that would come from a massive nuclear exchange between two or more of the sovereign states that possess these weapons in significant numbers. Even the worst terrorism that the twenty-first century might bring would fade into insignificance alongside considerations of what a general nuclear war would have wrought in the Cold War period. And it must be admitted that as long as the major nuclear weapons states have hundreds and even thousands of nuclear weapons at their disposal, there is always the possibility of a truly awful nuclear exchange taking place precipitated entirely by state possessors themselves. But

these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today's and tomorrow's terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be “spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from.”⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington's relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington's early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the “Chechen insurgents’ ... long-standing interest in all things nuclear.”⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide. There is also the question of how other nuclear-armed states respond to the act of nuclear terrorism on another member of that special club. It could reasonably be expected that following a nuclear terrorist attack on the United States, both Russia and China would extend immediate sympathy and support to Washington and would work alongside the United States in the Security Council. But there is just a chance, albeit a slim one, where the support of Russia and/or China is less automatic in some cases than in others. For example, what would happen if the United States wished to discuss its right to retaliate against groups based in their territory? If, for some reason, Washington found the responses of Russia and China deeply underwhelming, (neither “for us or against us”) might it also suspect that they secretly were in cahoots with the group, increasing (again perhaps ever so slightly) the chances of a major exchange. If the terrorist group had some connections to groups in Russia and China, or existed in areas of the world over which Russia and China held sway, and if Washington felt that Moscow or Beijing were placing a curiously modest level of pressure on them, what conclusions might it then draw about their culpability? If Washington decided to use, or decided to threaten the use of, nuclear weapons, the responses of Russia and China would be crucial to the chances of avoiding a more serious nuclear exchange. They might surmise, for example, that while the act of nuclear terrorism was especially heinous and demanded a strong response, the response simply had to remain below the nuclear threshold. It would be one thing for a non-state actor to have broken the nuclear use taboo, but an entirely different thing for a state actor, and indeed the leading state in the international system, to do so. If Russia and China felt sufficiently strongly about that prospect, there is then the question of what options would lie open to them to dissuade the United States from such action: and as has been seen over the last several decades, the central

dissuader of the use of nuclear weapons by states has been the threat of nuclear retaliation. If some readers find this simply too fanciful, and perhaps even offensive to contemplate, it may be informative to reverse the tables. Russia, which possesses an arsenal of thousands of nuclear warheads and that has been one of the two most important trustees of the non-use taboo, is subjected to an attack of nuclear terrorism. In response, Moscow places its nuclear forces very visibly on a higher state of alert and declares that it is considering the use of nuclear retaliation against the group and any of its state supporters. How would Washington view such a possibility? Would it really be keen to support Russia's use of nuclear weapons, including outside Russia's traditional sphere of influence? And if not, which seems quite plausible, what options would Washington have to communicate that displeasure? If China had been the victim of the nuclear terrorism and seemed likely to retaliate in kind, would the United States and Russia be happy to sit back and let this occur? In the charged atmosphere immediately after a nuclear terrorist attack, how would the attacked country respond to pressure from other major nuclear powers not to respond in kind? The phrase "how dare they tell us what to do" immediately springs to mind. Some might even go so far as to interpret this concern as a tacit form of sympathy or support for the terrorists. This might not help the chances of nuclear restraint.

A2: No Means

Russia has loose nuclear material that terrorists can access – prefer our evidence, it's the only card that assumes breakdown of US/Russia cooperation post Ukraine

Zolotukhina, M.A. from the Harriman Institute at Columbia University, 15

(Elizabeth, "Money Is Not Enough: The Role of Economic Incentives in Cooperative Nonproliferation Initiatives," <http://jordanrussiacycenter.org/news/money-enough-role-economic-incentives-cooperative-nonproliferation-initiatives/#.VRjLOPnF8g0>)

Undetected smuggling of Russian nuclear material likely has occurred.^[1] **Terrorists have expressed interest in and have attempted to obtain nuclear materials.**^[2] **The Russian nuclear arsenal is not uniformly secure.** Given these facts, one would have expected Moscow to have collaborated equally and consistently with U.S.-funded nonproliferation accords. Instead, **Russian cooperation with the** then-current **Cooperative Threat Reduction (CTR) initiatives had varied.**^[3] U.S.-Russian nuclear security cooperation began shortly after the 1991 collapse of the Soviet Union. **Fearing the possibility of nuclear theft**^[4] and **the chance of diversion of former Soviet direct use nuclear materials to non-state actors,** American officials originally envisioned the **Cooperative Threat Reduction (CTR) program as an emergency measure** to hedge against potential chaos resulting from the USSR's collapse.^[5] The Soviet Nuclear Threat Reduction Act of 1991 authorized a cooperative program of U.S. aid to former Soviet republics, including Russia. **The CTR program,** which **expired** in June 2013, represented one of the most successful examples of peacetime security collaboration between major military powers.^[6] After the expiration of the CTR umbrella agreement, more limited U.S.-Russian nuclear security cooperation continued under the auspices of a 2003 accord, the Framework Agreement on a Multilateral Nuclear Environmental Program in the Russian Federation (MNEPR), and a related protocol signed on June 14, 2013. On December 16, 2014 Russian officials announced, not unexpectedly, Moscow's decision to terminate a large segment of nuclear security cooperation with Washington.^[7] Moscow's varied cooperation with CTR initiatives is puzzling, as the threat of theft or diversion of select Russian nuclear assets has not abated. Instead, it has morphed. Rather than emanating largely from a lack of physical protection elements (i.e. adequate fences, radiation detectors, etc...) **the current main threats to Russian nuclear materials are determined insiders,** coupled with a questionable commitment by Moscow to ensuring sustainability and improving security culture.^[8] These **continuing lapses ease smuggling, leakage, and** possibly **could enable terrorists to divert select Russian nuclear materials.** There is also a real threat—as well as past instances—of theft, seizure, or diversion of select Russian nuclear material. **Once diverted, it would be relatively easy to construct, transport, and detonate a crude nuclear explosive device.**^[9] For a state-sponsored program, the difficulty in constructing a nuclear weapon lies first in legally acquiring the requisite nuclear material, and, later, in the miniaturization required to mount a nuclear warhead atop a guided missile. Terrorists and non-state actors are not bound by such considerations. Given the risks, it is crucial to ascertain the factor/s on which Moscow's cooperation with U.S.-Russian nonproliferation initiatives hinges.

A2: No Motive

Multiple terrorist organizations are seeking nuclear weapons now – fissile material and smuggling provides the means

Iqbal, consultant to IPRI on Policy and Strategic Response, former assistant chief of air staff, Pakistan Air Force, 14

(Khalid, “Nuclear Terrorism: Myth and Reality,” Criterion Quarterly: Vol 9 No 4, <http://www.criterion-quarterly.com/nuclear-terrorism-myth-and-reality/>)

There is a consensus among international leaders **that the threat of nuclear terrorism is real**, not a Hollywood confection. President Obama, a number of leaders of other nations, the heads of the IAEA and the United Nations, and numerous experts have called nuclear terrorism one of the most serious threats to global security and stability. At the same time, there is a silver lining too: it is preventable through proactive actions. A radiological weapon may be very appealing to terrorist groups as it is highly successful in instilling fear and panic amongst a population and would contaminate the immediate area for some period of time, disrupting attempts to repair the damage and subsequently inflicting significant economic losses. **At least four terrorist groups have demonstrated interest in using a nuclear device**. These groups operate in or near states with histories of questionable nuclear security practices. **Terrorists do not need to steal a nuclear weapon**. It is quite possible to make an improvised nuclear device from highly enriched uranium or plutonium being used for civilian purposes. **According to leaked diplomatic documents, al-Qaeda can produce radiological weapons, after sourcing nuclear material and recruiting rogue scientists to build dirty bombs**.^[xxii] **Al-Qaeda, and some North Caucasus terrorist groups had consistently stated that they seek nuclear weapons and had even tried to acquire them**^[xxiii]. Al-Qaeda has sought nuclear weapons for almost two decades by attempting to purchase stolen nuclear material and weapons and has also sought nuclear expertise on numerous occasions. Osama bin Laden had also stated that the acquisition of nuclear weapons or other weapons of mass destruction is a “religious duty.” While pressure from a wide range of counter-terrorist activity has hampered Al-Qaeda’s ability to manage such a complex project, there is no sign that it has jettisoned its goals of acquiring fissile material. **Statements made as recently as 2008 indicate that Al-Qaeda’s nuclear ambitions are still very strong**^[xxiv]. **North Caucasus terrorists had attempted to seize a nuclear submarine** armed with nuclear weapons. They have also engaged in reconnaissance activities on nuclear storage facilities and had repeatedly threatened to sabotage nuclear facilities. **These groups’ activities have also been hampered by counter-terrorism efforts; nevertheless they remain committed** to launching such a devastating attack within Russia. Likewise, the Japanese terror cult Aum Shinrikyo, which used nerve gas to attack a Tokyo subway in 1995, has also tried to acquire nuclear weapons. However, according to nuclear terrorism researchers at Harvard University’s Belfer Center for Science and International Affairs, there is no evidence that they continue to do so^[xxv]. Moreover, **there is a black market of such materials**. Nuclear weapons materials in the black market are a global concern; and **there is a lingering fear about the possible detonation of a small, crude nuclear weapon by a militant group in a major city**, with significant loss of life and property.^[xxvi] There have been 18 confirmed thefts or loss of weapons-usable nuclear material^[xxvii]. In **2011, the Moldovan police broke up part of a smuggling ring attempting to sell highly enriched uranium**.^[xxviii] Security specialist Shaun Gregory argued in an article that terrorists have attacked Pakistani nuclear facilities three times in the recent past; twice in 2007 and once in 2008^[xxix]; however this is contrary to facts; Gregory has erroneously equated attacks on air bases to attacks on nuclear facilities; no Pakistani nuclear facility civilian or military has ever come under any sort of attack. **A terrorist nuclear explosion could kill hundreds of thousands, create billions of dollars in damages and undermine the global economy**. Former UN Secretary General, Kofi Annan, had said

that an act of nuclear terrorism “would thrust tens of millions of people into dire poverty” and create “a second death toll throughout the developing world.” Surely after such an event, global leaders would produce a strong global system to ensure nuclear security. There is no reason to wait for a catastrophe to build such a system. Terrorists exploit gaps in security. The IAEA’s ITDB indicates existence of sufficient gaps. The NCI opines that: “World cannot afford to wait for the patchwork of nuclear security arrangements to fail before they are strengthened. Because we may not even know if materials that could be used in nuclear weapons are missing”^[xxx]. If terrorist groups could sufficiently damage safety systems to cause a core meltdown at a nuclear power plant, and/or sufficiently damage spent fuel pools, then such an attack could lead to widespread radioactive contamination.

Terrorism -JDI

1NC DA – Bulk/Metadata

Unique Internal Link – Domestic terrorism threat on the rise – Metadata collection is key to prevent attacks

*Generic terrorism defense doesn't apply

*Empirically Solves

*Lone Wolf Attacks

Carafano et al. 15 (James Jay, Ph.D., Charles "Cully" Stimson, Steven P. Bucci, Ph.D., John Malcolm and Paul Rosenzweig, Backgrounder #3018 on National Security and Defense, Heritage Foundation May 21, 2015, Section 215 of the PATRIOT Act and Metadata Collection: Responsible Options for the Way Forward, ME)

Any debate about America's counterterrorism capabilities must be conducted in the context of the actual terrorist threat the U.S. faces. Since 9/11, The Heritage Foundation has tracked Islamist terrorist plots and attacks, which now, after the recent shooting in Garland, Texas, total 68.[1] This figure, however, does not consider foiled plots of which the public is unaware. Recently, there has been a dramatic uptick in terrorism: The shooting in Garland is the sixth Islamist terrorist plot or attack in the past five months. Add to that number the surge of Americans seeking to support or join ISIS and al-Qaeda affiliates, and one fact becomes clear: The U.S. is facing the most concentrated period of terrorist activity in the homeland since 9/11. Of course, it is no coincidence that this spike in terrorism parallels the spread of the Islamic State and other radical groups across Syria, Iraq, and other parts of the Middle East. More than 150 American passport holders have traveled to Syria, or attempted to travel there, to join the fighting, along with more than 20,000 fighters from more than 90 countries.[2] Many of these individuals with American passports are believed to have joined ISIS or the Nusra Front, an affiliate of al-Qaeda in Syria. Both the Nusra Front and ISIS espouse an anti-Western Islamist ideology that calls for terrorist attacks against the United States. For example, in July 2012, the leader of ISIS, self-proclaimed caliph Abu Bakr Baghdadi, threatened to launch attacks against the U.S. homeland. Baghdadi warned Americans, "You will soon witness how attacks will resound in the heart of your land, because our war with you has now started." [3] Toward this end, al-Qaeda formed a unit of veteran terrorists to recruit some of the Western foreign fighters in Syria and train them to conduct terrorist attacks in their home countries. This unit, dubbed the Khorasan group by U.S. officials, is embedded in the Nusra Front and is particularly interested in recruiting fighters who hold American passports.[4] These terrorist organizations have undertaken a significant effort to reach out to individuals across the world in order to radicalize and recruit them. In recent testimony before the Senate Appropriations Committee, FBI Director James Comey stated that: The threats posed by foreign fighters, including those recruited from the U.S., traveling to join the Islamic State of Iraq and the Levant (ISIL) and from homegrown violent extremists are extremely dynamic. These threats remain the biggest priorities and challenges for the FBI, the U.S. Intelligence Community, and our foreign, state, and local partners. ISIL is relentless and ruthless in its pursuits to terrorize individuals in Syria and Iraq, including Westerners. We are concerned about the possibility of individuals in the U.S. being radicalized and recruited via the Internet and social media to join ISIL in Syria and Iraq and then return to the U.S. to commit terrorist acts. ISIL's widespread reach through the Internet and social media is most concerning as the group has proven dangerously competent at employing such tools for its nefarious strategy.[5] In the past several weeks, Director Comey has increased the intensity of his warnings, stating that "hundreds, maybe thousands" of individuals across the U.S. are being contacted by ISIS to attack the U.S. homeland.[6] Secretary of Homeland Security Jeh Johnson has echoed these warnings, saying that lone-wolf terrorists inspired by ISIS could strike at any moment."[7] The 2015 Worldwide Threat Assessment of the U.S. Intelligence Community states that: Attacks by lone actors are among the most difficult to warn about because they offer few or no signatures. If ISIL were to substantially increase the priority it places on attacking the West rather than fighting to maintain and expand territorial control, then the group's access to radicalized Westerners who have fought in Syria and Iraq would provide a pool of operatives who potentially have access to the United States and other Western countries.[8] On the same note, the Director of the National Counterterrorism Center also stated in his testimony

to the Senate Select Committee on Intelligence this February that there has been a recent “uptick in terror attacks in the West.” This increase in attacks “underscores the threat of emboldened Homegrown Violent Extremists and, how the rapid succession of these attacks may motivate some to attempt to replicate these tactics with little-to-no warning.”^[9] These statements and assessments, together with the explicit and public statements of intent by multiple terrorist groups and the recent surge in terrorist plots and attacks against the U.S. homeland, demonstrate that the threat of terrorism is on the rise. Fortunately, the U.S. has improved its ability to foil these attacks, largely due to intelligence capabilities that include but are not limited to the bulk telephone metadata program under Section 215 of the PATRIOT Act. Signals Intelligence and Section 215 For decades, the United States has relied on robust signals intelligence to gather critical information related to the enemy. During World War I, World War II, the Korean War, the Vietnam War, and the Cold War, this country has depended on the technical capabilities of our national security agencies and the Department of Defense to intercept suspected enemy communications. As technology improved, so did the capabilities of the U.S. government to intercept suspected or known enemy communications. For the most part, the communications the United States was most interested in happened overseas and were gathered without a warrant. In the 1970s, after the Supreme Court decision in *United States v. U.S. District Court* (also known as “the Keith case”)^[10] and the findings of the Senate’s so-called Church Committee, the Congress passed the Foreign Intelligence Surveillance Act of 1978 (FISA), which established a special court in Washington to review government requests for orders allowing for electronic surveillance.^[11] Pre-dating the Patriot Act, the FISA allowed the Director of the FBI to obtain orders from the Foreign Intelligence Surveillance Court (FISC) authorizing common carriers to provide the government certain business records for the purpose of foreign intelligence and international terrorism investigations. In order to obtain such an order, the government had to prove the existence of “specific and articulable facts giving reason to believe that the person to whom the records pertain [wa]s a foreign power or an agent of a foreign power.” After the horrific attacks of September 11, 2001, the United States Congress passed the USA PATRIOT Act. The PATRIOT Act gave the intelligence community and counterterrorism investigators a number of lawful tools to detect and thwart future acts of international terrorism. Among other things, Section 215 of the PATRIOT Act substantially revised the FISA to provide for the production not only of “business records,” but also of “any tangible things” and to eliminate the restrictions on the types of businesses such orders can reach. The current version of the FISA as amended by Section 215 allows the Director of the FBI to “make an application for an order requiring the production of any tangible thing...for an investigation to obtain foreign intelligence information not concerning a United States person or to protect against international terrorism or clandestine intelligence activities.” Under the FISA as amended by Section 215 of the PATRIOT Act, the government—pursuant to an order from the FISC—has been collecting telephone metadata information in bulk since at least May 2006. The court orders to be produced “all call-detail records or ‘telephony metadata’ created by” United States telecommunications providers “including comprehensive communications routing information, including but not limited to” date and time of call, number called, and duration of call. Once the government has reasonable, articulable suspicion that a particular phone number is associated with a foreign terrorist organization, that seed number is searched across the government’s metadata. The search results yield phone numbers, and the metadata associated with them, which have been in contact with the seed—a step known as the first “hop.” Until recently, the National Security Agency (NSA) has been conducting three hops from the original seed number and analyzing the resulting data. The FISA as amended by Section 215 requires the Attorney General of the United States to adopt “specific minimization procedures governing the retention and dissemination by the [government] of [information] received.”^[12] Those procedures include storing the metadata in a secure network, accessing the metadata only pursuant to a FISC court order, not disseminating query results outside of the NSA except under certain circumstances, and providing proper training and technical controls to relevant NSA personnel. The 215 bulk telephony metadata program does not collect, analyze, or listen to the content of telephone calls. The original order, which was good for 90 days, has been renewed 41 times since May 2006. The information is provided on a daily basis to the NSA, where it is kept for five years. On June 5, 2013, the English newspaper *The Guardian* published a copy of the FISC order that had been leaked illegally by former government contractor Edward Snowden, exposing the telephone metadata program. That leak and subsequent leaks by Snowden that were published by *The Guardian* and *The Washington Post* set in motion a frenzy of debate and discussion, nationally and internationally, about the efficacy of and need for gathering such data, as well as its implications for the privacy interests of American citizens. Following the Snowden disclosures and after the Obama Administration established the Privacy and Civil Liberties Oversight Board (PCLOB) and the President’s Review Group, the NSA limited its inquiries to two hops and required that a FISC judge find that the reasonable articulable suspicion standard has been satisfied before a seed can be queried. Both limitations were approved by a FISC order dated February 5, 2015. The American Civil Liberties Union subsequently sued the government, arguing that Section 215 was unconstitutional and that the statute did not authorize the bulk collection of telephone metadata. On May 7, 2015, the Court of Appeals for the Second Circuit held that Section 215 did not authorize the bulk telephone metadata program and that the program exceeded the scope of what Congress had authorized. The court declined to address the constitutional issue.^[13] Section 215 expires at the end of May 2015. The Way Forward The United States is in a state of armed conflict against al-Qaeda, the Afghan

Taliban, ISIS, and associated forces. It must therefore rely on all lawful tools of national security, including but not limited to robust signals intelligence. As the 9/11 Commission Report made crystal clear, one of the key failures of the United States before the 9/11 attacks was the government's inability to "connect the dots" between known or suspected terrorists. The artificial "wall" between domestic law enforcement and U.S. intelligence agencies, enacted during the 1990s, proved to be America's Achilles' heel. Some analysts believe that had America had a Section 215-type program in place before 9/11, U.S. intelligence, along with domestic law enforcement, would have been able to connect the dots and prevent at least some of the hijackers from launching their devastating attack.^[14] In fact, according to a report by the House Permanent Select Committee on Intelligence, using the authorities under Section 215 of the PATRIOT Act and Section 702 of the FISA has contributed to thwarting 54 total international terrorist plots in 20 countries.^[15] Thirteen of those plots were directed inside the United States. As Americans, we cherish our constitutional rights, including our right to privacy. Numerous court decisions have held that data, in the hands of third-party providers, are not protected by the Fourth Amendment of the Constitution.^[16] There is a case pending before the Court of Appeals for the District of Columbia Circuit in which the issue before the court is whether Section 215 violates the Fourth Amendment; that court has not yet issued its opinion.^[17] As Section 215 expires at the end of May 2015, policymakers are faced with the following quandary: How do they protect Americans from a determined enemy while respecting this nation's healthy distrust of government surveillance? First, given the increasing nature of the threat and the unique nature of this enemy, it would be unwise to completely abandon the use of telephone metadata in helping to disrupt future terrorist plots and/or gain intelligence about known or suspected foreign terrorists. Second, Senator Mitch McConnell (R-KY) has proposed a straight extension of Section 215 to the year 2020. However, that approach does not address the Second Circuit's ruling that the statute as written does not authorize the bulk metadata collection program and would likely result in the federal district court judge who now has the case enjoining the government from continuing the program. In view of ISIS and al-Qaeda's renewed determination to strike the American homeland, there are three major policy options that Congress should consider. Policy Option No. 1. The first option would be to amend Section 215 specifically to allow the NSA to collect bulk telephone metadata and query that data pursuant to FISC court orders; codify the existing program as it has been modified by the Administration but add in cell phone data as well; and fold in the transparency, privacy, and civil liberties contained within the USA Freedom Act, discussed in detail below. Such an amendment would put the program on stronger statutory grounds and address the Second Circuit's holding. There are technical and business practice arguments in favor of this, but it would not address the concerns of many that the government was maintaining a database of telephony metadata. While this approach offers the simplest method to query and analyze the metadata, as it is housed in one place, this approach currently suffers from lack of transparency, lack of civil liberties protections, and privacy concerns. In 2014, the National Research Council appointed a committee of experts to assess "the feasibility of creating software that would allow the U.S. intelligence community more easily to conduct targeted information acquisition rather than bulk collection"^[18] as called for in Section 5(d) of Presidential Policy Directive 28. Committee members and experts included people from Oracle, Microsoft, Google, and other industry and academic experts. After a thorough review, these experts found that there is currently no technologically feasible alternative to the current metadata bulk collection platform. It is safe to assume that the commercial IT world is already working to find a way to provide the tools to do just that sort of analysis. Today, only by keeping all the data together and making appropriate inquiries of the data can the dots be connected, but in the immediate future, other options should become available. Policy Option No. 2. The chief concern among policymakers who are skeptical of government surveillance, and in particular Section 215, is that it is the government that holds the telephony metadata. Such policymakers have also noted that there are not enough privacy protections built into the existing program. One solution to the first concern would be to establish and require that a private, third-party entity house the telephony metadata, including cell phone metadata. The metadata would be collected in bulk but housed by a private third party. Court orders from the FISC would authorize select employees of the private entity, with appropriate security clearances, to query the database. Just as in policy option number one, the Congress could add transparency, civil liberties, and privacy protections to the FISC and program, as discussed below. This alternative would take time to develop and has gained little traction on either side of the debate. Policy Option No. 3. The third policy option is the House-passed USA FREEDOM Act—legislation that reauthorizes Section 215 and reforms it to end government bulk collection of telephone metadata by the NSA. Instead, the metadata resides with the telephone carriers, where the government will have access to it subject to a court order by the FISC. The USA FREEDOM Act replaces bulk collection with a program called a "Call Detail Record." Under this new program, whenever the NSA feels it has reasonable, articulable suspicion that a phone number is associated with international terrorism, it can seek an order to access information about that number from the FISC. If the FISC gives the order, the NSA will submit one or several queries to the telecom companies for historical and real-time data on the number in question. At that time, both historical and real-time data related to the suspicious number will flow into the NSA, as well as data on the two generations of numbers surrounding it (referred to as "hops"). This information will flow on a 24/7 basis for 180 days, double the amount

of time that a FISC order currently authorizes. At the end of 180 days, the NSA can seek renewal for another 180-day time period. Ending the bulk collection of telephone metadata by the government, or even housing it in a private third-party entity, may encumber the ability of the intelligence community to analyze all the data in real time across a known pool of data. Such a change will inevitably slow down investigators, but as the technology changes, this should be rectified. That said, numerous intelligence community leaders have said that while it is far from ideal, they could live with such a system, understanding that America is accepting some risk by doing so. Section 102 provides for emergency authority for the Attorney General to require emergency production of tangible things absent a court order as long as he or she informs a FISC judge and subsequently makes an application to the court within seven days after taking this action. The USA FREEDOM Act also establishes several civil liberties protections for the existing program as it relates to the telephone metadata program. Section 401 of the Act requires the presiding judges of the FISC to designate not fewer than five individuals to be eligible to serve as amicus curiae—friends of the court. Those designated shall be experts in privacy and civil liberties, intelligence collection, and communications technology and be eligible for a security clearance. The amicus curiae serve to assist the court in the consideration of any novel or significant interpretation of the law. Section 402 of the Act also mandates the Director of National Intelligence, in consultation with the Attorney General, to conduct a declassification review of each decision, order, or opinion by the FISC and, to the extent practicable, make those decisions, orders, or opinions publicly available. The USA FREEDOM Act also contains other reforms, including prohibiting bulk collection utilizing FISA pen register and the “trap and trace” procedures in Section 201. The Act is the only legislative vehicle that has passed a chamber of Congress. It is not perfect and could be improved. For example, there should be a uniform period of time for carriers to maintain the telephone metadata. Another could be designating a specific format in which the carriers must maintain the data to allow more expeditious analysis once the data is appropriately obtained. The USA FREEDOM Act strikes a balance between maintaining our national security capabilities and protecting privacy and civil liberties, and this should always be the goal. Conclusion The threat of international terrorism is real and on the rise. The United States remains in a state of armed conflict against non-state actors: al-Qaeda, the Afghan Taliban, ISIS, and associated forces. Winning this armed conflict requires a coordinated, sophisticated, and comprehensive strategy that harnesses all aspects of America’s national power. For decades, over many armed conflicts, the United States has relied on and utilized the fruits of lawful signals intelligence to disrupt, degrade, detect, and ultimately defeat the enemies of the United States. Today, because of stunning advances in technology, we have the ability to search through billions of anonymous bits of telephone call data and draw connections among known and suspected foreign terrorists about whom we otherwise might never have known. Those connections and the connections made possible by other aspects of national power enable those who defend our freedoms to keep us safe. In crafting the best policies with respect to mining telephone metadata, Congress has a solemn duty to abide by the Constitution, particularly our Fourth Amendment right to be secure in our persons, houses, papers, and effects against “unreasonable searches and seizures.” At the same time, Congress has to recognize that telephone metadata is not a subscriber’s personal property: It is owned by the telephone companies as part of their business records. Yet the data is sensitive, and American citizens expect that their phone records, even if they do not own them, are private information. Congress must find a way to balance these two interests, because allowing the capacity to query third-party telephone metadata—signals intelligence—to expire is unwise and dangerous, especially during a time of armed conflict.

Surveillance key to stop lone wolf terrorism – multiple scenarios for WMD use – generic defense doesn’t apply
Lederman chief counsel for national security and investigations of the U.S. Senate Homeland Security and Governmental Affairs Committee ’12 (Gordon, “The Threat from Within: What Is the Scope of Homegrown Terrorism?” July 1,
http://www.abajournal.com/magazine/article/the_threat_from_within_what_is_the_scope_of_homegrown_terrorism, ME)

Homegrown terrorism is a major national security threat to the United States in the 21st century because of the combination of violent extremist ideology—especially violent Islamist extremism and its suicidal terrorism—with **the Internet accelerating an individual’s radicalization and** with **the proliferation of technology enabling an individual to cause mass casualties or widespread disruption**. In other words, the scope of the insider threat to the United States in the 21st century is virtually unprecedented—there exists the potential for an individual within the United States, segregated within his or her own Internet community of sympathizers, to radicalize to violent extremism and then to utilize modern technology to kill millions of people or to hobble critical infrastructure. This insider threat requires a greater emphasis on preventing potentially catastrophic attacks before they occur. The attacks of Sept. 11, 2001, heightened America’s consciousness to the threat posed by violent Islamist extremism. “Violent Islamist extremism” refers to the ideology advocating creation of a global state that would impose the most radical version of Islamic law and the use of violence against non-Muslim military personnel and civilians and even against Muslim opponents of this ideology. To recruit adherents, violent Islamist extremism utilizes a narrative that the West, led by the United States, is at war with Islam. The process by which individuals adopt violent Islamist extremism is commonly called “radicalization.” Violent Islamist extremists demonstrated on 9/11 and in subsequent plots that they seek to kill large numbers of U.S. civilians domestically, and al-Qaida leadership has sanctioned the use and pursued the development of weapons of mass destruction. Moreover, the 9/11 attacks showed violent Islamist extremists’ willingness to commit suicide while attacking—thus making them difficult to deter. These characteristics make violent Islamist extremism the most dangerous terrorist threat to the United States. Indeed, the Obama administration has identified this threat—which it calls “violent extremism and terrorism inspired by al-Qaida and its affiliates and adherents”—as **the “pre-eminent” violent extremist threat** to the United States. The 9/11 hijackers came from outside the United States to attack. During the initial years after 9/11, the U.S. government assumed that the United States’ experience as a melting pot of immigrants pursuing the American dream was a bulwark against U.S. citizens—native and immigrant—radicalizing to violent Islamist extremism. This assumption seemed generally correct because there were only 21 cases of homegrown violent Islamist extremism—that is, terrorist attacks or plots by U.S. citizens, permanent residents or visitors radicalized largely within the United States—from Sept. 11, 2001 until April 2009. But since May 2009, there have been 32 cases of homegrown violent Islamist extremism. Two of these post-2009 cases have resulted in deaths on U.S. soil. On June 1, 2009, Carlos Bledsoe killed one service member and wounded a second at a military recruiting station in Little Rock, Ark. And on Nov. 5, 2009, 12 service members and one Department of Defense civilian were killed and 32 wounded at Fort Hood, Texas. Army-trained psychologist Major Nidal Hasan, who reportedly had radicalized to violent Islamist extremism during his military medical training, is being court-martialed for the attack. Other notable plots have included one in 2008 led by Najibullah Zazi to attack the New York City subway system and the attempt on May 1, 2010, by Faisal Shahzad to detonate a car bomb in Manhattan’s Times Square. The vast majority of these cases have not involved plans for suicide, but Zazi and his fellow plotters did plan their attack as a suicide mission and several Americans who joined the al-Shabaab terrorist group in Somalia reportedly became suicide attackers there. To be sure, these cases of homegrown violent Islamist extremism represent a tiny percentage of the estimated 6 million Muslim-Americans. Moreover, as Presidents George W. Bush and Barack Obama have stressed since 9/11, the United States is not at war with Islam but rather with adherents to an ideology that perverts it. However, this upward trend in cases is worrisome particularly when combined with the role of the Internet and the proliferation of destructive and disruptive technology. The Internet has facilitated radicalization to violent Islamist extremism and resulting terrorist activity. To be sure, the Internet has provided billions of people with access to information, and social media has played a critical role in democratic revolutions across the world. However, the Internet has also enabled radicalization, with violent Islamist extremists becoming adept at using the Internet to spread their propaganda. Violent Islamist extremists originally used password-protected forums, but they are now present on mainstream sites such as YouTube. The Internet enables individuals who are vulnerable to radicalization to find violent Islamist extremist material easily and to self-segregate and interact only with individuals who share that ideology—and in the privacy of their own homes. To be sure, homegrown violent Islamist extremist plots to date have not involved weapons of mass destruction but rather conventional explosives and firearms. Of course, firearms can cause significant casualties, such as the terrorist attack that killed 168 people in Mumbai, India, in November 2008. But the proliferation of mass destructive and disruptive technology enables even a single individual to wreak havoc domestically. For example, a single terrorist

with microbiological training and access to a laboratory with dangerous pathogens—or equipment enabling the synthesis of a new pathogen—could release a pathogen that could kill millions. In addition, an individual with cyberskills could cause extensive damage to infrastructure and even loss of life through a cyberattack, such as by interfering with “supervisory control and data acquisition” systems, which are computer systems controlling the underpinnings of modern society such as electrical power transmission, communications and airports. An individual could also gain access to radiological material—such as that held by hospitals for medical purposes—and create a “dirty bomb” that renders several city blocks or larger uninhabitable and sow panic. The vector of technological development thus continually increases the power of an individual to cause mass destruction and disruption. The result of the combination of violent extremism, especially violent Islamist extremism, the role of the Internet, and the proliferation of destructive technology is that the government must increasingly emphasize prevention of homegrown terrorism. This task is complicated by the fact that, although an overall four-stage model of radicalization to violent Islamist extremism does exist, individuals who have radicalized have not necessarily followed the model’s sequence of stages, and an analysis of homegrown terrorism cases does not reveal a profile to predict who will radicalize except that homegrown terrorists are predominantly male and approximately two-thirds are younger than 30. Immediately after the 9/11 attacks, Federal Bureau of Investigation Director Robert Mueller declared that the FBI—which had previously focused on investigating terrorism after its occurrence—now had the top priority of preventing terrorist attacks. To do so, the FBI needed to reorient itself from prosecutions after an attack to an intelligence-driven effort to detect and dismantle terrorist threats prior to an attack. For example, Mueller charged each of the 56 FBI field offices with “domain awareness,” defined as “a 360-degree understanding of all national security and criminal threats in any given city or community. It is the aggregation of intelligence, to include what we already know and what we need to know, and the development of collection plans to find the best means to answer the unknowns. With this knowledge, we can identify emerging threats, allocate resources effectively, and identify new opportunities for intelligence collection and criminal prosecution.” Director Mueller also declared that every counterterrorism lead would be pursued. However, prior to the 9/11 attacks, the FBI was not authorized to conduct investigative activity without sufficient factual predication that a crime was being or had been committed. In order for the FBI to become “intelligence-driven,” it had to develop a protocol for collecting intelligence information—meaning information concerning potential threats even if there was no factual predication of criminal activity. Without such a protocol, the FBI would have limited ability to track down counterterrorism leads that lacked predication of criminal activity or to gather information to be able to analyze the nature and trend of violent extremist threats above and beyond whatever criminal cases the FBI had ongoing. Accordingly, in 2008 Attorney General Michael Mukasey authorized and Director Mueller instituted a new FBI operational protocol permitting “assessments” when there is “no particular factual predication” that a crime has been committed and instead based on an “authorized purpose” such as “to detect, obtain information about, or prevent or protect against federal crimes or threats to the national security, or to collect foreign intelligence.” Limited investigative tools are permitted, including reviewing publicly available information and conducting physical surveillance not otherwise requiring a warrant—as opposed to intrusive tools such as wiretaps, which require a warrant. Assessments are prohibited “based solely on the exercise of First Amendment-protected activities or on the race, ethnicity, national origin or religion of the subject.” FBI agents must use the “least intrusive” investigative mechanisms possible. As stated in Mukasey’s authorization to the FBI, “For example, assessment activities may involve proactively surfing the Internet to find publicly accessible websites and services through which recruitment by terrorist organizations and promotion of terrorist crimes is opening taking place.”

Extinction

Nathan **MYHRVOLD**, PhD in theoretical and mathematical physics from Princeton, former chief technology officer of Microsoft, **13** [July 2013, “Strategic Terrorism: A Call to Action,” The Lawfare Research Paper Series No.2, <http://www.lawfareblog.com/wp-content/uploads/2013/07/Strategic-Terrorism-Myhrvold-7-3-2013.pdf>]

Several powerful trends have aligned to profoundly change the way that the world works. Technology now allows stateless groups to organize, recruit, and fund themselves in an unprecedented fashion. That, coupled with the extreme difficulty of finding and punishing a stateless group, means that stateless groups are positioned to be lead players on the world stage. They may act on their own, or they may act as proxies for

nation-states that wish to duck responsibility. Either way, stateless groups are forces to be reckoned with. At the same time, a different set of technology trends means that small numbers of people can obtain incredibly lethal power. Now, for the first time in human history, a small group can be as lethal as the largest superpower. Such a group could execute an attack that could kill millions of people. It is technically feasible for such a group to kill billions of people, to end modern civilization—perhaps even to **drive the human race to extinction**. Our defense establishment was shaped over decades to address what was, for a long time, the only strategic threat our nation faced: Soviet or Chinese missiles. More recently, it has started retooling to address tactical terror attacks like those launched on the morning of 9/11, but the reform process is incomplete and inconsistent. A real defense will require rebuilding our military and intelligence capabilities from the ground up. Yet, so far, strategic terrorism has received relatively little attention in defense agencies, and the efforts that have been launched to combat this existential threat seem fragmented. History suggests what will happen. The only thing that shakes America out of complacency is a direct threat from a determined adversary that confronts us with our shortcomings by repeatedly attacking us or hectoring us for decades.

2NC DA – Uniqueness Wall

Number one terrorist threat to the U.S. is homegrown extremism that comes from recruitment over the Internet and social media – metadata collection is key to track domestic terrorist activity and prevent lone wolf attacks that destroy critical infrastructure – if their evidence isn't in context of homegrown extremists and data collection strike it from your flow – that's 1NC Carafano

Terrorist organizations watching policy changes closely – the aff would cause a major perceptual shift

Corcoran 5-31-15 (Kieran, “Head of CIA warns that US is at risk of lone wolf terror attack after NSA powers to monitor all phone calls expired – as Isis ‘watch carefully’ for security gaps,” <http://www.dailymail.co.uk/news/article-3105089/Senate-makes-ditch-bid-extend-NSA-s-bulk-collection-phone-records-Rand-Paul-swears-block-legislation-let-Patriot-Act-expire.html>, ME)

The head of the CIA has warned that Americans are now at risk after the Senate was unable to extend laws giving authorities special powers to fight terrorists. Politicians in the upper house were unable to come to an agreement to extend key parts of the Patriot Act - that legalize controversial methods of surveillance by the National Security Agency (NSA) - which expired on Sunday. Attempts were frustrated by Presidential candidate Rand Paul, who has taken a firm stance against the extension of powers allowing the mass collection of phone records, wire taps and warrants without evidence. But the Head of the CIA John Brennan claims ordinary Americans, who expect the NSA to do their jobs, have been put at risk by 'political grandstanding and crusading for ideological causes' that fueled the debate. Speaking on CBS show Face The Nation, he warned that the US - and Europe - is now in danger from technologically 'sophisticated' terrorists who are watching developments carefully and 'looking for the seams to operate' within. He claimed that the authorities do not abuse the powers, extended in 2011 to help fight lone wolf terror suspects not connected to a specific group, and that without them, it's difficult for the NSA to protect America. Mr Brennan said: 'I think terrorist elements have watched very carefully what has happened here in the United States, whether or not it's disclosures of classified information or whether it's changes in the law and policies. They are looking for the seams to operate within. 'And this is something that we can't afford to do right now, because if you look at the horrific terrorist attacks and violence that is being perpetrated around the globe, we need to keep our country safe. And our oceans are not keeping us safe the way they did a century ago.' The Patriot Act was passed in 2001 in the wake of the 9/11 terror attacks. Now that the provisions have expired, government agents will need to subpoena phone companies for the records. The White House previously justified collecting the records because of the Patriot Act's Section 215, which expired on Sunday. Two other provisions, added in 2011, also expired with it. The first is a 'roving wiretap' provision which allows government agencies to keep tracking suspects as they switch devices. The second is a 'lone wolf' clause which allows warrants to be granted without any evidence linking a suspect to a foreign power or terrorist group. Political struggles over the NSA and its data collection have become a national issue since whistleblower Edward Snowden revealed the extent of government programs in 2013. The senate's efforts to pass a replacement bill were frustrated by Kentucky's junior senator Rand Paul, who has spoken at length against the NSA's activities, which he has excoriated as illegal and unconstitutional. Paul, a Republican who is running for president, came up against members of his own party, as well as the Obama administration. With his presidential campaign waning, he has been accused of irresponsible political opportunism by opponents, by fighting a bill on ideological grounds that may put ordinary people at risk. He was criticized by the White House Sunday night, which called the Patriot Act expiration an 'irresponsible lapse'. While Brennan didn't mention Paul by name, he said on Face The Nation: 'Unfortunately I think there is a little too much political grandstanding and crusading for ideological causes that have really fuelled the debate on this issue. He added: 'These are authorities that have been used by the government to make sure that we're able to safeguard Americans. And the sad irony is that most

Americans expect the government to protect them. And so although there's a lot of debate that goes on, on the Congress and the Hill on this issue, I think, when you go out to Boise or Tampa or Louisville, Americans are expecting their law enforcement and homeland security and intelligence professionals to do their work. And these authorities are important.' Paul argued 'there must be another way' but even he agrees that the lapse in these powers are likely to be temporary as politicians work on the USA Freedom Act, which is expected to pass within the next week. Republican Senate Majority Leader Mitch McConnell called a rare Sunday session to try to pass the replacement law, but was unable to push it through in time. And although the replacement is set to pass this week, Paul said the expiration was 'a victory no matter how you look at it'. In a statement, he said: 'It might be short lived, but I hope that it provides a road for a robust debate, which will strengthen our intelligence community, while also respecting our Constitution. He added: 'The expiration of the NSA's sweeping, all-encompassing and ineffectual powers will not relinquish functions necessary for protecting national security. The expiration will instead do what we should have done all along - rely on the Constitution for these powers.' According to a top lawmaker, as of 8pm Sunday no NSA employee could access their enormous phone records database, which holds metadata on millions of phone conversations handed over by telecoms companies like Verizon and AT&T. Senate Intelligence Committee chairman Richard Burr said on Sunday: 'There is no way to get any type of agreement tonight -- either an extension or passage of a bill. So at 8pm tonight, NSA employees can not query the database'. In a statement issued Sunday night, Obama's press secretary Josh Earnest, urged action to pass the USA Freedom Act as quickly as possible. He said: 'The Senate took an important - if late - step forward tonight. We call on the Senate to ensure this irresponsible lapse in authorities is as short-lived as possible. 'On a matter as critical as our national security, individual Senators must put aside their partisan motivations and act swiftly. The American people deserve nothing less.' Some lawmakers have said the lapse raises alarming questions about how US authorities can keep the homeland safe with a diminished security toolbox. 'I think it's very very unfortunate that we're in this position,' said Senator Mike Lee, a conservative Republican who supports the reform bill. 'We've known this date was coming for four years. Four years. And I think it's inexcusable that we adjourned' for a weeklong break last week without resolving the issue. Lee, too, conceded that the reform bill would most likely pass in the coming week. **With the clock ticking, CIA chief John Brennan warned Sunday that allowing vital surveillance programs to lapse could increase terror threats, and argued that the phone metadata dragnet has not abused civil liberties and only serves to safeguard citizens.** 'This is something that we can't afford to do right now,' Brennan said of allowing the counterterrorism provisions to expire. 'Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,' he said on CBS talk show Face the Nation. Brennan added that online threats from groups like Isis would continue to grow over the next five to ten years. He said: 'Isis has been very sophisticated and adept at using the Internet to propagate its message and reach out to individuals. We see what is happening as far as thousands upon thousands of individuals, including many thousands from the West, that have traveled into Syria and Iraq. And a number of these individuals are traveling back. 'And what we see, they're also using the Internet as a way to incite and encourage individuals to carry out acts of violence. 'So as the director of FBI says, you know, this use of these websites and their Internet capabilities is something of great concern. So yes, I think ISIS is a threat not just in the Middle East and South Asia and African regions but also to Europe as well as to the United States.'

The threat is rising --- NSA surveillance disrupts attacks

Bolton 15. [John R., Formerly served as the U.S. permanent representative to the United Nations, and under secretary of state for arms control and international security. At AEI, Ambassador Bolton's area of research is U.S. foreign and national security policy. 4/28/ "NSA activities key to terrorism fight," American Enterprise Institute, <https://www.aei.org/publication/nsa-activities-key-to-terrorism-fight/>.

Congress is poised to decide whether to re-authorize programs run by the National Security Agency that assess patterns of domestic and international telephone calls and emails to uncover linkages with known terrorists. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, have played a vital role in protecting America and our citizens around the world from the still-metastasizing terrorist threat. The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural

protections to prevent spying on U.S. citizens.¶ Nonetheless, critics from the right and left have attacked the NSA for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics, hoping to score political points with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail."¶ The ill-informed nature of the debate has facilitated scare-mongering, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And there is an important asymmetry at work here as well. The critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond. By definition, the programs' success rests on the secrecy fundamental to all intelligence activities. Frequently, therefore, explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists and others, in turn, could use to stymie future detection efforts.¶ After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since his approach to foreign and defense issues has consistently reflected near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces.¶ In fact, just in the year since Congress last considered the NSA programs, the global terrorist threat has dramatically increased. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. Boko Haram is expanding beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016.¶ This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Terrorist threats are high now – intel is key

Collins 15 (Eliza, wirtler for Politico, 5/10, "Mike McCaul Warns of Growing Us Terrorist Threat")

More people are being recruited by terrorist groups than the FBI estimates, the chairman of the House Homeland Security Committee said on Sunday.¶ FBI Director James Comey said last week that hundreds, maybe thousands of people, are being recruited on encrypted websites that the FBI can't penetrate to carry out attacks in the U.S.¶ "We have this phenomenon in the United States where they can be activated by the Internet. Really, terrorism has gone viral," Rep. Mike McCaul (R-Texas) said on "Fox News Sunday."¶ The Texas shooting was a textbook case of law enforcement intercepting a threat, McCaul said, but homegrown terrorism is nonetheless difficult to stop.¶ Late last week, **the U.S. raised the threat level at all U.S. military bases.**¶ "This threat is like finding a needle in the haystack sometimes - and it's going to get worse, not better," McCaul warned.

A2: No Attack Coming Now

Terrorist attacks on the rise – surveillance is key to prevent the next attack

Zuckerman, Bucci and Carafano 13 (Jessica, Policy Analyst, Western Hemisphere, Heritage Foundation, Steven P., Director of the Center for Foreign and National Security Policy at the Heritage Foundation, and James Jay, PhD, Vice President for the Institute for National Security and Foreign Policy, "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism")

Strengthening the Domestic Counterterrorism Enterprise¶ Three months after the attack at the Boston Marathon, the pendulum of awareness of the terrorist threat has already begun to swing back, just as it did after 9/11. Due to the resilience of the nation and its people, for most, life has returned to business as usual. The threat of terrorism against the United States, however, remains.¶ Expecting to stop each and every threat that reaches a country's borders is unreasonable, particularly in a free society committed to individual liberty. Nevertheless, there are important steps that America's leaders can take to strengthen the U.S. domestic counterterrorism enterprise and continue to make the U.S. a harder target. Congress and the Administration should:¶ Ensure a proactive approach to preventing terrorist attacks. Despite the persistent threat of terrorism, the Obama Administration continues to focus on reactive policies and prosecuting terrorists rather than on proactive efforts to enhance intelligence tools and thwart terrorist attempts. This strategy fails to recognize the pervasive nature of the threat posed by terrorist groups such as al-Qaeda and homegrown extremism. The Administration, and the nation as a whole, should continue to keep in place a robust, enduring, and proactive counterterrorism framework in order to identify and thwart terrorist threats long before the public is in danger.¶ Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sunset provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.¶ Break down the silos of information. Washington should emphasize continued cooperation and information sharing among federal, state, and local law enforcement agencies to prevent terrorists from slipping through the cracks between the various jurisdictions. In particular, the FBI should make a more concerted effort to share information more broadly with state and local law enforcement. State and local law enforcement agencies are the front lines of the U.S. national security strategy. As a result, local authorities are able to recognize potential danger and identify patterns that the federal authorities may miss. They also take the lead in community outreach, which is crucial to identifying and stopping "lone wolf" actors and other homegrown extremists. Federal law enforcement, on the other hand, is not designed to fight against this kind of threat; it is built to battle cells, groups, and organizations, not individuals.¶ Streamline the domestic counterterrorism system. The domestic counterterrorism enterprise should base future improvements on the reality that governments at all levels are fiscally in crisis. Rather than add additional components to the system, law enforcement officials should streamline the domestic counterterrorism enterprise by improving current capabilities, leveraging state and local law enforcement resources and authorities, and, in some cases, reducing components where the terrorist threat is not high and the financial support is too thin or could be allocated more effectively. For example, the Department of Homeland Security should dramatically reduce the number of fusion centers, many of which exist in low-risk areas or areas where similar capabilities exist. An easy way to reduce the number of fusion centers is to eliminate funding to those that are located outside the 31 urban areas designated as the highest risk.¶ Fully implement a strategy to counter violent extremism. Countering violent extremism is an important complementary effort to an effective counterterrorism strategy. In August 2011, the U.S. government released a strategic plan called "Empowering Local Partners to Prevent Violent Extremism in the United States." [209] The plan focuses on outlining how federal agencies can assist local officials, groups, and private organizations in preventing violent extremism. It includes strengthening law enforcement cooperation and helping communities understand how to counter extremist propaganda

(particularly online). Sadly, this plan is not a true strategy. It fails to assign responsibilities and does not direct action or resource investments. More direction and leadership must be applied to transform a laundry list of good ideas into an effective program to support communities in protecting and strengthening civil society.¶ Vigilance Is Not Optional¶ In a political environment of sequestration on the one hand and privacy concerns on the other, there are those on both sides of the aisle who argue that counterterrorism spending should be cut and U.S. intelligence agencies reigned in. As the above list indicates however, **the long war on terrorism is far from over**. Most disturbingly, **an increasing number of Islamist-inspired terrorist attacks are originating within America's borders. The rise of homegrown extremism is the next front in the fight against terrorism and should be taken seriously by the Administration.**¶ **While there has not been another successful attack on the homeland on the scale of 9/11, the bombings in Boston reminded the country that the threat of terrorism is real and that continued vigilance is critical to keeping America safe.** Congress and the Administration must continue to upgrade and improve the counterterrorism capabilities of law enforcement and intelligence agencies as well exercise proper oversight of these capabilities. The American people are resilient, but the lesson of Boston is that **the government can and should do more to prevent future terror attacks.**

The threat is increasing – recruiting levels

VOA News 15 (Homeland Security Chief: Global Terror Threat Has Entered 'New Phase'" 5/11)

Appearing on the Fox News Sunday broadcast from Paris, Congressman Michael McCaul, chairman of the House Homeland Security Committee, said there has been an uptick in threat streams against local police and military bases.¶ "We're seeing these on an almost daily basis. It's very concerning. I'm over here with the French counter-terrorism experts on the Charlie Hebdo case, how we can stop foreign fighters coming out of Iraq and Syria to Europe. But then, we have this phenomenon in the United States where they (terrorists) can be activated by the Internet. **And, really, terrorism has gone viral.**" said McCaul.¶ McCaul said the potential terror threat may even be greater than the FBI has outlined. **He said the United States faces two threats: one from fighters coming out of the Middle East and the other from thousands at home who will take up the call to arms when the IS group sends out an Internet message.** He warned **the threat will only get worse**, largely because **of the existence of so many failed states in the Middle East and North Africa.**

Lone wolf risk is growing

Zenko 15 (Micah, 5/19, Council on Foreign Relations, "Is US Foreign Policy Ignoring Homegrown Terrorists?")

On February 12, National Counterterrorism Center Director Nicholas Rasmussen told the Senate Select Committee on Intelligence:¶ **"We face a much greater, more frequent, recurring threat from lone offenders and probably loose networks of individuals. Measured in terms of frequency and numbers, it is attacks from those sources that are increasingly the most noteworthy..."**¶ On February 26, during the annual worldwide threats hearing, Director of National Intelligence James Clapper warned:¶ **"Home-grown violent extremists continue to pose the most likely threat to the homeland."**¶ Last Friday, Secretary of Homeland Security Jeh Johnson stated on MSNBC:¶ **"We're in a new phase...**in the global terrorist threat where, because of effective use of social media, the Internet, by ISIL, al-Qaeda, we have to be concerned about the independent actor who is here in the homeland who may strike with little or no warning..."¶ Finally, yesterday, former CIA deputy director Michael Morell described the messaging efforts of jihadist groups generally and the self-declared Islamic State (IS) more specifically:¶ **"Their narrative is pretty powerful: The West, the United States, the modern world, is a significant threat to their religion. Their answer to that is to establish a caliphate. And they are being attacked by the U.S. and other Western nations, and by these apostate regimes in the region. Because they are being attacked they need support in two ways; people coming to fight for them, and people coming to stand up and attack**

coalition nations in their home.”¶ In summary, the most likely—though not most lethal—terror threats to Americans come from individuals living within the United States who are partially motivated to undertake self-directed attacks based upon their perception that the United States and the West are at war with the Muslim world.

Al-Qaeda planning attacks now – surveillance is key

Wall Street Journal 15. Cassell Bryan-Low. “U.K. MI5 Chief Andrew Parker Warns of Threat of al Qaeda Attack in West,” <http://www.wsj.com/articles/u-k-mi5-chief-andrew-parker-warns-of-threat-of-al-qaeda-attack-in-west-1420757705>.

LONDON—The head of the U.K.’s domestic intelligence agency said Thursday that al Qaeda continued to pose an immediate threat and was planning large-scale attacks against the West.¶ In a rare public speech, MI5 chief Andrew Parker said “a group of core al Qaeda terrorists in Syria is planning mass casualty attacks against the West,” without elaborating on how advanced such planning was. The comments underscore that the terrorist threat remains diverse despite the recent focus on Islamic State, which has gained territory in Syria and Iraq.¶ The comments, made at MI5’s London headquarters, come on the heels of Wednesday’s shooting attack in Paris, which left 12 people dead. While authorities haven’t yet confirmed any possible connections of the perpetrators to terrorist organizations, intelligence officials have said that links to al Qaeda were a possibility.¶ In his remarks, Mr. Parker briefly addressed the Paris attack. “It is too early for us to come to judgments about the precise details or origin of the attack, but it is a terrible reminder of the intentions of those who wish us harm,” Mr. Parker said.¶ Speaking more generally, Mr. Parker said, “we face a very serious level of threat that is complex to combat and unlikely to abate significantly for some time.” He added that in recent months, authorities have prevented three U.K. terrorist plots that “would certainly” have resulted in deaths.¶ Mr. Parker said there had been an increase in the number of “crude but potentially deadly plots” and cited last year’s attacks in Canada and Australia as examples. “Such attacks are inherently harder for intelligence agencies to detect,” he said. “They are often the work of volatile individuals, motivated by terrorist propaganda rather than working as part of sophisticated networks. They often act spontaneously or after very short periods of prior training.”¶ He focused in particular on the threat stemming from the conflict in Syria. There have been more than 20 terrorist plots outside of Syria and Iraq that were either directed or provoked by extremist groups in Syria, including those in Canada, Australia, Belgium and France, according to Mr. Parker.¶ Britain’s security agencies in August raised the assessment of the threat from international terrorism to “severe” from “substantial,” the second-highest level on its five-point scale, primarily because of the threat of Islamist militants in Syria. The change, which triggered a step-up in security measures such as visible police patrols, reflects an assessment that an attack is highly likely but that there isn’t intelligence to suggest an imminent terror strike.¶ The MI5 chief said some 600 extremists now had traveled from Britain to Syria and that a “significant proportion” of those had joined Islamic State, also known as ISIL.¶ He also talked about the stiff challenges intelligence agencies face, ranging from the difficulty in collecting intelligence in Syria, where the U.K. has no partner agency to work with to technological challenges more broadly.¶ As the terrorism threat is increasing, intelligence agencies are finding their ability to counter them is decreasing, he said. The reasons include the increased availability—and use—of encryption that makes it harder for intelligence agencies to intercept communications.¶ “Changes in the technology that people are using to communicate are making it harder for the agencies to maintain the capability to intercept the communications of terrorists,” he said. “The further reduction of this capability will seriously harm our ability to investigate and disrupt such threats in the future.”¶ Mr. Parker also waded into Britain’s feud with Internet companies over how much they should help in combating terrorist activity. British authorities say they remain frustrated that U.S. Internet

companies don't feel obliged to comply with U.K. warrants requesting information about users.¶ He said intelligence agents need to be able to access communication among terrorists if they are to do their job, which means including the assistance of companies which hold relevant data. "Currently this picture is patchy," he said.¶ He also defended the communications-data gathering work by intelligence agencies, which has come under criticism following the disclosure of mass-surveillance techniques by former U.S. National Security Agency contractor Edward Snowden.¶ "MI5 does not browse through the private lives of the population at large," he said. "We need to have powerful capabilities that enable us to range widely, with the potential to reach anyone who might threaten national security—but with our efforts always concentrated on the tiniest minority who actually present threats."

A2: PATRIOT Act Expiration

NSA still has sufficient surveillance authority

Salon, 6-1 [Marcy Wheeler. “Reports of the Patriot Act’s death are greatly exaggerated,” [http://www.salon.com/2015/06/01/reports_of_the_patriot_acts_death_are_greatly_exaggerated/.](http://www.salon.com/2015/06/01/reports_of_the_patriot_acts_death_are_greatly_exaggerated/)]

The PATRIOT Act-authorized phone dragnet expired last night. For the first time since 2006, the NSA won’t receive records of the phone calls you make within the United States.¶ But that doesn’t mean spying on Americans has stopped. The NSA still obtains records of calls — potentially all calls — you make with people overseas. It still tracks Americans’ Internet communications using metadata obtained overseas. The FBI can still access the content of any communications Americans have with foreigners targeted under PRISM without a warrant or even any evidence of wrong doing. FBI can still, and indeed does, obtain phone records of individuals in conjunction with national security investigations without any court review.¶ Not even the spying conducted under Section 215 — the authority that had been used to collect all of Americans’ phone records, but which is also used to collect certain kinds of Internet data — or the two other expiring provisions will stop. Because they’re tied to more focused investigations (though the Internet collection is probably not targeted at one individual), they will probably continue under a grandfather clause allowing ongoing investigations using those authorities to continue.

NSA surveillance authority is likely to be restored.

Slate, 6/1/2015. Lily Hay Newman. “NSA Bulk Data Collection Expired Last Night. What’s Different Today?” http://www.slate.com/blogs/future_tense/2015/06/01/portions_of_the_patriot_act_expired_on_may_31_what_does_that_mean.html.

Yesterday bulk collection was in effect, but are we being surveilled today? For the first time in 14 years, there’s no automatic NSA mechanism for recording who you call and when you call them. But there are still ways for the NSA to use its network abroad to get information about your international calls and online browsing. The agency can even still get the content of your international communications through PRISM. Salon’s Marcy Wheeler writes, “Reports of the Patriot Act’s death are greatly exaggerated”

The NSA still obtains records of calls—potentially all calls—you make with people overseas. It still tracks Americans’ Internet communications using metadata obtained overseas. The FBI can still access the content of any communications Americans have with foreigners targeted under PRISM without a warrant or even any evidence of wrongdoing. The FBI can still, and indeed does, obtain phone records of individuals in conjunction with national security investigations without any court review.

In addition to the halt in bulk NSA communication surveillance, the act’s expiration means that the FBI can no longer use it to get sweeping wiretap orders to track a suspect when he or she changes phones. Each new device now requires a fresh warrant. Additionally, the agency can no longer use the act to justify wiretaps of “lone wolf” terrorism suspects—individuals who don’t have a known affiliation to a larger group.

As the New York Times points out, though, it seems that the NSA is keeping its existing trove of data, since the Justice Department will have grandfathered ability to continue to access files for ongoing investigations. The Times also indicates that law enforcement agencies have other workarounds to continue to get the approvals they want.

In the tension between the security need for surveillance and the desire to preserve individuals’ rights to privacy, it seems like eliminating bulk surveillance would be an obvious solution. So that would make today a better day than yesterday, right? But there is strong bipartisan agreement

that some surveillance is necessary to maintain safety from international bad actors.
Rep. Adam Schiff, a Democrat from California, called the expiration “a lose-lose.”

The Senate will probably restore the expired portions of the act this week. And Congress has been mulling alternatives, like the USA Freedom Act, which would notably mandate that phone companies, not the government itself, store bulk collections. That way, agencies would have to go through the Foreign Intelligence Surveillance Act court in order to pull individual records, instead of having full, broadly approved access.

New NSA reforms allow metadata

Lake 5-20 (Eli, Bloomberg View, "Congress Falls out of Love with the Surveillance State")

There is urgency to act. The Patriot Act provision on NSA bulk metadata collection expires June 1.¶ Nunes told us the chances of just reauthorizing section 215 of the Patriot Act when an alternative bill was on the floor were slim. He said he reluctantly endorsed the slimmed-down approach to data collection: "Do you want to keep something and hope the changes can work, or risk the whole program going dark?"¶ **To be sure, the new bill still allows the FBI and NSA to search the numbers dialed and times and dates of phone calls to find the confederates of terrorists in the United States.** But no longer would the NSA be allowed to store those records. Eventually, President Obama made it known that he favors the changes as well. Nunes told us Obama met with the chairmen and ranking members of the House and Senate intelligence committees last Monday and said he supported the new legislation.

A2: Lone Wolf Overwhelms

DHS attention has refocused on lone wolf now – the threat is growing

Fobbs 14 – Kevin Fobbs began writing professionally in 1975 and has been published in the "New York Times," and written for the "Detroit News," "Michigan Chronicle," "GOPUSA", "Soul Source" magazine and "Writers Digest" magazine. As the former Community Concerns columnist for 12 years with The Detroit News, "Is America ready – U.S. officials fear radicalized lone-wolf terrorist plots maybe soon!" <http://buzzpo.com/america-ready-u-s-officials-fear-radicalized-lone-wolf-terrorist-plots-maybe-soon/>

How prepared do you believe America is if ISIS or Al Qaeda terrorism crept into your neighborhood and attacked? Are you as afraid as many U.S. intelligence community officials are who fear radicalized citizens will carry out lone-wolf terrorist plots? Maybe you and your family should be. Because, according to PBS News, Obama administration officials are suggesting a far ranging list of threat assessments to America's national security. But chief among them are the lone-wolf terrorist plots because, "they don't require large conspiracies of people whose emails or phone calls can be intercepted." Unlike the September 11th 2001 terrorist attacks on America's homeland, these breed of terrorists are not only well trained but they have joined or are affiliated with ISIS; a well financed terrorist organizational network. This extremist group has established a highly efficient caliphate, or Islamic state, in eastern Syrian and northern and western Iraq; it is also the group that is responsible for the beheading of American journalist James Foley. Although Obama and his administration officials appear to be discounting the seriousness of terrorist attacks on America by lone-wolf operators to the same degree as Britain, they should. On Friday, England raised its terror threat to its second highest level from "substantial" to "severe". They have based this reaction to intelligence community information in Britain that cites that an "a foreign fighter danger that made a terrorist attack "highly likely," reported PBS News. America does not have to wonder if this type of terrorism can happen, because it did with the 2013 Boston Marathon bombings. Several people were killed and dozens of innocent citizens were injured. By apparent self-radicalized American brothers Dzhokhar and Tamerlan Tsarnaev. Then of course there was the New York Times bomb attempt in 2010 by Faisal Shahzad. Shahzad had received training and instructions while in Pakistan. Is America ready for this threat, even though the White House refuses to declare the jihadists and ISIS declared terrorist intentions real? This should definitely concern the nation because it only take approximately 90 seconds of period of violence to harm hundred if not thousands of Americans, from the alleged 200 plus citizens who have gone to fight for extremist terrorists in Iraq and Syria. The real pressing urgent matter lies in the terrorist trained Americans that return to American soil. Rutgers University professor John Cohen who recently left as Homeland Security Department's counterterrorism coordinator stressed that the officials worked very hard, "to detect Westerners who have gone to Syria, no one knows for sure whether there are those who have gone there undetected." reported PBS News. As the 9/11 terrorist attack anniversary approaches it is probably wise for all Americans to be aware of not just the possibility that a terrorist act could occur, but to report anything suspicious to law enforcement. Remember, America does not get a second chance to get it right.

Preparedness is increasing – local law enforcement are ramping up vigilance

Perez and Prokupecz 15 -- Evan Perez joined CNN as a justice reporter in 2013. In his current role, he regularly writes for CNN.com and appears across the network's programs to report on his findings. Shimon Prokupecz covers law enforcement for CNN and is based in New York City. "FBI struggling with surge in homegrown terror cases" <http://www.cnn.com/2015/05/28/politics/fbi-isis-local-law-enforcement/>

New York (CNN)The New York Police Department and other law enforcement agencies around the nation are increasing their surveillance of ISIS supporters in the U.S., in part to aid the FBI which is struggling to keep up with a surge in the number of possible terror suspects, according to law enforcement officials. The change is part of the fallout from the terrorist attack in Garland, Texas earlier this month. The FBI says two ISIS supporters attempted a gun attack on a Prophet Mohammad cartoon contest but were killed by police. One of the attackers, Elton Simpson, was already under investigation by the FBI but managed to elude surveillance to attempt the foiled attack. FBI Director James Comey told a group of police officials around the country in a secure conference call this month that the FBI needs help to keep tabs on hundreds of suspects. As a result, some police agencies are adding surveillance teams to help the FBI monitor suspects. Teams of NYPD officers trained in surveillance are now helping the FBI's surveillance teams to better keep track of suspects, law enforcement officials say. NYPD Commissioner William Bratton has said he wants to add 450 officers to the force's counterterrorism unit, partly to counter the increasing domestic threat posed by ISIS sympathizers. The same is happening with other police departments around the country. The Los Angeles Police Department's counterterrorism unit is also beefing up its surveillance squads at the request of the FBI, law enforcement officials say. Comey said at an unrelated news conference Wednesday that he has less confidence now that the FBI can keep up with the task. "It's an extraordinarily difficult challenge task to find -- that's the first challenge -- and then assess those who may be on a journey from talking to doing and to find and assess in an environment where increasingly, as the attorney general said, their communications are unavailable to us even with court orders," Comey said. "They're on encrypted platforms, so it is an incredibly difficult task that we are enlisting all of our state, local and federal

partners in and we're working on it every single day, but I can't stand here with any high confidence when I confront the world that is increasingly dark to me and tell you that I've got it all covered," he said. **"We are working very, very hard on it but it is an enormous task."**

On Saturday, **an FBI spokesman said the bureau doesn't have a shortage of resources** and the Garland attack wasn't the result of lack of surveillance personnel. If agents had any indication that Simpson was moving toward an attack, they would have done everything to stop it, the spokesman said. **The appeal for local help isn't intended to seek more surveillance, but**

more broadly to encourage local law enforcement to increase vigilance given the

heightened threat, the FBI said. The Garland attack prompted a reassessment for FBI officials. Simpson's social media and other communications with known ISIS recruiters drew the FBI's interest earlier this year. FBI agents in Phoenix began regular surveillance of Simpson, though it was not round-the-clock monitoring, according to a U.S. official. The agents watching Simpson noticed he disappeared for a few days. Investigators looked into his communications and found social media postings making reference to the Garland cartoon contest. That discovery is what prompted the FBI to send a bulletin to the joint terrorism task force that was monitoring the Garland event. The bulletin arrived about three hours before the attack. Comey told reporters this month the FBI had no idea Simpson planned to attack the event or even that he had traveled from his home in Phoenix to Texas.

A2: Losing War on Terror

We'll win the WOT – intel gathering is key

McDONOUGH 2/28/15 – Doug, Citing American spy, James Olson “**U.S. winning the war on terror**”
http://www.myplainview.com/news/article_c1881ec4-bf9b-11e4-a9b1-b342ff9491d6.html

After spending 31 years as an American spy, James Olson is blunt in his assessment. “Make no mistake, our country is at war,” he said Thursday while keynoting the annual Plainview Chamber of Commerce banquet. “It’s a war on terror, and it will be long, bloody and deadly. But America will win this war because our best young people today are stepping forward in droves.” While many of those are putting on uniforms and joining the ranks of the nation’s combat forces on the front lines, still more are going in harm’s way behind the scenes as counterintelligence operatives. “We are on the front lines in the war on terror,” Olson warns. “And we will be hit again, inside our own borders. It will be a weapon of mass destruction, and no region or sector is immune from this attack. The best way to combat this threat is through good intelligence.” Olson was in his final year as a law student at the University of Iowa on the fast track to fulfill his dream of practicing law in a rural town when he received a phone call one Friday afternoon.

We’re winning the war on terrorism now -- Continued vigilance is key

Zenko 4/8/15 – Zenko covers the U.S. national security debate and offers insight on developments in international security and conflict prevention. “CIA Director: We’re Winning the War on Terror, But It Will Never End”
<http://blogs.cfr.org/zenko/2015/04/08/cia-director-were-winning-the-war-on-terror-but-it-will-never-end/>

Last night, Director of Central Intelligence John Brennan participated in a question-and-answer session at Harvard Kennedy School’s Institute of Politics. The first thirty-seven minutes consisted of an unusually probing exchange between Brennan and Harvard professor Graham Allison (full disclosure: Graham is a former boss of mine). Most notably, between 19:07 and 29:25 in the video, Allison pressed Brennan repeatedly about whether the United States is winning the war on terrorism and why the number of al-Qaeda-affiliated groups has only increased since 9/11: “There seem to be more of them than when we started...How are we doing?” Brennan replied: If I look across the board in terms of since 9/11 at terrorist organizations, and if the United States in all of its various forms, In intelligence, military, homeland security, law enforcement, diplomacy. If we were not as engaged against the terrorists, I think we would be facing a horrendous, horrendous environment. Because they would have taken full advantage of the opportunities that they have had across the region... We have worked collectively as a government but also with our international partners very hard to try and root many of them out. Might some of these actions be stimulants to others joining their ranks? Sure, that’s a possibility. I think, though it has taken off of the battlefield a lot more terrorists, than it has put on. This statement is impossible to evaluate or measure because the U.S. government has consistently refused to state publicly which terrorist organizations are deemed combatants, and can therefore be “taken out on the battlefield.” However, relying upon the State Department’s annual Country Reports on Terrorism, the estimated strength of all al-Qaeda-affiliated groups has grown or stayed the same since President Obama came into office. Of course, non-al-Qaeda-affiliated groups have arisen since 9/11, including the self-proclaimed Islamic State, which the Central Intelligence Agency estimated last September to contain up to 31,500 fighters, and Boko Haram, which has perhaps 10,000 committed members. However, the most interesting question posed to Brennan came at the very end from a Harvard freshman who identified himself as Julian: “We’ve been fighting the war on terror since 2001. Is there an end in sight, or should we get used to this new state of existence? Brennan replied: It’s a long war, unfortunately. But it’s been a war that has been in existence for millennia, at the same time—the use of violence for political purposes against noncombatants by either a state actor or a subnational group. Terrorism has taken many forms over the years. What is more challenging now is, again, the technology that is available to terrorists, the great devastation that can be created by even a handful of folks, and also mass communication that just proliferates all of this activity and incitement and encouragement. So you have an environment now that’s very conducive to that type of propaganda and recruitment efforts, as well as the ability to get materials that are going to kill people. And so this is going to be something, I think, that we’re always going to have to be vigilant about. There is evil in the world and some people just want to kill for the sake of killing...This is something that, whether it’s from this group right now or another group, I think the ability to cause damage and violence and kill will be with us for many years to come. We just have to not kill our way out of this because that’s not going to address it. We need to stop those attacks that are in train

but we also have to address some of those underlying factors and conditions. I'm not saying that poverty causes somebody to become a terrorist, or a lack of governance, but they certainly do allow these terrorist organizations to grow and they take full advantage of those opportunities. To summarize, **the war on terrorism is working, compared to inaction or other policies. But, the American people should expect it to continue** for millennia, or as long as lethal technologies and mass communication remain available to evil people.

Current strategies prevent attacks – groups can still rebound – intel key

Pomerleau 4/24/15 – Mark, bachelor's degree in Political Science from Westfield State University. a freelance journalist in Washington covering politics and policy. "Is the US Winning the War on Terror?" <http://www.theepochtimes.com/n3/blog/is-the-us-winning-the-war-on-terror/>

The War on Terror, or described differently, the global struggle to curb violent extremism, can be boiled down to optics and rhetoric. While military operations play a small role, the larger conflict encompasses so much more. The United States has struggled both on and off the battlefield to win this conflict but victory can be, and in this case, is subjective. Successes: **The United States deposed the Taliban regime that ruled Afghanistan in the 1990s and early 2000s, that provided al-Qaeda safe-haven. The uprooting of these sanctuaries put both organizations on the run, which disrupted their long-term planning against the U.S. homeland. Drone strikes and raids have allowed the U.S. to take out several key leaders** of these terrorist entities, dealing a blow to operational planning. Documents and correspondence between Osama bin Laden and his associates unveiled in the trial of an al-Qaeda member in February that the robust aerial drone campaign expanded by the Obama administration had a profound impact in limiting the movements of terrorist groups hiding out in Pakistan. The ability of drones to loiter 24/7 combined with Special Operations Forces raids allowed the United States to gain intrusive access to and vital intelligence about the inner workings of terrorist organizations. **There has not been a successful attack on the homeland since 9/11, due in part to changes made to the intelligence community after 9/11 and counterterrorism operations. Additionally, the U.S. has made great strides in monitoring would-be domestic terror suspects and prosecuted them with the full extent of the law.**

Failures: While the U.S. was successful in degrading terrorist entities, it was unsuccessful in destroying them.

Consider the Islamic State group's predecessor organization, al-Qaeda in Iraq/Islamic State of Iraq (AQI/ISI). The group was severely weakened as a result of the Iraqi Tribal Awakening Movement when Iraqi tribes joined the U.S. surge to dispel the violent insurgents. AQI/ISI was, however, never officially destroyed and its survivors were able to regroup and rebuild. Despite the demise of several key leaders of al-Qaeda, the Taliban and associated groups, the strategy of leadership decapitation has not worked in dismantling these organizations. The Obama administration has made the mistake of thinking that "if you sort of lop off the top of the pyramid, the whole thing crumbles," Tom Joscelyn, Senior Fellow at the Foundation for Defense of Democracies told lawmakers regarding the idea of destroying these terrorist groups by taking out their leadership. Al-Qaeda is not organized that way Joscelyn stated. However, it is also entirely possible that the U.S. is simply just trying to eliminate as many terrorists as possible in a sort-of whack-a-mole campaign, which would be equally ineffective, though the president has maintained he does not wish this as counterterrorism strategy. The drone campaign has been highly criticized by human rights groups for its collateral civilian damage. This collateral damage is also being touted as a recruiting device, which incites more people to join terrorist groups so they can retaliate against the United States. By some estimates, in confirmed strikes that have taken place in Pakistan, Yemen, and Somalia, the number of civilians killed ranges from 237-308. A recent figure released by the Syrian Observatory for Human Rights, considered one of the premier sources for on-the-ground reporting in Syria's volatile civil war, 66 civilians have been killed in coalition air strikes. Though, collateral damage is expected in wars, the nature of drone strikes (e.g. zero risk to soldiers as well as controversial signature strikes that target a specific area based on behavioral patterns without knowing exactly who the targets are) obfuscates this reality. Civilians in nations where U.S. drones prominently operate have long feared succumbing to death. This reality hit home for Americans as the U.S. officially acknowledged yesterday that an American hostage and an Italian aid worker were killed in a strike that targeted a suspected militant compound. The government asserts that it was not aware the American was being held at that location. Similarly, U.S. raids by Special Operations Forces have also rendered tragic results. A U.S. raid in Yemen to rescue a U.S. hostage failed when the militants were alerted to the presence of U.S. soldiers and killed the American and a South African being held by the group, whom the U.S. did not know was present. Many of these failures boil down to intelligence and a willingness to pull the trigger. They contribute to a broader narrative of negative optics. The al-Qaeda "vanguard" movement was started by Osama bin Laden partially due to an undesired American presence in Muslim lands. Several groups have continued this narrative calling for lone wolf actors to incite violence inside western nations. The fact that the U.S. continues operations in these nations despite widespread reporting of collateral damage, that could be preventable, only feeds this narrative. The U.S. has had great success in fighting terrorism over the last 14 years, especially in the military context. While the Islamic State group is marginally losing ground on the battlefield, governments are still struggling to figure out how to curb radical messaging and recruitment online. The U.S. battlefield successes to oust the Taliban could be for naught if, as suspected, the Afghan forces will not be able to stand up on their own against a formidable Taliban insurgency that is certain to continue to fight to reestablish their Islamic Emirate. With the online propaganda success of the Islamic State group, **there has been a greater need for the non-military counterterror metrics. Many have questioned if U.S. counterterror policies (military and non-military such as controversial sting operations in American communities thought to drive non-violent individuals to commit crimes) are**

creating more terrorists than killing them. Despite the great successes, however, it is not overtly clear that the U.S. is winning the War on Terror.

2NC DA – Link Wall

Metadata is vital to counter-terrorism intelligence – empirically stops attacks and can't be replaced with other surveillance methods

Young 14 (Mark D., Senior Vice President and Chief Strategy Officer of National Security Partners, LLC. Previously he served as the Executive Director for the Directorate of Plans and Policy at United States Cyber Command, the Special Counsel for Defense Intelligence for the House Permanent Select Committee on Intelligence, and as a senior leader at the National Security Agency. 2014 I/S: A Journal of Law & Policy for the Information Society, 10 ISJLP 367, “NSA SURVEILLANCE: ISSUES OF SECURITY, PRIVACY AND CIVIL LIBERTY: ARTICLE: National Insecurity: The Impacts of Illegal Disclosures of Classified Information” ME)

Current examples of the NSA's contributions to national security are difficult to find because of the sensitivity of the agency's mission. In recent congressional testimony, however, the DNI said that SIGINT is the primary contributor to counterterrorism intelligence and that multiple empirical studies have shown that signal intelligence, provided by the NSA, is the major contributor to answering the hardest intelligence challenges faced by the U.S. n33 Although the claims in these books are unconfirmed, publications such as Counter Strike: The Untold Story of America's Secret Campaign Against Al Qaeda by Eric Schmitt and Thom Shanker and Operation Dark Heart: Spycraft and Special Ops on the Frontlines of Afghanistan--and the Path to Victory by Lieutenant Colonel Anthony Shaffer suggest that the NSA may have prevented significant terrorist attacks and provided critical intelligence during U.S. military operations. These books, together with the claims of senior intelligence officials before Congress, strongly suggest that the NSA's efforts are the most effective shield against the acts of violence that harm U.S. and allied military members, Americans, and our national security interests. In response to apparent disclosures of NSA activities, President Obama directed the declassification of sensitive NSA collection conducted under the Foreign Intelligence Surveillance Act (FISA). In September 2013, multiple documents concerning "bulk telephony metadata" collection under Section 501 of FISA were declassified and publically released by the ODNI. n34 These disclosures included a Foreign Intelligence Surveillance Court finding of reasonable grounds that the call records were relevant to an authorized terrorism investigation. n35 The same order required the [*376] NSA to establish "mandatory procedures strictly to control access to and use of the archived data collected pursuant to [the court's] order." n36 Additionally, the order mandated that the NSA's General Counsel monitor the designation of those with access to the data and act as an approval authority for the actual queries analysts wished to make of the data. n37 In late October 2013, the ODNI released a number of additional documents related to the NSA's alleged collection programs. These documents include a 2009 NSA congressional notification describing the failure to comply with a Foreign Intelligence Surveillance Court order, n38 and a March 2009 Internal NSA Memorandum of Understanding required for access and query privileges of data collected through the NSA's bulk telephony metadata program. n39 These documents describe the legal justifications for and technical detail about how the NSA collects and uses intelligence. This information was declassified and publically released to inform the public about what data was collected and analyzed by the NSA, to balance inaccurate speculations by the media about the NSA, and to facilitate the debate about U.S. Intelligence Community operations. When examined together, the information disclosed by Snowden and the declassified information released by the ODNI present a positive picture of prudent measures for national security. If the information about programs such as PRISM, FAIRVIEW, or OAKSTAR is accurate, then it appears as if the Intelligence Community has not only adjusted well to global technical advancements in telecommunications, but also learned significant lessons from the September 11, 2001 terrorist attacks. [*377] It was known in early 2001 that the NSA's effectiveness was challenged by the "multiplicity of new types of communications links, by the widespread availability of low-cost encryption systems, and by changes in the international environment in which dangerous security threats can come from small, but well organized, terrorist groups as well as hostile nation states." n40 Any challenge about the value of an intelligence program must address the importance of data quantity and quality. First, since intelligence analysis depends on having access to relevant information, logic dictates that more data is always better. As noted by Mark Lowenthal: The issue then becomes how to extract the intelligence from the mountain of information. One answer would be to increase the number of analysts who deal with the incoming intelligence, but that raises further demands on the budget. Another possible response, even less palatable, would be to collect less. But, even then, there would be no assurance that the "wheat" remained in the smaller volume still being collected. n41 Thus, quantity has an intelligence quality all its own. In addition, the type of information needed by the Intelligence Community is also

important. Given the priorities noted in the National Security Strategy, the importance of NSA collection and analysis as noted in congressional testimony and the ever-present threats by terrorist groups and hostile nations the American public should vigorously endorse the type of programs viewed by Snowden as oppressive. It is troubling to see the disclosure of techniques allegedly used by the NSA to obtain "cryptographic details of commercial cryptographic information security systems through industry relationships,"ⁿ⁴² and the rampant speculation about the monitoring of the mobile phones of the heads of state from Europe.¶ **It is not only logic that leads one to believe in the value of NSA collection, but also testimony by intelligence professionals.** For example, according to the House Intelligence Committee, NSA activities have "been **integral in preventing multiple terrorist attacks, [*378]** including a plot to attack [sic] the New York Stock Exchange in 2009."ⁿ⁴³ **The PRISM program, a program reported to provide the NSA access to information from some of the largest technology companies, provided "critical leads" to disrupt more than fifty potential terrorist events in more than twenty countries. According to officials, the FISA authority--the congressional authorization to target communications of foreign persons who are located abroad for foreign intelligence purposes--contributed to more than ninety percent of these disruptions. n44**¶ The Deputy Attorney General has noted that the FBI benefited from the NSA's Section 702 collection in the fall of 2009. Using Section 702 collection and "while monitoring the activities of [al-Qaeda] terrorists in Pakistan, the [NSA] noted contact from an individual in the U.S. that the [FBI] subsequently identified as Colorado-based Najibulla Zazi. The U.S. Intelligence Community, including the FBI and NSA, worked in concert to determine his relationship with [al-Qaeda], as well as identify any foreign or domestic terrorist links."ⁿ⁴⁵¶ The FBI tracked Zazi as he traveled to New York to meet with co-conspirators, where they were planning to conduct a terrorist attack. Zazi and his co-conspirators were subsequently arrested. Zazi, upon indictment, pled guilty to conspiring to bomb the NYC subway system. Compelled collection (authorized under Foreign Intelligence Surveillance Act, FISA, Section 702) against foreign terrorists was critical to the discovery and disruption of this threat against the U.S.ⁿ⁴⁶¶ Regardless of the accuracy of the information released by Snowden, the types of programs described by the material appear to directly contribute to national security; its release, regardless of its validity, will negatively impact U.S. security.¶ **Homegrown Violent Extremists n47** continue to be inspired by global jihadist propaganda and the perceived success of plots such as the November 2009 attack at Fort Hood, Texas and the March 2012 attacks by an al-Qaeda-inspired extremist in Toulouse, France. n48 **The threat from terror groups remains constant, urgent, and of great concern to the U.S. Intelligence Community.** The revelations concerning the NSA's counterterrorism successes will motivate terror groups to reexamine how they communicate, plan, and execute these attacks.¶ Despite these publically acknowledged examples of the value of the bulk metadata program, multiple reports and a federal district court opinion have denied its efficacy. The Privacy and Civil Liberties Oversight Boardⁿ⁴⁹ recommends discontinuing the program. The board noted, "an intelligence-gathering tool with significant ramifications for privacy and civil liberties cannot be regarded as justified merely because it provides some value in protecting the nation from terrorism."ⁿ⁵⁰¶ A panel of advisors that included former government officials such as Richard Clarke (former National Coordinator for Security, Infrastructure Protection, and Counterterrorism), Michael J. Morell (former deputy director of the CIA), and Cass Sunstein (former head of the Office of Information and Regulatory Affairs in the Obama [*380] White House) did not recommend the cessation of the bulk metadata program. In an unreleased report, commissioned by the president in August, the panel "went further than some of the agency's backers in Congress, who would make only cosmetic changes to it, but stopped short of calling for the program to be shut down, as its critics have urged."ⁿ⁵¹ They did, however question its value: "The [NSA] uses the telephone data to search for links between people in an effort to identify hidden associates of terrorism suspects, but the report says it 'was not essential to preventing attacks.'"ⁿ⁵²¶ The panel's report was provided to the president three days after a federal judge determined, in a case seeking an injunction to stop the NSA program, that the Government failed to cite a "single instance in which the analysis of the NSA's bulk metadata collection actually stopped an imminent attack or otherwise aided the government in achieving any objective that was time-sensitive in nature."ⁿ⁵³ United States District Judge Richard J. Leon came to a dramatically different conclusion than United States District Judge William Pauley in similar cases dealing with the same program. n54¶ In this volume, Mueller and Stewart claim that "the achievements of [the bulk metadata program] do seem to be decidedly underwhelming," despite acknowledging that in at least four cases, analysis of the metadata contributed to the arrest or locating of known terrorists or facilitators. n55 Their analysis is flawed in the same way as is Judge Leon's and the Privacy and Civil Liberties Board. **The comments made by critics of the program appear to be motivated more by ideology than dispassionate assessment of analytical tradecraft. The complexities, technology, and ambiguity of the modern security environment make it unlikely that any single intelligence source or program will provide a "smoking gun" on a national security threat.**ⁿ⁵⁶ The Intelligence Community has sharpened its techniques since September 11, 2001 with this new reality in

mind.¶ The complexity of the international system, incomplete and inconsistent information, and the "inherent limitations of the human mind" are perennial problems for intelligence professionals. n57 To overcome these realities, the Intelligence Community must apply a dizzying set of analytic techniques and mental discipline to review key assumptions about their operational tasks, validate the quality of the information collected and available to them, identify indicators of actualized threats, and continually strive to anticipate the thinking of those who seek to harm U.S. citizens or the security interests of the United States and our allies. This is no small task and it requires a mosaic of information, to include bulk metadata.¶ Judge Leon at least acknowledged his unfamiliarity with the complexities of any conversation about bulk metadata collection and analysis. By staying his order to discontinue the program, he concedes that the data may be of critical importance to national security: "[I]n light of the significant national security interests at stake in this case and the novelty of the constitutional issues, I will stay my order pending appeal." n58¶ Examples of the efficacy of the program are provided below, yet the public should keep in mind the unsatisfying fact that intelligence analysis is a laborious process that requires reason and passion. The author concedes that none of these examples provides an irrefutable defense of the accessing of bulk metadata. The program does, however, provide a valuable link in the national security chain. Although frustrating to the intelligence professionals who devote a large portion of their professional lives to the protection of the security, and civil liberties, of all U.S. citizens the debate is welcome, yet certainly not new.

NSA bulk collection crucial to counter-terror

McCall '15 [ALEXANDER MCCALL, Indiana Public Media, June 1, 2015, Indiana Politicians Aren't Happy About Patriot Act Expiring, <http://indianapublicmedia.org/news/indianas-senators-patriot-act-82874/>]

In the debate over the Patriot Act, which, in part, allows the National Security Agency's bulk collection of Americans' phone records and temporarily expired last night, Indiana's Senators are seeking for it to be re-instated.¶ Three provisions of the Patriot Act lapsed after a midnight deadline Sunday, at least temporarily.¶ One of those three provisions, Section 215, accommodates the NSA collection of phone records – a collection that has come under fire since former military contractor Edward Snowden revealed the collection program nearly two years ago.¶ In the days leading up to the provisions' expiration, Sen. Rand Paul, R-Ky., called that bulk collection "illegal."¶ But in a recent opinion published in Goshen News, Indiana Republican Sen. Dan Coats argued those provisions were "valuable." Coats has been part of the Republican faction pushing for the provisions' renewal.¶ "I certainly understand concerns about the possibility that this program could be used to breach personal privacy and civil liberties, which are important to all Americans and protected by the Constitution," Coats said in the piece. "But to date, there is no evidence to support accusations of abuse or unlawful spying on American citizens under this program."¶ Coats has expressed concerns about **implementing a replacement program, adding that he's worried it would make U.S. counter-terrorism efforts less effective.**¶ **"It puts Americans at risk,"** Coats said in an interview with Fox59.¶ And Sen. Coats' Democratic counterpart, Indiana Sen. Joe Donnelly, says he's on the same page.¶ "At a time when ISIS is causing so much havoc in the Middle East and at the same time trying to stir up lone wolf attacks right here in our own country, to leave the country without the ability to do surveillance even for a minute is extremely dangerous." Donnelly told Fox59.

Domestic Surveillance is key to ensure access to information in counter-terror efforts

Alexander 13

Gen. Keith Alexander, Keynote Address, 7-2013, Federal News Service

Washington, D.C.,

https://www.nsa.gov/public_info/_files/speeches_testimonies/transcript_of_gen_alexanders_black_hat_speech_31_july_2013.pdf

The intelligence community, according to the 9/11 commission, failed to connect the dots. What do I mean by that? What do I mean by failed to connect the dots? We had intercepts of one of the 9/11 hijackers, Mihdhar, from Yemen. We didn't know because we didn't have the tools and the capabilities to see that he was actually in California. We couldn't provide the right tip or information that connected that foreign dot to a domestic plot. The intelligence community failed to connect those dots. And now what we're doing is putting into existence these programs. But I think, in order to understand – so how do we actually use these programs? From my perspective, it's important to first understand the people at the National Security Agency, what they do and how they do it. So from my perspective, the best first thing is to step back and say, what did they do during this time period? What are they doing? And so our job is defending this country, saving lives, supporting our troops in combat. And when you think about our soldiers, sailors, airmen and Marine that were in Iraq and in Afghanistan, it is our responsibility, along with the rest of the intelligence community, to provide the information that they need to survive, to go after the enemy.

Even altering metadata policy would eviscerate counterterrorism efforts

Wiser 15 – Daniel Wiser is a staff writer for the Washington Free Beacon. “U.S. Surveillance Programs Could Expire, Despite Terror Threat” <http://freebeacon.com/national-security/u-s-surveillance-programs-could-expire-despite-terror-threat/>

The decreased authorities for counterterrorism agents would come as the FBI is reportedly scrambling to cope with a proliferation of terror suspects inspired by the Islamic State (IS). Two IS sympathizers—including one who was monitored by the FBI—were killed by police in Garland, Texas, earlier this month before they could attack a Prophet Muhammad cartoon

contest. James Comey, director of the FBI, said at a press conference on Wednesday that terror suspects are increasingly using “encrypted platforms” to evade U.S. surveillance. “I can't stand here with any high confidence when I confront the world that is increasingly dark to me and tell you that I've got it all covered,” he said. “We are working very, very hard on it but it is an enormous task.” The House-passed USA

Freedom Act—which has the backing of the Obama administration and would transfer metadata storage from the government to telephone companies—appears to have the best chance of passage before the deadline. But it is not without critics. Sen. Richard Burr (R., N.C.), chairman of the Senate Intelligence Committee, said earlier this month that the House bill provided “illusory protection” because it did not require telecommunications companies to retain data. He has since introduced a bill that would gradually shift the storage of metadata to corporations but require them to inform the government before they alter their data retention policies. Sen. Dan Coats (R., Ind.), another member of the Senate Intelligence Committee, wrote in a recent op-ed that the transfer of data to phone companies “would require an expansive regulatory system” and might be “operationally useless.” “I am deeply concerned that ending the current program would render our counterterrorism tools less agile and unreliable.

he said. The remaining capability would be less responsive, if not operationally useless.” The Patriot Act fight is likely to last right until the deadline, as proponents of the surveillance programs try to corral supporters during a congressional recess. “It's all very up in the air right now,” said one Senate aide tracking the debate.

Terrorists are paying attention to metadata collection – if it stops they'll exploit holes

Newsmax 15 – Citing CIA Chief John Brennan “CIA Chief: Ending NSA Spying Would Boost Terror Threat” <http://www.newsmax.com/Newsfront/john-brennan-patriot-act-terrorism/2015/05/31/id/647804/>

CIA chief John Brennan warned Sunday that allowing vital surveillance programs to expire could increase terror threats, as the US Senate convened for a crunch debate on whether to renew the controversial provisions. With key counterterrorism programs

set to expire at midnight Sunday, the top intelligence official made a final pitch to senators, arguing that the bulk data collection of telephone records of millions of Americans unconnected to terrorism has not abused civil liberties and only serves to safeguard citizens. This is something that we can't afford to do right now, Brennan said of allowing the expiration of counterterrorism provisions, which "sunset" at the end of May 31. "Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago," he said CBS' "Face the Nation" talk show. Brennan added that groups like Islamic State have followed the developments "very carefully" and are "looking for the seams to operate." The House has already passed a reform bill, the USA Freedom Act, that would end the telephone data dragnet by the National Security Agency and require a court order for the NSA to access specific records from the vast data base retained by telecommunications companies. If no action is taken by the Senate Sunday, authorities will be forced to shut down the bulk collection program and two other provisions, which allow roving wiretaps of terror suspects who change their mobile phone numbers and the tracking of lone-wolf suspects. Senator Rand Paul, a Republican 2016 presidential candidate adamantly opposed to reauthorizing the surveillance, is threatening to delay votes on the reform bill or an extension of the original USA Patriot Act. That would force the counterterrorism provisions to lapse until at least Wednesday. Former NSA chief Michael Hayden, who is also a former CIA director, equated such a temporary lapse as "giving up threads" in a broader protective fabric. "It may not make a difference for a while. Then again, it might," he told CNN's State of the Union. "Over the longer term, I'm willing to wager, it will indeed make a difference."

Restrictions on tools used for domestic surveillance disrupts the most important counter-terror tools.

Alexander 13

Jenny Jiang, Transcript: Testimony of NSA Director Gen. Keith Alexander before the House Intelligence Committee on June 18, 2013, What The Folly
<http://www.whatthefolly.com/2013/06/19/transcript-testimony-of-nsa-director-gen-keith-alexander-before-the-house-intelligence-committee-on-june-18-2013/>

The events of Sept. 11, 2001 occurred in part because of a failure on the part of our government to connect those dots. Some of those dots were in the United States. The intelligence community was not able to connect those domestic dots - phone calls between operatives in the U.S. and Al Qaeda terrorists overseas. Following the 9/11 Commission, we investigated the intelligence community's failure to detect 9/11. Congress passed the Patriot Act, Section 215 of that act, as it has been interpreted and applied, helps the government close that gap by enabling the detection of telephone contacts between terrorists overseas and operatives within the United States. As Director [Robert] Mueller emphasized last week during his testimony to the Judiciary Committee, if we have had Section 215 in place prior to 9/11, we may have known that the 9/11 hijacker - [Khalid] Mihdhar - was located in San Diego and communicating with a known Al Qaeda safe house in Yemen. In recent years, these programs, together with other intelligence, have protected the U.S. and our allies from terrorist threats across the globe, to include helping prevent a terrorist - potential terrorist events OVER. times since 9/11. We will actually bring forward to the committee tomorrow documents that the inter-agency has agreed on that in a classified setting gives every one of those cases for you to review. We'll add two more today publicly - we'll discuss - but as the Chairman noted, if we give all those out, we give all the secrets of how we're tracking down terrorists as a community and we can't do that. Too much is at risk for us and for our allies. I'll go into greater detail as we go through this testimony this morning. I believe we have achieved this security and relative safety in a way that does not compromise the privacy and civil liberties of our citizens. We would like to make three fundamental points: First, these programs are critical to the intelligence community's ability to protect our nation and our allies' security. They assist the intelligence community's efforts to connect the dots. Second, these programs are limited, focused, and subject to rigorous oversight. They have distinct purposes and oversight mechanisms. We have rigorous training programs for our analysts and their supervisors to understand their responsibilities regarding compliance. Third, the disciplined operations of these programs protect the privacy and civil liberties of the American people. We will provide important details about each of those... As we stated, these programs are immensely valuable to protecting our nation and securing the security of our allies. In recent years, the information gathered from these programs provided the U.S. government with critical leads to help prevent over 50

potential terrorist events in more than 20 countries around the world. FAA To2 contributed to over 90% of these cases. At least 10 of these events included homeland-based threats and [in] the vast majority business records, FISA reporting, contributed as well. I would also point out it's a great partnership with the Department of Homeland Security and those with a domestic nexus. But the real lead for domestic events is the Federal Bureau of Investigation. It has been our honor and privilege to work with Director Mueller and Deputy Director Joyce... So that's four cases total that we've put out publicly. What we're in the process of doing with the inter-agency is looking at over 50 cases that are classified and will remain classified that will be brought to both the intel committees of the Senate and the House - to all of you. Those 50 cases right now have been looked at by the FBI, CIA, and other partners within the community and the National Counter-Terrorism Center is validating all the points so that you know that what we've put in there is exactly right. I believe the numbers from those cases, they're something that we can publicly reveal and all publicly talk about. What we are concerned, as the Chairman said, is going into more detail on how we stop some of these cases as we are concerned it will give our adversaries a way to work around those and attack us or our allies, and that would be unacceptable. I have concerns that the intentional and irresponsible release of classified information about these programs will have a long and irreversible impact on our nation's security and on that of our allies. This is significant. I want to emphasize that the foreign intelligence programs that we're talking about is the best counter-terrorism tools that we have to go after these guys. We can't lose those capabilities. Soto wrap up, Chairman, first I'd like to just hit on when we say 7 officials, that's 7 positions at NSA, can disseminate U.S. person's data. Today, there are 10 people in those positions. One of those is our SIGINT operations officer. Every one of those have to be credentialed. Chris and I are two of those officials.

NSA surveillance prevents crucial terrorism cooperation programs

Basteiro 13

Daniel, Divided EU Responds To NSA Spying Scandal,
http://www.huffingtonpost.com/2013/10/25/eu-nsa-spying_n_4164559.html

Leaders from 28 European Union countries signed a joint statement after a meeting in Brussels on Friday to warn the United States that "a lack of trust could prejudice the necessary cooperation" required in the fight against terrorism. The statement also reminded Washington that U.S.-EU relations ought to be "based on respect and trust." The memo is the first joint statement from EU leaders in response to revelations that point to massive U.S. espionage activities in Europe. The Guardian reported Thursday that the phone numbers of 35 European leaders -- including German Chancellor Angela Merkel -- had been turned over to the National Security Agency and immediately "tasked" for monitoring. Despite sharing a common position, the EU is divided about what steps to take in response to the alleged spying, and countries are making decisions separately. Merkel announced that she will ask the U.S. for a new agreement that limits the scope of both countries' investigations and surveillance activities, The Guardian reported. French President Francois Hollande is looking for a similar arrangement. According to leading French newspaper Le Monde, Hollande said on Friday that his government has gathered "several trails" pointing to a cyberattack against the Élysée Palace -- the official residence of the president -- in May 2012. The announcement gave credibility to a report previously published by Le Monde, which pointed to the NSA as the organization responsible for the attack. The UK and Spain show more caution. The United Kingdom and Spain have distanced themselves from the German and French proposals. UK Prime Minister David Cameron has focused on Edward Snowden's leaks, which he said at a press conference in Brussels on Friday have made it "a lot more difficult to keep our countries and our people safe" from terrorists who "want to blow up our families." Mariano Rajoy, Spain's prime minister, has announced that he is summoning the U.S. ambassador in Madrid to ask him for explanations, just like Merkel did on Thursday. Nevertheless, Rajoy has not joined Germany and France's request for bilateral talks with Washington. "We have no proof of espionage against Spain," Rajoy said Friday in a press conference. The EU Parliament asks for sanctions. Beyond the national initiatives, the European Union has several tools to respond to what they consider scandalous espionage. This week, the European Parliament asked through a non-binding resolution to suspend the Terrorist Finance Tracking Program (TFTP), also known as the "Swift agreement." The program allows the U.S. access to banking data from the Swift money-transfer system in order to aid the fight against terrorism. In 2010, the EU Parliament rejected a version of the TFTP because it permitted what the parliament considered to be excessive access to data. The current version was established after additional privacy protections were added. A group of nine members of the EU Parliament will travel to Washington on Monday to gather information about

the alleged surveillance.¶ The espionage scandal could also delay or block another major treaty: the free-trade agreement between the EU and the U.S. In February, both parties announced the beginning of negotiations around the much-anticipated agreement. According to a European Commission memo, the commercial treaty could generate up to 86 billion euros for the EU and 65 billion euros for the U.S.¶ On Thursday, Martin Schulz, the European Parliament's president, asked members to stop the ongoing negotiations for the agreement. But so far, all 28 governments have declined.

Metadata is an essential counter terrorism tool – key to intel and tracking

Fleitz 15 [Fred, senior vice president for policy and programs for the Center for Security Policy. He worked in national-security positions for 25 years with the CIA, the State Department, and the House Intelligence Committee, “NSA Data Collection: Necessary, or Unconstitutional?”

<http://www.nationalreview.com/article/418207/nsa-data-collection-necessary-or-unconstitutional-fred-fleitz>]

While its detractors refuse to admit it, the 215 program has been a successful tool in stopping terrorist attacks. It has been strongly defended by many intelligence officials and members of Congress, including Senator Dianne Feinstein (D., Calif.), vice chairman of the Senate Intelligence Committee, who said during a January 14, 2014, Judiciary Committee hearing that this program had helped stop terrorist plots to bomb the New York City subways, the New York stock exchange, and a Danish newspaper.¶ Former deputy CIA director Michael Morell said in a December 27, 2013, Washington Post op-ed: “Had the [metadata] program been in place more than a decade ago, it would likely have prevented 9/11. And it has the potential to prevent the next 9/11.”¶ Although 35 of 38 court decisions have found the 215 program to be constitutional, its opponents like to quote a December 2013 opinion by D.C. District Court Judge Richard Leon, which questioned its constitutionality. Instead of shutting down the program, however, Leon stayed his decision pending a government appeal. When this appeal was heard by a D.C. Circuit Court of Appeals panel last November, the judges did not accept the challengers’ contentions that the 215 program violated the Fourth Amendment’s protection against unreasonable searches. Opponents of the 215 program are now praising a decision on May 7 by a New York Court of Appeals panel that found that the program was not authorized by the Patriot Act. However, this decision fell far short of what the ACLU was seeking in the case, since the court did not order the 215 program halted, noting that the debate in Congress could render the issue moot. The court also did not find the 215 program to be unconstitutional or a violation of privacy rights, although it said it could revisit these issues if Congress passes new legislation to reauthorize the program. Indeed, if the 215 program continues, legal challenges to it are likely to be eventually decided by the Supreme Court. Despite the continuing need for the 215 program, it is in trouble because Republicans are sharply divided on it. RELATED: Republicans and the Patriot Act Much of the opposition from both sides of the political spectrum is a result of the deluge of Snowden leaks. The release of so much information out of context led to a media frenzy and wild claims that American intelligence is illegally spying on Americans. Both intelligence officials and the White House did a poor job at defending the program, and conspiracy theories flourished. And, of course, there also is in America a venerable history of suspicion of government and government secrecy. Senator Rand Paul (R., Ky.) has said that America’s Founding Fathers would be “appalled” at the 215 program. Actually, Senator Paul is probably right, if only because the Founding Fathers lived in the era of wooden ships and simple firearms and had no notion of modern warfare and weapons of mass destruction. I suspect they would be appalled at many aspects of modern society. If Senator Lee is really worried about privacy threats, he should focus on the unregulated gathering of such data on Americans by technology companies. In an April 25 National Review article, Senator Mike Lee (R., Utah) made a similar argument when he expressed his concerns about the U.S. governments gathering data “to paint a fairly complete picture of the private lives of every person in this country.” In fact, although there is no evidence that the NSA has ever done or ever intended to do such a thing, it is being done, and on a huge scale, by Google, Facebook, other social-media sites, and data brokers. According to a March 9, 2014, 60 Minutes report, Axiom, a data broker, claims that it has on average 1,500 pieces of information each on more than 200 million Americans. If Senator Lee is really worried about privacy threats, he should focus on the unregulated gathering of such data on Americans by technology companies. From what people have told me as I’ve traveled around the country giving talks on this topic, I know that a major factor driving Republicans to oppose the 215 program is Obama-administration policies and scandals. These abuses include the effort by the IRS to discriminate against conservative groups, and the Justice Department’s seizing the phone records and e-mails of Fox News correspondent James Rosen and his parents. Many Republicans complain that they have been repeatedly lied to by the Obama administration — about Obamacare, the 2012 attacks on the U.S. consulate in Benghazi, the Iran nuclear talks, and other issues. MORE NSA RAND PAUL’S FAUX-LIBERTARIAN OPPOSITION TO THE PATRIOT ACT WHY WE SHOULDN’T TRUST THE NSA WITH OUR METADATA WHY RAND’S SECOND FILIBUSTER FLOPPED As a result, some Republican members of Congress are loath to extend an intelligence program that they fear could be used by the Obama administration against its political

enemies. Although I understand this concern, the realities are that the 215 program is subject to intense oversight and has been an effective counterterrorism tool. Abuse of this program is purely theoretical. Shutting it down because of the Obama administration's scandals and failings makes no sense. At the other end of the political spectrum, the metadata program has been broadly opposed by the Left and by electronic-privacy advocates. However, this opposition goes beyond the metadata program: These groups are also pushing for granting privacy rights to foreign citizens on foreign soil (which President Obama tacitly supports), negotiating international treaties banning Internet spying, and preventing the NSA from exploiting software vulnerabilities. President Obama has struggled to deal with controversy sparked by the Snowden leaks. In August 2013, he named a panel to look at reforming NSA collection, though he eventually ignored most of its recommendations, probably because they were so radical and naïve. These included recommendations similar to those by the Left mentioned above, such as extending the Privacy Act of 1974 to non-U.S. persons; calling for U.S. electronic surveillance to be guided by Article 12 of the Universal Declaration of Human Rights and Article 17 of the International Covenant on Civil and Political Rights; codes of conduct between intelligence agencies on electronic surveillance against foreign citizens, and barring U.S. intelligence agencies from cracking Internet encryption methods and penetrating computer software. People who make such recommendations are oblivious to the reality that we need aggressive intelligence collection to keep our nation safe in a dangerous world. They also do not understand that adopting such standards would severely undermine or shut down many crucial intelligence-collection programs but would be completely ignored by America's enemies and adversaries. President Obama also instructed intelligence officials to defend the 215 program and work to block legislative language that would overly restrict it. This led Jeb Bush to remark last month, "I would say the best part of the Obama administration has been his continuance of the protections of the homeland using the big metadata programs, the NSA being enhanced." However, Bush may need to retract this statement. According to a House Intelligence Committee source, the White House gave up on defending the metadata program late last year in response to its supporters on the left, especially deep-pocketed Democratic contributors in Silicon Valley. Congress also has struggled with NSA reform. Last May, the House passed the 2014 USA Freedom Act, which would put significant restrictions on the 215 program, including a mandate that metadata be retained by the phone companies, not the NSA. Although I viewed this as a bad bill, I endorsed it in a June 23, 2014, National Review article because I believed that, regardless of the merits and capabilities of the metadata program, it has been so damaged by fear-mongering attacks by the press and some politicians that it could not continue in its current form. Unfortunately, the House version of the USA Freedom Act was made substantially worse by Patrick Leahy, then-chairman of the Senate Judiciary Committee, who added restrictions that would effectively kill the metadata program and interfere with the operation of the Foreign Intelligence Surveillance Court. Because of Leahy's changes to the House version of the 2014 USA Freedom Act, it did not garner a filibuster-proof majority last November, and the Senate failed to pass it. The top members of the Senate Intelligence Committee – then-chairman Feinstein and Saxby Chambliss – said Leahy's bill went too far. Former CIA director Michael Hayden and former attorney general Michael Mukasey condemned the bill in a November 17, 2014, Wall Street Journal op-ed titled "NSA Reform That Only ISIS Could Love." The challenge for Congress now is to pass legislation to extend the metadata program before it expires at the end of this month. Members of Congress and staff have been working over the past three months to devise a 2015 version of the USA Freedom Act. On April 30, the House Judiciary Committee approved this bill by a vote of 25 to 2. An identical version has been sponsored in the Senate by Senators Leahy and Lee. The House's 2015 USA Freedom Act is slightly better than the 2014 Senate version. The metadata program would continue, although the data would be held by phone companies. NSA searches of metadata databases would be narrowed. The bill also would create a panel of experts to advise the Foreign Intelligence Surveillance Court on privacy, civil liberties, and technological matters. Significant FISC decisions would be declassified. The bill includes concessions to the House Intelligence Committee, such as allowing the NSA authority to conduct surveillance for 72 hours without obtaining a warrant on foreign targets who enter the United States, and to monitor domestic targets on whom it has a probable-cause warrant when they travel overseas. The NSA will also be allowed to use the Patriot Act to collect data domestically in an emergency. The Left and privacy groups are split over the 2015 version of the USA Freedom Act. Some have endorsed it, because they believe that it is the best they can get and that it will open the door to greater reform down the road. These groups are pressuring Congress to remove the concessions made to the House Intelligence Committee. Several of these groups have stepped up their efforts to amend the bill in the light of the May 7 New York Court of Appeals decision. Others on the left, such as the ACLU and the New York Times, do not support the 2015 USA Freedom Act, since they would prefer that the electronic-surveillance provisions of the Patriot Act be allowed to expire. Senator McConnell has enlisted freshman Senator Tom Cotton (R., Ark.) to help push a clean reauthorization of the Patriot Act, which would retain the 215 program in its current form. Cotton, who now serves on the Senate Intelligence Committee and who supported the House version of the USA Freedom Act when he was a member of that body last year, has become a rising star in the Senate because of his outspoken opposition to the Obama administration's nuclear diplomacy with Iran. He reportedly is holding classified meetings with other Republican senators to explain the metadata program and to dispel the misinformation about it spread by its opponents. The shock of the Snowden leaks is fading, and the grandstanding against the NSA by Senator Paul, other libertarians, and the Left is becoming tiresome. Senators Richard Burr (R., N.C.), Jeff Sessions (R., Ala.), and Marco Rubio (R., Fla.) have also spoken out in defense of the NSA and in support of McConnell's Patriot Act bill. Rubio suggested during a May 7 floor speech that if the 215 program isn't reauthorized and there is then another terrorist attack within the United States, Congress will be under fire to explain whether the program could have helped prevent such an attack. With three GOP senators already running for president, the 215 program has become an issue in the presidential campaign. Senator Paul has criticized Rubio and Bush for supporting the program and opposes the 2015 USA Freedom Act, preferring that the Patriot Act be repealed. Senator Ted Cruz (R., Tex.) also opposes the metadata program but supports the USA Freedom Act. Senator Burr, the chairman of the Senate Intelligence Committee, has criticized Paul and Cruz for their attacks on the 215 program

as weakening their standing on national defense; Burr claims that their position “tells me that they don’t want to learn what bulk data collection is.” Security-minded Republicans therefore must work to strengthen the House bill and fend off efforts by Democrats and libertarians to weaken it. We may hope that growing concerns about future ISIS terrorism in the United States will allow Republican congressional leaders to limit the damage to the metadata program from the House bill and move it in McConnell’s direction. McConnell’s bill, which I strongly support, is unlikely to pass. The Snowden leaks and anti-NSA hysteria have done too much damage to the 215 program for it to continue without substantial changes. Moreover, support for the House bill is probably too strong to allow the McConnell version to become law. ¶ Passage of the 2015 USA Freedom Act is far from an ideal outcome, since this bill would needlessly undermine an effective counterterrorism tool that is needed to protect our country. But this may be only a short-term setback for American national security: Already the shock of the Snowden leaks is fading, and the grandstanding against the NSA by Senator Paul, other libertarians, and the Left is becoming tiresome. This could mean the metadata program might be revised in a few years under a new Republican president. Unfortunately, before that time comes, **there is a real danger of an ISIS terrorist attack in the United States if Congress seriously weakens the metadata program.** Congress needs to think long and hard about such an outcome as it moves ahead with legislation on this issue this month.

Metadata casts a wide net – alternatives can’t fill in

Yoo 15. [John, Emanuel Heller professor of law at the University of California at Berkeley and a Visiting Scholar at the American Enterprise Institute, former official in the Office of Legal Counsel in the U.S. Department of Justice. 5/8/20 “Will Congress reject the dangerous NSA ruling by reauthorizing the Patriot Act?” American Enterprise Institute, <https://www.aei.org/publication/will-congress-reject-todays-dangerous-nsa-ruling-by-reauthorizing-the-patriot-act/>.

Finally, the Court displays a deep misunderstanding of the challenges of counterterrorism policy, which Congress understands far better. As Judge Richard Posner has recognized, an intelligence search “is a search for the needle in a haystack.” Rather than pursue suspects who have already committed a crime and whose identity is already known, intelligence agencies must search for clues among millions of potentially innocent connections, communications, and links. “The intelligence services,” Posner writes, “must cast a wide net with a fine mesh to catch the clues that may enable the next attack to be prevented.” Our government can detect terrorists by examining phone and e-mail communications, as well as evidence of joint travel, shared assets, common histories or families, meetings, and so on. If our intelligence agents locate a lead, they must quickly follow its many possible links to identify cells and the broader network of terrorists. A database of call data would allow a fast search for possible links in the most important place — the United States, where terrorists can inflict the most damage. Most of the calling records may well be innocent (just as most of the financial records of a suspected white-collar criminal may also be innocent), but the more complete the database, the better our intelligence agencies can pursue a lead into the U.S.

Metadata is key to tracking terrorist communication patterns – now is key

McCarthy 15 [Andrew C., policy fellow at the National Review Institute. May 23, “Why National Security Republicans Lost the Patriot Act Debate”<http://www.nationalreview.com/article/418807/why-national-security-republicans-lost-patriot-act-debate-andrew-c-mccarthy>]

Yet the NSA program’s advocates have failed to offer a compelling defense. We have fallen into the trap of arguing the case on the opposition’s terms. They claim that the program has not stopped a single terrorist attack. Program advocates counter that it has, but this is not only hard to prove, it’s beside the point. First, intelligence doesn’t work that way: It is a mosaic drawing on several sources, and it is rare that one piece of it completes the picture. More important, the principal purpose of the program is not to thwart individual attacks but to map terror cells and uncover their support networks. Consequently, the program could be quite valuable even if it never stopped a single terrorist attack. That is vital at a time when the jihadist threat is intensifying but gaps in our intelligence collection are widening because of wrong-headed Obama policies (e.g., the

decrease in interrogations of captured terrorists and the discouragement of focus by our intelligence analysts on jihadist ideology). ¶ Advocates have also been counterproductively guarded in explaining why **they need a full dataset: namely (we can infer), so they can run algorithms against it, based on known terrorist communication patterns, and thus discover latent terrorist communications.** If this were better understood, most Americans would no more object to the anonymous storage of their phone number's records (which cannot be further accessed without judicial supervision) than they do to the government's possession of phone books that list their names and addresses (which are regularly accessed with no judicial supervision). Almost all of us would like to help the government identify and stop terrorists, especially if there is no risk to ourselves in doing so. The reluctance to talk openly about intelligence methods is understandable. Whatever the government tells the public it performe tells the terrorists. But it's not like transcontinental jihadist networks have an option to cease communicating just because they know our government is watching. What does the NSA gain by preserving the secrets of its methodology if the cost is losing the program?

A2: Targeted Surveillance Turn

Metadata is necessary and targeted searches prevent the ability to identify networks and halt terrorist activities

Posner, 8. [Richard A., Judge, United States Court of Appeals for the Seventh Circuit; Senior Lecturer in Law, The University of Chicago. "Privacy, Surveillance, and Law," 75 University of Chicago Law Review 245, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=2808&context=journal_articles.

What is most notable about the amendments, as indeed of the Terrorist Surveillance Program to which they seem addressed, is their backing away from reliance on warrants to prevent abuses of electronic surveillance. The warrant is a poorly designed means for balancing the security and liberty interests involved in counterterrorist surveillance. It is true that instead of requiring probable cause to believe that the target of an interception is a terrorist, FISA could be amended to require merely reasonable suspicion. But even that would be too restrictive from the standpoint of effective counterterrorism; effective surveillance cannot be confined to suspected terrorists when the object is to discover who may be engaged in terrorism or ancillary activities. Further attenuation of FISA's standard for obtaining a warrant might be possible without running afoul of the Fourth Amendment. Conceivably the issuance of a warrant could be authorized on the basis of a showing that while the target was probably not a terrorist, national security required making assurance doubly sure by intercepting some of his electronic communications. A model might be the criterion for issuing a search warrant to the Canadian Security Intelligence Service, where a warrant can be issued on the basis of a factually supported "belief, on reasonable grounds, that [it] ... is required to enable the Service to investigate a threat to the security of Canada." 9 Such a criterion might pass muster under the Fourth Amendment, which requires probable cause for the issuance of a warrant but does not state what it is that there must be probable cause to believe. The Supreme Court has said that there must be probable cause to believe that the search will yield contraband or evidence of crime when the search is part of a criminal investigation." The Constitution binds the government more tightly when it is exerting its powers to convict people of crimes than in other areas of government activity. A search intended not to obtain evidence of crime but to obtain information about terrorism might, as under Canadian law, require only probable cause to believe that the search would yield such information. The lower the standard for getting a warrant, however, the more porous the filter that the requirement of a warrant creates, bearing in mind the ex parte character of a warrant proceeding. If all the application need state is that an interception might yield data having value as intelligence, judges would have no basis for refusing to issue the warrant. Alternatively, reliance on warrants could invite legislation to expand the reach of the criminal laws relating to terrorism in order to make it easier to establish probable cause to believe that a search will reveal evidence of a crime. That expansion could raise issues under the First Amendment, since the natural route for expanding criminal laws against terrorism is to criminalize extremist speech or even attendance at extremist (though peaceful) speeches and rallies, as activities that may be preparatory to or encouraging of terrorism. Warrants that satisfy FISA's standard as traditionally understood should continue to be required for all physical searches, because they are far greater intrusions on privacy than electronic interceptions, and for all electronic surveillance for which FISA's existing probable cause requirement can reasonably be satisfied (mainly cases in which the government wanted to intercept communications of a person who they had probable cause to believe was a terrorist). With these exceptions, civil libertarians' preoccupation with warrants is not only harmful to national security (and possibly to civil liberties if it induces legislation to expand the reach of the criminal law) but also anachronistic. The government's ready access to the vast databases that private and public entities compile for purposes unrelated to national security has enabled it to circumvent much of the protection of privacy that civil libertarians look to warrant requirements to secure. There are a number of possible measures, apart from requiring warrants, that Congress could adopt in order to minimize abuses of domestic surveillance. If all were adopted, the risk of such abuses would be slight. The temporary FISA amendments take tiny steps in this direction. Bolder steps would include the following: 1. Congress could create a steering committee for national security electronic surveillance, composed of the attorney general, the director of national intelligence, the secretary of homeland security, and a retired federal judge or justice appointed by the chief justice of the Supreme Court. The committee would monitor all such surveillance to assure compliance with the Constitution and federal statutes. The requirement in the temporary amendments that the attorney general and the director of national intelligence devise procedures for a new warrantless surveillance program is one of the tiny steps to which I referred."

The other, and legally dubious one, is requiring submission of the procedures for approval by the Foreign Intelligence Surveillance Court; that court becomes in effect the steering committee. 2. The NSA could be required to submit to the steering committee, to departmental inspectors general, to the Privacy and Civil Liberties Oversight Board (a White House agency created by the Intelligence Reform Act), to the congressional intelligence and judiciary committees, and to an independent watchdog agency of Congress modeled on the GAO every six months a list of the names and other identifying information of all persons whose communications had been intercepted in the previous six months without a warrant, with a brief statement of why these persons had been targeted. 3. The responsible officials of the NSA could be required to certify annually to the watchdog groups that there had been no violations of the statute during the preceding year. False certification would be punishable as perjury. But lawsuits challenging the legality of the Terrorist Surveillance Program should be precluded. Such lawsuits would distract officials from their important duties to no purpose if the kind of statute that I am suggesting were enacted. The statute should sunset after five years. 4. The use of intercepted information for any purpose other than investigating threats to national security would be forbidden. Information could not be used as evidence or leads in a prosecution for ordinary crime-this to alleviate concern that wild talk bound to be picked up by electronic surveillance would lead to criminal investigations unrelated to national security. Violations of this provision would be made felonies punishable by substantial prison sentences and heavy fines. But the punishments must not be made too severe lest they cause intelligence officers to steer so far clear of possible illegality that they fail to conduct effective surveillance. The risk of abuses is not great enough to justify savage penalties in order to deter them, because intelligence officers have no interest in assisting in the enforcement of criminal laws unrelated to national security. A neglected point is that violations of privacy and civil liberties tend to emanate from the White House and the top management level of executive branch agencies rather than from the working or middle-management levels. 5. To limit the scope of surveillance, "threats to national security" should be narrowly defined as threats involving a potential for mass deaths or catastrophic damage to property or to the economy. That would exclude, for the time being anyway, ecoterrorism, animal-rights terrorism, and other political violence that, though criminal, does not threaten catastrophic harm (yet). Congressional action is also needed to protect the phone companies that cooperated with the NSA's surveillance program from potentially immense liability for allegedly having violated federal law protecting the privacy of telephone records; a number of suits are pending. The intelligence system is enormously dependent on informal assistance from private companies in communications, banking, and other industries. At times such assistance is made a legal duty, as in the federal law requiring banks to report cash transactions of \$10,000 or more; and this is also a feature of the new amendments to FISA. Were it not for the threat of liability, which the amendments do not address, voluntary assistance would probably as in the past be all the government needed. But if voluntary assistance-even when tendered in a national emergency, as in the wake of the 9/11 terrorist attacks- places companies in legal jeopardy, such assistance will dry up. FISA needs to be amended not only to authorize more extensive domestic surveillance than its anachronistic terms permit but also to insulate from liability conduct that may have violated the Act or some other statute but that would be permitted under the amended regime. Until the temporary amendments were enacted, the type of approach that I am advocating (call it the "nonwarrant" approach) for regularizing domestic surveillance was getting little attention from Congress and the Bush Administration, possibly because the Administration wanted to retain a completely free hand and thought it could fend off the sort of restrictions that I have sketched. (It is remarkable how tepid the public reaction to the Terrorist Surveillance Program has been.) A related possibility is that the Administration's aggressive claims of presidential power prevented it from acknowledging the legitimacy of congressional controls over intelligence and hence of a legislative solution to the controversy over the program. Still another possibility was (and is) that because no one is in charge of domestic intelligence, authority over which is divided among the attorney general, the FBI director, the Department of Homeland Security, and the director of national intelligence (among others), no one is formulating a comprehensive legislative and public relations strategy for ending the controversy over the role of electronic surveillance in such intelligence. (At this writing, the only confirmed senior official in the Justice Department is the solicitor general.) And another possibility is the grip of our legalistic culture, which makes us think that the regulation of national security must be modeled on the regulation of criminal law enforcement. The temporary amendments suggest, however, that the logjam may be breaking, though one of the reasons, it appears, is that the Administration's decision to bring the Terrorist Surveillance Program under FISA resulted in a paper jam at the Foreign Intelligence Surveillance Court as the number of warrant applications soared. We should be playing to our strengths, and one of the greatest of them is technology. We may not be able to prevail against terrorism with one hand tied behind our back. Critics of surveillance argue that since our enemies know that we

monitor electronic communications, they will foil us by simply ceasing to use such communications. That is wrong. We know it is wrong because we do intercept terrorist communications. ²⁴ But if it were true that our monitoring caused the terrorists to abandon the telephone and the internet, that would be an enormous victory for counterterrorism, as it is extremely difficult to coordinate and execute a major terrorist attack if all communications among the plotters must be face to face to avoid detection. The greater danger is that encryption and other relatively cheap and simple countermeasures will defeat our surveillance. Opponents of efforts to amend FISA point out that the Foreign Intelligence Surveillance Court has almost never turned down an application for a warrant. In 2005, for example, although more than 2,000 applications were filed, not a single one was denied in whole or in part. ⁵ The inference the critics wish drawn is that FISA is not inhibiting surveillance. The correct inference is that the Justice Department is too conservative in seeking warrants. The analogy is to a person who has never missed a plane in his life because he contrives always to arrive at the airport eight hours before the scheduled departure time. The effect of our legalistic culture is to cause law enforcement agencies, notably the FBI, to avoid not only violating the law but also steering so close to the wind that they might be accused, albeit groundlessly, of violating the law or of being "insensitive" to values that inform the law, even when those values have not been enacted into law.

No replacement for Metadata

Sessions 15 [Jeff, U.S. Senator, May 20, "Why Should Terrorists Be Harder to Investigate than Routine Criminals?" <http://www.nationalreview.com/article/418675/why-should-terrorists-be-harder-investigate-routine-criminals-jeff-sessions>]

The 9/11 attacks exposed the dangerous wall separating the intelligence and law-enforcement communities. In response, Congress developed a number of tools to eliminate those barriers so that critical information could be timely and appropriately shared to address radical Islamic terrorism. Among them was Section 215 of the USA Patriot Act. In 2006, the National Security Agency transitioned the bulk telephone-metadata acquisition program authorized under the president's Terrorist Surveillance Program to the business-records court-order authority of Section 215. Since shortly after 9/11, this program has been helping to keep Americans safe by acquiring non-content call records, i.e., telephone numbers and the date, time, and duration of a call. This program has yielded invaluable intelligence that has helped prevent attacks and uncovered terrorist plots. Nevertheless, the Obama administration has built up unnecessary barriers that sacrifice the fragile operational efficiency of the program without actually accomplishing anything in terms of data security. Meanwhile, the threat level has only increased. On the heels of an ISIS-inspired attack in Texas, the administration has greatly increased security at military bases, airports, railroads, and other potential targets. Just this year, the FBI has so far arrested at least 30 Americans for planning ISIS-inspired attacks in the U.S. FBI director James Comey recently issued this chilling warning: The siren song sits in the pockets, on the mobile phones, of the people who are followers [of ISIS] on Twitter . . . It's almost as if there's a devil sitting on the shoulder, saying "Kill! Kill! Kill! Kill!" all day long. Most people would agree it should not be more difficult to investigate a terrorist plot than check fraud. As the National Academy of Sciences noted in its recent report, Section 215 of the Patriot Act simply "allow[s] the [Foreign Intelligence Surveillance Court] to require production of documents and other tangible things determined relevant to national security investigations, much like other courts do in criminal and grand jury investigations." But unlike in the criminal context, Section 215 is subject to extraordinary oversight by the Executive and Judicial branches, as well as minimization procedures to protect Americans' civil liberties. Moreover, information acquired under Section 215 can be accessed by only a limited number of trained intelligence professionals and only after the government has demonstrated to the court that there is a reasonable, articulable suspicion that a number or identifier is associated with a specific foreign-terrorist organization. Compare this with how a local district attorney can obtain the same type of information in a routine criminal case. He issues a grand-jury subpoena for phone records, which requires only a showing that the records are relevant to an investigation. The subpoena could require the production of much more detailed information than is acquired under Section 215, such as names and addresses of the callers. Indeed, the U.S. Drug Enforcement Agency and Internal Revenue Service can obtain telephone call records and bank records with an administrative subpoena without even a prosecutor's approval, much less approval by a judge. The Supreme Court has long held this process constitutional under the Fourth

Amendment because such information is already in the hands of a third-party — the phone companies — and therefore, a customer has no reasonable expectation of privacy in that information. But legislation known as the USA Freedom Act would prevent our intelligence officers from obtaining information in this manner at all. As former federal judge and attorney general Michael Mukasey said: The bill's imposition of the warrant requirement on the NSA would be more burdensome than what any assistant U.S. attorney must do to get metadata in a routine criminal case, which is simply to aver that the information is needed in connection with a criminal investigation — period. The bill would also eliminate entirely the database through which the NSA is able to quickly access information to “connect the dots” in order to prevent terror attacks. This is significant because, as the National Academy of Sciences explained, in contrast to domestic law enforcement . . . the world of intelligence analysis has many fewer tools available for investigation. In hostile foreign environments, personal interviews and observations and records review are much more limited. Accordingly, the role of bulk data as a way to understand the significance of past events is important, and the loss of this tool becomes more serious. Instead, the USA Freedom Act relies on a nonexistent, untested system and the hope that private companies will agree to retain records long enough for the NSA to obtain data when it may be critical to preventing an imminent attack. But as the National Academy of Sciences noted, “there is no technological magic . . . that will fully substitute for bulk collection” and service providers “have no incentive to cooperate, even if paid; indeed, their customers may object to such cooperation.” Moreover, requiring the government to obtain a court order every time it seeks to search data held by private companies would significantly delay investigations, giving terrorists a substantial operational advantage. In short, the USA Freedom Act would make it vastly more difficult for the NSA to stop a terrorist than it is to stop a tax cheat. Why make it much harder to investigate terrorists than common criminals?

A2: Perception Turn

The plan is perceived as weakness – invites attacks

Daily Mail 15. “Head of CIA warns that US is at risk of lone wolf terror attack after NSA powers to monitor all phone calls expired – as Isis ‘watch carefully’ for security gaps,” 5-31-2015, <http://www.dailymail.co.uk/news/article-3105089/Senate-makes-ditch-bid-extend-NSA-s-bulk-collection-phone-records-Rand-Paul-swears-block-legislation-let-Patriot-Act-expire.html>.

The head of the CIA has warned that Americans are now at risk after the Senate was unable to extend laws giving authorities special powers to fight terrorists. ¶ Politicians in the upper house were unable to come to an agreement to extend key parts of the Patriot Act - that legalize controversial methods of surveillance by the National Security Agency (NSA) - which expired on Sunday. ¶ Attempts were frustrated by Presidential candidate Rand Paul, who has taken a firm stance against the extension of powers allowing the mass collection of phone records, wire taps and warrants without evidence. ¶ But the Head of the CIA John Brennan claims ordinary Americans, who expect the NSA to do their jobs, have been put at risk by 'political grandstanding and crusading for ideological causes' that fueled the debate. ¶ Speaking on CBS show Face The Nation, he warned that the US - and Europe - is now in danger from technologically 'sophisticated' terrorists who are watching developments carefully and 'looking for the seams to operate' within. ¶ He claimed that the authorities do not abuse the powers, extended in 2011 to help fight lone wolf terror suspects not connected to a specific group, and that without them, it's difficult for the NSA to protect America. ¶ Mr Brennan said: 'I think terrorist elements have watched very carefully what has happened here in the United States, whether or not it's disclosures of classified information or whether it's changes in the law and policies. They are looking for the seams to operate within.' ¶ And this is something that we can't afford to do right now, because if you look at the horrific terrorist attacks and violence that is being perpetrated around the globe, we need to keep our country safe. And our oceans are not keeping us safe the way they did a century ago.' ¶ The Patriot Act was passed in 2001 in the wake of the 9/11 terror attacks. Now that the provisions have expired, government agents will need to subpoena phone companies for the records. ¶ The White House previously justified collecting the records because of the Patriot Act's Section 215, which expired on Sunday. ¶ Two other provisions, added in 2011, also expired with it. The first is a 'roving wiretap' provision which allows government agencies to keep tracking suspects as they switch devices. ¶ The second is a 'lone wolf' clause which allows warrants to be granted without any evidence linking a suspect to a foreign power or terrorist group. ¶ Political struggles over the NSA and its data collection have become a national issue since whistleblower Edward Snowden revealed the extent of government programs in 2013. ¶ The senate's efforts to pass a replacement bill were frustrated by Kentucky's junior senator Rand Paul, who has spoken at length against the NSA's activities, which he has excoriated as illegal and unconstitutional. ¶ Paul, a Republican who is running for president, came up against members of his own party, as well as the Obama administration. ¶ With his presidential campaign waning, he has been accused of irresponsible political opportunism by opponents, by fighting a bill on ideological grounds that may put ordinary people at risk. ¶ He was criticized by the White House Sunday night, which called the Patriot Act expiration an 'irresponsible lapse'. ¶ While Brennan didn't mention Paul by name, he said on Face The Nation: 'Unfortunately I think there is a little too much political grandstanding and crusading for ideological causes that have really fuelled the debate on this issue.' ¶ He added: 'These are authorities that have been used by the government to make sure that we're able to safeguard Americans. And the sad irony is that most Americans expect the government to protect them. And so although there's a lot of debate that goes on, on the Congress and the Hill on this issue, I think, when you go out to Boise or Tampa or Louisville, Americans are expecting their law enforcement and homeland security and intelligence professionals to do their work. And these authorities are important.' ¶ Paul argued 'there must be another way' but even he agrees that the lapse in these powers are likely to be temporary as politicians work on the USA Freedom Act, which is expected to pass within the next week. ¶ Republican Senate Majority Leader Mitch McConnell called a rare Sunday session to try to pass the replacement law, but was unable to push it through in time. ¶ And although the replacement is set to pass this week, Paul said the expiration was 'a victory no matter how you look at it'. ¶ In a statement, he said: 'It might be short lived, but I hope that it provides a road for a robust debate, which will strengthen our intelligence community, while also respecting our Constitution.' ¶ He added: 'The expiration of the NSA's sweeping, all-encompassing and ineffectual powers will not relinquish functions necessary for protecting national security. The expiration will instead do what we should have done all along - rely on the Constitution for these powers.' ¶ According to a top lawmaker, as of 8pm Sunday no NSA employee could access their enormous phone records database, which holds metadata on millions of phone conversations handed over by telecoms companies like Verizon and AT&T. ¶ Senate Intelligence Committee chairman Richard Burr said on Sunday: 'There is no way to get any type of agreement tonight -- either an extension or passage of a bill. So at 8pm tonight, NSA employees can not query the database'. ¶ In a statement issued Sunday night,

Obama's press secretary Josh Earnest, urged action to pass the USA Freedom Act as quickly as possible.¶ He said: 'The Senate took an important - if late - step forward tonight. We call on the Senate to ensure this irresponsible lapse in authorities is as short-lived as possible.¶ 'On a matter as critical as our national security, individual Senators must put aside their partisan motivations and act swiftly. The American people deserve nothing less.'¶ Some lawmakers have said the lapse raises alarming questions about how US authorities can keep the homeland safe with a diminished security toolbox.¶ 'I think it's very very unfortunate that we're in this position,' said Senator Mike Lee, a conservative Republican who supports the reform bill.¶ 'We've known this date was coming for four years. Four years. And I think it's inexcusable that we adjourned' for a weeklong break last week without resolving the issue.¶ Lee, too, conceded that the reform bill would most likely pass in the coming week.¶ With the clock ticking, CIA chief John Brennan warned Sunday that allowing vital surveillance programs to lapse could increase terror threats, and argued that the phone metadata dragnet has not abused civil liberties and only serves to safeguard citizens.¶ 'This is something that we can't afford to do right now,' Brennan said of allowing the counterterrorism provisions to expire.¶ 'Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,' he said on CBS talk show Face the Nation.¶ Brennan added that online threats from groups like Isis would continue to grow over the next five to ten years.¶ He said: 'Isis has been very sophisticated and adept at using the Internet to propagate its message and reach out to individuals. We see what is happening as far as thousands upon thousands of individuals, including many thousands from the West, that have traveled into Syria and Iraq. And a number of these individuals are traveling back.'¶ 'And what we see, they're also using the Internet as a way to incite and encourage individuals to carry out acts of violence.'¶ So as the director of FBI says, you know, this use of these websites and their Internet capabilities is something of great concern. So yes, I think ISIS is a threat not just in the Middle East and South Asia and African regions but also to Europe as well as to the United States.'

NSA programs are reasonable, legal, and key to stopping the rising terrorist threat

Bolton 4/28/15 (John R. Bolton, former U.S. permanent representative to the United Nations, "NSA activities key to terrorism fight", 4/28/15, <http://www.aei.org/publication/nsa-activities-key-to-terrorism-fight/>) -LL

Congress is poised to decide whether to re-authorize programs run by the National Security Agency that assess patterns of domestic and international telephone calls and emails to uncover linkages with known terrorists. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, have played a vital role in protecting America and our citizens around the world from the still-metastasizing terrorist threat. The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural protections to prevent spying on U.S. citizens. Nonetheless, critics from the right and left have attacked the NSA for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics, hoping to score political points with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail." The ill-

informed nature of the debate has facilitated scare-mongering, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And there is an important asymmetry at work here as well. The critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond. By definition, the programs' success rests on the secrecy fundamental to all intelligence activities. Frequently, therefore, explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists and others, in turn, could use to stymie future detection efforts. After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since his approach to foreign and defense issues has consistently reflected near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces. In fact, just in the year since Congress last considered the NSA programs, the global terrorist threat has dramatically increased. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. Boko Haram is expanding beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016. This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Aggressive anti-terrorism creates a new security paradigm – hardens the public to government intrusions – scaling back surveillance eliminates that paradigm and creates vulnerability

Givens 13 -- Austen D. Givens is a PhD student in the Department of Political Economy at King's College London. His forthcoming book with Nathan E. Busch, *The Business of Counterterrorism: Public-Private Partnerships in Homeland Security*, will be published by Peter Lang. "The NSA Surveillance Controversy: How the Ratchet Effect Can Impact Anti-Terrorism Laws" <http://harvardnsj.org/2013/07/the-nsa-surveillance-controversy-how-the-ratchet-effect-can-impact-anti-terrorism-laws/>

The ratchet effect can occur because anti-terrorism laws create a new security paradigm. An aggressive anti-terrorism law can fundamentally alter societal approaches to terrorism. Surveillance may increase. Police powers can expand. Intelligence efforts may grow. Public expectations of privacy can diminish. In the aggregate, these types of changes can represent a drastic change in a government's approach to terrorism, and effectively create a "new normal" level of security. Because this "new normal" is linked to the law itself, reversing the law begins to dismantle the new security paradigm. From the public's perspective, this might be an unacceptable option because it may increase societal vulnerability to terrorism. Government agencies also risk losing resources—personnel, money, and political support—by returning to the status quo ante.

Violent war on terror is the only way to win – history proves non-violent strategies fail

Hanson 10 – senior fellow @ Hoover Institute

Victor, “The Tragic Truth of War” [<http://www.nationalreview.com/node/229152/print>] February 17 //mtc

Victory has usually been defined throughout the ages as forcing the enemy to accept certain political objectives. “Forcing” usually meant killing, capturing, or wounding men at arms. In today’s polite and politically correct society we seem to have forgotten that nasty but eternal truth in the confusing struggle to defeat radical Islamic terrorism. What stopped the imperial German army from absorbing France in World War I and eventually made the Kaiser abdicate was the destruction of a once magnificent army on the Western front – superb soldiers and expertise that could not easily be replaced. Saddam Hussein left Kuwait in 1991 when he realized that the U.S. military was destroying his very army. Even the North Vietnamese agreed to a peace settlement in 1973, given their past horrific losses on the ground and the promise that American air power could continue indefinitely inflicting its damage on the North. When an enemy finally gives up, it is for a combination of reasons – material losses, economic hardship, loss of territory, erosion of civilian morale, fright, mental exhaustion, internal strife. But we forget that central to a concession of defeat is often the loss of the nation’s soldiers – or even the threat of such deaths. A central theme in most of the memoirs of high-ranking officers of the Third Reich is the attrition of their best warriors. In other words, among all the multifarious reasons why Nazi Germany was defeated, perhaps the key was that hundreds of thousands of its best aviators, U-boaters, panzers, infantrymen, and officers, who swept to victory throughout 1939–41, simply perished in the fighting and were no longer around to stop the allies from doing pretty much what they wanted by 1944–45. After Stalingrad and Kursk, there were not enough good German soldiers to stop the Red Army. Even the introduction of jets could not save Hitler in 1945 – given that British and American airmen had killed thousands of Luftwaffe pilots between 1939 and 1943. After the near destruction of the Grand Army in Russia in 1812, even Napoleon’s genius could not restore his European empire. Serial and massive Communist offensives between November 1950 and April 1951 in Korea cost Red China hundreds of thousands of its crack infantry – and ensured that, for all its aggressive talk, it would never retake Seoul in 1952–53. But aren’t these cherry-picked examples from conventional wars of the past that have no relevance to the present age of limited conflict, terrorism, and insurgency where ideology reigns? Not really. We don’t quite know all the factors that contributed to the amazing success of the American “surge” in Iraq in 2007–08. Surely a number of considerations played a part: Iraqi anger at the brutish nature of al-Qaeda terrorists in their midst; increased oil prices that brought massive new revenues into the country; General Petraeus’s inspired counterinsurgency tactics that helped win over Iraqis to our side by providing them with jobs and security; much-improved American equipment; and the addition of 30,000 more American troops. But what is unspoken is also the sheer cumulative number of al-Qaeda and other Islamic terrorists that the U.S. military killed or wounded between 2003 and 2008 in firefights from Fallujah to Basra. There has never been reported an approximate figure of such enemy dead – perhaps wisely, in the post-Vietnam age of

repugnance at “body counts” and the need to create a positive media image.¶ Nevertheless, in those combat operations, **the** marines and **army** not only proved that to meet them in battle was a near death sentence, but also **killed thousands of low-level terrorists and hundreds of top-ranking operatives** who otherwise would have continued to harm Iraqi civilians and American soldiers. Is Iraq relatively quiet today because many who made it so violent are no longer around?¶ **Contemporary** conventional **wisdom** **tries to persuade us that there is no such thing as a finite** number of the **enemy**. **Instead, killing them** supposedly only incites others to step up from the shadows to take their places. Violence begets violence. It **is counterproductive**, and creates an endless succession of the enemy. Or so we are told.¶ **We may wish that were true. But military history suggests it is not** quite accurate. In fact, **there was a finite number of SS diehards and kamikaze suicide bombers** even in fanatical **Nazi Germany and imperial Japan**. **When they were attrited**, not only were their acts of terror curtailed, but it turned out that **far fewer than expected wanted to follow the dead to martyrdom**.¶ The Israeli war in Gaza is considered by the global community to be a terrible failure — even though the number of rocket attacks against Israeli border towns is way down. That reduction may be due to international pressure, diplomacy, and Israeli goodwill shipments of food and fuel to Gaza — or it may be due to the hundreds of Hamas killers and rocketeers who died, and the thousands who do not wish to follow them, despite their frequently loud rhetoric about a desire for martyrdom.¶ **Insurgencies**, of course, are complex operations, but in general even they **are not immune from eternal rules of war**. Winning hearts and minds is essential; providing security for the populace is crucial; improving the economy is critical to securing the peace. But all that said, **we cannot avoid the pesky truth that in war** — any sort of war — **killing enemy soldiers stops the violence**.¶ **For all the much-celebrated counterinsurgency tactics in Afghanistan, note that we are currently in an offensive in Helmand province to “secure the area.” That means killing the Taliban** and their supporters, and convincing others that they will meet a violent fate if they continue their opposition.¶ Perhaps the most politically incorrect and Neanderthal of all thoughts would be that the American military’s long efforts in both Afghanistan and Iraq to kill or capture radical Islamists has contributed to the general safety inside the United States. Modern dogma insists that our presence in those two Muslim countries incited otherwise non-bellicose young Muslims to suddenly prefer violence and leave Saudi Arabia, Yemen, or Egypt to flock to kill the infidel invader.¶ A more tragic view would counter that there was always a large (though largely finite) number of radical jihadists who, even before 9/11, wished to kill Americans. They went to those two theaters, fought, died, and were therefore not able to conduct as many terrorist operations as they otherwise would have, and also provided a clear example to would-be followers not to emulate their various short careers. That may explain why in global polls the popularity both of bin Laden and of the tactic of suicide bombing plummeted in the Middle Eastern street — at precisely the time America was being battered in the elite international press for the Iraq War.¶ **Even the most utopian and idealistic do not escape these tragic eternal laws of war**. **Barack Obama may think he can win over the radical Islamic world** — or at least convince the more moderate Muslim community to reject jihadism — by means such as his Cairo speech, closing Guantanamo, trying Khalid Sheikh Mohammed in New York, or having General McChrystal emphatically assure the world that killing Taliban and al-Qaeda terrorists will not secure Afghanistan.¶ Of course, such soft- and smart-power approaches have utility in a war so laden with symbolism in an age of globalized communications. **But note that Obama has upped the number of combat troops in**

Afghanistan, and he **vastly increased** the frequency of **Predator-drone assassination missions** on the Pakistani border.¶ Indeed, even as Obama damns Guantanamo and tribunals, he has massively increased the number of targeted assassinations of suspected terrorists — the rationale presumably being either that we are safer with fewer jihadists alive, or that we are warning would-be jihadists that they will end up buried amid the debris of a mud-brick compound, or that it is much easier to kill a suspected terrorist abroad than detain, question, and try a known one in the United States.¶ In any case, the president — immune from criticism from the hard Left, which is angrier about conservative presidents waterboarding known terrorists than liberal ones executing suspected ones — **has concluded that one way to win** in Afghanistan **is to kill as many terrorists and insurgents as possible**. And while the global public will praise his kinder, gentler outreach, privately he evidently thinks that we will be safer the more the U.S. marines shoot Taliban terrorists and the more Hellfire missiles blow up al-Qaeda planners.

2NC DA – Impact Wall

Homegrown terrorism kills millions of people – radical extremists will target critical infrastructure, build dirty bombs, and launch biological, chemical, and cyber attacks – radicalization makes the threshold for an individual to trigger the impact extremely low – prioritize probability over magnitude because a single lone wolf attack starts a chain reaction – that’s Lederman and Myhrvold

Critical Infrastructure solves heg, the economy, food prices, energy shocks, nuclear melt downs, and chemical industry
Sebastian 09

(Rohan,- research for the office of Virginia Senator Mark Warner CS Computer Science from UVA, 6-24 “The Federal Government’s Role in Preserving Cybersecurity for Critical Infrastructure”)

The intersection of critical infrastructure and cyberspace has presented many challenges to policymakers. Critical infrastructure includes areas like the water and food supply, telecommunications, nuclear power, transportation, banking, and energy---areas crucial to the functioning of society. Eighty percent of this critical infrastructure is owned by the private sector. The continual delegation of control of critical infrastructure to cyberspace without regard to security has posed many vulnerabilities that malicious actors could exploit. To address these vulnerabilities, policymakers can utilize three options: strengthening partnerships between the public and private sectors, installing a White House official to deal solely with cyber security issues, and encouraging collaboration between critical infrastructure operators for coordinating best practices and crisis management. In conclusion, this analysis recommends that the federal government follow a course incorporating all three options because the effects could be mutually reinforcing. A long term solution to cybersecurity must take note of the private sector’s insight to be successful; a national dialogue on the importance of cyber security needs to take its cue from the White House; in the meanwhile, proprietors of critical infrastructure should ensure that they can reduce the damage caused by disasters or attacks by establishing clear lines of communication. [End of Abstract – Start of Intro] Critical Infrastructure Government and the private sector have reaped digital networking’s benefits by using computer networks to control vital parts of critical infrastructure from cyberspace. However, remote access to critical infrastructure from cyberspace has placed these systems at risk of destruction by other countries, malicious actors, or terrorists. This analysis proposes three options that the federal government can implement: strengthening partnerships between the public and private sectors, integrating resources under a White House official, and increasing collaboration between levels of critical infrastructure. After scrutinizing these options under the criteria of political feasibility, industry acceptance, and efficacy, this analysis recommends that the federal government pursue a combination of all three policy options. Critical infrastructure includes areas such as transportation, water supplies, public health, telecommunications, energy, banking and finance, emergency and information services, nuclear facilities, food supplies, and defense and chemical industries (Moteff & Parfomak, 2004). According to the Department of Homeland Security’s National Strategy for Homeland Security, critical infrastructure consists of “assets, systems, and networks, whether physical or virtual, so vital to the United States that their incapacitation or destruction would have a debilitating effect on security, national economic security, public health or safety, or any combination thereof” (Homeland Security Council, 2007). Figure 1 illustrates the myriad of infrastructures and their interdependencies with one another. Simply put, critical infrastructures comprise the foundation for the modern economy and national security, so the federal government shares responsibility for protecting them. However, the government rests in a precarious position because the private sector owns about eighty percent of critical infrastructure (Forest, 2006, p. 78). Furthermore, about eighty percent of all American commerce occurs on privately owned telecommunications networks, primarily the Internet (Theohary, 2009, p. 20). Even the most valuable national defense systems rely on privately owned telecommunications networks (National Security Agency, 2009). As digital networking proliferates through society, builders will delegate control of more and more parts of critical infrastructure to the realm of cyberspace. In fact, every piece of software added to a system expands the “attack surface” accessible to external actors (Welander, 2009, p. 42). Therefore, cybersecurity is necessary to safeguard this infrastructure. The Need for Cybersecurity

Proprietors often control critical infrastructure from cyberspace. According to the National Security Presidential Directive 54 and Homeland Security Presidential Directive 23 issued by the George W. Bush Administration, cyberspace consists of the “interdependent network of information technology infrastructures, and includes the Internet, telecommunications networks, computer systems, and embedded processors and controllers in critical industries” (as cited in National Cyber Security Center, 2009, p. 11). The intersection of critical infrastructure and cyberspace means that policymakers should strive to establish security while retaining a relatively open cyberspace. Several government officials have emphasized **the catastrophic effects of compromised cybersecurity**. Paul Kurtz, an advisor on President Obama’s transition team, warned of a “cyber Katrina,” **a cataclysm in which government agencies would fail to coordinate** after a cyber attack **and** would subsequently collapse (Epstein, 2009). Mike McConnell, a former director of both the National Security Agency and National Intelligence, declared that if the September 11th, 2001, hijackers had launched a focused attack on an American bank, the economic ramifications would have been of “an order of magnitude greater” than the destruction of the World Trade Center (Harris, 2008). Former cyber security advisor Richard Clarke, who served in the Clinton and Bush Administrations, asserted that the primary target for a terrorist’s cyber attack would be the economy whereas casualties and chaos would be secondary (as cited in Rollins & Wilson, 2007, p. 3). In fact, Director of National Intelligence Dennis Blair stated that **cyber attacks against financial sectors and physical infrastructure could “severely impact the national economy” and disturb energy sources like oil and electricity** for an indefinite period (Annual Threat Assessment, 2009). Beyond threatening the private sector, intruders have been specifically targeting the federal government’s information technology infrastructure. A report by the International Business Machines Corporation revealed that of the 237 million security attacks carried out in the first half of 2005, more than twenty-two percent, the highest percentage against any given group, aimed for government agencies (Fitzgerald, 2006, p. 57). Between 2008 and March 2009, the number of attacks against federal computer networks swelled about forty percent (Smith, 2009). The Department of Defense dubbed the military’s electronic information infrastructure **the American military’s “Achilles’ heel”** (Defense Science Board, 2008). Though these assorted officials would concur on the gravity of cybersecurity, they might dissent on the correct policy solution. As the White House’s Cyberspace Policy Review pointed out, cyberspace policy envelops the following: security of and operations in cyberspace,...the full range of threat reduction, vulnerability reduction, deterrence, international engagement, incident response, resiliency, and recovery policies and activities, including computer network operations, information assurance, law enforcement, diplomacy, military, and intelligence missions as they relate to the security and stability of the global information and communications infrastructure (National Cyber Security Center, 2009, p. 5). This analysis will lay out three policy options to address these issues. Strengthening Partnerships between the Public and Private Sectors Any kind of long term solution to cybersecurity threats must consider **the private sector** since it **owns about eighty percent of the nation’s critical infrastructure**. Legislators cannot expect a law ignoring the private sector’s input to succeed because business’s efforts will ultimately determine effective cybersecurity policies. Thus, the government can continue encouraging the deepening of relationships with the private sector. Advocating a redefinition of government’s relationship to the software business, General James Cartwright stated that government should treat “cyber security as a weapon system” (Rutherford, 2008). A paradigm shift to Gen. Cartwright’s mindset would be favorable for government and business because the public sector widely uses private sector products. The Department of Defense, in particular, uses “Commercial-Off-the-Shelf” products since these packages are cheaper and more innovative than a government established standard. Communication between government and the private sector would be helpful for alleviating situations involving systemic software threats. For example, the Microsoft Windows operating system runs on “ninety-five percent of personal computers worldwide,” so hackers often exploit its vulnerabilities. In 2003, the Blaster worm infected “some 400,000 host PCs” in a single day. Microsoft responded by permitting “several governments across the world to take a peek at the precious Windows source code” for input and disclosure (Taylor, 2003). Thus, government benefitted by receiving insight into the potential problems the Blaster worm posed; business benefitted by receiving the government’s assistance with this problem. A number of forums already exist to serve as models for more formal mechanisms of public-private communication. Microsoft created a Security Response Center that works with the Department of Defense to secure its products (Information Technology in the 21st Century Battlespace, 2003). Learning from Carnegie Mellon University’s public-private alliance model, the Department of Homeland Security in 2003 founded the United States-Computer Emergency Readiness Team, a group of government and industry experts compiling software vulnerabilities (Barnes, 2004, p. 327). Similarly, the Protected Critical Infrastructure Information Program in the Department of Homeland Security represents the federal government’s first ever mechanism to collect and analyze data from private companies without fear of releasing that data to the public by the Freedom of Information Act (Grubestic & Murray, 2006, p. 65). In response to the government’s creation of federal agencies like the Critical Infrastructure Assurance Office and National Infrastructure Protection Center in 1998, industry responded with the creation of the Partnership for Critical Infrastructure Security as well as the generation of Information Sharing Analysis Centers (Michel-Kerjan, 2003, p. 136). Industry agents staff these Centers, which specialize in areas like telecommunications, electricity, and finance (Michel-Kerjan, 2003, p. 136). This analysis evaluates this option under the aforementioned criteria. **Industry acceptance and political obstacles could obstruct the way to success**. Politically, the Freedom of Information Act, which could force the disclosure of details of infrastructure weaknesses to the public, may make private companies apprehensive about sharing their data with the government. Laws like the Critical Infrastructure Information Act of 2002 protect the private sector from such disclosures, but companies

may be reluctant nonetheless (Pozen, 2005, p. 678). Industry acceptance also affects this option's efficacy. There are currently federal organizations like the United States-Computer Emergency Readiness Team bridging the communication gap between the public and private sectors, but only serious attention to these programs by both parties will evoke substantive results. Companies confront a tradeoff between security and efficiency as well as transparency and customer satisfaction. Noting this trend, Clay Wilson addressed studies revealing a low rate of cybercrime incident reporting because companies fear consumer backlash from "negative publicity" (Wilson, 2009, p. 24). According to a study conducted among Fortune 1000 companies, one of the most trenchant effects of compromised cyber security is damage to reputation among consumers (Hansen, 2001, p. 1161). This option's effectiveness is directly tied to political feasibility and industry acceptance.

Dirty bombs go nuclear---high risk of theft and attacks escalate

Dvorkin 12 (Vladimir Z., Major General (retired), doctor of technical sciences, professor, and senior fellow at the Center for International Security of the Institute of World Economy and International Relations of the Russian Academy of Sciences. The Center participates in the working group of the U.S.-Russia Initiative to Prevent Nuclear Terrorism, 9/21/12, "What Can Destroy Strategic Stability: Nuclear Terrorism is a Real Threat," belfercenter.ksg.harvard.edu/publication/22333/what_can_destroy_strategic_stability.html)

Hundreds of scientific papers and reports have been published on nuclear terrorism. International conferences have been held on this threat with participation of Russian organizations, including IMEMO and the Institute of U.S. and Canadian Studies. Recommendations on how to combat the threat have been issued by the International Luxembourg Forum on Preventing Nuclear Catastrophe, Pugwash Conferences on Science and World Affairs, Russian-American Elbe Group, and other organizations. The UN General Assembly adopted the International Convention for the Suppression of Acts of Nuclear Terrorism in 2005 and cooperation among intelligence services of leading states in this sphere is developing.¶ At the same time, these efforts fall short for a number of reasons, partly because various acts of nuclear terrorism are possible. Dispersal of radioactive material by detonation of conventional explosives ("dirty bombs") is a method that is most accessible for terrorists. With the wide spread of radioactive sources, raw materials for such attacks have become much more accessible than weapons-useable nuclear material or nuclear weapons. The use of "dirty bombs" will not cause many immediate casualties, but it will result into long-term radioactive contamination, contributing to the spread of panic and socio-economic destabilization.¶ Severe consequences can be caused by sabotaging nuclear power plants, research reactors, and radioactive materials storage facilities. Large cities are especially vulnerable to such attacks. A large city may host dozens of research reactors with a nuclear power plant or a couple of spent nuclear fuel storage facilities and dozens of large radioactive materials storage facilities located nearby. The past few years have seen significant efforts made to enhance organizational and physical aspects of security at facilities, especially at nuclear power plants. Efforts have also been made to improve security culture. But these efforts do not preclude the possibility that well-trained terrorists may be able to penetrate nuclear facilities.¶ Some estimates show that sabotage of a research reactor in a metropolis may expose hundreds of thousands to high doses of radiation. A formidable part of the city would become uninhabitable for a long time.¶ Of all the scenarios, it is building an improvised nuclear device by terrorists that poses the maximum risk. There are no engineering problems that cannot be solved if terrorists decide to build a simple "gun-type" nuclear device. Information on the design of such devices, as well as implosion-type devices, is available in the public domain. It is the acquisition of weapons-grade uranium that presents the sole serious obstacle. Despite numerous preventive measures taken, we cannot rule out the possibility that such materials can be bought on the black market. Theft of weapons-grade uranium is also possible. Research reactor fuel is considered to be particularly vulnerable to theft, as it is scattered at sites in dozens of countries. There are about 100 research reactors in the world that run on weapons-grade uranium fuel.

according to the International Atomic Energy Agency (IAEA). **A terrorist “gun-type” uranium bomb can have a yield of least 10-15 kt, which is comparable to the yield of the bomb dropped on Hiroshima.** The explosion of such a bomb in a modern metropolis can kill and wound hundreds of thousands and cause serious economic damage. There will also be long-term sociopsychological and political consequences.¶ The vast majority of states have introduced unprecedented security and surveillance measures at transportation and other large-scale public facilities after the terrorist attacks in the United States, Great Britain, Italy, and other countries. These measures have proved burdensome for the countries’ populations, but the public has accepted them as necessary. **A nuclear terrorist attack will make the public accept further measures meant to enhance control even if these measures significantly restrict the democratic liberties they are accustomed to. Authoritarian states could be expected to adopt even more restrictive measures.**¶ If a nuclear terrorist act occurs, **nations will delegate tens of thousands of their secret services’ best personnel to investigate and attribute the attack. Radical Islamist groups are among those capable of such an act.** We can imagine what would happen if they do so, **given the anti-Muslim sentiments and resentment that conventional terrorist attacks by Islamists have generated in developed democratic countries. Mass deportation of the non-indigenous population and severe sanctions would follow such an attack in what will cause violent protests in the Muslim world. Series of armed clashing terrorist attacks may follow.** The prediction that Samuel Huntington has made in his book “The Clash of Civilizations and the Remaking of World Order” may come true. Huntington’s book clearly demonstrates that it is not Islamic extremists that are the cause of the Western world’s problems. Rather there is a deep, intractable conflict that is rooted in the fault lines that run between Islam and Christianity. **This is especially dangerous for Russia because these fault lines run across its territory.** To sum it up, the political leadership of Russia has every reason to revise its list of factors that could undermine strategic stability. BMD does not deserve to be even last on that list because its effectiveness in repelling massive missile strikes will be extremely low. BMD systems can prove useful only if deployed to defend against launches of individual ballistic missiles or groups of such missiles. Prioritization of other destabilizing factors—that could affect global and regional stability—merits a separate study or studies. But even without them I can conclude that nuclear terrorism should be placed on top of the list. **The threat of nuclear terrorism is real, and a successful nuclear terrorist attack would lead to a radical transformation of the global order.** All of the threats on the revised list must become a subject of thorough studies by experts. States need to work hard to forge a common understanding of these threats and develop a strategy to combat them.

Independently causes extinction via retaliation

Ayson 10 - Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington (Robert, July. “After a Terrorist Nuclear Attack: Envisaging Catalytic Effects.” Studies in Conflict & Terrorism, Vol. 33, Issue 7. InformaWorld.)

But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that **some sort of terrorist attack**, and especially an act of nuclear terrorism, **could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more** of the **states** that possess them. In this context, today’s and tomorrow’s terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as **raising the risks of a catalytic nuclear war between the superpowers started by third parties.** These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from

Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be “spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from.”⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington’s relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? Washington’s early response to a terrorist nuclear attack on its own soil might also raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China. For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country’s armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an infringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the “Chechen insurgents’ ... long-standing interest in all things nuclear.”⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide. There is also the question of how other nuclear-armed states respond to the act of nuclear terrorism on another member of that special club. It could reasonably be expected that following a nuclear terrorist attack on the United States, both Russia and China would extend immediate sympathy and support to Washington and would work alongside the United States in the Security Council. But there is just a chance, albeit a slim one, where the support of Russia and/or China is less automatic in some cases than in others. For example, what would happen if the United States wished to discuss its right to retaliate against groups based in their territory? If, for some reason, Washington found the responses of Russia and China deeply underwhelming, (neither “for us or against us”) might it also suspect that they secretly were in cahoots with the group, increasing (again perhaps ever so slightly) the chances of a major exchange. If the terrorist group had some connections to groups in Russia and China, or existed in areas of the world over which Russia and China held sway, and if Washington felt that Moscow or Beijing were placing a curiously modest level of pressure on them, what conclusions might it then draw about their culpability.

Cyber attacks cause extinction Adhikari '09

(Richard, - leading journalist on advanced-IP issues for several major publications, including The Wall Street Journal “Civilization’s High Stakes Cyber-Struggle: Q&A With Gen. Wesley Clark (ret.)”)

The conflicts in the Middle East and Afghanistan, to name the most prominent, are taking their toll on human life and limb. However, the escalating cyberconflict among nations is far more dangerous, argues retired general Wesley Clark, who spoke with TechNewsWorld in an exclusive interview. That cyberconflict will take a far greater toll on the world, contends Clark, who last led the NATO forces to end the ethnic cleansing in Albania. There is a pressing need for new institutions to cope with the ongoing conflict, in his view. Clark is a member of the boards of several organizations. He has a degree in philosophy, politics and economics from Oxford University and a master's degree in military science from the U.S. Army's Command and General Staff College. Background: In November 2008, the Center for Strategic and International Studies, a Washington-based bipartisan think tank, presented recommendations on national security to the then-incoming Obama administration. These called for an overhaul of the existing national cybersecurity organization. Since then, the state of national cybersecurity has appeared chaotic. In August, White House cybersecurity adviser Melissa Hathaway resigned for reasons that echoed the departure in 2004 of Amit Yoran, who then held essentially the same post. In an exclusive interview earlier this year, Yoran told TechNewsWorld that national cybersecurity was still a mess. TechNewsWorld: Security experts warn that nations are preparing for a new cyberwar. Is our government doing enough to protect our national cyber-infrastructure? Or is it in the process of protecting the cyber-infrastructure? Gen. Wesley K. Clark: I think we're in the process of trying to get it protected, but unlike conventional

security considerations, where one can easily see an attack and take the appropriate response, the cyberstruggle is a daily, ongoing affair. **It's a matter of thousands of probes a day, in and out, against** systems that belong to obvious targets like the United States Department of Defense; not-so-obvious targets like **banks and energy companies; and individual consumers or taxpayers.** It's ongoing, it's undeclared, it's often unreported, and it's very much an ongoing concern at all levels -- business, commerce and individual privacy. TechNewsWorld: The national security infrastructure has repeatedly been reported to be sorely lacking. Is the government moving fast enough? Does it need to do more? Clark: It does need to do more. It's in the process of doing more, and there's a tremendous amount of public and private sector effort going into cybersecurity right now. Whether it's going to be adequate or not is not the issue. There are many approaches to this problem that are mainly based on software, but software is vulnerable. When you open up to communicate with the Web, when you bring in data and programs from another source, when you bring in applications -- all that entails huge risks. It's dealing with those risks and trying to gain the rewards of doing so that make it such a difficult proposition. Online banking was a novelty 20 years ago. Now, everything happens on the Internet. People pay their bills, they do business, they do their work with customers. People don't fax documents any more if they don't have to -- they do webinars and briefings. All of this exposes the opportunity for mischief. You don't know the source of the mischief. You don't know whether it's individuals trying to solve a difficult technical challenge on their own or if they're connected to governments, or if they're cells attached to governments -- and it's very difficult to pin down ... incoming probes to a source. TechNewsWorld: While it's generally agreed that the next war may be a cyberwar, much of our infrastructure is either hooked up to the Internet or in the process of being hooked up to the Internet. Electricity companies, for example, are agitating for the use of smart meters. That being the case, and with hackers increasing the frequency and sophistication of their attacks, does the increasing pace of hooking everything up to the Internet pose a real security threat? Clark: We're going into completely digitized medical records, which could lead to a huge invasion of privacy. It could also lead to things like blackmail and is physically dangerous because people can tamper with records of vital signs, or can alter prescriptions. There's no telling just what could be done. Companies could lose their supply chain management, lose their accounting records, lose their customer lists. Trying to rebuild this on paper when we've all been interconnected on the Internet will cause years of economic decline. **We are, as a civilization, quite vulnerable to disruption.** and this security problem doesn't just affect one nation but the whole global economic infrastructure. You can't conceive of the threats from the point of view of a traditional war. Cyber-efforts are ongoing today; we're in a cyber-struggle today. We don't know who the adversaries are in many cases, but we know what **the stakes are: continued economic vitality and, ultimately, global civilization.**

Link Toolbox

2NC Link Boosters

Be skeptical of Aff ev – the necessity of NSA secrecy creates an asymmetrical epistemological bias in the lit

Bolton 15 – John R. Bolton, a diplomat and a lawyer, has spent many years in public service. From August 2005 to December 2006, he served as the U.S. permanent representative to the United Nations. From 2001 to 2005, he was under secretary of state for arms control and international security. At AEI, Ambassador Bolton's area of research is U.S. foreign and national security policy. "NSA activities key to terrorism fight" <http://www.aei.org/publication/nsa-activities-key-to-terrorism-fight/>

Congress is poised to decide whether to re-authorize programs run by the National Security Agency that assess patterns of domestic and international telephone calls and emails to uncover linkages with known terrorists. These NSA activities, initiated after al-Qaeda's deadly 9/11 attacks, have played a vital role in protecting America and our citizens around the world from the still-metastasizing terrorist threat. The NSA programs do not involve listening to or reading conversations, but rather seek to detect communications networks. If patterns are found, and more detailed investigation seems warranted, then NSA or other federal authorities, consistent with the Fourth Amendment's prohibition against unreasonable searches and seizures, must obtain judicial approval for more specific investigations. Indeed, even the collection of the so-called metadata is surrounded by procedural protections to prevent spying on U.S. citizens. Nonetheless, critics from the right and left have attacked the NSA for infringing on the legitimate expectations of privacy Americans enjoy under our Constitution. Unfortunately, many of these critics have absolutely no idea what they are talking about; they are engaging in classic McCarthyite tactics, hoping to score political points with a public justifiably worried about the abuses of power characteristic of the Obama administration. Other critics, following Vietnam-era antipathies to America's intelligence community, have never reconciled themselves to the need for robust clandestine capabilities. Still others yearn for simpler times, embodying Secretary of State Henry Stimson's famous comment that "gentlemen don't read each others' mail." The ill-informed nature of the debate has facilitated scare-mongering, with one wild accusation about NSA's activities after another being launched before the mundane reality catches up. And there is an important asymmetry at work here as well. The critics can say whatever their imaginations conjure up, but NSA and its defenders are significantly limited in how they can respond. By definition, the programs' success rests on the secrecy fundamental to all intelligence activities. Frequently, therefore, explaining what is not happening could well reveal information about NSA's methods and capabilities that terrorists and others, in turn, could use to stymie future detection efforts. After six years of President Obama, however, trust in government is in short supply. It is more than a little ironic that Obama finds himself defending the NSA (albeit with obvious hesitancy and discomfort), since his approach to foreign and defense issues has consistently reflected near-total indifference, except when he has no alternative to confronting challenges to our security. Yet if harsh international realities can penetrate even Obama's White House, that alone is evidence of the seriousness of the threats America faces. In fact, just in the year since Congress last considered the NSA programs, the global terrorist threat has dramatically increased. ISIS is carving out an entirely new state from what used to be Syria and Iraq, which no longer exist within the borders created from the former Ottoman Empire after World War I. In already-chaotic Libya, ISIS has grown rapidly, eclipsing al-Qaeda there and across the region as the largest terrorist threat. Boko Haram is expanding beyond Nigeria, declaring its own caliphate, even while pledging allegiance to ISIS. Yemen has descended into chaos, following Libya's pattern, and Iran has expanded support for the terrorist Houthi coalition. Afghanistan is likely to fall back under Taliban control if, as Obama continually reaffirms, he withdraws all American troops before the end of 2016. This is not the time to cripple our intelligence-gathering capabilities against the rising terrorist threat. Congress should unquestionably reauthorize the NSA programs, but only for three years. That would take us into a new presidency, hopefully one that inspires more confidence, where a calmer, more sensible debate can take place.

Independently, the perception of widespread surveillance is crucial to deter effective terrorist communication --- the plan emboldens effective regrouping

Rascoff 14 [Samuel J. Rascoff, Associate Professor of Law, Faculty Director, Center on Law and Security, New York University School of Law, "COUNTERTERRORISM AND NEW DETERRENCE," 2014]

An open question - an answer to which requires more empirical data - is whether the government's prosecution of relatively amateur would-be terrorists based on stings is likely to be effective in deterring better-trained terrorists.ⁿ¹⁰⁹ But it bears remembering that the viability [*855] of the deterrence-based account of stings does not depend on who is prosecuted. The mere fact of prosecution can alter terrorists' perceptions of future success by implying a

pervasive surveillance network ⁿ¹¹⁰ **facilitated by technology.** ⁿ¹¹¹ As Alex Wilner observed of Canadian counterterrorism, the fact that the country's "**intelligence** community clearly **has the means and the tools to uncover plots expeditiously**" creates an "**overwhelming perception** ... that terrorists are unlikely to evade Canada's watchful eye." ⁿ¹¹² In sum, the meaning of a sting operation and subsequent trial must include the strategic benefits of revealing the fact of undercover surveillance as well as the normative costs implied by **widespread surveillance.** ⁿ¹¹³ This in turn illustrates the [*856] complicated relationship between transparency and secrecy entailed by new deterrence. C. Psychology and Strikes **New deterrence also enriches understanding of the role of fear and emotion in counterterrorism.** Terrorism aims at communicating vulnerability and sowing distrust; violent attacks are, in a sense, means to bring about these more intangible objectives. ⁿ¹¹⁴ (Thus, building sufficient social resiliency to withstand terrorist attacks, as new deterrence counsels, deprives terrorists of an important goal, even when an attack succeeds. ⁿ¹¹⁵) But fear ⁿ¹¹⁶ and distrust are also part of the counterterrorism repertoire. ⁿ¹¹⁷ Inevitably this fact raises serious [*857] normative issues. First is the foundational question of what it means for the state to manage terrorist risk through the potentially widespread, deliberate employment of fear. ⁿ¹¹⁸ Rich sociological and historical literature attest to the emotional costs of aggressive national security tactics. ⁿ¹¹⁹ Second is a concern about the distribution of fear and whether the government considers race and religion when employing it. ⁿ¹²⁰ My central point here, however, is not normative so much as conceptual: Whereas policymakers, lawyers, and the general public often define counterterrorism as the sum of so many violent interventions, **new deterrence reminds us that counterterrorism also operates in a psychological register. Unlike traditional deterrence,** which conveys its message through fear of being caught and punished, **new deterrence relies on a wider and subtler range of official modalities that go to the likelihood of terrorist success. For example, the government may aim to demoralize an adversary by telegraphing the state's overwhelming might.** The state might do so by "**spreading false or exaggerated rumors of the** [*858] **existence of sting operations,**" ⁿ¹²¹ **sowing a sense of distrust within a cell** by implying that one among them is on an official payroll, **or even conveying an image of officials as irrational and prone to unmeasured violence.** ⁿ¹²²

***Domestic Surveillance Generic**

Government surveillance critical to prevent terror attacks

Sulmasy, 13 --- Professor of Law and Governmental Affairs Officer at Coast Guard Academy (6/10/2013, Glenn, "Why we need government surveillance," <http://www.cnn.com/2013/06/10/opinion/sulmasy-nsa-snowden/>, JMP)

The current threat by al Qaeda and jihadists is one that requires aggressive intelligence collection and efforts. One has to look no further than the disruption of the New York City subway bombers (the one being touted by DNI Clapper) or the Boston Marathon bombers to know that the war on al Qaeda is coming home to us, to our citizens, to our students, to our streets and our subways.

This 21st century war is different and requires new ways and methods of gathering information. As technology has increased, so has our ability to gather valuable, often actionable, intelligence. However, **the move toward "home-grown" terror will necessarily require**, by accident or purposefully, **collections of U.S. citizens' conversations with potential overseas persons of interest.**

An open society, such as the **United States**, ironically needs to use this technology to protect itself. This truth is naturally uncomfortable for a country with a Constitution that prevents the federal government from conducting "unreasonable searches and seizures." American historical resistance towards such activities is a bedrock of our laws, policies and police procedures.

But what might have been reasonable 10 years ago is not the same any longer. **The constant armed struggle against the jihadists** has adjusted our beliefs on what we think our government can, and must, do in order to protect its citizens.

Domestic surveillance is key to intel gathering – allows effective executive decision-making

Bolton 13 -- John Bolton, a senior fellow at the American Enterprise Institute, served as US ambassador to the United Nations in 2005-06. "3 views on NSA reform after Snowden leaks" <http://www.csmonitor.com/Commentary/One-Minute-Debate-3-Views/2013/0926/3-views-on-NSA-reform-after-Snowden-leaks/Don-t-overreact-Anger-over-abuses-must-not-harm-NSA-capabilities-secrecy>

For years, America's enemies have yearned to cripple its foreign electronic intelligence-gathering capabilities. Now, the ongoing furor over the National Security Agency (NSA) gives them the chance. Outright falsehoods, distortions, and hysteria have unfortunately been fueled by actual abuses and mistakes. We face a general debate about whether vital electronic-surveillance programs should be substantially curtailed. We must prevent hype and anger over specific abuses from harming the NSA's actual capabilities and the secrecy needed to protect them. Intelligence exists not for its own sake but **to support executive decisionmaking** Accordingly, President Obama is principally responsible for explaining and advocating clandestine activities. This, he appallingly failed to do. Mr. Obama must act like a president, leading the defense of our embattled capabilities. The inevitable congressional proceedings must not repeat the irreparable damage that the 1970s-era congressional investigative committees caused the CIA. Deficiencies there were, but our enemies were the principal beneficiaries of the committees' destructive investigations. Most important, whatever fixes are made today must not deny America the tools to protect itself from terrorists, their state sponsors, and foreign adversaries, many of which

are developing massive cyberwarfare programs. Moreover, the largely preventable or imaginary invasions of privacy pale before security breakdowns that have allowed serious intelligence leaks. The NSA's opponents should be put on notice: If you materially restrict surveillance capabilities, you risk having American blood on your hands. Yes, stop the abuses, increase constitutional oversight, tighten NSA security, and demand accountability. But do not render America deaf and blind.

That's key – the president is the cornerstone of national security

Berman 13 -- Emily Berman, Assistant Professor, Brooklyn Law School. New York University School of Law, LL.M. 2011, J.D. 2005. "THE PARADOX OF COUNTERTERRORISM SUNSET PROVISIONS" <http://ir.lawnet.fordham.edu/cgi/viewcontent.cgi?article=4863&context=flr>

One crucial element of any discussion of counterterrorism powers goes unaddressed in the accounts of legislators and commentators who favor sunsets: the President dominates the formulation of national security and foreign affairs policy in ways that he does not in any other policy area. This domination arises from many sources, including the drastic expansion of presidential power in the post-war era, which is most highly pronounced in the national security context; the advantage that accompanies the President's position as first mover in responding to crises; the ability to act quickly and secretly; the President's role as the "sole organ" of U.S. foreign affairs; the executive's information monopoly; substantive expertise in military and security matters; and a norm of executive primacy that fosters expectations that the President will take the lead in national security.²³⁰

Domestic Surveillance is necessary to stop terror and foreign espionage – the NSA has found a happy medium between privacy and security now

Honorof 13 – Marshall "How the NSA's Spying Keeps You Safe" <http://www.tomsguide.com/us/nsa-spying-keeps-safe,review-1899.html>

The U.S. National Security Agency (NSA) may have taken some fairly extreme liberties when it comes to collecting user data, but the organization hasn't acted on a whim. Call the NSA's surveillance unethical or unconstitutional or dangerous, but it has a responsibility to protect the United States with every tool at its disposal. If you haven't been keeping up with the issue, Americans and Britons are very angry with their governments right now. Reports from The Guardian and The New York Times indicate that the NSA and its British counterpart, Government Communications Headquarters (GCHQ), have the capacity to intercept just about everything their citizens do online, from social media information to encrypted emails. While this anger is both understandable and justifiable, relatively few people have stopped to consider the other side of the coin. You can have total privacy or total national security, but you cannot have both. A modern democratic society requires a compromise between the two extremes. The most important thing to keep in mind is that there is, at present, absolutely no indication that the NSA has done anything illegal or outside the parameters of its mission statement. The NSA monitors external threats to the U.S., and, in theory, does not turn its attention to American citizens without probable cause. There is no evidence to the contrary among the documents that Edward Snowden leaked. "How do we protect our nation? How do we defend it?" asked Gen. Keith Alexander, the NSA's director, at the Black Hat 2013 security conference, held in Las Vegas in July. "[This information] is not classified to keep it from you: a good person. It's classified because sitting among you are people who wish us harm." While the thought of the NSA controlling every bit of information that the average American citizen posts online is disconcerting, Alexander maintained that a terrorist attack is even worse for a country's basic freedoms. "What we're talking about is future terrorist attacks," Alexander said, discussing a number of planned attacks that the NSA foiled over the last 10 years. "It is worth considering what would have happened in the world if those attacks – 42 of those 54 were terrorist plots – if they were successfully executed. What would that mean to our civil liberties and privacy?" James Lewis, a researcher at the Center for Strategic and International Studies, agrees. "The NSA said there were 54 cases where they were able to detect plans and stop them, and 50 of them led to arrests." Lewis told Tom's Guide. "Fifty doesn't sound like a lot compared to the number of records [the NSA collected], but would you have preferred to have 50 more Boston bombings?" Counterterrorism is not the only function of the NSA's widespread surveillance. Although it cannot report exact numbers, Lewis theorizes that the data-mining has allowed the NSA to put a stop to a number of international espionage plots. "The original intent of all these programs was to find foreign spies," he said. "They haven't talked about that, but presumably there have been some successes there, too. A lot of times when you see things and there doesn't appear to be any explanation of how we seemed to magically know about it, it might very well be espionage." As an example of how domestic surveillance can unearth

international plots, Lewis pointed to the North Korean ship stopped in Panama in August 2013. The vessel turned out to be smuggling illegal arms from Cuba. "The Panamanians just woke up one day and decided to look in their ship? I think not," Lewis said. The NSA is not the only government in the world that runs surveillance programs. In fact, if the NSA is keeping tabs on you, there's a good chance that other countries are as well. If you're lucky, they'll be Germany and Australia; if not, then Russia and China may have you under the microscope. Robert David Graham, founder and chief executive officer of Errata Security, spoke with Tom's Guide about how countries leverage surveillance data. "There are two parts to the information," he said. "Information about foreigners and information about your own citizens. The information you get about your own citizens affects political processes within your own country." He went on to explain that if you stir up negative sentiment about Germany, for example, the Germans can hoard your emails just the same as the NSA. Just like the NSA, though, they are unlikely to do anything with those emails unless you represent some kind of clear threat. "The Russians and the Chinese don't have anything to learn about how to do surveillance from us," Lewis said. He explained that the Scandinavian countries and Australia have programs that rival the NSA's as well. "It's just par for the course everywhere in the world." Lewis believes that the NSA's surveillance is much less problematic than its transparency on the issue. "[Security and privacy] have to be balanced, and the debate has largely been 'they should stop doing this,'" he said. "It's weird seeing Rand Paul and the ACLU getting together [to condemn the NSA]. If Rand Paul is for it, it's probably a bad idea." The NSA is also taking the lion's share of the blame for a problem that began at the dawn of the consumer Internet age, got worse after 9/11, and still continues to this day: Internet privacy, or more accurately, the almost total lack thereof. "There really isn't any privacy anymore, and I don't think Americans have realized that," Lewis said. Credit card companies, for example, know just about everything about you, right down to what street you've lived on every year of your life. "This was commercial ... The NSA just happens to be the poster child for this at the moment." There's one thing on which both staunch critics like Graham and fierce proponents like Lewis agree: The U.S. government must be clear and open with its citizens regarding the need for security, even when that security becomes invasive. "Total security means zero privacy. Total privacy means zero security," Graham said. "The extremes are what we have to fear ... The NSA should be monitoring people. It's just the issue of monitoring Americans without probable cause that really bothers the heck out of me." "If you have the right rules, if you have the right laws, if you have the right amount of transparency, you can feel comfortable with this," Lewis said. "Comfortable" is a very strong word, but if the choice is between invasive surveillance and the very real threats of terrorism and espionage, it's not so easy to write the NSA off entirely.

Domestic surveillance is a key link – informs troops on the ground

McLaughlin 14 -- John McLaughlin teaches at the Johns Hopkins School of Advanced International Studies. He was deputy director and acting director of the CIA from 2000 to 2004." NSA intelligence-gathering programs keep us safe
http://www.washingtonpost.com/opinions/nsa-intelligence-gathering-programs-keep-us-safe/2014/01/02/ofd51b22-7173-11e3-8b3f-b1666705ca3b_story.html

It's time we all came to our senses about the National Security Agency (NSA). If it is true, as many allege, that the United States went a little nuts in its all-out pursuit of al-Qaeda after the Sept. 11, 2001, attacks, it is equally true that we are going a little nuts again in our dogged pursuit of the post-Snowden NSA. Those who advocate sharply limiting the agency's activities ought to consider that its work is the very foundation of U.S. intelligence. I don't mean to diminish the role of other intelligence agencies, and I say this as a 30-year veteran of the Central Intelligence Agency who is "CIA" through and through. But in most cases, the NSA is the starting point for determining what holes need to be filled through other means of intelligence-collection. That's because its information on foreign developments is so comprehensive and generally so reliable. It is the core of intelligence support to U.S. troops in battle. Any efforts to "rein in" the agency must allow for the possibility that change risks serious damage to U.S. security and the country's ability to navigate in an increasingly uncertain world. The presumption that the NSA "spies" on Americans should also be challenged. In my experience, NSA analysts err on the side of caution before touching any data having to do with U.S. citizens. In 2010, at the request of then-Director of National Intelligence Dennis Blair, I chaired a panel investigating the intelligence community's failure to be aware of Umar Farouk Abdulmutallab, the "underwear bomber" who tried to blow up a commercial plane over Detroit on Dec. 25, 2009. The overall report remains classified, but I can say that the government lost vital time because of the extraordinary care the NSA and others took in handling any data involving a "U.S. person." (Abdulmutallab, a Nigerian, was recruited and trained by the late Anwar al-Awlaki, a U.S. citizen based in Yemen.) Regarding outrage over the NSA's collection of telephone calling records, or metadata, I don't know why anyone would have greater confidence in this information being held by private companies. And given the perceived threat to privacy, it's astonishing how little attention has been paid to the Senate commerce committee's recent report on companies that gather personal information on hundreds of millions of Americans and sell it to marketers, often highlighting people with financial vulnerability. Some companies group the data into categories including "rural and barely making it," "retiring on empty" and "credit crunched: city families." The aim is often to sell financially risky products to transient consumers with low incomes, the report found. That's a real scandal – and a universe away from the NSA's ethical standards and congressional oversight. The NSA, of course, is not perfect. But it is less a victim of its actions – the independent commission appointed by President Obama found no illegality or abuses – than of the broad distrust of government that has taken root

in the United States in recent decades. Studies by Pew and others show distrust of government around 80 percent, an all-time high. This distrust is the only logical explanation I see for fear of data being held by “the government” — and it’s not a circumstance the NSA created. Although our society lauds, in almost “Stepford Wives”-like fashion, the merits of “transparency,” it lacks a collective, mature understanding of how intelligence works, how it integrates with foreign policy and how it contributes to the national welfare. Meanwhile, prurient interest in the details of leaked intelligence skyrockets, and people devour material that is not evidence of abuse but merely fascinating — and even more fascinating to U.S. adversaries. So what makes sense going forward? Clearly, the widespread perception that there is at least the “potential for abuse” when the government holds information even as limited as telephone call metadata must be addressed. The recent presidential commission recommended adding a public privacy advocate to the deliberation process of courts that approve warrants — one proposal that would do no harm. But as the administration contemplates reform, it must reject any ideas that add time and process between the moment the NSA picks up a lead overseas and the time it can cross-check records to determine whether there is a domestic dimension to overseas plotting. As our debate continues, the terrorist threat is not receding but transforming. The core leadership of al-Qaeda has been degraded and remains under pressure, but robust al-Qaeda affiliates have multiplied. With the decline of central government authority in the Middle East and North Africa in the wake of the Arab Spring and the war in Syria, terrorists have the largest havens and areas for operational planning in a decade. If anything, the atomization of the movement has made the job of intelligence more labor-intensive, more detail-oriented and more demanding. Now is not the time to give up any tool in the counterterrorism arsenal.

NSA surveillance is uniquely key to the fight against terrorism

Sanger and Shanker 13 (David E. Sanger, chief Washington correspondent of The New York Times, and Thom Shanker, Pentagon correspondent for The New York Times, “NSA Director Firmly Defends Surveillance Efforts”, 10/12/13, www.nytimes.com/2013/10/13/us/nsa-director-gives-firm-and-broad-defense-of-surveillance-efforts.html) -LL

FORT MEADE, Md. — The director of the National Security Agency, Gen. Keith B. Alexander, said in an interview that to prevent terrorist attacks he saw no effective alternative to the N.S.A.’s bulk collection of telephone and other electronic metadata from Americans. But he acknowledged that his agency now faced an entirely new reality, and the possibility of Congressional restrictions, after revelations about its operations at home and abroad. While offering a detailed defense of his agency’s work, General Alexander said the broader lesson of the controversy over disclosures of secret N.S.A. surveillance missions was that he and other top officials have to be more open in explaining the agency’s role, especially as it expands its mission into cyberoffense and cyberdefense. “Given where we are and all the issues that are on the table, I do feel it’s important to have a public, transparent discussion on cyber so that the American people know what’s going on,” General Alexander said. “And in order to have that, they need to understand the truth about what’s going on.” General Alexander, a career Army intelligence officer who also serves as head of the military’s Cyber Command, has become the public face of the secret — and, to many, unwarranted — government collection of records about personal communications in the name of national security. He has given a number of speeches in recent weeks to counter a highly negative portrayal of the N.S.A.’s work, but the 90-minute interview was his most extensive personal statement on the issue to date. Speaking at the agency’s heavily guarded headquarters, General Alexander acknowledged that his agency had stumbled in responding to the revelations by Edward J. Snowden, the contractor who stole thousands of documents about the N.S.A.’s most secret programs. But General Alexander insisted that the chief problem was a public misunderstanding about what information the agency collects — and what it does not — not the programs themselves. “The way we’ve explained it to the American people,” he said, “has gotten them so riled up that nobody told them the facts of the program and the controls that go around it.” But he was firm in saying that the disclosures had allowed adversaries, whether foreign governments or terrorist organizations, to learn how to avoid detection by American intelligence and had caused “significant and irreversible damage” to national security. General Alexander said that he was extremely sensitive to the power of the software tools and electronic weapons being developed by the United States for surveillance and computer-network warfare, and that he set a very high bar for when the nation should use them for offensive purposes. “I see no reason to use offensive tools unless you’re defending the country or in a state of war, or you want to achieve some really important thing

for the good of the nation and others,” he said. Those comments were prompted by a document in the Snowden trove that said the United States conducted more than 200 offensive cyberattacks in 2011 alone. But American officials say that in reality only a handful of attacks have been carried out. They say the erroneous estimate reflected an inaccurate grouping of other electronic missions. But General Alexander would not discuss any specific cases in which the United States had used those weapons, including the best-known example: its years-long attack on Iran’s nuclear enrichment facility at Natanz. To critics of President Obama’s administration, that decision made it easier for China, Iran and other nations to justify their own use of cyberweapons. General Alexander, who became the N.S.A. director in 2005, will retire early next year. The timing of his departure was set in March when his tour was extended for a third time, according to officials, who said it had nothing to do with the surveillance controversy spawned by the leaks. The appointment of his successor is likely to be a focal point of Congressional debate over whether the huge infrastructure that was built during his tenure will remain or begin to be restricted. Senator Patrick J. Leahy, a Vermont Democrat who leads the Senate Judiciary Committee, has already drafted legislation to eliminate the N.S.A.’s ability to systematically obtain Americans’ calling records. And Representative Jim Sensenbrenner, a Wisconsin Republican and co-author of the Patriot Act, is drafting a bill that would cut back on domestic surveillance programs. General Alexander was by turns folksy and firm in the interview. But he was unapologetic about the agency’s strict culture of secrecy and unabashed in describing its importance to defending the nation. He insisted that it would have been impossible to have made public, in advance of the revelations by Mr. Snowden, the fact that the agency collected what it calls the “business records” of all telephone calls, and many other electronic communications, made in the United States. The agency is under rules preventing it from investigating that so-called haystack of data unless it has a “reasonable, articulable” justification, involving communications with terrorists abroad. he added. But he said the agency had not told its story well. As an example, he said, the agency itself killed a program in 2011 that collected the metadata of about 1 percent of all of the e-mails sent in the United States. “We terminated it,” he said. “It was not operationally relevant to what we needed.” However, until it was killed, the N.S.A. had repeatedly defended that program as vital in reports to Congress. Senior officials also said that one document in the Snowden revelations, an agreement with Israel, had been misinterpreted by those who believed that it meant the N.S.A. was sharing raw intelligence data on Americans, including the metadata on phone calls. Officials said the probability of American content in the shared data was extremely small. General Alexander said that confronting what he called the two biggest threats facing the United States – terrorism and cyberattacks – would require the application of expanded computer monitoring. In both cases, he said, he was open to much of that work being done by private industry, which he said could be more efficient than government. In fact, he said, a direct government role in filtering Internet traffic into the United States, in an effort to stop destructive attacks on Wall Street, American banks and the theft of intellectual property, would be inefficient and ineffective. “I think it leads people to the wrong conclusion, that we’re reading their e-mails and trying to listen to their phone calls,” he said. Although he acknowledged that the N.S.A. must change its dialogue with the public, General Alexander was adamant that the agency adhered to the law. “We followed the law, we follow our policies, we self-report, we identify problems, we fix them,” he said. “And I think we do a great job, and we do, I think, more to protect people’s civil liberties and privacy than they’ll ever know.”

Domestic surveillance is essential to counterterrorism – the NSA has prevented over 50 terror plots since 9/11, including 10 in the US

Savage 13 (Charlie Savage, Washington correspondent for The New York Times, “N.S.A. Chief Says Surveillance Has Stopped Dozens of Plots”, 6/18/13, <http://www.nytimes.com/2013/06/19/us/politics/nsa-chief-says-surveillance-has-stopped-dozens-of-plots.html>) -LL

WASHINGTON – Top national security officials on Tuesday promoted two newly declassified examples of what they portrayed as “potential terrorist events” disrupted by government surveillance. The cases were made public as Congress and the Obama administration stepped up a campaign to explain and defend programs unveiled by recent leaks from a former intelligence contractor. One case involved a group of men in San Diego convicted of sending money to an extremist group in Somalia. The other was presented as a nascent plan to bomb the New York Stock Exchange, although its participants were not charged with any such plot. Both were described by Sean Joyce, deputy director of the Federal Bureau of Investigation, at a rare public oversight hearing by the House Intelligence Committee. At the same hearing, Gen. Keith B. Alexander, the head of the National Security

Agency, said that American surveillance had helped prevent “potential terrorist events over 50 times since 9/11,” including at least 10 “homeland-based threats.” But he said that a vast majority of the others must remain secret. Gen. Keith B. Alexander, director of the National Security Agency, testified before the House Permanent Select Committee on Intelligence on Tuesday. “In the 12 years since the attacks on Sept. 11, we have lived in relative safety and security as a nation,” General Alexander said. “That security is a direct result of the intelligence community’s quiet efforts to better connect the dots and learn from the mistakes that permitted those attacks to occur on 9/11.” The hearing was aimed at bolstering public support for surveillance programs after leaks by Edward J. Snowden, a former N.S.A. contractor who was one of about 1,000 systems administrators who ran the agency’s networks. Its title: “How Disclosed N.S.A. Programs Protect Americans, and Why Disclosure Aids Our Adversaries.” The Republican chairman of the committee, Representative Mike Rogers of Michigan, and the top Democrat, Representative C. A. Dutch Ruppersberger of Maryland, both defended the surveillance programs revealed by Mr. Snowden and expressed anger over his leaks. “It is at times like these where our enemies within become almost as damaging as our enemies on the outside,” Mr. Rogers said. The testimony on Tuesday by General Alexander, Mr. Joyce and three other national security officials focused on two types of surveillance. One was a huge database logging all domestic American phone calls, which Mr. Snowden’s leaks brought to light. The other was the collection of the contents of certain e-mails and phone calls under the FISA Amendments Act of 2008, which allows surveillance without individualized warrants if the targets are noncitizens abroad, even if the collection takes place on domestic soil. As an example of how the domestic calling log database has been used, Mr. Joyce cited the case of several men convicted by a jury in February of raising and sending about \$8,500 to Al Shabab, a terrorist group in Somalia. The N.S.A. had flagged the calling activities of one of the men as suspicious, he said. Representative Mac Thornberry, Republican of Texas, pressed Mr. Joyce to say more, asking, “But there was some connection to suicide bombings that they were talking about, correct?” Mr. Joyce replied, “Not in the example that I’m citing right here.” Speaking of the calling log program, the deputy director of the N.S.A., John C. Inglis, said that “only 20 analysts at N.S.A. and their two managers, for a total of 22 people, are authorized to approve numbers that may be used to query this database.” The N.S.A. has said that it searched for links to fewer than 300 numbers in 2012. Sean Joyce, a deputy director of the F.B.I., testified before the House Intelligence Committee. Representative Adam B. Schiff, Democrat of California, pressed General Alexander to explain why the F.B.I. could not simply get the relevant logs of calls linked to a suspicious number without keeping a database of all domestic calls. General Alexander said he was open to discussing doing it that way, but added, “The concern is speed in crisis.” As a newly disclosed example of how the FISA Amendments Act surveillance authority has been used, Mr. Joyce described a case in which he said the authorities had discovered and disrupted a plot to bomb the New York Stock Exchange. Monitoring a terrorist in Yemen, the N.S.A. discovered that he was talking to a man named Khalid Ouazzani in Kansas City, Mo. After applying for a separate warrant for Mr. Ouazzani’s communications, they identified two additional conspirators and discovered they were “in the very initial stages” of the stock exchange bomb plot, he said. Mr. Ouazzani pleaded guilty in 2010 to sending money to Al Qaeda but was not charged with any domestic plots. Later on Tuesday, law enforcement officials said Mr. Joyce had been referring to Sabirhan Hasanoff and Wesam El-Hanafi, two Brooklyn men who pleaded guilty to providing material support to terrorism. A sentencing memorandum filed by prosecutors contends that in 2008, “at the direction of a senior terrorist leader,” Mr. Hasanoff conducted surveillance of the New York Stock Exchange and sent the leader a one-page report on it. “The report was rudimentary and of limited use” for any terrorist operation, the memo acknowledges, while nevertheless contending that Mr. Hasanoff’s willingness to conduct such surveillance bolstered the case for giving him a 20-year sentence. At the hearing, Mr. Thornberry asked Mr. Joyce whether the stock exchange attack was a “serious plot” or just “something that they kind of dreamed about.” Mr. Joyce replied, “I think the jury considered it serious, since they were all convicted.” However, Joshua L. Dratel, a lawyer for Mr. Hasanoff, called Mr. Joyce’s portrayal “astonishing” because none of the defendants was charged with the stock exchange allegation and there was no jury trial in any of the cases. Mr. Joyce also invoked two cases officials have previously linked to surveillance conducted under the FISA Amendments Act — a plot to bomb the New York City subway and the discovery that David Headley, a Chicago man, was working on a plot to bomb a Danish newspaper that published cartoon depictions of the Prophet Muhammad. Representative Jim Himes, Democrat of Connecticut, told General Alexander that he was “more troubled” by the domestic

calling log program, which he called “historically unprecedented in the extent of the data that is being collected on potentially all American citizens,” than with the gathering of foreign data. He pressed the officials to say how many attacks were stopped by it. Mr. Joyce replied that it was “an almost impossible question,” but that “I can tell you, every tool is essential and vital. And the tools, as I outlined to you, and the uses today have been valuable to stopping some of those plots.”

The PATRIOT Act is essential to counterterrorism efforts– it allows agents to use traditional tools to fight terror

Sales 14 (Nathan A. Sales, Associate Professor of Law at Syracuse University, “The Patriot Act Is a Vital Weapon in Fighting Terrorism”, 5/23/14, <http://www.nytimes.com/roomfordebate/2011/09/07/do-we-still-need-the-patriot-act/the-patriot-act-is-a-vital-weapon-in-fighting-terrorism>)

America needs the Patriot Act because it helps prevent terrorism while posing little risk to civil liberties. The law simply lets counterterrorism agents use tools that police officers have used for decades. And it contains elaborate safeguards against abuse. Consider the three provisions Congress renewed last May. 1. Congress authorized “roving wiretaps” back in 1986 -- court orders that allow police to monitor criminals even if they switch phones. The Patriot Act allows the same thing in terrorism investigations. The law levels the playing field: If a roving wiretap is good enough for Tony Soprano, it’s good enough for Mohamed Atta. The Patriot Act features strict safeguards. Agents can’t eavesdrop unless they get a judge’s permission. They must demonstrate that the suspect is a terrorist. And they must notify the judge when they go up on a new phone. 2. Grand juries in criminal cases routinely subpoena “business records” from companies like banks and retailers. The Patriot Act lets counterterrorism agents get the same documents. The law simply lets counterterrorism agents use tools that police officers have used for decades. The act’s protections are even stronger than the grand jury rules. Prosecutors issue subpoenas unilaterally, but the Patriot Act requires the F.B.I. to get a judge’s approval. Americans can’t be investigated on the basis of First Amendment activities, and special limits apply to sensitive materials like medical or library records. 3. Before 9/11, it was difficult for authorities to monitor “lone wolves” with murky ties to overseas terrorist groups. The F.B.I. suspected that Zacarias Moussaoui was a terrorist, but agents hadn’t connected him to Al Qaeda, so it wasn’t clear they could search his apartment. Congress fixed that problem. Now, agents can monitor a terrorist even if they haven’t yet found evidence he belongs to a foreign terrorist organization. Again, the Patriot Act has robust safeguards. Agents have to convince a judge to let them track a lone wolf.

Communication surveillance *crucial* in our ability to defend national security

Carafano 13 — Vice President for Defense and Foreign Policy Studies at the Heritage Foundation, PhD

(James, 8-6-2013, "PRISM is Essential to U.S. Security in War Against Terrorism," <http://www.heritage.org/research/commentary/2013/8/prism-is-essential-to-us-security-in-war-against-terrorism>, Date Accessed: 6-23-2015) //NM

"Our intelligence professionals must be able to find out who the terrorists are talking to, what they are saying, and what they're planning." said the president. "The lives of countless Americans depend on our ability to monitor these communications." He added that he would cancel his planned trip to Africa unless assured Congress would support the counterterrorism surveillance program. The president was not Barack Obama. It was George W. Bush, in 2008, pressing Congress to extend and update reforms to the Foreign Intelligence Surveillance Act (FISA). He was speaking directly to the American public, in an address broadcast live from the Oval Office. How times have changed. Back then, the President of the United States willingly led the fight for the programs he thought necessary to keep the nation safe. Now, our president sends underlings to make the case. In distancing himself from the debate over PRISM (the foreign intelligence surveillance program made famous by the world-travelling leaker Edward Snowden), President Obama followed the precedent he established in May at the National Defense University. There, he spoke disdainfully of drone strikes, the authorization to use military force against terrorists, and the detention facilities at Guantanamo Bay. All three are essential components of his counterterrorism strategy. In distancing himself from his own strategy, Obama hoped to leave the impression that he is somehow above it all. He has dealt with the Snowden case the same way. When asked while traveling in Africa if he would take a role in going after the leaker, the president replied "I shouldn't have to." The White House's above-it-all attitude sends seriously mixed messages to the American people, who are trying to figure if the government's surveillance programs are legal and appropriate. Congress has not been much better. The authority for PRISM is in FISA Section 702. Congress debated these authorities in 2007 and again when the program was reauthorized in 2008. Senate Majority Leader Harry Reid, D-Nev., surely remembers the controversy. He wrote President Bush: "There is no crisis that should lead you to cancel your trip to Africa. But whether or not you cancel your trip, Democrats stand ready to negotiate a final bill, and we remain willing to extend existing law for as short a time or as long a time as is needed to complete work on such a bill." Evidently, Reid must have felt the authorities granted under Section 702 received a full and sufficient hearing. Most current members of Congress were seated under the dome during the 2008 debates. They had every opportunity not just to read the law, but to be briefed on the program by intelligence officials before voting on the bill. For them to act shocked at the scope of the program today rings about as hollow as Obama's expressed disdain for the operations he oversees. The reality is that Congress and the administration share responsibility for these programs. If they want to change or modify them, who's stopping them? If changes are made, however, they should to be made for the right reason. Leaders must never compromise our security for political expediency. At least 60 Islamist-inspired terrorist plots have been aimed at the U.S. since the 9/11 attacks. The overwhelming majority have been thwarted thanks to timely, operational intelligence about the threats. Congress should not go back to a pre-/11 set of rules just to appeal to populist sentiment. Congress and the White House have an obligation to protect our liberties and to safeguard our security-- in equal measure. Meeting that mission is more important than winning popularity polls.

*Courts Affirmatives

Plan undermines Judicial deference – critical to effective counter-terrorism operations – secrecy and expertise

Posner 12 (Eric A. – Kirkland & Ellis Professor, University of Chicago Law School, “DEFERENCE TO THE EXECUTIVE IN THE UNITED STATES AFTER SEPTEMBER 11: CONGRESS, THE COURTS, AND THE OFFICE OF LEGAL COUNSEL”, 1/11, Harvard Journal of Law & Public Policy, <http://www.harvard-jlpp.com/wp-content/uploads/2012/01/PosnerFinal.pdf>)

The deference thesis states that during emergencies the **legislature and judiciary should defer to the executive**.⁸ It assumes that the executive is controlled by the

President, but to the extent that the President could be bound by agents within the executive, the deference thesis also holds that those agents should follow the President’s orders, not the other way around. In normal times, the three branches of government share power. For example, if the executive believes that a new, dangerous drug has become available, but possession of the drug is not yet illegal, the executive may not act on its own to detain and prosecute those who deal and use the drug. The legislature must first enact a statute that outlaws the drug. The executive also depends on the legislature for financial appropriations and other forms of support. The executive also faces constraints from the courts. If the executive arrests drug dealers and seeks to imprison them, it must first obtain the approval of courts. The courts ensure that the executive does not go beyond the bounds of the new law, does not violate earlier-enacted laws that have not been superseded by the new law, and does not violate the Constitution. In

emergencies, the executive often will contemplate actions that do not have clear legislative authority and might be constitutionally dubious. For example, after September 11, the U.S. government engaged in immigration sweeps, detained people without charges, used coercive interrogation, and engaged in warrantless wiretapping of American citizens.⁹ Many, if not all, of these actions would have been considered violations of the law and the U.S. Constitution if they had been undertaken against normal criminal suspects the day before the attacks. After September 11, both the legislature and the courts gave the executive some deference. The legislature gave explicit

authorities to the executive that it had initially lacked;¹⁰ the courts did not block actions that they would have blocked during normal times.¹¹ But neither body was entirely passive. Congress objected to coercive interrogation and did not give the executive all the authorities that it requested.¹² After a slow start, the courts also resisted some of the assertions the executive made. There is some dispute about whether this resistance was meaningful and caused the executive to change policy or merely reacted to the same stimuli that caused the executive to moderate certain policies

independently.¹³ In any event, no one disputes that the courts gave the executive a nearly free pass over at least the first five to seven years of the conflict with al Qaeda. The deference thesis, then, can be strong-form or weak-form. This ambiguity has had unfortunate consequences for debates about post-September 11 legal policies. Few people believe that the courts should impose exactly the same restrictions on the executive during an emergency as during normal times. Indeed, doctrine itself instructs courts to balance the security value of a course of action and its cost to civil liberties, implying that certain actions might be legally justified to counter high-stakes threats but not to counter low-stakes threats.¹⁴ Nor does anyone believe that the executive should be completely unconstrained. The debate is best understood in the context of the U.S. government’s post-September 11 policies. Defenders of these policies frequently invoked the deference thesis—not so much as a way of justifying any particular policy, but as a way of insisting that the executive should be given the benefit of the doubt, at least in the short term.¹⁵ The deference thesis rests on basic intuitions about institutional competence: that the executive can act more decisively and with greater secrecy than Congress or the courts because

it is a hierarchical body and commands forces that are trained and experienced in countering security threats. The other branches lack expertise. Although they may have good ideas from time to time, and are free to volunteer them, the ability of the executive to respond to security threats would be unacceptably hampered if Congress and the courts had the power to block it to any significant degree. Secrecy is an **important part** of the argument. Policymaking depends on information, and information during emergencies often must be kept secret. Congress and the courts are by nature and tradition **open bodies**; if they were to act in secret, their value would be diminished. Meanwhile, the argument continues, the fear of an out-of-control executive who would engage in abuses unless it was constrained by the other branches **is**

exaggerated. The President has strong electoral and other political incentives to act in the public interest (at least, in the United States). Even if the executive can conceal various “inputs” into counterterrorism policy, it cannot conceal the “output”—the existence, or not, of terrorist attacks that kill civilians. Thus, it was possible for defenders of the Bush Administration’s counterterrorism policies to express discomfort with certain policy choices, while arguing nonetheless that Congress and the courts should not try to block executive policymaking or the duration of the emergency—at least not as a matter of presumption. Critics of the Bush Administration argued that deference was not warranted—or at least not more than a limited amount of deference was warranted, although again these subtleties often were lost in the debate—for a variety of reasons. I now turn to these arguments.

Surveillance programs are state secrets – case law proves

Bazze 12 (Tom – J.D., Georgetown University Law Center, 2011, “Shutting the Courthouse Doors: Invoking the State Secrets Privilege to Thwart Judicial Review in the Age of Terror”, 2012, 23 Geo. Mason U. Civ. Rts. L.J. 29, lexis)

A. No Harm, No Judicial Review: State Secrets and the Terrorist Surveillance Wiretapping Program Revelations in late 2005 and early 2006 about the TSP - a secret terrorist surveillance wiretapping program operated by the NSA without judicial supervision,ⁿ⁶⁶ whose existence the Bush Administration later confirmedⁿ⁶⁷ - triggered numerous lawsuits against telecommunications providers for violations of subscribers’ constitutional and statutory rights.ⁿ⁶⁸ These lawsuits were not the first legal challenges to government wiretapping, nor were they the first time the government had invoked state secrets to thwart judicial inquiry of wiretapping challenges.ⁿ⁶⁹ Rather than revisit that history, this Article instead focuses only on post-9/11 circuit court decisions to consider the extent [*41] to which courts have acquiesced to government assertions of the state secrets privilege. While circuit courts have tended to recognize state secrets claims in these cases, it is significant that many of these decisions actually reversed district court decisions that had rejected the state secrets claims. Perhaps the most thorough treatment of whether the state secrets privilege precludes judicial review of the terrorist surveillance program occurred in *Hepting v. AT&T Corp.*, where the plaintiffs argued that AT&T’s alleged warrantless wiretapping of its communications violated their First and Fourth Amendment rights.ⁿ⁷⁰ The Bush Administration intervened, moving for dismissal on state secrets grounds.ⁿ⁷¹ After reviewing the purportedly secret evidence in camera,ⁿ⁷² the District Court for the Northern District of California denied the government’s motion to dismiss, ruling that discovery should commence because the state secrets claim was inapplicable in light of the government’s repeated admissions about the existence of the program.ⁿ⁷³ The district court’s thoughtful opinion offers a framework for review of state secrets claims in the war-on-terror context. The district court’s threshold inquiry in resolving the state secrets claim was determining whether the NSA surveillance program that gave rise to the suit actually qualified as a “secret.”ⁿ⁷⁴ Because the government had disclosed the existence of the program and AT&T admitted to assisting the government in classified matters when asked, the court concluded that state secrets did not foreclose discovery.ⁿ⁷⁵ While the state secrets privilege did not support pre-discovery dismissal of the case, the court found that there was sufficient ambiguity about the extent of AT&T’s involvement in the program, and the contents of any communication records surveyed, so as to permit AT&T to not disclose the extent of its participation in the TSP.ⁿ⁷⁶ The court [*42] made clear, however, that if information about AT&T’s role in supporting the TSP became public during the course of the litigation, the government could no longer invoke state secrets to resist disclosing this information.ⁿ⁷⁷

Surveillance information is classified as a state secret – the plan must circumvent the doctrine

Bazze 12 (Tom – J.D., Georgetown University Law Center, 2011, “Shutting the Courthouse Doors: Invoking the State Secrets Privilege to Thwart Judicial Review in the Age of Terror”, 2012, 23 Geo. Mason U. Civ. Rts. L.J. 29, lexis)

The war on terror has led to an increased use of the state secrets privilege by the Executive Branch - to dismiss legal challenges to widely publicized and controversial government actions - ostensibly aimed at protecting national security from terrorist threats.ⁿ¹ Faced with complaints that allege indiscriminate and warrantless surveillance,ⁿ² tortious detention, and torture that flouts domestic and international law,ⁿ³ courts have had to reconcile impassioned appeals for private justice with the government’s unyielding insistence on protecting national security. Courts, almost unanimously, have cast their lot with national security, granting

considerable deference to government assertions of the state secrets principle.

This deference to state secrets shows no signs of abating; indeed, the growing trend is for courts to dismiss these legal challenges pre-discovery, n4 even before the private litigants have had the chance to present actual, non-secret evidence to meet their burden of proof. Although many looked optimistically at President Obama's inauguration as a chance to break decisively from the Bush Administration's aggressive application of the state secrets [*30] privilege, n5 the Obama Administration has largely disappointed on the state-secrets front, asserting the privilege with just as much fervor - if not as much regularity n6 - as its predecessor. n7

Courts are normally minimalist – the aff collapses executive independence – key to counter terrorism

Keynes 10 -- Professor of Political Science at Pennsylvania State University, University of Wisconsin Ph.D. (Edward, 2010, "Undeclared War: Twilight Zone of Constitutional Power," p. 83)

While the constitutional separation of powers does not preclude judicial review of war-POWERS controversies or require absolute deference to congressional and presidential judgment that the political-question doctrine sometimes suggests, the separation of powers provides a broad standard for judicial intervention in the vast, complex, and uncertain realm of foreign affairs. When the courts intervene in boundary disputes in order to protect an individual's constitutional rights or society's interest in constitutional government, they should not impair the performance of legislative or executive functions that are essential to protecting national-security interests.¹²⁶ Although the courts do not owe Congress or the President absolute deference in defining the boundaries of legislative and executive power, the principle of comity suggests that the judiciary should search for formulas that least restrict each branch in the performance of its functions, i.e., formulas that maximize each department's independence. As Robert Nagel recommends, when the courts challenge the exercise of legislative or executive power, they should pause to examine the effect of their decisions on the other department's operation. In cases that involve conflicting claims of power, the courts should first determine how broadly and deeply their decisions cut into another department's functions before marching into the political thicket.¹²⁶

*Drone Surveillance Affirmatives

Warrantless use of drones is key to staving off domestic terror attacks

McNeal 2014 — professor at Pepperdine University and a contributor to Forbes. He is an expert in law and public policy with a specific focus on security, technology and crime.

(Law Enforcement, November 2014, "Drones and Aerial Surveillance: Considerations for Legislators," <http://www.brookings.edu/research/reports/2014/11/drones-and-aerial-surveillance>, Date Accessed: 6-22-2015) //NM

The looming prospect of expanded use of unmanned aerial vehicles, colloquially known as drones, has raised understandable concerns for lawmakers.^[1] Those concerns have led some to call for legislation mandating that nearly all uses of drones be prohibited unless the government has first obtained a warrant. Privacy advocates have mounted a lobbying campaign that has succeeded in convincing thirteen states to enact laws regulating the use of drones by law enforcement, with eleven of those thirteen states requiring a warrant before the government may use a drone.^[2] The campaigns mounted by privacy advocates oftentimes make a compelling case about the threat of pervasive surveillance, but the legislation is rarely tailored in such a way to prevent the harm that advocates fear. In fact, in every state where legislation was passed, the new laws are focused on the technology (drones) not the harm (pervasive surveillance). In many cases, this technology centric approach creates perverse results, allowing the use of extremely sophisticated pervasive surveillance technologies from manned aircraft, while disallowing benign uses of drones for mundane tasks like accident and crime scene documentation, or monitoring of industrial pollution and other environmental harms. The first drone-related legislation appeared in 2013 in Florida, Idaho, Montana, Oregon, North Carolina, Tennessee, Virginia, and Texas.^[3] In 2014, Wisconsin, Illinois, Indiana, Utah, and Iowa also passed laws seeking to address the use of drones by law enforcement.^[4] As of the writing of this paper, the California legislature passed a drone-related bill that was vetoed by the governor, but the bill's sponsors have vowed to revisit the issue in the next legislative session.^[5] These legislative efforts have been aimed at restricting the government's use of drone technology, while largely allowing the government to conduct identical surveillance when not using drone technology. This absurd anachronism is intentional, as privacy advocates have explicitly chosen to capitalize on the public interest and attention associated with the demonization of drone technology as a way to achieve legislative victories. These advocates are admittedly not focused on more sensible legislation that addresses harms irrespective of the technology used.^[6] Privacy advocates contend that with drones, the government will be able to engage in widespread pervasive surveillance because drones are cheaper to operate than their manned counterparts. While drones are cheaper to operate, the drones most law enforcement agencies can afford are currently far less capable than their manned counterparts (oftentimes these drones are small remote controlled helicopters or airplanes, capable of a flight time of less than one hour). The surveillance equipment that can be placed on these drones is also far less intrusive than that which can be mounted to manned aircraft. Moreover, the term "unmanned aircraft" is also misleading as there are no systems currently available to law enforcement that can conduct fully autonomous operations, all systems need an operator for part of the mission. Thus, in almost all instances drones are less capable than manned aerial surveillance platforms, and while the platform is cheaper (but less capable), the personnel costs still remain constant as an officer is required to operate the drone. Granted, there are very sophisticated systems used by the military, but even if law enforcement agencies were able to afford the highly sophisticated multi-million dollar Predator and Reaper systems like those used for surveillance on battlefields, those systems (both the aircraft and the ground control station) are more expensive than manned helicopters, require a ground crew to launch and recover the aircraft, and require both a pilot and a camera operator. In light of these facts, the legislation being pushed by privacy advocates has been explicitly directed at drone technology, not because the technology represents an actual threat to civil liberties, but because someday in the future, the technology may be intrusive.^[7] To counter the threat of surveillance, privacy advocates have focused solely on requiring warrants before the use of drones by law enforcement. Such a mandate oftentimes will result in the grounding of

drone technology in circumstances where law enforcement use of drones would be beneficial and largely non-controversial. For example, in light of the Boston Marathon bombing, police may want to fly a drone above a marathon to ensure the safety of the public. Under many bills, police would not be allowed to use a drone unless they had a warrant, premised upon probable cause to believe a crime had been or was about to be committed. This requirement exceeds current Fourth Amendment protections with regard to the reasonableness of observing activities in public places. What this means is that the police would need to put together a warrant application with sufficient facts to prove to a judge that they had probable cause. That application would need to define with particularity the place to be searched or the persons to be surveilled. All of this would be required to observe people gathered in a public place, merely because the observation was taking place from a drone, rather than from an officer on a rooftop or in a helicopter. In a circumstance like a marathon, this probable cause showing will be difficult for the police to satisfy. After all, if the police knew who in the crowd was a potential bomber, they would arrest those individuals. Rather, a marathon is the type of event where the police would want to use a drone to monitor for unknown attackers, and in the unfortunate event of an attack, use the footage to identify the perpetrators. This is precisely the type of circumstance where the use of drone could be helpful, but unfortunately it has been outlawed in many states. To make matters worse, this type of drone surveillance would pose little to no harms to privacy. A marathon is a highly public event, the event is televised, it takes place on streets where there are surveillance cameras and spectators are photographing the event. Moreover, in the states where drones have been banned (unless accompanied by a warrant), the police have not been prohibited from using any other type of surveillance equipment --- just drones. This technology centric approach has done little to protect privacy, but will certainly harm public safety, depriving law enforcement of a tool that they could use to protect people.

Drones key to combatting chemical and biological weapons

Koerner 2015 — Duke University School of Law, J.D. expected 2015

(Matthew, 3-1-2015, "Drones and the Fourth Amendment: Redefining Expectations of Privacy," <http://www.highbeam.com/doc/1G1-410904603.html>, Date Accessed: 6-22-2015) //NM

Senator Dianne Feinstein, a staunch advocate of governmental surveillance n1 and Chairman of the 113th Congress's Senate Intelligence Committee, n2 recently found herself, rather ironically, as the target of surveillance. n3 One day at her home, Senator Feinstein walked to the window to check on a protest that was taking place outside. n4 Much to her surprise, a small drone n5 hovered on the other side of the window, only inches away, spying on her. n6 The drone immediately flew away. n7 Senator Feinstein's experience is just one example of drones being used for surveillance within the United States. But her story and others like it n8 have sparked significant controversy over the use of drones for domestic surveillance, which falls within a broader debate [*1131] on privacy and governmental surveillance programs. n9 Advocates of robust federal surveillance policies champion governmental surveillance as the only way to prevent terrorist and cyber attacks against the United States. n10 President Barack Obama defended these surveillance programs as "modest encroachments on privacy" that "strike the 'right balance' between national security and civil liberties." n11 In comparison, privacy advocates envision these surveillance programs leading to a dystopian, totalitarian government watching over its citizenry - undetected but omnipresent. n12 References to George Orwell's Nineteen Eighty-Four n13 abound. n14 [*1132] Apart from the surrounding privacy-concerns debate, drones currently provide many practical benefits and their projected applications seem limitless. n15 Based on

their obvious advantage of being unmanned, drones have the capability to conduct missions previously considered too risky, dangerous, or impracticable. These applications are also provided at continuously decreasing costs and with the latest technological sophistication, such as the capability to see through physical obstructions, to detect various chemical and biological agents in the air, to recognize human faces and license plates, and to fly in strategic, coordinated formations. n16

Drone sales key to crush ISIS

Tucker and Weisgerber 2015 (Patrick and Marcus; Obama to Sell Armed Drones to More Countries; Feb 17; www.defenseone.com/technology/2015/02/obama-sell-armed-drones-more-countries/105495/; kdf)

The State Department on Tuesday announced that the United States would be expanding the sale of armed unmanned aerial vehicles, or UAVs, to carefully selected allied countries. The announcement suggests that strategic partners – especially in the Middle East – could acquire American-made armed drones before the year is out. Some of those could go toward the international campaign against the Islamic State, or ISIS. Battlefield commanders and the intelligence community are hungry for large, armed drones as they could loiter over targets for hours. The footage captured by high-powered cameras attached to these unmanned aircraft has been critical in determining the locations for airstrikes against Islamic State militants in Iraq and Syria, U.S. officials say. State Department officials maintained that every export request would meet “a strong presumption of denial,” according to Tuesday’s release, but U.S. officials will allow exports on “rare occasions’ that are justified in terms of the nonproliferation and export control factors specified in the [Missile Technology Control Regime Guidelines.]” The Missile Technology Control Regime, or MTCR, is a voluntary partnership that the United States and 33 other countries established in 1987 to curb the proliferation of weapons of mass destruction. Officials who spoke to the Washington Post said that new export applications would be approved or denied within months of receipt, clearing the way for armed drones and armed drone technology to potentially arrive in other countries by year’s end. The new policy affects drones that are capable of flying a distance of 300 kilometers and carrying a payload of 500 kilograms. Those specifications come from the MTCR but apply to drones like the Reaper, which are capable of carrying laser-guided bombs and Hellfire missiles. Exporting more drones—either armed or outfitted with laser targeting systems for smart bombs—to key allies and partners in the Middle East like Jordan would help them strike Islamic State, according to experts. “Transferring drones, particularly those that had laser designators so they could designate targets for strikes from manned fighter aircraft, to coalition partners such as Jordan participating in strikes against ISIL could be a significant advantage to them,” Paul Scharre, fellow and director of the 20YY Warfare Initiative at the Center for a New American Security, told Defense One. Earlier this year, a member of the House Armed Services Committee disclosed to the Washington Times that the Obama administration had denied a request from Jordan for unarmed Predator spy drones. But that was before Jordan stepped up its F-16-led air assault to retaliate against Islamic State for the brutal burning alive of First Lt. Moaz al-Kasasbeh, the Jordanian pilot captured by the terrorist group. “Given our mutual interests, and our strong relationship, it’s absolutely critical that we provide Jordan the support needed to defeat the Islamic State,” Rep. Duncan Hunter, R-Calif., wrote to President Obama in a Feb. 5 letter. The loosened export rules do not mean that every ally in a pinch will be fast-tracked for the most lethal drones that America produces. Ukraine is reportedly seeking unarmed drones to bolster its campaign against Russian-supported separatists. “I find it hard to imagine that this would lead to transferring large-scale armed drones to Ukraine, not to mention the fact that they would likely have difficulty operating them effectively. This might help pave the way for transferring small, tactical drones to Ukrainian forces, which wouldn’t be a game-changer, but would help them with tactical reconnaissance and would be a sensible move,” said Scharre. “The new drone export policy is unlikely to lead to the transfer of armed drones to Ukraine.” Michael Horowitz, associate professor of political science at the University of Pennsylvania, told Defense One. Horowitz and other experts argue that the policy change could allow the U.S. to regain some control if not over armed proliferation at least over how proliferation occurs. Last May, the Chinese Times reported that China would be selling their Wing Loong armed UAV, sometime called a Predator knockoff, to U.S. ally Saudi Arabia.

***PRISM/Section 702 Reform Affirmatives**

PRISM is key to effective intelligence and counter-terrorism – outweighs all other policies

Wittes Senior Fellow for Governance Studies at the Brookings Institute '14 (Benjamin, “Is Al Qaeda Winning: Grading the Administration’s Counterterrorism Policy?” April 08, <http://www.brookings.edu/research/testimony/2014/04/08-is-al-qaeda-winning-wittes>, ME)

As I said at the outset of this statement, the question of intelligence collection under Section 702 of the FAA may seem connected to the AUMF’s future in only the most distant fashion. In fact, the connection between intelligence collection authorities and the underlying regime authorizing the conflict itself is a critical one. Good intelligence is key to any armed conflict and good technical intelligence is a huge U.S. strength in the fight against Al Qaeda. Yet ironically, the more one attempts to narrow the conflict, the more important technical intelligence becomes. The fewer boots on the ground we have in Afghanistan, for example, the greater our reliance will become on technical collection. The more we rely on drone strikes, rather than large troop movements, in areas where we lack large human networks, the more we rely on technical intelligence. **Particularly if one imagines staying on offense against a metastasizing Al Qaeda in the context of a withdrawal from Afghanistan and a narrowing—or a formal end—of the AUMF conflict, the burden on technical intelligence collection to keep us in the game will be huge even ignoring the many other foreign intelligence and national security interests Section 702 surveillance supports.** Section 702 is a complicated statute, and it is only one part of a far more complicated, larger statutory arrangement. But broadly speaking, it permits the NSA to acquire without an individualized warrant the communications of non-US persons reasonably believed to be overseas when those communications are transiting the United States or stored in the United States. Under these circumstances, the NSA can order production of such communications from telecommunications carriers and internet companies under broad programmatic orders issued by the Foreign Intelligence Surveillance Court (FISC), which reviews both targeting and minimization procedures under which the collection then takes place. Oversight is thick, both within the executive branch, and in reporting requirements to the congressional intelligence committees. **Make no mistake: Section 702 is a very big deal in America’s counterterrorism arsenal. It is far more important than the much debated bulk metadata program,** which involves a few hundred queries a year. Section 702 collection, by contrast, is vast, a hugely significant component not only of contemporary counterterrorism but of foreign intelligence collection more generally. In 2012, the Senate Select Committee on Intelligence wrote that “[T]he authorities provided [under section 702] have greatly increased the government’s ability to collect information and act quickly against important foreign intelligence targets. . . . [The] failure to reauthorize [section 702] would ‘result in a loss of significant intelligence and impede the ability of the Intelligence Community to respond quickly to new threats and intelligence opportunities.’”^[8] The President’s Review Group on Intelligence and Communications Technologies, after quoting this language, wrote that “Our own review is not inconsistent with this assessment. . . . [W]e are persuaded that **section 702 does in fact play an important role in the nation’s effort to prevent terrorist attacks across the globe.**”^[9] The Washington Post has reported that **702** was in 2012 **the single most prolific contributor** to the President’s Daily Brief.^[10] Yet we have seen enormous anxiety about Section 702 collection, along with its close cousin, collection overseas against non-US person targets under Executive Order 12333. Sometimes, these anxieties have been rooted in the supposed effects of this collection on U.S. persons.^[11] Sometimes, however, the complaints have stemmed from broader concerns about infringement of privacy worldwide. Europeans have expressed shock, for example, that a U.S. spy agency would presume to collect against an allied foreign leader like German Chancellor Angela Merkel^[12]—surveillance that now seems forward-thinking and reasonable given later reports that

Merkel has been on the phone frequently during the Crimea crisis with Vladimir Putin.[13] Major news organizations have considered it front-page news that NSA has pursued intelligence targets on online gaming platforms and smartphone apps,[14] that NSA has collected contact lists in large numbers around the world,[15] even that foreign countries spy on one another, collect attorney-client communications involving U.S. lawyers along the way, and may share that material with NSA subject to U.S. law and minimization requirements.[16] Whether one considers these stories important journalism or reckless blowing of valuable surveillance activities, they both reflect and further stoke a deep concern about the scope of U.S. surveillance practices. And that concern is creating inexorable pressures for reforms we may regret in the counterterrorism space. The legal regime here is one that this body knowingly and deliberately created in an iterative set of interactions with the intelligence community and the courts. It requires no apology. Rather, it requires an active defense. And while there are certainly areas in which the regime could benefit from reform, the big risk here is that overreaction and panic in the face of exposure will lead to a burdening of the core signals intelligence capacity of the United States with legal processes designed to protect civil liberties domestically. This could happen either because reform efforts go too far or because Congress fails to reauthorize 702 and thus applies the terms of core FISA—which require an individualized warrant based on probable cause—to a wide swath of overseas collection. Broadly then, **the legislative task with respect to Section 702 is** something of the opposite of the task with respect to the AUMF. To the extent that members of this committee **continue** to believe, as I do, in **the essential integrity and value of the existing legal authorities for intelligence collection and oversight**, the task in the current political environment is to **defend that architecture—publicly and energetically—rather than to race to correct imagined deficiencies, or even real structural deficiencies** that, however real they may be, bear little relation to the outcomes that disquiet us. Conclusion To tie these threads together, then, circumstances are forcing us to revisit two of the most basic statutory engines of modern American counterterrorism. In the case of one of those engines, the AUMF, our political system is insufficiently willing to take on the project. In the case of the other, our basic intelligence authorities, we risk diving in with excessive zeal and insufficient care. In both cases, the decisions we will make over the next few months and years will **fatefully shape the future of this country's confrontation with Al Qaeda and its successor organizations**. In neither are we obviously proceeding in the right direction.

PRISM key to counterterrorism — produces most important data — any threat to security outweighs “liberties”

Thompson 13 — Chief Operating Officer of the non-profit Lexington Institute and Chief Executive Officer of Source Associates, Deputy Director of the Security Studies Program at Georgetown University, Taught at Harvard University's Kennedy School of Government, holds doctoral and masters degrees in government from Georgetown University and a bachelor of science degree in political science from Northeastern University.

(Loren Thompson, 6-7-2013, "Why NSA's PRISM Program Makes Sense," <http://www.forbes.com/sites/lorenthompson/2013/06/07/why-nsas-prism-program-makes-sense/>, Date Accessed: 6-23-2015) //NM

President Obama's firm defense of the National Security Agency's "domestic" surveillance program on Friday should calm some of the more extravagant fears provoked by public disclosure of its existence. I put the word "domestic" in quotes because the effort to monitor Internet and other communications traffic isn't really about listening in on Americans, or even foreign nationals living here, but rather intercepting suspicious transmissions originating overseas that just happen to be passing through the United States. That is an eminently sensible way of keeping up with terrorists, because it is so much easier than tapping into network conduits in other countries or under the seas (not that we don't do that). In order to grasp the logic of the NSA program, which is code-named PRISM, you have to understand how the Internet evolved. It was a purely American innovation at its inception, with most of the infrastructure concentrated in a few places like Northern Virginia. I live a few miles from where the Internet's first big East Coast access point was located in the parking garage of an office building near the intersection of Virginia's Routes 7 and 123, an area that some people refer to as Internet Alley. Because the Worldwide Web grew so haphazardly in its early days, it was

common until recently for Internet traffic between two European countries to pass through my neighborhood. There were only a few major nodes in the system, and packet-switching sends messages through whatever pathway is available. The Washington Post story on PRISM today has a graphic illustrating my point about how bandwidth tends to be allocated globally. Like a modern version of ancient Rome's Appian Way, all digital roads lead to America. It isn't hard to see why Director of National Intelligence James R. Clapper could say on Thursday that "information collected under this program is among the most important and valuable foreign intelligence information we collect." No kidding: PRISM generated an average of four items per day for the President's daily intelligence briefing in 2012. The key point to recognize, though, is that this really is foreign intelligence. The architecture of the Internet enables NSA to collect it within U.S. borders, but there is no intention to spy on U.S. citizens. A few elementary algorithms used in narrowing the analysis of traffic should be sufficient to assure that the privacy of American citizens is seldom compromised. President Obama stressed in his comments today that safeguards have been put in place to prevent the scope of NSA surveillance from expanding beyond its original purpose. I don't want to minimize the dangers to civil liberties associated with such a program. It needs to be monitored closely, which is one reason why Congress has been kept informed about its existence. However, compared with the threat posed by terrorists bent upon destroying America, PRISM presents at worst only modest danger to our liberties. Its main purpose is to protect those liberties, not subvert them.

PRISM is the most effective way to combat terror domestic *and* abroad — prefer empirics

Mattise 13 — graduate of Syracuse University with a BA in Economics and Newspaper Journalism and a Master's in Magazine, Newspaper and Online Journalism

(Nathan Mattise, 6-16-2013, "PRISM helped stop terrorism in US and 20-plus countries, NSA document argues," <http://arstechnica.com/tech-policy/2013/06/prism-helped-stop-terrorism-in-us-and-20-plus-countries-nsa-document-argues/>, Date Accessed: 6-23-2015) //NM

US intelligence officials sent Congress a new declassified document on Saturday, which the Senate Intelligence Committee then made public. Outlets such as CNN and the Associated Press received the document and revealed a number of interesting statistics related to the government's use of the NSA's controversial PRISM program. However, this document has not yet been published on the Senate Intelligence Committee's website (and does not seem to be easily obtained through basic Internet search). The new document is part of an intelligence official's effort to "show Americans the value of the program," according to the AP. The report's primary supporting stat? Intelligence officials said that information gleaned from these NSA initiatives helped prevent terrorist plots in the US and more than 20 other countries. Additionally, the release stated that phone metadata was searched for less than 300 times within the secretive database last year. The document also added details to the public's growing picture of the PRISM program. CNN reported that the NSA must delete these records after five years. The AP wrote that the NSA programs are reviewed every 90 days by a secret court authorized by the Foreign Intelligence Surveillance Act (FISA), and that the metadata records (which includes a call's time and length) can only be inspected for "suspected connections to terrorism." Despite all the public attention, the Obama Administration continues to insist that no privacy violations took place. According to White House Chief of Staff Denis McDonough (speaking Sunday on Face The Nation), the president plans to further clarify this "in the days ahead." On Friday, TechDirt also published a set of two documents described as "talking points about scooping up business records (i.e., all data on all phone calls) and on the Internet program known as PRISM." One of the talking points' main arguments is that Section 702 of the Foreign Intelligence Surveillance Act authorizes actions similar to those described above. This is despite the fact that no member of the public has ever been able to see the FISA court's ruling of the government's interpretation. Section 702 is a vital legal tool that Congress reauthorized in

December 2012, as part of the FISA Amendments Act Reauthorization Act, after extensive hearings and debate. Under Section 702, the Foreign Intelligence Surveillance Court (FISA Court) certifies foreign intelligence collection. There is no secret program involved—it is strictly authorized by a US statute.

PRISM decimates Al Qaeda's ability to conduct mass attacks

Etzioni 15 [Amitai Etzioni, Director of the Institute for Communitarian Policy Studies at George Washington University, former President of the American Sociological Association, former Professor at Harvard Business School, former Senior Adviser to the White House, “

NSA: National Security vs. Individual Rights,” *Intelligence and National Security*, Volume 30, Issue 1, 2015, pages 100-136]

One telling piece of evidence regarding the effectiveness of the electronic surveillance programs is the way they **hobbled bin Laden**. He found out that he was unable to use any modern communication device to run his terror organizations that had branches in three continents.⁵⁴ He was reduced to using the same means of communication employed 5000 years ago – a messenger, a very slow, low-volume, cumbersome, and unreliable way of communication and command; in effect, preventing bin Laden from serving as an effective commander-in-chief of Al Qaeda. Moreover, once the CIA deduced that using a messenger was the only way left for him to communicate – tracking the messenger led to bin Laden's downfall.⁵⁵ Additional evidence publicly available that the NSA programs forced terrorists to limit their communications is gleaned from reports that following the revelation that the United States intercepted the communications of Ayman al-Zawahiri, there was a sharp decline in Al Qaeda's electronic communications.⁵⁶ In short, we have seen that there continues to be a serious threat of terrorism to national security; that terrorists cannot be handled like other criminals and to counter them distinct measures are best employed; and that surveillance programs like PRISM and the phone surveillance programs make a significant contribution to curbing terrorism. In short these programs do enhance one core element of the liberal communitarian balance. The next question the article addresses is the extent they undermine the other core element.

PRISM roadblocks terrorists – guts them of the tools necessary to pull off an attack

Arquilla 2013 (John [Professor and Chair Department of Defense Analysis @ Naval postgrad school]; In Defense of PRISM; Jun 7; foreignpolicy.com/2013/06/07/in-defense-of-prism/; kdf)

Prior to TIA, and well before 9/11, there were other ancestors of our current big data efforts. At the National Security Agency, and in other parts of the extensive American intelligence community, search systems known by such evocative names as "Echelon" and "Semantic Forests," among others, were in use, striving relentlessly to detect patterns of communication that might open up golden seams of information from the most secret caches of the world's various malefactors. Often enough, these and other tracking tools did distinguish the pattern from the noise, and national security was well served. And in the early days of the war against al Qaeda, the enemy was still using means of communication that American intelligence had the ability to monitor – including satellite phones and such – leading to several counterterror coups and high-level captures. But the network learned quickly and adjusted, becoming far more elusive, more dispersed, its cells increasingly attuned to operating independently, its nodes and links ever less visible. It was against this shift that something like PRISM had to be mobilized to improve our ability to find the foe whose best, and only real defense against us is his capacity for concealment. Thus, the tantalizing prospect of PRISM, and of the whole "finding effort," is to deny the terrorists the virtual haven that

they enjoy throughout the world's telecommunications spaces — indeed, throughout the whole of the "infosphere," which includes cyberspace. The piercing of this veil would mark a true turning point in the war on terror, for al Qaeda and other networks simply cannot function with any kind of cohesion, or at any sort of reasonable operational tempo if their communications become insecure. Cells and nodes would be ripped up, operatives killed or captured, and each loss would no doubt yield information that imperiled the network further. Even if al Qaeda resorted to the drastic measure of moving messages, training, and financial information by courier, operations would be so slowed as to cripple the organization. And even couriers can be flagged on "no fly" lists or caught boarding tramp steamers and such. So for all the furor caused by the PRISM revelations, my simple recommendation is to take a deep breath before crying out in protest. Think first about how the hider/finder dynamic in the war on terror has driven those responsible for our security to bring to bear the big guns of big data on the problem at hand. Think also about whether a willingness to allow some incursions into our privacy might lead to an improved ability to provide for our security, and where that equilibrium point between privacy and security might be. And last, think about the world as it might be without such a sustained effort to find the hidden — to detect, track, and disrupt the terrorists. That would be a world in which they stay on their feet and fighting, and in which they remain secure enough, for long enough, to acquire true weapons of mass destruction. Those of us in the national security business, who know that networks so armed will be far harder to deter than nations ever were, believe that big data approaches like PRISM and its forebears, have been and remain essential elements in the unrelenting and increasingly urgent effort to find the hidden.

Section 702 has empirically led the NSA to detecting and preventing terror attacks

- Section 702 — PRISM
- Metadata good
- Prevented 50 attacks

Hines 13 — Defense council member of the Truman National Security Project

(Written By, 6-19-2013, "Here's how metadata on billions of phone calls predicts terrorist attacks," <http://qz.com/95719/heres-how-metadata-on-billions-of-phone-calls-predicts-terrorist-attacks/>, Date Accessed: 6-23-2015) //NM

Yesterday, when NSA Director General Keith Alexander testified before the House Committee on Intelligence, he declared that the NSA's surveillance programs have provided "critical leads to help prevent over 50 potential terrorist events." FBI Deputy Director Sean Boyce elaborated by describing four instances when the NSA's surveillance programs have had an impact: (1) when an intercepted email from a terrorist in Pakistan led to foiling a plan to bomb of the New York subway system; (2) when NSA's programs helped prevent a plot to bomb the New York Stock Exchange; (3) when intelligence led to the arrest of a U.S. citizen who planned to bomb the Danish Newspaper office that published cartoon depictions of the Prophet Muhammad; and (4) when the NSA's programs triggered reopening the 9/11 investigation. So what are the practical applications of internet and phone records gathered from two NSA programs? And how can "metadata" actually prevent terrorist attacks? Metadata does not give the NSA and intelligence community access to the content of internet and phone communications. Instead, metadata is more like the transactional information cell phone customers would normally see on their billing statements—metadata can indicate when a call, email, or online chat began and how long the communication lasted. Section 215 of the Patriot Act provides the legal authority to obtain "business records" from phone companies. Meanwhile, the NSA uses Section 702 of the Foreign Intelligence Surveillance Act to authorize its PRISM program. According the figures provided by Gen. Alexander, intelligence gathered based on Section

702 authority contributed in over 90% of the 50 cases. One of major benefits of metadata is that it provides hindsight—it gives intelligence analysts a retrospective view of a sequence of events. As Deputy Director Boyce discussed, the ability to analyze previous communications allowed the FBI to reopen the 9/11 investigation and determine who was linked to that attack. It is important to recognize that terrorist attacks are not orchestrated overnight; they take months or years to plan. Therefore, if the intelligence community only catches wind of an attack halfway into the terrorists' planning cycle, or even after a terrorist attack has taken place, metadata might be the only source of information that captures the sequence of events leading up to an attack. Once a terrorist suspect has been identified or once an attack has taken place, intelligence analysts can use powerful software to sift through metadata to determine which numbers, IP addresses, or individuals are associated with the suspect. Moreover, phone numbers and IP addresses sometimes serve as a proxy for the general location of where the planning has taken place. This ability to narrow down the location of terrorists can help determine whether the intelligence community is dealing with a domestic or international threat. Even more useful than hindsight is a crystal ball that gives the intelligence community a look into the future. Simply knowing how many individuals are in a chat room, how many individuals have contacted a particular phone user, or how many individuals are on an email chain could serve as an indicator of how many terrorists are involved in a plot. Furthermore, knowing when a suspect communicates can help identify his patterns of behavior. For instance, metadata can help establish whether a suspect communicates sporadically or on a set pattern (e.g., making a call every Saturday at 2 p.m.). Any deviation from that pattern could indicate that the plan changed at a certain point; any phone number or email address used consistently and then not at all could indicate that a suspect has stopped communicating with an associate. Additionally, a rapid increase in communication could indicate that an attack is about to happen. Metadata can provide all of this information without ever exposing the content of a phone call or email. If the metadata reveals the suspect is engaged in terrorist activities, then obtaining a warrant would allow intelligence officials to actually monitor the content of the suspect's communication. In Gen. Alexander's words, "These programs have protected our country and allies . . . [t]hese programs have been approved by the administration, Congress, and the courts." Now, Americans will have to decide whether they agree.

*Airport Security

Surveillance by TSA, Border and Customs agents key to security --- internal safe guards will protect civil rights

Horwitz, 14 --- covers the Justice Department and criminal justice issues nationwide for The Washington Post (12/8/2014, Sari, "Justice Dept. announces new rules to curb racial profiling by federal law enforcement,"
http://www.washingtonpost.com/world/national-security/justice-dept-to-announce-new-rules-to-curb-racial-profiling-by-federal-law-enforcement/2014/12/07/e00eca18-7e79-11e4-9f38-95a187e4c1f7_story.html)

A fact sheet on the policy said that some DHS activity is not covered by the policy because of the "unique nature of DHS's mission." "This does not mean that officers and agents are free to profile," according to the DHS fact sheet. "To the contrary, **DHS's existing policies make it categorically clear that profiling is prohibited, while articulating limited circumstances where it is permissible to rely in part on these characteristics, because of the unique nature of border and transportation security as compared to traditional law enforcement.**" President George W. Bush banned racial profiling in 2003, but the prohibition did not apply to national security investigations and covered only race — not religion, national origin, gender or sexual orientation and gender identity. Civil rights groups and Democratic lawmakers have pushed for expanded anti-profiling protections since President Obama was elected in 2008. Holder began the process to revamp the rules in 2009 and considers the new policy one of the signature accomplishments of his tenure. About six months ago, the Justice Department delivered the rules to the White House. But they applied only to the department, and White House officials wanted the polices to cover additional agencies. The rules have been delayed in part because DHS officials pushed the White House and the Justice Department to allow major exclusions for agencies such as the Transportation Security Administration, Immigration and Customs Enforcement, and Customs and Border Protection. In several high-level meetings, DHS Secretary Jeh Johnson argued that immigration and customs agents and airport screeners needed to consider a variety of factors to keep the nation safe, according to officials familiar with his personal efforts. TSA officials argued that the rules should not apply to them because the TSA is not a law enforcement agency. In its fact sheet, DHS officials said that they will review activities not directly covered by the guidance to ensure that "we are including every appropriate safeguard and civil rights protection in the execution of those important security activities, and to enhance our policies where necessary."

TSA suffers hypocritical persecution-IS actually really good-SL

Reed 8/9/-12(Ted, Transportation Journalist for over 20 years, "Surprise Gallup Poll: People Think TSA Does A Good Job",
Forbes,<http://www.forbes.com/sites/tedreed/2012/08/09/surprise-gallup-poll-people-think-tsa-does-a-good-job/>)

Surprisingly, despite all of the negative Internet commentary and Congressional complaining about the Transportation Security Administration, the majority of U.S. travelers have a positive opinion of the agency. Not only that, but people who fly, and who are exposed to TSA screening, have an even more positive opinion than people who rarely or never fly. According to a Gallup poll released Wednesday, 54% of Americans think the TSA is doing either an excellent or a good job of handling security screening at airports. Moreover, among Americans who have flown at least once in the past year, 57% have an excellent or

good opinion of the agency. As far as TSA effectiveness at preventing acts of terrorism on U.S. airplanes, 41% think the screening procedures are extremely or very effective.

Another 44% think the procedures are somewhat effective. That number varies little for people who fly somewhat regularly and people who rarely or never fly. The poll was conducted with telephone interviews July 9th through July 12. Gallup interviewed 1,014 adults living in all 50 states and the District of Columbia. Interestingly, younger Americans "have significantly more positive opinions of the TSA than those who are older," Gallup said, noting that 67% of people between 18 and 29 rate the agency as excellent or good. This may be because young people fly more frequently, or it may be because that for young people TSA screening, first implemented in 2001, has been part of their flying experience for the majority of their lives.

Criticism of the TSA seems to come primarily from two sources. One is Internet sites, where reporting standards are generally not at the same level as newspapers, where reporters are taught to consider what is told to them with skepticism and to seek responses to charges. On Wednesday, some sites were repeating charges by a man who said that his wife was admitted to the emergency room for treatment after TSA agents at Fort Lauderdale-Hollywood International Airport harassed her and subjected her to closed door screening after metal in her bra set off an alarm. The man said his wife was subject to a brutal rape three years ago and is still recovering from the psychological impact. Without denigrating the man or his wife in any way, it is possible to say that the **TSA is put into a difficult situation when such charges are posted with little or no fact checking by reporters.** As for Congress, the House Homeland Security Committee's Transportation Security Subcommittee recently convened a hearing on the topic: "Breach of Trust: Addressing Misconduct Among TSA Screeners." According to About.com, "It didn't take (committee chairman) Rep. Mike Rogers (R-Alabama) long to set the tone for the day, saying in his opening statement: "Stealing from checked luggage; accepting bribes from drug smugglers; sleeping or drinking while on duty – this kind of criminal behavior and negligence has contributed significantly to TSA's shattered public image." Now there is a poll to show that in fact, TSA does not actually have a bad public image. And here, it is worth mentioning that the public image of Congress is not so good, perhaps reflecting a tendency to be excessively critical of perceived enemies rather than to seek compromise and solve problems.

Without NSA current Procedures we're susceptible to Terrorism-SL

Herridge 12/17/-14(Catherine Catherine Herridge is an award-winning Chief Intelligence correspondent for FOX News Channel, "TSA head: Threat from terrorism worse now but US better able to combat it", FNC, "<http://www.foxnews.com/politics/2014/12/17/tsa-head-threat-from-terrorism-worse-now-but-us-better-able-to-combat-it/>)

Khorasan contains long-time associates of Usama bin Laden, including Sanafi al-Nasr and Muhsin al-Fadhli, as well as a handful of operatives trained by the Yemeni bomb maker Ibrahim al-Asiri, who specializes in non-metallic bombs that traditional airport screening can miss. "Without going into details about what that may look like from a classified intelligence perspective, we do remain concerned that there is active plotting going on," Pistole said. And with new information that the French bomb maker David Drugeon likely survived a U.S. air strike last month, Pistole added, "there is concern that there are still individuals out there who have not only the ability to do that, but also the intent to use that on a flight to Europe or the US." The TSA administrator also described classified procedures that track foreign fighters, based on their travel history, before they check in at overseas airports for U.S.-bound flights. "There are individuals we are concerned about and we are again looking at if they make travel reservations, then they of course receive proper scrutiny," Pistole said. The continued threat from groups like Khorasan explains why procedures, implemented in July, requiring passengers to turn on their phone and computers at some airports, remain in place. As the holiday travel season begins, TSA officials say they are not expecting big changes at the checkpoints, but if there are changes, they will be driven by new and specific intelligence.

TSA Prevents Terrorist Attacks- SL

Reed 10/23/-12(Ted, Transportation Journalist for over 20 years, “Remember 9/11? TSA finally gets its gloves off”, Forbes,”

<http://www.forbes.com/sites/tedreed/2012/10/23/remember-911-tsa-finally-takes-off-the-gloves-reminds-critics-of-reality/>”

The Transportation Security Administration has taken off the gloves and started to respond more aggressively to the constant barrage of criticism – as well it should. Last week, in an opinion piece in the Rockland County Times, published in a close-in New York City suburb, TSA spokeswoman Lisa Farbstein responded to a critical column by area resident Diane Dimond, a syndicated columnist, ”Perhaps the next time Diane and her family fly out of a New York-area airport to a fun vacation spot, they’ll look out the car window at the New York skyline minus the Twin Towers and remember some of the true facts about TSA and why it exists,” Farbstein wrote. Dimond “criticized the very security measures that were designed to keep passengers safe –to help ensure that there is not another 9/11 in her back yard,” said Farbstein, who answered about a dozen criticisms, point-by-point. Among them: it is inconvenient, undignified and an invasion of your privacy to be forced to remove your shoes, jackets and belts, take off your belt and take your computer from its case. TSA agents “treat all of us like we’re new arrivals at a prison camp.” The lines are too long and some agents seem to stand around doing nothing. While the criticisms are familiar, the aggressive response is new. In fact, the TSA responds to multiple daily attacks, most far less coherent than Dimond’s. Critics include travelers who make up stories; members of Congress who seek political gain and bloggers, tweeters and other self-promoters aware that the best way to be noticed and collect Internet hits is to express outrage. The outrage business, it must be said, is a growth business, thriving in the age of new media. Last week, radio talk show host Dana Loesch tweeted about an incident at the Phoenix airport. Loesch claimed she was sexually molested after a sensor showed traces of explosives on her. She was upset that the incident took place in private: she had requested a public screening. Earlier, in June, Loesch and her husband were detained by the TSA in Providence, R.I., after he allegedly underwent intrusive screenings because sensors detected traces of explosives on him. Perhaps we should conclude that TSA agents are engaged in a nationwide plot to harass the couple whenever possible. Or perhaps explosive pixie dust suddenly finds them whenever they head to the airport. Clearly, they are outliers among the 650 million people TSA screens annually. Last year, about one tenth of one percent of those filed complaints. The truth is that, for all of the complaints, most U.S. travelers have a positive opinion of the TSA. According to a Gallup poll released in August, 54% of Americans think TSA is doing either an excellent or a good job of handling airport screening. Among Americans who have flown at least once in the past year, 57% have an excellent or good opinion of the agency. In other words, the more you see them, the better you like them. Of course, TSA is not perfect. It employs 62,000 people, a few of whom have stolen from the luggage they are paid to inspect. The annual \$8.1 billion budget seems high: the same work was done for far less by private firms before Sept. 11. The firms followed federal guidelines, which sadly did not prevent box cutters on airplanes. The TSA is very visible to millions of travelers, some of whom have had a bad day by the time they get to the airport. And of course the agency is overseen by a dysfunctional Congress, whose 535 members bring a love of the limelight, vastly differing agendas and an inability to compromise. Probably the biggest problem is that, unfortunately, we really don’t know how much screening is enough and how much is too much. Eleven years later, that is something we are still learning.

***Project BULLRUN/Decryption Affirmatives**

NSA decryption is vital to counterterrorism – international consensus

Robertson 13 (Adi Robertson, tech policy correspondent for The Verge, “Intelligence chief says the US attacks encryption because the bad guys use it”, 10/4/13, <http://www.theverge.com/2013/10/4/4803646/james-clapper-justifies-tor-breaking-as-necessary-to-fight-terrorists>) -LL

Director of National Intelligence James Clapper has responded to leaks showing how the NSA tried (and largely failed) to break through Tor's encryption network. While his statement doesn't shed much new light on the situation, it encapsulates the intelligence community's general response to criticism since the first leaks were published: that the threat of terrorism or other threats to national security makes any arguably legal tactic not only ethical, but vital. Recently published news articles discuss the intelligence community's interest in tools used to facilitate anonymous online communication. The articles accurately point out that the intelligence community seeks to understand how these tools work and the kind of information being concealed. However, the articles fail to make clear that the intelligence community's interest in online anonymity services and other online communication and networking tools is based on the undeniable fact that these are the tools our adversaries use to communicate and coordinate attacks against the United States and our allies. Clapper accuses the articles' authors (unnamed, but likely journalist Glenn Greenwald and security expert Bruce Schneier) of painting an "inaccurate and misleading picture of the intelligence community. “The reality is that the men and women at the National Security Agency and across the intelligence community are abiding by the law, respecting the rights of citizens and doing everything they can to help keep our nation safe,” he says. To do this, they must “use every intelligence tool available to understand the intent of our foreign adversaries.” In the modern telecommunications era, our adversaries have the ability to hide their messages and discussions among those of innocent people around the world. They use the very same social networking sites, encryption tools and other security features that protect our daily online activities. These are promises and warnings we've heard many times, and they're all valid defenses of the overall surveillance apparatus. What they don't do, unfortunately, is address the implicit questions that Greenwald and Schneier have posed: should one wing of the US government attempt to undermine the very tools that other branches have helped create? And is it valuable to be able to keep some communications almost completely private, even if terrorists can also exercise this privacy? If the dismissive GCHQ comments of "pseudo-legitimate" Tor uses are any indication, the international intelligence community's answer may be a resounding "No."

Decryption Methods Prevent Terrorism

Peterson 6/4-15(Andrea Reporter for Washington Post, “FBI official: Companies should help us ‘prevent encryption above all else’”, Washington Post, “<http://www.washingtonpost.com/blogs/the-switch/wp/2015/06/04/fbi-official-companies-should-help-us-prevent-encryption-above-all-else/>”

The debate over encryption erupted on Capitol Hill again Wednesday, with an FBI official testifying that law enforcement's challenge is working with tech companies "to

build technological solutions to prevent encryption above all else." At first glance the comment from Michael B. Steinbach, assistant director in the FBI's Counterterrorism Division, might appear to go further than FBI Director James B. Comey. Encryption, a technology widely used to secure digital information by scrambling data so only authorized users can decode it, is "a good thing," Comey has said, even if he wants the government to have the ability get around it. [Special report: The Internet's founders saw its promise but didn't foresee users attacking one another] But Steinbach's testimony also suggests he meant that companies shouldn't put their customers' access to encryption ahead of national security concerns -- rather than saying the government's top priority should be preventing the use of the technology that secures basically everything people do online. **"Privacy, above all other things, including safety and freedom from terrorism, is not where we want to go,"** Steinbach said. He also disputed the "back door" term used by experts to describe such built-in access points. "We're not looking at going through a back door or being nefarious," he argued, saying that the agency wants to be able to access content after going through a judicial process.

Decryption is effective for counter-terrorism

Ataide 2/7/-13(Rui As a security conscious individual, I've learned to educate people on the advantages of encryption, "The Man in the Middle: Advantages of SSL Decryption", RSA "<https://blogs.rsa.com/author/rui-ataide/>")

I'm currently involved on a lot of security analytics, security response, and other defensive activities. While encryption provides a level of protection when it comes to defense, it also causes a lack of visibility when analyzing network traffic. More and more, even the "bad guys" are using encryption to cover their tracks and avoid detection. It's therefore no surprise that more and more organizations are using SSL inspection devices to monitor their traffic and infrastructure. I actually find myself recommending that they do use the technology and how to best implement it. SSL inspection devices are nothing more than a well designed man-in-the-middle attack that breaks the encryption into two separate encrypted streams. Therefore, they still provide an adequate level of protection to end-users while allowing security analysts and devices to properly monitor and alert when malicious or unwanted activity takes place. This could be something as simple as a user uploading a confidential document to his/her personal webmail account or more elaborate as someone using an SSL VPN to connect back to a host using a Dynamic DNS name service (a technique commonly used by current malware and advanced attackers).

Decryption is crucial to fighting cyberattacks

Butler 13 (J. Michael Butler, Associate Professor of Humanities at Flagler College, "Finding Hidden Threats by Decrypting SSL", November 2013, <http://www.sans.org/reading-room/whitepapers/analyst/finding-hidden-threats-decrypting-ssl-34840>)

SSL encryption is crucial to protecting data in transit during web transactions, email communications and the use of mobile apps. Data encrypted with this common method can sometimes pass uninspected through almost all the components of your security framework, both inbound and outbound. As such, SSL encryption has become a ubiquitous tool for the enemy to hide sensitive data transfers and to obfuscate their command and control communications. For example, suppose a user has succumbed to one of the many phishing emails she receives every day, has followed a bad URL link and inadvertently downloaded encrypted Zeus malware to the financial officer's computer used for ACH bank transfers. Under the cover of encryption, Zeus sends that password information and other sensitive data to an external user, making it possible for the remote attacker to capture a login session, use the transmitted password and deposit the

organization's money in an offshore account. With all commands and traffic transmitted into and out of the network via SSL, the company's security tools were blind to these activities. Now companies are accepting even more encrypted traffic as they shift toward greater use of cloud services. This means malware will find more innovative ways to take advantage of this common form of transport encryption. For example, attackers can use cloud services to bypass the firewall and synchronize malware from one computer to another, as described in an August 2013 article in "Technology Review News." ¹ With the good guys and bad guys both using encryption, making malicious traffic visible through decryption—and inspecting it—becomes essential. The decryption must be conducted in a way that doesn't interfere with legitimate network traffic, while working with other security systems for optimum accuracy and performance. Then, the traffic must be re-encrypted before sending it on to its destination to protect sensitive information that might be caught up in the packets being decrypted. This whitepaper describes the role of SSL, the role SSL decryption/inspection tools play in security, options for deploying inspection tools, and how the information generated by such inspection can be shared with other security monitoring systems.

NSA decryption Program Works

Insider Surveillance 12/30/-14("NSA Decryption: New Snowden Leak is Ancient History ",Insider surveillance"<https://insidersurveillance.com/nsa-decryption-new-snowden-leak-is-ancient-history/>")

Well-known for many months now is that the NSA views encryption as a threat to national security, and classifies five types of network communications challenges ranging from "trivial," "minor" and "moderate" on the low end to the most serious, "major" and "catastrophic." Small time stuff for NSA Decryption experts: Peer-to-Peer. Skype, still touted as a "secure" form of voice & video communication by owner Microsoft, has been an open book to NSA analysts since at least 2011. Secure Socket Layer — Not so Much. Web connections via https — with the "s" standing for secure, and using secure socket layer (SSL) for encryption, are a snap to break into. NSA routinely captures untold number of SSL handshakes, then analyzes metadata about the connections and metadata from the encryption protocols to break the keys and decrypt any traffic on the Internet via man-in-the-middle attacks. Virtual Private Networks. Long considered highly secure, and still used to connect mediation devices/routers with law enforcement end points, VPNs have for quite some time been readily opened and their contents reviewed by NSA analysts. "Major" encryption challenges deemed difficult but not impossible: Zoho and Tor. As of 2012 the NSA had problems cracking messages sent through encrypted email service providers Zoho. Monitoring users of the Tor network was also a challenge. Truecrypt. The leaked files point to Truecrypt, a program for "on the fly encryption," as a major headache for the NSA several years ago. Truecrypt was discontinued in May 2014 and developers urged site visitors to find another source for encryption. Read: The NSA figured it out. Off-the-Record (OTR). OTR is an open source protocol for encrypting instant messaging in an end-to-end encryption process. OTR once proved a formidable challenge by combining AES symmetric key algorithm, the Diffie-Hellman method of securely exchanging cryptographic keys over a public channel, and SHA-1 (secure hash algorithm) cryptographic hash function developed by the NSA itself in the mid-1990s.

Any combination of encryption modes raises the bar for network penetration. In addition, open source software is harder to attach back doors to without the public noticing. Back in 2011 – 2012, released documents showed that OTR occasionally created problems for NSA. One internal comment reads, “No decrypt available for this OTR encrypted message.” However, tech moves on. The NSA – being a significant user of encryption itself – is often directly behind new developments in the field like SHA-1. Like all honest brokers in the field, NSA likes to crack its own work, find the weak spots, fix them and move on. New and improved versions of the hash function include SHA-2 and SHA-3. Companies are following NSA’s lead. Microsoft announced in Nov 2013 its “deprecation” policy for discontinuing use of SHA-1. Google followed suit for Chrome in Sept 2014. Does this mean that the SHA-1 component of OTR is no longer a head-scratcher for NSA? Yep. What earns the moniker “catastrophic” at NSA? At the head of the list, at least in 2012, was the challenge of users combining Tor with other anonymizing services such as ZRTP, which encrypts VoIP voice and text chats on mobile phones. The “Z” stands for its author, Phil Zimmerman, and the “RTP” for Real-Time Transport Protocol.” ZRTP uses Diffie-Hellman secure key cryptography, and auto-senses for other VoIP clients that support ZRTP. It is common to open source programs such as Signal and Redphone. While Tor and ZRTP penetration may have seemed insurmountable several years, the UK’s NSA equivalent – GCHQ – has proposed methods for breaking into Tor and defeating other encryption methods.

Impact Toolbox

***Terror Talk/Defense of Scholarship**

Threats are real and our scholarship is sound – surveillance is the key tool in preventing attacks

-AT: Terror Talk- the risk of a terrorist attack is enough that we need to have discussions about particular groups
-AT: No Threats- Al Qaeda, Hamas, Hezbollah, and ISIS disagree, as they splinter they become more difficult to stop
-Surveillance Key- “The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems”

Lewis 2014 (James Andrew [senior fellow and director of the Strategic Technologies Program at CSIS]; Underestimating Risk in the Surveillance Debate; Dec; http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf; kdf)

The phrase “terrorism” is overused, and the threat of terrorist attack is easily exaggerated, but that does not mean this threat it is nonexistent. Groups and individuals still plan to attack American citizens and the citizens of allied countries. The dilemma in assessing risk is that it is discontinuous. There can be long periods where no activity is apparent, only to have the apparent calm explode in an attack. The constant, low-level activity in planning and preparation in Western countries is not apparent to the public, nor is it easy to identify the moment that discontent turns into action. There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences. A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia. Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security forces. The chief difference between now and the situation before 9/11 is that all of these countries have put in place much more robust surveillance systems, nationally and in cooperation with others, including the United States, to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and Afghanistan and the opportunities created by the Arab Spring have opened a new “front” for jihadi groups that makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the Arabian Peninsula) continues to regularly plan attacks against U.S. targets. ²⁷ The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped, but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its conclusion because of operational

difficulties. **these attacks are the threat that mass surveillance was created to prevent.** The needed reduction in public anti-terror measures without increasing the chances of successful attack is contingent upon maintaining the capability provided by communications surveillance to detect, predict, and prevent attacks. Our opponents have not given up; neither should we.

Terrorism studies are epistemologically and methodologically valid---our authors are self-reflexive

Michael J. **Boyle 8**, School of International Relations, University of St. Andrews, and John Horgan, International Center for the Study of Terrorism, Department of Psychology, Pennsylvania State University, April 2008, "A Case Against Critical Terrorism Studies," *Critical Studies On Terrorism*, Vol. 1, No. 1, p. 51-64

Jackson (2007c) calls for the development of an explicitly CTS on the basis of what he argues preceded it, dubbed 'Orthodox Terrorism Studies'. The latter, he suggests, is characterized by: (1) its poor methods and theories, (2) its state centrism, (3) its problemsolving orientation, and (4) its institutional and intellectual links to state security projects. Jackson argues that the major defining characteristic of CTS, on the other hand, should be 'a skeptical attitude towards accepted terrorism "knowledge"'. **An implicit**

presumption from this is that terrorism scholars have laboured for all of these years without being aware that their area of study has an implicit bias, as well as definitional and methodological problems. In fact, **terrorism scholars are not only well aware of these problems, but also have provided their own**

searching **critiques** of the field at various points during the last few decades (e.g. Silke 1996, Crenshaw 1998, Gordon 1999, Horgan

2005, esp. ch. 2, 'Understanding Terrorism'). **Some of those scholars** most associated with the critique of empiricism

implied in 'Orthodox Terrorism Studies' **have also engaged in deeply critical examinations of**

the nature of sources, methods, and data in the study of terrorism. For example,

Jackson (2007a) regularly cites the handbook produced by **Schmid and Jongman** (1988) to support his claims that theoretical progress has been limited. But this fact was well recognized by the authors; indeed, in the introduction of the second edition they

point out that they have not revised their chapter on theories of terrorism from the first edition, because the **failure to**

address persistent conceptual and **data problems** has undermined progress in the field. The point of their handbook was to sharpen and make more comprehensive the result of research on terrorism, not to glide over its methodological and definitional failings

(Schmid and Jongman 1988, p. xiv). Similarly, **Silke's** (2004) **volume on the state of the field of**

terrorism research performed a similar function, highlighting the shortcomings of the field, in

particular the lack of rigorous primary data collection. **A non-reflective community of scholars does not produce such scathing indictments of its own work.**

Terror is a real threat driven by forces the aff can't resolve---we should reform the war on terror, not surrender---any terror attack turns the entire case

Peter **Beinart 8**, associate professor of journalism and political science at CUNY, *The Good Fight; Why Liberals – and only Liberals – Can Win the War on Terror and Make America Great Again*, vii-viii

APPLYING THAT TRADITION today is not easy. Cold war liberals developed their narrative of national greatness in the shadow of a totalitarian ♣ superpower. **Today, the United States faces** no such unified threat. Rather, it faces **a web of dangers**—from disease to environmental degradation to weapons of mass destruction—all **fueled by globalization, which leaves America increasingly vulnerable to pathologies bred in distant corners of the world.** And **at the center of this nexus sits jihadist terrorism,** a new totalitarian movement that lacks state power but harnesses the power of globalization instead. ♣ Recognizing that the United States again faces a totalitarian foe does not provide simple policy prescriptions, because today's totalitarianism takes such radically different form. But **it reminds us** of something more basic, **that liberalism does not**

find its enemies only on the right—a lesson sometimes **forgotten in the age of** George W. **Bush**. ¶ Indeed, it is because liberals so despise this president that they increasingly reject his trademark phrase, the “war on terror.” Were this just a semantic dispute, it would hardly matter; **better alternatives to war on terror abound**. But the rejection signifies something deeper: a turn away from the very idea that anti-totalitarianism should sit at the heart of the liberal project. **For too many liberals today**, George W. **Bush’s war on terror is the only one they can imagine**. This alienation may be understandable, but that does not make it any less disastrous, for it is liberalism’s principles—even more than George W. Bush’s—that jihadism threatens. **If today’s liberals cannot rouse** as much **passion for fighting a movement that flings acid at unveiled women** as they do for taking back the Senate in 2006, **they have strayed far from liberalism’s best traditions**. And **if they believe it is only George W. Bush who threatens America’s freedoms**, **they should ponder what will happen if the United States is hit with a nuclear or contagious biological attack**. **No matter who is president**, Republican or Democrat, **the reaction will make John Ashcroft look like the head of the ACLU**.

Ethical rebellion does not require rejecting all resort to lethal force---killing is conditionally justified in cases where the target is culpable for injustice. This distinction will win us the debate---ethical rebellion can allow killing, so long as we recognize that it is simultaneously necessary, but cannot be truly ethically justified. Recognizing our own conduct as ethically unjustifiable despite its necessity in preserving innocent life sets up killing as truly exceptional

Matt **Hartman 13**, MA, Philosophy, University of Chicago, 6/5/13, “The Rebel or the Militant: Universality and Political Violence,”
<http://lucian.uchicago.edu/blogs/colloquium/2013/06/05/the-rebel-or-the-militant-universality-and-political-violence/>

I begin with rebellion, Camus’ analogue to Badiou’s event. For him, rebellion means something restricted, something that respects its own limits.

The rebels who [...] wanted to construct [...] a savage immortality are terrified at the prospect of being obliged to kill in their turn. Nevertheless, if they retreat they must accept death; if they advance they must accept murder. Rebellion, cut off from its origins and cynically travestied, oscillates, on all levels, between sacrifice and murder.[24]

In other words, rebellion is characterized by a recognition that the status quo is structurally unjust and must be opposed—hence the rebel’s inability to retreat—and a simultaneous recognition that the means of opposition themselves imply a crime. [25] The ‘savage immortality’ that appears to arise from rebellion—the point where rebellion’s initial impetus appears to no longer to govern the sequence—cannot be, and yet the rebel must act. This conflict forms the paradoxical, logical structure of rebellion that creates an inherent limit upon what can be (ethically) done. As we will see, that limit is marked by murder.

Moreover, that limit is dependent upon the beginnings of the rebellion. “I rebel—therefore we exist,” says Camus (R 22). This formulation is variously suggestive, but the two most important implications for our purposes are the axiomatic claims to universality and equality. Similar to Badiou’s claim that all are ‘virtual militants’ of the event, Camus argues that a rebellion reaches for universality (by transforming the ‘I’ into a ‘We’). Its virtues must apply to all. And for this reason, it must aim at equality, as all must be equal in their ability to make the same declaration.

Rebellion is the assertion of an axiom of equality between one and all. “In assigning oppression a limit within which begins the dignity[26] common to all men, rebellion defined a primary value” (R 281). Camus’ formulation necessitates an understanding—an ethical principle—of equality that rebels must recognize. Rebellion is the very process of the assertion of this egalitarianism. We can already begin to see, then, how Camus’ axiom is an ethical principle.

But this point further implies that the claim of rebellion—a claim to act from principle, not simply to take power—must recognize universality as a claim concerning the situation. The principle now instituted refers to a governing logic, not to an individual. Again, this claim parallels Badiou’s rethinking of the State’s logic of ordering. The structure of thought, not the identity of the master, is the problem. Thus, one claims a wrong against the situation: if the slave merely takes his master’s place, there is no rebellion but a coup. The logic must change. The ‘we exist’ half of Camus’ formulation necessitates as much: if the rebellion’s axiom does not apply to all, the rebellion has no coherent ground or claim. It would be a mere simulacrum. Rebels must act towards all—they have a limit on what they can not do.

But, against Badiou, they also have a limit on what they can do. The result of the ‘universal value’ defined by the axiom/principle in Camus’ formulation is a limit placed upon rebels. This limit is murder:

[M]urder is thus a desperate exception or it is nothing. It is the limit that can be reached but once, after which one must die. The rebel [...] kills and dies so that it shall be clear that murder is impossible. He demonstrates that, in reality, he prefers the ‘We are’ to the ‘We shall be.’ [...] Beyond the farthest frontier, contradiction and nihilism begin. (R 282)

This passage contains the core of The Rebel. Camus condemns any logic that justifies murder on the grounds of a history—either because it helps bring about a desired future state or because it is part of a larger, necessary historical epoch. He denies any logic that determinatively ties ethical action to a historical context, subsuming particular situations under history.

To justify an act by history is to implicitly de-value the present. It is to imply that a present claim to justice—to the axiomatic principles of rebellion—are not to be met. It is to deny the ‘we are’ to the ‘we shall be,’ as Camus says above. The axiomatic structure of the statement ‘I rebel, therefore we exist,’ demands the present be equal to the future. If not, the very structure of politics is denied and rebellion’s logic is made incoherent. The situatedness of the rebellion—the fact that the axiom is declared now—implies that as a universal, logical claim it is definitively tied to the present. Because it is universal, the present cannot be devalued to the future, otherwise it would be a mere instrument. By not separating history into pre- and post-event with an ontologically uncontainable state between them, Camus is providing a framework to make historical change sensible even as it is ongoing.

The axiomatic aspect of rebellion’s principles conditions this thought. Camus does not claim that rebellion’s ends should exist, or that they will exist, or that it would be morally right if they existed. “Nothing justifies the assertion that these principles have existed eternally; it is of no use to declare that they will one day exist” (R 283). Rather, the axiom is a demand for equality (or justice or freedom) against the State. Because the axiom acts as an ethical principle for the rebels during the course of their rebellion, the coherence between the rebels’ actions and their axiom is the justification of their logic. Every (legitimate) rebellion has this form.

And as a result, for Camus, universality is not a matter of Badiou’s virtuality, but of actuality. Because “[rebellion’s] reasons—the mutual recognition of a common destiny and the communication of men between themselves—are always valid” at the same time they are axiomatic, Camus is demanding concrete coherence between the rebellion’s actions and its axiom (R 283). The axiomatic principles are merely actualized by their declaration. But this is possible only because Camus does not posit an axiom that is (materially, historically) transformed into an ethical principle. As a result, though Camus may have supported all of the Libyan rebels’ actions, he has built the framework to sensibly ask the ethical question of them, even though it is based in particularity.

This is because the actual universality Camus posits provides a substantial ethics: murder is the limit of rebellion and cannot be justified. “Logically,” he says, “one should reply that murder and rebellion are contradictory. If a single master should, in fact, be killed, the rebel, in a certain way, is no longer justified in using the term community of men from which he derived his justification” (R 281). The claim is drastic: to murder anyone, even the source of injustice, is unjustifiable. It denies all egalitarian maxims by denying the victim the chance to meet rebellion’s demand—and it does so because Camus’ concern is actuality: Badiou’s universality in principle holds whether acted upon or not. But Camus shows in the first three sections of *The Rebel* that rebellions that have accepted murder became incoherent.[27]

However, Camus did not forswear murder—he claimed that it was a limit that could be met exactly once. On the one hand, it is simply utopian to refuse the use of violence in politics: Assad must be

overthrown for the sake of creating a democracy. But Camus has already denied historical justification as nihilistic and incoherent. And yet inaction would implicitly accept the unjust status quo. So, then, murder is necessary but unjustifiable; the rebel “kills and dies so that it shall be clear that murder is impossible.”

Camus navigates this paradox by insisting on murder’s exceptional status. One should rebel, even by murder, but simultaneously recognize murder as contrary to one’s own principles. An act of murder, we can say, will be legitimate but not just: legitimate in battling the unjust present, but unjust itself because legitimacy cannot clear the rebel of guilt. This claim—which is the core of Camus’ argument against Robespierre and Lenin, as well as his defense of the Russian terrorist Kaliayev—asserts that history cannot enter into politics’ logic. This time, this point in history may legitimize an act, but it cannot justify that act because ethical principles are eternal. Their universality must be protected in the material actions throughout the rebellion.

For this reason, even the legitimacy of murder is conditional.^[28] First, the victim must be a cause of the present injustices—e.g., the master of the slaves or the Ba’athist dictator. The murder of innocents can only be legitimated by historicist arguments unavailable to the coherent rebel. Second, the rebel’s act must be recognized as a crime by her own standards. She must recognize her own guilt as a failure to cohere with her axiom: only this recognition ensures murder remains exceptional, protecting a practical manifestation of the rebellion’s logic. The crime of Saint-Just and Robespierre was allowing the Terror to become an institution that altered the rebellion’s logic.

***Lone Wolf Terror 2NC/1NR**

Surveillance key to stop lone wolf terrorism – multiple scenarios for WMD use

Lederman chief counsel for national security and investigations of the U.S. Senate Homeland Security and Governmental Affairs Committee '12 (Gordon, “The Threat from Within: What Is the Scope of Homegrown Terrorism?” July 1,

http://www.abajournal.com/magazine/article/the_threat_from_within_what_is_the_scope_of_homegrown_terrorism, ME)

Homegrown terrorism is a major national security threat to the United States in the 21st century because of the combination of violent extremist ideology—especially violent Islamist extremism and its suicidal terrorism—with **the Internet accelerating an individual’s radicalization and with the proliferation of technology enabling an individual to cause mass casualties or widespread disruption.** In other words, the scope of the insider threat to the United States in the 21st century is virtually unprecedented—there exists the potential for an individual within the United States, segregated within his or her own Internet community of sympathizers, to radicalize to violent extremism and then to utilize modern technology to kill millions of people or to hobble critical infrastructure. This insider threat requires a greater emphasis on preventing potentially catastrophic attacks before they occur. The attacks of Sept. 11, 2001, heightened America’s consciousness to the threat posed by violent Islamist extremism. “Violent Islamist extremism” refers to the ideology advocating creation of a global state that would impose the most radical version of Islamic law and the use of violence against non-Muslim military personnel and civilians and even against Muslim opponents of this ideology. To recruit adherents, violent Islamist extremism utilizes a narrative that the West, led by the United States, is at war with Islam. The process by which individuals adopt violent Islamist extremism is commonly called “radicalization.” Violent Islamist extremists demonstrated on 9/11 and in subsequent plots that they seek to kill large numbers of U.S. civilians domestically, and al-Qaida leadership has sanctioned the use and pursued the development of weapons of mass destruction. Moreover, the 9/11 attacks showed violent Islamist extremists’ willingness to commit suicide while attacking—thus making them difficult to deter. These characteristics make violent Islamist extremism the most dangerous terrorist threat to the United States. Indeed, the Obama administration has identified this threat—which it calls “violent extremism and terrorism inspired by al-Qaida and its affiliates and adherents”—as **the “pre-eminent” violent extremist threat** to the United States. The 9/11 hijackers came from outside the United States to attack. During the initial years after 9/11, the U.S. government assumed that the United States’ experience as a melting pot of immigrants pursuing the American dream was a bulwark against U.S. citizens—native and immigrant—radicalizing to violent Islamist extremism. This assumption seemed generally correct because there were only 21 cases of homegrown violent Islamist extremism—that is, terrorist attacks or plots by U.S. citizens, permanent residents or visitors radicalized largely within the United States—from Sept. 11, 2001 until April 2009. But since May 2009, there have been 32 cases of homegrown violent Islamist extremism. Two of these post-2009 cases have resulted in deaths on U.S. soil. On June 1, 2009, Carlos Bledsoe killed one service member and wounded a second at a military recruiting station in Little Rock, Ark. And on Nov. 5, 2009, 12 service members and one Department of Defense civilian were killed and 32 wounded at Fort Hood, Texas. Army-trained psychologist Major Nidal Hasan, who reportedly had radicalized to violent Islamist extremism during his military medical training, is being court-martialed for the attack. Other notable plots have included one in 2008 led by Najibullah Zazi to attack the New York City subway system and the attempt on May 1, 2010, by Faisal Shahzad to detonate a car bomb in Manhattan’s Times Square. The vast majority of these cases have not involved plans for suicide, but Zazi and his fellow plotters did plan their attack as a suicide mission and several Americans who joined the al-Shabaab terrorist group in Somalia reportedly became suicide attackers there. To be sure, these cases of homegrown violent Islamist extremism represent a tiny percentage of the estimated 6 million Muslim-Americans. Moreover, as Presidents George W. Bush and Barack Obama have stressed since 9/11, the United States is not at war with Islam but rather with adherents to an ideology that perverts it. However, this upward trend in cases is worrisome particularly when combined with the role of the Internet and the proliferation of destructive and disruptive technology. The Internet has facilitated radicalization to violent Islamist extremism and resulting terrorist activity.

To be sure, the Internet has provided billions of people with access to information, and social media has played a critical role in democratic revolutions across the world. However, the Internet has also enabled radicalization, with violent Islamist extremists becoming adept at using the Internet to spread their propaganda. Violent Islamist extremists originally used password-protected forums, but they are now present on mainstream sites such as YouTube. The Internet enables individuals who are vulnerable to radicalization to find violent Islamist extremist material easily and to self-segregate and interact only with individuals who share that ideology—and in the privacy of their own homes. To be sure, homegrown violent Islamist extremist plots to date have not involved weapons of mass destruction but rather conventional explosives and firearms. Of course, firearms can cause significant casualties, such as the terrorist attack that killed 168 people in Mumbai, India, in November 2008. But the proliferation of mass destructive and disruptive technology enables even a single individual to wreak havoc domestically. For example, a single terrorist with microbiological training and access to a laboratory with dangerous pathogens—or equipment enabling the synthesis of a new pathogen—could release a pathogen that could kill millions. In addition, an individual with cyberskills could cause extensive damage to infrastructure and even loss of life through a cyberattack, such as by interfering with “supervisory control and data acquisition” systems, which are computer systems controlling the underpinnings of modern society such as electrical power transmission, communications and airports. An individual could also gain access to radiological material—such as that held by hospitals for medical purposes—and create a “dirty bomb” that renders several city blocks or larger uninhabitable and sow panic. The vector of technological development thus continually increases the power of an individual to cause mass destruction and disruption. The result of the combination of violent extremism, especially violent Islamist extremism, the role of the Internet, and the proliferation of destructive technology is that the government must increasingly emphasize prevention of homegrown terrorism. This task is complicated by the fact that, although an overall four-stage model of radicalization to violent Islamist extremism does exist, individuals who have radicalized have not necessarily followed the model’s sequence of stages, and an analysis of homegrown terrorism cases does not reveal a profile to predict who will radicalize except that homegrown terrorists are predominantly male and approximately two-thirds are younger than 30. Immediately after the 9/11 attacks, Federal Bureau of Investigation Director Robert Mueller declared that the FBI—which had previously focused on investigating terrorism after its occurrence—now had the top priority of preventing terrorist attacks. To do so, the FBI needed to reorient itself from prosecutions after an attack to an intelligence-driven effort to detect and dismantle terrorist threats prior to an attack. For example, Mueller charged each of the 56 FBI field offices with “domain awareness,” defined as “a 360-degree understanding of all national security and criminal threats in any given city or community. It is the aggregation of intelligence, to include what we already know and what we need to know, and the development of collection plans to find the best means to answer the unknowns. With this knowledge, we can identify emerging threats, allocate resources effectively, and identify new opportunities for intelligence collection and criminal prosecution.” Director Mueller also declared that every counterterrorism lead would be pursued. However, prior to the 9/11 attacks, the FBI was not authorized to conduct investigative activity without sufficient factual predication that a crime was being or had been committed. In order for the FBI to become “intelligence-driven,” it had to develop a protocol for collecting intelligence information—meaning information concerning potential threats even if there was no factual predication of criminal activity. Without such a protocol, the FBI would have limited ability to track down counterterrorism leads that lacked predication of criminal activity or to gather information to be able to analyze the nature and trend of violent extremist threats above and beyond whatever criminal cases the FBI had ongoing. Accordingly, in 2008 Attorney General Michael Mukasey authorized and Director Mueller instituted a new FBI operational protocol permitting “assessments” when there is “no particular factual predication” that a crime has been committed and instead based on an “authorized purpose” such as “to detect, obtain information about, or prevent or protect against federal crimes or threats to the national security, or to collect foreign intelligence.” Limited investigative tools are permitted, including reviewing publicly available information and conducting physical surveillance not otherwise requiring a warrant—as opposed to intrusive tools such as wiretaps, which require a warrant. Assessments are prohibited “based solely on the exercise of First Amendment-protected activities or on the race, ethnicity, national origin or religion of the subject.” FBI agents must use the “least intrusive” investigative mechanisms possible. As stated in Mukasey’s authorization to the FBI, “For example,

assessment activities may involve proactively surfing the Internet to find publicly accessible websites and services through which recruitment by terrorist organizations and promotion of terrorist crimes is opening taking place.”

Extinction

Nathan **MYHRVOLD**, PhD in theoretical and mathematical physics from Princeton, former chief technology officer of Microsoft, **13** [July 2013, “Strategic Terrorism: A Call to Action,” The Lawfare Research Paper Series No.2, <http://www.lawfareblog.com/wp-content/uploads/2013/07/Strategic-Terrorism-Myhrvold-7-3-2013.pdf>]

Several powerful trends have aligned to profoundly change the way that the world works. Technology now allows stateless groups to organize, recruit, and fund themselves in an unprecedented fashion. That, coupled with the extreme difficulty of finding and punishing a stateless group, means that stateless groups are positioned to be lead players on the world stage. They may act on their own, or they may act as proxies for nation-states that wish to duck responsibility. Either way, stateless groups are forces to be reckoned with. At the same time, a different set of technology trends means that small numbers of people can obtain incredibly lethal power. Now, for the first time in human history, a small group can be as lethal as the largest superpower. Such a group could execute an attack that could kill millions of people. It is technically feasible for such a group to kill billions of people, to end modern civilization—perhaps even to **drive the human race to extinction.** Our defense establishment was shaped over decades to address what was, for a long time, the only strategic threat our nation faced: Soviet or Chinese missiles. More recently, it has started retooling to address tactical terror attacks like those launched on the morning of 9/11, but the reform process is incomplete and inconsistent. A real defense will require rebuilding our military and intelligence capabilities from the ground up. Yet, so far, strategic terrorism has received relatively little attention in defense agencies, and the efforts that have been launched to combat this existential threat seem fragmented. History suggests what will happen. The only thing that shakes America out of complacency is a direct threat from a determined adversary that confronts us with our shortcomings by repeatedly attacking us or hectoring us for decades.

A2: No Lone Wolf WMDs

Lone wolves use WMDs

Gary A. **ACKERMAN**, Director of the Special Projects Division at the National Consortium for the Study of Terrorism and Responses to Terrorism (START), University of Maryland, **AND** Lauren E. **PINSON**, Senior Research/Project Manager at START and PhD student at Yale University, **14** ["An Army of One: Assessing CBRN Pursuit and Use by Lone Wolves and Autonomous Cells," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

The first question to answer is whence the concerns about the nexus between CBRN weapons and isolated actors come and whether these are overblown. The general threat of mass violence posed by lone wolves and small autonomous cells has been detailed in accompanying issue contributions, but the potential use of CBRN weapons by such perpetrators presents some singular features that either amplify or supplement the attributes of the more general case and so are deserving of particular attention. Chief among these is the impact of rapid technological development. Recent and emerging advances in a variety of areas, from synthetic biology³ to nanoscale engineering,⁴ have opened doors not only to new medicines and materials, but also to new possibilities for malefactors to inflict harm on others. What is most relevant in the context of lone actors and small autonomous cells is not so much the pace of new invention, but rather the commercialization and consumerization of CBRN weapons-relevant technologies. This process often entails an increase in the availability and safety of the technology, with a concurrent diminution in the cost, volume, and technical knowledge required to operate it. Thus, for example, whereas fifty years ago producing large quantities of certain chemical weapons might have been a dangerous and inefficient affair requiring a large plant, expensive equipment, and several chemical engineers, with the advent of chemical microreactors,⁵ the same processes might be accomplished far more cheaply and safely on a desktop assemblage, purchased commercially and monitored by a single chemistry graduate student. The rapid global spread and increased user-friendliness of many technologies thus represents a potentially radical shift from the relatively small scale of harm a single individual or small autonomous group could historically cause.⁶ From the limited reach and killing power of the sword, spear, and bow, to the introduction of dynamite and eventually the use of our own infrastructures against us (as on September 11), the number of people that an individual who was unsupported by a broader political entity could kill with a single action has increased from single digits to thousands. Indeed, it has even been asserted that "over time ... as the leverage provided by technology increases, this threshold will finally reach its culmination—with the ability of one man to declare war on the world and win."⁷ Nowhere is this trend more perceptible in the current age than in the area of unconventional weapons. These new technologies do not simply empower users on a purely technical level. Globalization and the expansion of information networks provide new opportunities for disaffected individuals in the farthest corners of the globe to become familiar with core weapon concepts and to purchase equipment—online technical courses and eBay are undoubtedly a boon to would-be purveyors of violence. Furthermore, even the most solipsistic misanthropes, people who would never be able to function socially as part of an operational terrorist group, can find radicalizing influences or legitimation for their beliefs in the maelstrom of virtual identities on the Internet. All of this can spawn, it is feared, a more deleterious breed of lone actors, what have been referred to in some quarters as "super-empowered individuals."⁸ Conceptually, super-empowered individuals are atomistic game-changers, i.e., they constitute a single (and often singular) individual who can shock the entire system (whether national, regional, or global) by relying only on their own resources. Their core characteristics are that they have superior intelligence, the capacity to use complex communications or technology systems, and act as an individual or a "lone-wolf."⁹ The end result, according to the pessimists, is that if one of these individuals chooses to attack the system, "the unprecedented nature of his attack ensures that no counter-measures are in place to prevent it. And when he strikes, his attack will not only kill massive amounts of people, but also profoundly change the financial, political, and social

systems that govern modern life.”¹⁰ It almost goes without saying that the same concerns attach to small autonomous cells, whose members' capabilities and resources can be combined without appreciably increasing the operational footprint presented to intelligence and law enforcement agencies seeking to detect such behavior. With the exception of the largest truck or aircraft bombs, the most likely means by which to accomplish this level of system perturbation is through the use of CBRN agents as WMD. On the motivational side, therefore, lone actors and small autonomous cells may ironically be more likely to select CBRN weapons than more established terrorist groups—who are usually more conservative in their tactical orientation—because the extreme asymmetry of these weapons may provide the only subjectively feasible option for such actors to achieve their grandiose aims of deeply affecting the system. The inherent technical challenges presented by CBRN weapons may also make them attractive to self-assured individuals who may have a very different risk tolerance than larger, traditional terrorist organizations that might have to be concerned with a variety of constituencies, from state patrons to prospective recruits.¹¹ Many other factors beyond a “perceived potential to achieve mass casualties” might play into the decision to pursue CBRN weapons in lieu of conventional explosives,¹² including a fetishistic fascination with these weapons or the perception of direct referents in the would-be perpetrator's belief system. Others are far more sanguine about the capabilities of lone actors (or indeed non-state actors in general) with respect to their potential for using CBRN agents to cause mass fatalities, arguing that the barriers to a successful large-scale CBRN attack remain high, even in today's networked, tech-savvy environment.¹³ Dolnik, for example, argues that even though homegrown cells are “less constrained” in motivations, more challenging plots generally have an inverse relationship with capability,¹⁴ while Michael Kenney cautions against making presumptions about the ease with which individuals can learn to produce viable weapons using only the Internet.¹⁵ However, even most of these pundits concede that low-level CBR attacks emanating from this quarter will probably lead to political, social, and economic disruption that extends well beyond the areas immediately affected by the attack. This raises an essential point with respect to CBRN terrorism: irrespective of the harm potential of CBRN weapons or an actor's capability (or lack thereof) to successfully employ them on a catastrophic scale, these weapons invariably exert a stronger psychological impact on audiences—the essence of terrorism—than the traditional gun and bomb. This is surely not lost on those lone actors or autonomous cells who are as interested in getting noticed as in causing casualties. Proven Capability and Intent While legitimate debate can be had as to the level of potential threat posed by lone actors or small autonomous cells wielding CBRN weapons, possibly the best argument for engaging in a substantive examination of the issue is the most concrete one of all—that these actors have already demonstrated the motivation and capability to pursue and use CBRN weapons, in some cases even close to the point of constituting a genuine WMD threat. In the context of bioterrorism, perhaps the most cogent illustration of this is the case of Dr. Bruce Ivins, the perpetrator behind one of the most serious episodes of bioterrorism in living memory, the 2001 “anthrax letters,” which employed a highly virulent and sophisticated form of the agent and not only killed five and seriously sickened 17 people, but led to widespread disruption of the U.S. postal services and key government facilities.¹⁶ Other historical cases of CBRN pursuit and use by lone actors and small autonomous cells highlight the need for further exploration. Among the many extant examples: ¹⁷ Thomas Lavy was caught at the Alaska-Canada border in 1993 with 130 grams of 7% pure ricin. It is unclear how Lavy obtained the ricin, what he planned to do with it, and what motivated him. In 1996, Diane Thompson deliberately infected twelve coworkers with shigella dysenteriae type 2. Her motives were unclear. In 1998, Larry Wayne Harris, a white supremacist, was charged with producing and stockpiling a biological agent—bacillus anthracis, the causative agent of anthrax. In 1999, the Justice Department (an autonomous cell sympathetic to the Animal Liberation Front) mailed over 100 razor blades dipped in rat poison to individuals involved in the fur industry. In 2000, Tsiugio Uchinshi was arrested for mailing samples of the mineral monazite with trace amounts of radioactive thorium to several Japanese government agencies to persuade authorities to look into potential uranium being smuggled to North Korea. In 2002, Chen Zhengping put rat poison in a rival snack shop's products and killed 42 people. In 2005, 10 letters containing a radioactive substance were mailed to major organizations in Belgium including the Royal Palace, NATO headquarters, and the U.S. embassy in Brussels. No injuries were reported. In 2011, federal agents arrested four elderly men in Georgia who were plotting to use ricin and explosives to target federal buildings, Justice Department officials, federal judges, and Internal Revenue Service agents. Two recent events may signal an even greater interest in CBRN by lone malefactors. First, based on one assessment of Norway's Anders Breivik's treatise, his references to CBRN weapons a) suggest that CBRN weapons could be used on a tactical level and b) reveal (to perhaps previously uninformed audiences) that even low-level CBRN weapons could achieve far-reaching impacts driven by

fear. 18 Whether or not Breivik would actually have sought or been able to pursue CBRN, he has garnered a following in several (often far-right) extremist circles and his treatise might inspire other lone actors. Second, Al-Qaeda in the Arabian Peninsula (AQAP) released two issues of Inspire magazine in 2012. Articles, on the one hand, call for lone wolf jihad attacks to target non-combatant populations and, on the other, permit the use of chemical and biological weapons. The combination of such directives may very well influence the weapon selection of lone actor jihadists in Western nations. 19

Homegrown terrorism is the most likely scenario for an attack

Zenko 15 -- Zenko covers the U.S. national security debate and offers insight on developments in international security and conflict prevention. "Is US Foreign Policy Ignoring Homegrown Terrorists" <http://www.defenseone.com/threats/2015/05/us-foreign-policy-ignoring-homegrown-terrorists/113197/>

Senior U.S. intelligence and counterterrorism officials increasingly warn of the threat of "lone wolf" individuals attempting terror attacks within the United States. These potential perpetrators are characterized as externally motivated, but predominantly self-directed in plotting and attempting acts of politically and/or ideologically motivated violence. They need not travel to purported foreign "safe havens" to receive training or guidance, nor be in direct contact with terrorist organizations based abroad. Rather, their inspiration, in large part, appears to stem from the principles and narratives promoted by Islamist jihadist groups. On February 12, National Counterterrorism Center Director Nicholas Rasmussen told the Senate Select Committee on Intelligence: "We face a much greater, more frequent, recurring threat from lone offenders and probably loose networks of individuals. Measured in terms of frequency and numbers, it is attacks from those sources that are increasingly the most noteworthy..." On February 26, during the annual worldwide threats hearing, Director of National Intelligence James Clapper warned: "Home-grown violent extremists continue to pose the most likely threat to the homeland." Last Friday, Secretary of Homeland Security Jeh Johnson stated on MSNBC: "We're in a new phase...in the global terrorist threat where, because of effective use of social media, the Internet, by ISIL, al-Qaeda, we have to be concerned about the independent actor who is here in the homeland who may strike with little or no warning..." Finally, yesterday, former CIA deputy director Michael Morell described the messaging efforts of jihadist groups generally and the self-declared Islamic State (IS) more specifically: "Their narrative is pretty powerful: The West, the United States, the modern world, is a significant threat to their religion. Their answer to that is to establish a caliphate. And they are being attacked by the U.S. and other Western nations, and by these apostate regimes in the region. Because they are being attacked they need support in two ways; people coming to fight for them, and people coming to stand up and attack coalition nations in their home." In summary, the most likely—though not most lethal—terror threats to Americans come from individuals living within the United States who are partially motivated to undertake self-directed attacks based upon their perception that the United States and the West are at war with the Muslim world. Remarkably, these two observations have had virtually no impact on U.S. foreign policy discourse. In Washington, there is an agreed-upon, bipartisan understanding that under no circumstances will officials or politicians acknowledge, or even explore, the concept that foreign policy activities might play a role in compelling U.S. residents, who would not otherwise consider terrorism, to plot and attempt attacks. This is somewhat understandable given that there are many different backgrounds, experiences, and precursors that lead people to become violent extremists. Yet, whereas there are constant hearings and debates—even White House summits—about how to "counter violent extremism," there is rarely any consideration of which U.S. foreign policy activities might themselves be precursors to U.S. terrorism. In fact, the only foreign policy decisions that the Obama administration admits might inspire terrorism are those made by Obama's predecessor. The first is one that the White House has tried to reverse since January 2009: detaining terror suspects at Guantanamo Bay, Cuba. Most recently, at a House Armed Services Committee hearing on March 18, Secretary of Defense Ashton Carter endorsed closing the military prison because, "It still provides a rallying point for Jihadi recruiting." The other decision is the 2003 invasion of Iraq; as President Obama stated on March 17, "ISIL is a direct outgrowth of al-Qaeda in Iraq that grew out of our invasion, which is an example of unintended consequences." Of course, another unintended consequence emerged from the U.S.-led airwar in 2011 that ensured the toppling of Muammar al-Qaddafi in Libya. As a U.S. military official told The Wall Street Journal today, "ISIL now has an operational presence in Libya, and they have aspirations to make Libya their African hub. Libya is part of their terror map now." Compare this recent warning to how the State Department described Libya on the eve of the 2011 airwar: "The Libyan government continued to demonstrate a strong and active commitment to combating terrorist organizations and violent extremism through bilateral and regional counterterrorism and security cooperation, particularly on the issue of foreign fighter flow to Iraq." Now, foreign fighters are flowing from Iraq and Syria to establish a stronghold in Libya. This is clearly an unintended, though not at all unsurprising, consequence, but not one that the Obama administration will acknowledge because it happened under its watch. (See also: Are We Downplaying the Risks of Homegrown Terrorism?) More critically, what foreign policy activities are bolstering the narrative of Islamic jihadist groups today? Is it really just the 122 terror suspects still in Guantanamo? What about drone strikes, which themselves are universally hated? Or, what of the support for President Abdel Fattah el-Sisi in Egypt, whose government sentenced that country's first elected leader to death this week? Finally, is the U.S.-led airwar against IS fueling that narrative and making the likelihood of lone wolf attacks within the United States more likely? What else is the United States doing abroad that could be making Americans less safe from lone wolf terrorism at home? Why is this never asked or considered when officials and politicians discuss how the thirteen-and-a-half-year war on terrorism is progressing?

A2: No WMD Supplies

Their defense doesn't assume lone wolves and dual tech

Ellis 14 [Patrick D., WMD/Homeland Security Analyst and Instructor at the U.S. Air Force Counterproliferation Center, Air University, ["Lone Wolf Terrorism and Weapons of Mass Destruction: An Examination of Capabilities and Countermeasures," *Terrorism and Political Violence*, Vol. 26, Issue 1, 2014]

Today, the specters of lone wolves and autonomous cells acquiring and using chemical, biological, radiological, and nuclear (CBRN) Weapons of mass destruction, whether in their traditional military forms or the more non-traditional industrial forms, seems less far-fetched. Fortunately, military CBRN agents and weapons are not normally accessible to lone wolves or autonomous cells and are often located in highly secured areas. Therefore, lone wolves and autonomous cells may be drawn to materials similar to CBRN located in less secure areas. These commonplace industrial chemicals, biological contaminants, and radioactive materials could be used to cause disruptions or mass casualties. The dual use nature of these materials and technologies enables them to be turned into weapons and delivered by nonmilitary means. Future "over-the-horizon" threats, such as the proliferation of new biotechnologies and amateur do-it-yourself capabilities, pose a risk that lone wolves could develop weapons at a time when travel, access to knowledge, and dual-use technologies, in the globalizing environment, make lone wolf terrorists more dangerous. Thus, the author explores existing countermeasures, such as laws, strategies, passive and active measures designed to stop these dangerous threats. In particular, capabilities to prevent, protect, respond, and recover from CBRN terrorist acts are examined.

A2: No Recruitment

NSA Authority more important than ever – groups like ISIS are contacting US citizens through the Internet

Corcoran 5/31/15 (Corcoran, Kieran, [Journalist for Dailymail], “Head of CIA warns that US is at risk of lone wolf terror attack after NSA powers to monitor all phone calls expired – as Isis ‘watch carefully’ for security gaps”, <http://www.dailymail.co.uk/news/article-3105089/Senate-makes-ditch-bid-extend-NSA-s-bulk-collection-phone-records-Rand-Paul-swears-block-legislation-let-Patriot-Act-expire.html>)

The head of the CIA has warned that Americans are now at risk after the Senate was unable to extend laws giving authorities special powers to fight terrorists. Politicians in the upper house were unable to come to an agreement to extend key parts of the Patriot Act - that legalize controversial methods of surveillance by the National Security Agency (NSA) - which expired on Sunday. Attempts were frustrated by Presidential candidate Rand Paul, who has taken a firm stance against the extension of powers allowing the mass collection of phone records, wire taps and warrants without evidence. +8 Concerned: Director of Central Intelligence Agency John Brennan warns that terrorists will be watching developments in the US closely after legislation allowing special surveillance lapsed on Sunday But the Head of the CIA John Brennan claims ordinary Americans, who expect the NSA to do their jobs, have been put at risk by 'political grandstanding and crusading for ideological causes' that fueled the debate. Speaking on CBS show Face The Nation, he warned that the US - and Europe - is now in danger from technologically 'sophisticated' terrorists who are watching developments carefully and 'looking for the seams to operate' within. He claimed that the authorities do not abuse the powers, extended in 2011 to help fight lone wolf terror suspects not connected to a specific group, and that without them, it's difficult for the NSA to protect America. Mr Brennan said: 'I think terrorist elements have watched very carefully what has happened here in the United States, whether or not it's disclosures of classified information or whether it's changes in the law and policies. They are looking for the seams to operate within. RELATED ARTICLES Previous 1 Next 'I'm not giving him a pass': Obama 'Hope' poster artist said...How FIFA were nailed by last act of revenge of a dying man:...Former Maryland Governor Martin O'Malley launches White... SHARE THIS ARTICLE Share 425 shares 'And this is something that we can't afford to do right now, because if you look at the horrific terrorist attacks and violence that is being perpetrated around the globe, we need to keep our country safe. And our oceans are not keeping us safe the way they did a century ago. The Patriot Act was passed in 2001 in the wake of the 9/11 terror attacks. Now that the provisions have expired, government agents will need to subpoena phone companies for the records. The White House previously justified collecting the records because of the Patriot Act's Section 215, which expired on Sunday. Two other provisions, added in 2011, also expired with it. The first is a 'roving wiretap' provision which allows government agencies to keep tracking suspects as they switch devices. The second is a 'lone wolf' clause which allows warrants to be granted without any evidence linking a suspect to a foreign power or terrorist group. Political struggles over the NSA and its data collection have become a national issue since whistleblower Edward Snowden revealed the extent of government programs in 2013 Majority Leader Mitch

McConnell tried to cobble together a solution Sunday but came up short. The senate's efforts to pass a replacement bill were frustrated by Kentucky's junior senator Rand Paul, who has spoken at length against the NSA's activities, which he has excoriated as illegal and unconstitutional. With his presidential campaign waning, he has been accused of irresponsible political opportunism by opponents, by fighting a bill on ideological grounds that may put ordinary people at risk. He was criticized by the White House Sunday night, which called the Patriot Act expiration an 'irresponsible lapse'. While Brennan didn't mention Paul by name, he said on Face The Nation: 'Unfortunately I think there is a little too much political grandstanding and crusading for ideological causes that have really fuelled the debate on this issue. He added: **These are authorities that have been used by the government to make sure that we're able to safeguard Americans.** And the sad irony is that most Americans expect the government to protect them. And so although there's a lot of debate that goes on, on the Congress and the Hill on this issue, I think, when you go out to Boise or Tampa or Louisville, Americans are expecting their law enforcement and homeland security and intelligence professionals to do their work. And these authorities are important.' Paul argued 'there must be another way' but even he agrees that the lapse in these powers are likely to be temporary as politicians work on the USA Freedom Act, which is expected to pass within the next week. Republican Senate Majority Leader Mitch McConnell called a rare Sunday session to try to pass the replacement law, but was unable to push it through in time. And although the replacement is set to pass this week, Paul said the expiration was 'a victory no matter how you look at it'. Several provisions of the Patriot Act will expire at on June 1st, including the authority for the NSA's bulk collection of Americans' phone records. In a statement, he said: 'It might be short lived, but I hope that it provides a road for a robust debate, which will strengthen our intelligence community, while also respecting our Constitution. WHAT IS THE SENATE'S NEXT MOVE? The Patriot Act is supposed to be replaced by the USA Freedom Act, an acronym for Strengthening America by Fulfilling Rights and Ending Eavesdropping, Dragnet-collection and Online Monitoring Act. It is expected to pass next week and will: Rein in powers for the mass collection of data, requiring agencies instead to apply for information on a specific entity, such as a person, account or device. Require intelligence agencies to be more transparent about what they collect, allowing technology companies to be more open about what they share. EXTEND powers offered in the lone wolf and roving wire tap provisions. It was first proposed in 2013 but is expected to pass this week. He added: 'The expiration of the NSA's sweeping, all-encompassing and ineffectual powers will not relinquish functions necessary for protecting national security. The expiration will instead do what we should have done all along - rely on the Constitution for these powers.' According to a top lawmaker, as of 8pm Sunday no NSA employee could access their enormous phone records database, which holds metadata on millions of phone conversations handed over by telecoms companies like Verizon and AT&T. Senate Intelligence Committee chairman Richard Burr said on Sunday: 'There is no way to get any type of agreement tonight -- either an extension or passage of a bill. So at 8pm tonight, NSA employees can not query the database'. In a statement issued Sunday night, Obama's press secretary Josh Earnest, urged action to pass the USA Freedom Act as quickly as possible. He said: 'The Senate took an important - if late - step forward tonight. We call on the Senate to ensure this irresponsible lapse in authorities is as short-lived as possible. 'On a matter as critical as our national security, individual Senators must put aside their partisan motivations and act swiftly. The American people deserve nothing less.' Some lawmakers have said the

lapse raises alarming questions about how US authorities can keep the homeland safe with a diminished security toolbox. +8 Shut off: Other tools that will be removed include one that allows law enforcement officials to use roving wiretaps to monitor individuals using different phones, a power that is exercised less than 100 times a year 'I think it's very very unfortunate that we're in this position,' said Senator Mike Lee, a conservative Republican who supports the reform bill. 'We've known this date was coming for four years. Four years. And I think it's inexcusable that we adjourned' for a weeklong break last week without resolving the issue. Lee, too, conceded that the reform bill would most likely pass in the coming week. With the clock ticking, CIA chief John Brennan warned Sunday that allowing vital surveillance programs to lapse could increase terror threats, and argued that the phone metadata dragnet has not abused civil liberties and only serves to safeguard citizens. 'This is something that we can't afford to do right now,' Brennan said of allowing the counterterrorism provisions to expire. Rand Paul leads opposition to NSA surveillance as deal expires +8 The NSA Threat Operations Center: Hundreds of millions of records of U.S. phone calls were collected under a provision of the Patriot Act with just only 300 'queried' in 2012 for additional information about the callers 'Because if you look at the horrific terrorist attacks and violence being perpetrated around the globe, we need to keep our country safe, and our oceans are not keeping us safe the way they did century ago,' he said on CBS talk show Face the Nation. Brennan added that online threats from groups like Isis would continue to grow over the next five to ten years. He said: 'Isis has been very sophisticated and adept at using the Internet to propagate its message and reach out to individuals. We see what is happening as far as thousands upon thousands of individuals, including many thousands from the West, that have traveled into Syria and Iraq. And a number of these individuals are traveling back. 'And what we see, they're also using the Internet as a way to incite and encourage individuals to carry out acts of violence. 'So as the director of FBI says, you know, this use of these websites and their Internet capabilities is something of great concern. So yes, I think ISIS is a threat not just in the Middle East and South Asia and African regions but also to Europe as well as to the United States.'

ISIS is in the US

Piccoli 15 – Sean, Ex-DHS, NSA Official: ISIS Terror Cells in US 'Probable'

<http://www.newsmax.com/Newsmax-Tv/Stewart-ABaker-United-States-cells-ISIS/2015/02/12/id/624453/>

It's safe to assume that there are people with terrorist ambitions and instructions from the Islamic State operating inside the United States today, says a former Department of Homeland Security official, agreeing with a similar claim made by the agency's current chief. While hesitating to use the phrase "sleeper cells" to describe these attackers in waiting, former DHS assistant secretary Stewart A. Baker told "MidPoint" host Ed Berliner on Newsmax TV Thursday that it is "more probable than not" that they are here, "and we certainly should be acting as though that's likely." "It is quite possible that there were foreign fighters from the United States or from other countries whose names we never got and whose travel to Syria we never flagged," said Baker, "and that those folks have come back to the United States with instructions to try to carry out an attack if that's possible." Homeland Security Secretary Jeh Johnson said as much on Sunday, telling CNN's "State of the Union" that a number of individuals living in the U.S. are in touch with the Islamic State (ISIS) and other terror groups that share "a desire to conduct an attack" against America. Johnson said the problem of homegrown or reimported terrorists is worse in Europe than in the U.S., but that on both continents, social media make it easier for an ISIS or

an al-Qaida to recruit fighters from afar or groom lone-wolf terrorists within the targeted countries. It's against that backdrop that President Barack Obama is grudgingly seeking a new congressional authorization for military force against ISIS in Iraq and Syria, said Baker. "It's obvious he would very much like not to be fighting this war," said Baker, a lawyer and former general counsel to the National Security Agency. Obama "came into office thinking he would put an end to the use of force abroad and to unilateral executive decision-making about what force could be used," said Baker, "and he's found himself actually being more Bush than Bush on that topic, taking existing authorities and stretching them far." His written request to Congress for a war authorization lasting three years is an attempt to "thread a needle," said Baker, "to say, 'Give me a lot of authority but not as much authority as you've given the president in the past,' because he is genuinely ambivalent about whether this is a good idea." He's written it in a way that authorizes ground troops, just not for very long or in any large numbers," said Baker. "He is visibly uncomfortable doing what he feels he must do, both politically and militarily, and any limits he can come up with, he's glad to embrace, especially if those limitations will mostly be felt by his successor," said Baker. Baker also discussed the new cease-fire in Ukraine agreed to by Russia, which has been hit with international sanctions for backing separatists rebels in Ukraine and annexing Ukrainian territory. German and French leaders Angela Merkel and François Hollande helped broker the truce, but Baker was doubtful that it will last any longer than Russian President Vladimir Putin wants it to. "He is playing, especially, Europe, but he's playing us as well," said Baker. "He's managed to increase the [Ukrainian] territory that is largely under the control of his Special Forces and the rebels, and now the West has more or less validated that new territory in exchange for the same promise he gave last time," when Russia signed a ceasefire agreement in September. "So whether there's a cease-fire depends entirely on whether Putin really wants one," said Baker, "and right now he may simply be saying, 'Well, in order to head off the delivery of arms to the Ukraine, I'll promise them the cease-fire and in a week I can take it back.'"

ISIS is recruiting US citizen through social media to attack the US

Sanchez 5/5/15 (Sanchez, Ray, [CNN editor and writer], "ISIS exploits Social Media to make inroads with the US",

<http://www.cnn.com/2015/06/04/us/isis-social-media-recruits/>)

Hours before his fatal encounter with anti-terrorism officers, Usaamah Rahim told an associate he was switching from plans to behead a conservative blogger to assaults on the "boys in blue." Rahim, who officials believe was radicalized by ISIS, referred to his planned act of jihad against police officers in coded language -- "going on vacation," he said, according to an FBI affidavit. The 26-year-old security guard's so-called vacation ended in a hail of bullets Tuesday. FBI and Boston police officers tailing him suspected he was about to launch an attack. An associate, David Wright, 25, was arrested and charged with obstruction. The investigation into the depth of Rahim's network and possible overseas connections comes amid concerns by counterterrorism officials about future plots from a growing number of U.S.-based ISIS sympathizers. Using social media as well as encrypted online communications beyond the reach of law enforcement surveillance, the terror organization is increasingly reaching new sympathizers and encouraging attacks such as the one foiled in Boston, officials said. "The foreign terrorist now has direct access into the United States like never before," Michael Steinbach, assistant director of the FBI's counterterrorism division, told the House Homeland Security Committee this week. At least one of the men connected to the plot to behead conservative blogger Pamela Geller and kill officers in Massachusetts was being encouraged online by people overseas connected to ISIS, two U.S. officials with knowledge of the investigation said Thursday. The officials, however, cautioned that the exact ties are difficult to know. 'Thousands of messages' Rep. Michael McCaul, R-Texas, chairman of the Homeland Security Committee, said communications with ISIS first brought Rahim to the attention of law enforcement. "He was being investigated by the Boston Joint Terrorism Task Force after communicating with and spreading ISIS propaganda online," McCaul said. An estimated 3,400 Westerners have traveled to join ISIS in its quest to establish an Islamist state in Iraq and Syria, according to counterterrorism officials. At least 200 Americans have gone or attempted to travel to Syria. But even a rough estimate of the number of sympathizers on U.S. soil is hard to discern. "There are thousands of messages being put out into the ethersphere and they're just hoping that they land on an individual who's susceptible to that type of terrorist propaganda," said John Carlin, the assistant attorney general heading the Justice

Department's national-security division. "They just need to be right once to get a terrorist attack inside the United States." ISIS has the most sophisticated propaganda machine of any terrorist organization, a global communications strategy that has stumped counterterrorism officials while making significant inroads among U.S. sympathizers. "How many of those followers are actually in the United States, in your estimate?" McCaul asked at this week's hearing. "There's hundreds, maybe thousands," Steinbach replied. "It's a challenge to get a full understanding of just how many of those passive followers are taking action." Who are the Americans linked to ISIS? 'A call to arms' Rahim was "active on social media in ways that sparked interest" from law enforcement, according to a congressional source briefed on the investigation. His online interactions with possible ISIS contacts were tantamount to what the source called a "conspiracy over the Internet." While there was an effort to motivate action by Rahim, two U.S. officials told CNN they, so far, don't believe ISIS was directly involved in planning or directing the attack. Authorities described a scenario similar to the attempted ambush last month of a Garland, Texas, event featuring controversial cartoons of the Muslim Prophet Mohammed. The two attackers were killed by an off-duty police officer; one of the men was said to have been in contact with ISIS. Geller, president of the American Freedom Defense Initiative, which includes subsidiary programs Stop Islamization of America and Stop Islamization of Nations, organized the Texas event. She was the original target of this week's plot. "The targeting of the Mohammed Art Exhibit and Contest exemplifies the call to arms approach encouraged by (ISIS) along with the power of viral messaging," Steinbach said. "In this instance, the event gained much publicity prior to it occurring and attracted negative attention that reached areas of the country -- and the world -- that it may not have without the widespread reach of the Internet." Steinbach said the targeting of U.S. military personnel by ISIS supporters was evident in the recent release of hundreds of names of U.S. military personnel. The names were posted to the Internet and quickly spread via social media. "Once they identify an individual, they'll then try to directly communicate with that individual to give them coaching and guidance on how to do an attack inside the United States," Carlin said. Opinion: How ISIS recruiters win in the West 'Lone actor attack' ISIS recruitment efforts have become more difficult to detect because of encrypted "dark space" communication, officials said. "Do we have any idea how many communications are taking place in the dark space?" McCaul asked. "No, we don't and that's the problem -- the ability to know what they're saying in these encrypted communication situations is troubling," Steinbach said. ISIS uses its social media prowess to lure more and more Americans, who are often young, sometimes disillusioned. "What they're telling them is, here's some easily available -- readily available information online that you can exploit," said John Mulligan, deputy director of the National Counterterrorism Center. "In other words, they believe that they can provide them everything that they will need to undertake some kind of lone actor attack." In January, the New York Police Department and other law enforcement agencies responded to a threat from ISIS after the re-released of a September 2014 online message and video urging followers to "rise up and kill intelligence officers, police officers, soldiers and civilians." The threat named the United States, France, Australia and Canada as targets. "What we're seeing is unprecedented," Carlin said. "It's a change in strategy."

Lone Wolf Terrorism is huge threat and will happen again-SL

Lancam 5/23/-15 (Rory, City Councilman of Brooklyn, "THE DANGERS OF LONE-WOLF TERRORISM", Times Newsweekly, http://www.timesnewsweekly.com/news/2015-05-28/Columns/THE_DANGERS_OF_LONEWOLF_TERRORISM.html)

In the years since 9/11, we have worked aggressively as a city and a country to defeat our enemies abroad and protect ourselves from future attacks. Recent tragedies, however, including the Boston Marathon bombing, show that there is a new form of terrorism that we must defend ourselves against. "Lone-wolf terrorism" occurs when an individual who is inspired by a terrorist organization, but is not a member of the organization, perpetrates an attack in their community. We saw this in Queens last year when Zale Thompson charged four police officers, striking them with a hatchet and causing serious injuries. In the months prior to the assault, Thompson had visited hundreds of websites tied to al-Qaeda, ISIS, the al-Shabaab militia and other extremist groups. Thompson researched how to commit violent acts and made posts online attacking American society. Thompson was inspired by extremist groups, but he wasn't a member of a terrorist organization. Although his actions may seem random, groups like al-Qaeda and ISIS are taking deliberate action to motivate and radicalize individuals like Thompson. Al-Qaeda pioneered this strategy in the late 2000s, when senior al-Qaeda official and U.S. citizen Anwar al-Awlaki wrote in an al-Qaeda magazine, "It is better to support the prophet by attacking those who slander him than it is to travel to land of Jihad like Iraq or Afghanistan." As Internet access has spread, and specifically with the growth of social media platforms including Reddit and Twitter, radical groups abroad have continued to try to provoke lone-wolf attacks on American soil. ISIS propagates its ideologies through these channels, reaching individuals throughout the Western world and turning them into soldiers for its cause. The group believes that these attacks, which often seem arbitrary and are more challenging to prevent, will terrorize the U.S. to an equal or greater extent than any attacks that ISIS could plan and carry out. Tragically, the group is currently succeeding in spreading its hateful message and mobilizing U.S. residents to attack their own communities. This is an incredibly dangerous approach because, as John Miller, the NYPD's head of counterterrorism, said, "If the conspiracy to commit a terrorist act is a conspiracy of one, and the planning for that is unsophisticated, doesn't require a lot pre-operational surveillance and is only happening in the mind of the offender, from an intelligence standpoint, from a prevention standpoint, that's very hard to detect." Police Commissioner Bill Bratton is on top of this evolving threat and working to stay ahead of it. But **we must ensure that he has every resource necessary to fight this dangerous and growing threat.** Commissioner Bratton has requested that 450 officers of the one thousand the Council hopes to add be assigned to the NYPD's counterterrorism unit. As the city budget moves forward, it is imperative that we ensure the appropriate funding for this is allocated. We must combat this threat before it is too late.

Lone Wolf Terrorism is real and Big enough that it is a massive problem-SL

Sanders 5/11/-15(Bol Political Columnist, "Girding for the long hall of terror", The Washington Times, <http://www.washingtontimes.com/news/2015/may/11/sol-sanders-lone-wolf-terrorists-mean-america-need/>)

Two seemingly unconnected recent events but in reality intimately connected are sure signs that the war on terrorism is being lost. Of course, we must begin with that old Chinese adage: When a fish starts rotting, it stinks first from the head. President Obama has undeclared the war on terrorism, refusing even to name the enemy.

But it takes two to tango — and the Islamic terrorists cling to their effort to inflict hurt on the United States whenever and now, alas, wherever, they can. The recent attack in Garland, Texas, revealed what the general public only had guessed: There are resident terrorists — some U.S. born, others naturalized citizens, some of Muslim descent, others converts to Islam — ready to spring into action. Whether, indeed, the Garland two were under the discipline of Daesh, the Islamic State, claimed or “lone wolves” operating on their own may be irrelevant. FBI Director James Comey confirms our worst fears: There are hundreds if not thousands of American Daesh sympathizers. The second event was the shift of Rear Adm. John Kirby, the Pentagon’s chief spokesman, to become the State Department’s voice. However unprecedented and humiliating for State’s cadre, one guesses Foreign Service officers long have cringed as a duo of political hacks made a farce of the daily briefings. There was a bitter joke making the rounds: They might just start World War III with their ineptitude. Whatever Mr. Obama’s reluctance to engage Daesh in Iraq and Syria with more than a token military force — e.g., aerial bombardment, a fraction of previous Mideast campaigns, a so-called 30-member coalition that doesn’t seem to have a central command — there is an even greater failing of intellectual engagement. An analogy with The Cold War is all too obvious. Not only did the United States and its allies rise to the Soviet military threat with the North Atlantic Treaty Organization, the most successful alliance in history. But an American cultural offensive was constant through the official U.S. Information Service and semi-official organizations such as Radio Liberty, Radio Free Europe and the Congress for Cultural Freedom. The role of the U.S. Information Service libraries, for example, while difficult to quantify, was enormous as a rallying point for factual information and propaganda to answer the onslaught of Soviet lies and their repetition by followers in the West. Nor are semi-hysterical cries of Islamophobia so different from shouts of McCarthyism, which too often excused covert members of the vast Communist conspiracy. the United States not only faces the Islamic terrorists’ military threat, but propaganda waged so successfully on the social networks that it has enlisted thousands of recruits inside and outside the Middle East. That this has been accomplished despite their flagrant display of atrocities against American and foreign innocent civilians is remarkable. Just as during the Cold War, when U.S. policymakers had to cope with Europe’s neutralism, today it faces mobilizing the bulk of Muslims to stamp out terrorism in their ranks. Nor, with a traditional Islamic concept of taqiyya — the religious lie — is there all that much difference from Western Communists who kept their beliefs and activities secret. With the Soviet implosion, American activities to sell its story of freedom and prosperity dimmed. The State Department takeover of the U.S. Information Service has been a disaster. Just as immigration problems arose in part from an earlier takeover of the Consular Service, the professional diplomat appears unable to cope with the detailed special knowledge that goes with propaganda. The time has come to resurrect an independent American propaganda agency, and to encourage the Ford and Gates foundations and others with their vast financial resources to undertake private initiatives as well. There are going to be new problems, of course. It appears unlikely that the Obama administration would endorse such an initiative, so congressional leadership must move. The old fear, that government propaganda would have a blowback effect on domestic media, is even greater today with an Internet that hardly distinguishes national borders. Still, the Internet, with the help of those who know it best, must be a principle instrument of the new campaign. An America whose popular culture penetrates every corner of the globe no matter how isolated — unfortunately sometimes with negative effect — certainly has the capacity to wage a worldwide campaign to expose Islamic terrorist horror, not least to their 1.3-billion fellow Muslims. Thinking about the problem needs to begin in congressional, academic and nonprofit circles for an early implementation in a war against Islamic terrorism that shows every sign of growing with no quick victory in sight.

Lone Wolf agents gaining ability to spread terror in America. **Riedel 13**

Bruce Riedel, Director of the Intelligence project at the Brookings institution, Lone Wolf Terrorists – No Easy Catch, 4/30/13, <http://yaleglobal.yale.edu/content/lone-wolf-terrorists-no-easy-catch>

The terrible attack on the Boston Marathon is the most vivid and violent demonstration of terrorism confronting the United States and its allies today. Instead of large, complex plots hatched by organized jihadist terror gangs abroad, the new challenge is homegrown Muslim extremists who use the internet to self-radicalize and learn how to build bombs and create chaos by studying Al Qaeda texts online. Much remains unknown about the two brothers, Tamerlan and Dzhokhar Tsarnaev, who allegedly built the bombs that exploded near the finish line of the marathon and killed three and wounded more than 200 on April 15. Experience shows that it’s dangerous to draw too many conclusions about a terror plot until the investigation is finished, but a preliminary judgment or two can be made about the Boston case. The surviving terrorist, Dzhokhar, has reportedly

told investigators that he and his brother were not part of an organized terror group like Al Qaeda or a broader conspiracy in the United States and that they decided to attack the marathon only a week or so before the event. They then decided to drive to New York City and carry out another attack in Times Square as a follow-up. The police stopped them before they got out of Boston, killing Tamerlan and capturing Dzhokhar. The two reportedly learned how to build their bombs from an internet magazine produced by Al Qaeda called Inspire, the brainchild of an American citizen of Yemeni origin, Anwar al Awlaki, killed in a 2011 drone strike in Yemen. They also listened to tapes of Awlaki's sermons on jihad, available on the internet. The older brother, Tamerlan, traveled to Russia last year, and his activities there remain largely a mystery. He may have had contact with the Chechen jihadist movement which has longstanding ties to Al Qaeda and especially its leader, Ayman al Zawahiri, who traveled there in the 1990s.

Terrorist Organizations are using lone wolves to increase their sphere of terror in America.

Riedel 13

Bruce Riedel, Director of the Intelligence project at the Brookings institution, Lone Wolf Terrorists – No Easy Catch, 4/30/13, <http://yaleglobal.yale.edu/content/lone-wolf-terrorists-no-easy-catch>

Enough is not known so far, but the plot appears to involve radicalized, angry, young Muslim men who found ideological and practical advice on the internet from Al Qaeda, but don't belong to the organization. Al Qaeda will likely adopt them as "heroes" of the global jihad. They and their evil deed fit perfectly with Al Qaeda's narrative – urging Muslims around the world to kill Americans, men, women and children since 1998 and glorifying any who do so as a "knight of the prophet," fighting holy war. In the last several years Al Qaeda has publicly urged Muslims in America and other western countries to act spontaneously like the Tsarnaev brothers. The Palestinian American Army Major Nidal Malik Hassan who killed 13 of his fellow soldiers at Fort Hood, Texas, in 2009 has since been lauded by Al Qaeda for his actions and has been listed in Inspire as a role model for others. A Pakistani American, Faisal Shahzad, who put a car bomb in Times Square in May 2010 has become an Al Qaeda knight. The French Algerian Mohammed Merah who killed seven in Toulouse, France, in 2012 has also been lauded since as a jihadist star. Hassan and Shahzad have said they were inspired by Awlaki's sermons and articles to carry out their attacks.

Terrorist organizations using new techniques to influence radicalism in America.

Zalkind, 15

Susan Zalkind, freelance reporter for Boston Magazine, and Washington Post, How ISIS's 'Attack America' Plan Is Working, 6/22/15, <http://www.thedailybeast.com/articles/2015/06/22/how-isis-s-attack-america-plan-is-working.html>

Fear and concern over ISIS-inspired terrorist attacks on U.S. soil has been turned up a notch in the last few months, thanks to ISIS's thriving social-media campaign. A State

Department report released Friday officially lists the self-proclaimed Islamic State as the world's leading terror organization, citing not only the rapid advance and particular brutality of the group but also its "adroit" use of social media and ability to inspire "lone wolf" attacks. "These attacks may presage a new era in which centralized leadership of a terrorist organization matters less, group identity is more fluid, and violent extremist narratives focus on a wider range of alleged grievances and enemies with which lone actors may identify and seek to carry out self-directed attacks," according to the report. Case in point: the shootings in Garland, Texas, and their aftermath. In the past five weeks, nine young men in Garland, Boston, and most recently New York and New Jersey, have either been arrested for allegedly attempting to carry out ISIS-inspired attacks, or killed by law enforcement in a confrontation. The attack in Garland, where two men opened fire outside a Draw Muhammad contest, was the first ISIS-inspired attack launched on U.S. soil. The shooters, Elton Simpson and Nadir Soofi, only managed to superficially injure a security guard before they were killed. The reactions on social media to the Garland attack and to the arrests of individuals in other cities offers a microcosm into how ISIS's social-media campaign is operating on a grassroots level, and how law enforcement is trying to nip the epidemic in the bud. "It's like the devil sitting on their shoulders, saying 'Kill, kill, kill.'" Though Simpson tweeted at an ISIS fighter before the attack, other than loose connections on social media and alleged confessions made to law enforcement in which they revealed their intended allegiance to ISIS, none of the individuals appear to have any formal ties to the terror group. No one other than the alleged perpetrators has been killed or seriously injured. Even so, the recent activity has served to fuel ISIS's social media campaign. "It was the lack of success that inspired people," said Karen Greenberg, the director of the Center on National Security at Fordham University, explaining why the shooting riled up so many ISIS wannabes. Simpson and Soofi's death may have motivated the young men in Boston and New York to finish the job, or at least try to, she suggests.

Lone Wolves spreading terror across the entire globe. **Krauthammer 14**

Charles Krauthammer, Columnist for the Washington Post and Journalist for the New Republic, 12/18/2014, How to fight the lone wolf,
http://www.washingtonpost.com/opinions/charles-krauthammer-how-to-fight-the-lone-wolf/2014/12/18/af58fa8c-8703-11e4-9534-f79a23c40e6c_story.html

The lone wolf is the new nightmare, dramatized and amplified this week by the hostage-taking attack in Sydney. But there are two kinds of lone wolves – the crazy and the evil – and the distinction is important. The real terrorists are rational. Maj. Nidal Hasan, the Fort Hood shooter, had been functioning as an Army doctor for years. Psychotics cannot carry that off. Hasan even had a business card listing his occupation as SoA (Soldier of Allah). He then went out and, shouting "Allahu Akbar," shot dead 13 people, 12 of them fellow soldiers. To this day, Hasan speaks coherently and proudly of the massacre. That's terrorism. Sydney's Man Haron Monis, on the other hand, was a marginal, alienated Iranian immigrant with a cauldron of psychopathologies. Described by his own former lawyer as "unhinged," Monis was increasingly paranoid. He'd been charged as accessory to the murder of his ex-wife and convicted of sending threatening letters to the families of dead Australian soldiers. His religiosity was both fanatical and confused. A Shiite recently converted to Sunni Islam, his Internet postings showed not just the zeal of the

convert but a remarkable ignorance of Islam and Islamism. He even brought the wrong Islamic banner to the attack. He had to ask the authorities to provide him with an Islamic State flag.

A2: No Lone Wolves

Lone – wolf terrorist attack coming – all surveillance resources are crucial to prevent an attack

Short 5/11 – New York post staff writer

(Aaron Short, 5-11-2015, "Lone-wolf terror attack could come at any time: Homeland Security secretary," <http://nypost.com/2015/05/11/lone-wolf-terror-attack-could-come-at-any-time-homeland-security-secretary/>, Date Accessed: 6-24-2015) //NM

A lone-wolf terrorist could attack the United States at any time, Homeland Security Secretary Jeh Johnson warned Sunday. **"We're very definitely in a new phase in the global terrorist threat, where the so-called lone wolf could strike at any moment,"** Johnson told ABC's Martha Raddatz on "This Week." "It is a new environment, but we are not discouraging Americans from doing the things they do on a daily basis." **Johnson praised the FBI for stopping more than 50 Americans who tried to join the Islamic State terror group in the past two years and alerting law enforcement agencies about ISIS's reach.** But he said one of the challenges has been rebuffing ISIS's "slick" and "effective" Internet recruitment efforts. "We need to get the message out, and that's not necessarily ... a government mission," he said. **It has to come from within the community.** It has to come from Islamic leaders, who frankly can talk the language better than the federal government can." FBI Director James Comey told reporters Thursday that **he estimated ISIS has amassed thousands of online followers inside the United States. Both agencies have been working to monitor online threats to carry out attacks within the United States, and corraling Americans who attempt to fly to Syria to join terrorists.** Federal authorities increased security conditions at military bases, according to a CNN report on Friday. Johnson said the government would increase security at federal buildings as well, and called the move "self-evident." **The announcements came after two gunmen opened fire at a Texas event honoring artists who drew the Muslim Prophet Muhammad** last Sunday.

! Turns Case – Increases Surveillance

Empirically - a terror attack leads to greater surveillance, turns the aff

Tuccille 2015 (J.D. [Managing Editor, Reason.com]; What's a terrorist attack if not an excuse for domestic spying?; Jan 14; reason.com/blog/2015/01/14/whats-a-terrorist-attack-if-not-an-excuse; kdf)

Following on last week's terrorist attacks in France, the British government has dusted off a long-sought "snooper's charter"—better known as the Data Communications Bill—to ease the power of officials to track people's private communications. "It is too soon to say for certain, but it is highly probable that communications data was used in the Paris attacks to locate the suspects and establish the links between the two attacks," Home Secretary Theresa May told Parliament. "Quite simply, if we want the police and the security services to protect the public and save lives, they need this capability. You get that? There's no evidence that the bill would have prevented the Charlie Hebdo attack, but that incident is why you should pass the bill. Prime Minister David Cameron even says that messaging services that can't be intercepted should be banned. Using the latest outrage to inject new life into old security-state legislation isn't a British specialty. When the Patriot Act was introduced in 2001, then-Senator Joseph Biden boasted, "I drafted a terrorism bill after the Oklahoma City bombing. And the bill John Ashcroft sent up was my bill." This is a game in which politicians everywhere can participate. Never mind that, as Reason's Ron Bailey pointed out in November, "there is very little evidence that the Internet is making terrorism easier to do." But pretending otherwise, and passing legislation that empowers security services, lets government officials accumulate power and give the appearance of doing something when the public is frightened. Added Bailey: As [David Benson, a political scientist at the University of Chicago] argues, exaggerating the Internet's usefulness to terrorism has "egregious costs." Some officials, for example, have been calling for a "kill switch" that would allow the government to shut down the Internet in an emergency. Noting how much Americans depend upon the Net for commerce, communication, medical care, and so forth, Benson points out that "It is difficult to imagine a terrorist attack being as costly as turning off the Internet would be." **Terrorism also gives officials an excuse to tighten censorship**—especially in jurisdictions, including many democratic countries in Europe, where the whole free speech thing has relatively shallow roots. So get ready for the ride. Driven by a need to appear proactive, and a preexisting taste for accumulating power, government officials once again exploit a murderous incident to increase their authority over us. Which escalates the ongoing cold war between people who want to be left alone, and the governments that seek to control them.

! Turns Racism

Terror attacks incite racism domestically, regardless of who attacks

Akrahm and Johnson 2002 (Susan M [Associate Clinical Prof @ Boston U School of Law] and Kevin R [Associate Dean for Academic Affairs@ UC Davis, Prof of Law and Chicana/o Studies]; RACE, CIVIL RIGHTS, AND IMMIGRATION LAW AFTER SEPTEMBER 11, 2001: THE TARGETING OF ARABS AND MUSLIMS; Nov 2; www.privacysos.org/sites/all/files/akram.pdf; kdf)

Times of crisis are often accompanied by hostility toward minorities in the United States. For Arabs and Muslims, this may be even more problematic, as perpetrators of hate crimes against Arabs and Muslims frequently fail to differentiate among persons based on religion or ethnic origin, from Pakistanis, Indians, Iranians, and Japanese to Muslims, Sikhs and Christian Arabs.⁸⁹ The widespread perception in the United States is that Arabs and Muslims are identical and eager to wage a holy war against the United States.⁹⁰ In fact, according to a 1993 report, only 12% of the Muslims in the United States at that time were Arab,⁹¹ and Arab Muslims are even a minority in the Arab-American community.⁹² Although there are Muslim “extremists,” the majority of Muslims are “decent, law-abiding, productive citizens.”⁹³ Because of the lack of differentiation between different types of Arabs and Muslims, terrorist acts by small groups of Arabs and Muslims often have been followed by generalized hostility toward entire communities of Arabs and Muslims in the United States. For example, after Lebanese Shi’a gunmen in 1985 hijacked TWA Flight 847 to Beirut, beat an American on the plane to death, and held the remaining passengers hostage for over two weeks,⁹⁴ violent attacks against persons of Arab and Muslim origin occurred across the United States.⁹⁵ Islamic centers and Arab-American organizations were vandalized and threatened. A Houston mosque was firebombed. A bomb exploded in the American-Arab Anti-Discrimination Committee office in Boston, severely injuring two policemen.⁹⁶ Later that same year, after terrorists hijacked the Achille Lauro cruise liner and murdered a passenger, a wave of anti-Arab violence swept the country, including the bombing of an American Arab Anti-Discrimination Committee office that killed its regional executive director.⁹⁷ In 1986, in apparent response to the Reagan Administration’s “war on terrorism” directed at Libya,⁹⁸ another episode of anti-Arab harassment and violence broke out. The same night of a U.S. bombing raid on Libya, the American-Arab Anti-Discrimination Committee national office in Washington received threats. Shortly thereafter, the Detroit American-Arab Anti-Discrimination Committee office, the Dearborn Arab community center, and the Detroit Arab-American newspaper received bomb threats.⁹⁹ Threats, beatings and other violent attacks on Arabs were reported across the United States.¹⁰⁰ At this time, someone broke into a Palestinian family’s home, set off a smoke bomb inside the house, and painted slogans such as “Go Back to Libya” on the walls.¹⁰¹ The Gulf War intensified anti-Arab hostility in the United States. The American-Arab Anti-Discrimination Committee reported four anti-Arab hate crimes for 1990 before the invasion of Kuwait in August.¹⁰² Between the invasion and February 1991, the Committee reported 175 incidents.¹⁰³ When U.S. intervention commenced in January 1991, Arab and Muslim businesses and community organizations were bombed, vandalized, and subjected to harassment.¹⁰⁴

! Turns Economy

Crushes the economy

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. Javed Younasis Associate Professor of Economics at the American University of Sharjah, United Arab Emirates. "The Toll of Terrorism" <http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm>

modified for ableist language

New technology has lowered transportation costs and increased trade and capital flows across nations. But the same technology that has fostered international economic growth has also allowed terrorism to spread easily among countries whose interests are tightly interwoven. Terrorism is no longer solely a local issue. Terrorists can strike from thousands of miles away and cause vast destruction. The effects of terrorism can be terrifyingly direct. People are kidnapped or killed. Pipelines are sabotaged. Bombers strike markets, buses, and restaurants with devastating effect. But terrorism inflicts more than human casualties and material losses. It can also cause serious indirect harm to countries and economies by increasing the costs of economic transactions—for example, because of enhanced security measures to ensure the safety of employees and customers or higher insurance premiums. Terrorist attacks in Yemen on the USS Cole in 2000 and on the French tanker Limburg in 2002 seriously damaged that country's shipping industry. These attacks contributed to a 300 percent rise in insurance premiums for ships using that route and led ships to bypass Yemen entirely (Enders and Sandler, 2012). In this article we explore the economic burden of terrorism. It can take myriad forms, but we focus on three: national income losses and growth-[slowing]^{retarding} effects, dampened foreign direct investment, and disparate effects on international trade.

Domestic Terrorism deters FDI – even small attacks crush investor confidence

Bandyopadhyay et al 15 -- Subhayu Bandyopadhyay is Research Officer at the Federal Reserve Bank of St. Louis and Research Fellow at IZA, Bonn, Germany. Todd Sandler is Vibhooti Shukla Professor of Economics and Political Economy at the University of Texas at Dallas. Javed Younasis Associate Professor of Economics at the American University of Sharjah, United Arab Emirates. "The Toll of Terrorism" <http://www.imf.org/external/pubs/ft/fandd/2015/06/bandyopa.htm>

Scaring off investors Increased terrorism in a particular area tends to depress the expected return on capital invested there, which shifts investment elsewhere. This reduces the stock of productive capital and the flow of productivity-enhancing technology to the affected nation. For example, from the mid-1970s through 1991, terrorist incidents reduced net foreign direct investment in Spain by 13.5 percent and in Greece by 11.9 percent (Enders and Sandler, 1996). In fact, the initial loss of productive resources as a result of terrorism may increase manifold because potential foreign investors shift their investments to other, presumably safer, destinations. Abadie and Gardeazabal (2008) showed that a relatively small increase in the perceived risk of terrorism can cause an outsized reduction in a country's net stock of foreign direct investment and inflict significant damage on its economy. We analyzed 78 developing economies over the period 1984–2008 (Bandyopadhyay, Sandler, and Younas, 2014) and found that on average a relatively small increase in a country's domestic terrorist incidents per 100,000 persons sharply reduced net foreign direct investment. There was a similarly large reduction in net investment if the terrorist incidents originated abroad or involved foreigners or foreign assets in the attacked country. We also found that greater official aid flows can substantially offset the damage to foreign direct investment—perhaps in part because the increased aid allows recipient nations to invest in more effective counterterrorism efforts. Most countries that experienced above-average domestic or transnational terrorist incidents during 1970–2011 received less foreign direct investment or foreign aid than the average among the 122 in the sample (see table). It is difficult to assess causation, but the table suggests a troubling association between terrorism and depressed aid and foreign direct investment, both of which are crucial for developing economies. It is generally believed that there are higher risks in trading with a nation afflicted by terrorism, which cause an increase in transaction costs and tend to reduce trade. For example, after the September 11 attacks on New York City and the Washington, D.C., area, the U.S. border was temporarily closed, holding up truck traffic between the United States and Canada for an extended time. Nitsch and Schumacher (2004) analyzed a sample of 200 countries over the period 1960–93 and found that when terrorism incidents in a pair of trading countries double in one year, trade between them falls by about 4 percent that same year. They also found that when one of two trading partners suffers at least one terrorist attack, it reduces trade between them to 91 percent of what it would be in the

absence of terrorism. Blomberg and Hess (2006) estimated that terrorism and other internal and external conflicts retard trade as much as a 30 percent tariff. More specifically, they found that any trading partner that experienced terrorism experienced close to a 4 percent reduction in bilateral trade. But Egger and Gassebner (2015) found more modest trade effects. Terrorism had few to no short-term effects; it was significant over the medium term, which they defined as “more than one and a half years after an attack/incident.” Abstracting from the impact of transaction costs from terrorism, Bandyopadhyay and Sandler (2014b) found that terrorism may not necessarily reduce trade, because resources can be reallocated. If terrorism disproportionately harmed one productive resource (say land) relative to another (say labor), then resources would flow to the labor-intensive sector. If a country exported labor-intensive goods, such as textiles, terrorism could actually lead to increased production and exportation. In other words, although terrorism may reduce trade in a particular product because it increases transaction costs, its ultimate impact may be either to raise or reduce overall trade. These apparently contradictory empirical and theoretical findings present rich prospects for future study. Of course terrorism has repercussions beyond human and material destruction and the economic effects discussed in this article. Terrorism also influences immigration and immigration policy. The traditional gains and losses from the international movement of labor may be magnified by national security considerations rooted in a terrorism response. For example, a recent study by Bandyopadhyay and Sandler (2014a) focused on a terrorist organization based in a developing country. It showed that the immigration policy of the developed country targeted by the terrorist group can be critical to containing transnational terrorism. Transnational terrorism targeted at well-protected developed countries tends to be more skill intensive: it takes a relatively sophisticated terrorist to plan and successfully execute such an attack. Immigration policies that attract highly skilled people to developed countries can drain the pool of highly skilled terrorist recruits and may cut down on transnational terrorism. ■

FDI competitiveness is vital to sustained economic recovery

Kornecki '13 [L. PhD in Economics, Prof Embry-Riddle Aeronautical University's College of Business. “Inward FDI in the United States and its policy context” Columbia FDI Profiles, 2/4/13
http://www.vcc.columbia.edu/files/vale/documents/US_IFDI_-_FINAL_-_REVISED_Feb_4_2013.pdf]

Inward foreign direct investment (**IFDI**) represents **an integral part of the** United States (U.S.) **economy, with** its stock growing from US\$ 83 billion in 1980 to US\$ **3.5 trillion** in 2011. **The United States**, which had earlier been primarily a home for multinational enterprises (MNEs) rather than a host for affiliates of foreign MNEs, has become a preferred host country for FDI since the 1980s. Foreign **MNEs have contributed robust flows of FDI into diverse industries** of the U.S. economy, and total FDI inflows reached US\$ 227 billion in 2011, **equivalent to 15% of global inflows**, the single largest share of any economy. Inflows of **FDI**, with a peak of US\$ 314 billion in 2000 and another of US\$ 306 billion in 2008, **have been an important factor contributing to sustained economic growth** in the United States. The recent financial and economic crises negatively impacted FDI flows to the United States and opened a period of major uncertainty. **The effectiveness of government policy responses at both the national and international levels in addressing the financial crisis and its economic consequences will play a crucial role** for creating favorable conditions for a rebound in FDI inflows. **Inward foreign direct investment is an essential component of the U.S. economy, contributing to production, exports and high-paying jobs for the country's workers.** As the world's largest economy, **the United States is well positioned to participate in the increasingly competitive international environment for FDI** that has emerged as both advanced and developing economies have recognized the value of such investment. **The U.S. hosts the largest stock of IFDI among the world's economies and continues to be at the top as a destination for inward FDI flows.**

A2: Counter-Terror Solves Lone Wolf

United States currently not equipped to handle lone wolf terrorism

Callahan 11 (Rick Callahan, columnist for the Seattle Times, 9/11 panel: US remains vulnerable to 'lone wolf', 9/15/11, <http://www.seattletimes.com/nation-world/9-11-panel-us-remains-vulnerable-to-lone-wolf/>)

Former members of the 9/11 commission warned Thursday that despite efforts during the last decade to make American cities safer from terrorist attacks, the U.S. has failed to protect itself in at least three key areas and remains vulnerable to cyberterrorism and "lone wolf" terrorists. Committee members said the U.S. must develop better bomb detection technology, has not adequately improved radio equipment to allow police and fire departments nationwide to better communicate and has yet to develop a national identification card that could add another barrier to terrorists trying to slip into the country. Former Illinois Gov. James Thompson said he worries that terrorists from afar could hack into computers, crippling banks, businesses and key utilities while throwing the nation into disarray. "You read stories day after day about some 18-year-old Romanian hacker getting in and playing havoc with banks, public offices, so think about what some of the rogue state actors might be doing," Thompson said.

*Cyberterror 2NC/1NR

Increased restrictions on domestic surveillance causes terrorist attacks on critical infrastructure – NSA key Goldsmith 13

Jack Goldsmith, a contributing editor, teaches at Harvard Law School and is a member of the Hoover Institution Task Force on National Security and Law, 10-10-13, We Need an Invasive NSA, The New Republic, <http://www.newrepublic.com/article/115002/invasive-nsa-will-protect-us-cyber-attacks>

Ever since stories about the National Security Agency's (NSA) electronic intelligence-gathering capabilities began tumbling out last June, The New York Times has published more than a dozen editorials excoriating the "national surveillance state." It wants the NSA to end the "mass warehousing of everyone's data" and the use of "back doors" to break encrypted communications. A major element of the Times' critique is that the NSA's domestic sweeps are not justified by the terrorist threat they aim to prevent. At the end of August, in the midst of the Times' assault on the NSA, the newspaper suffered what it described as a "malicious external attack" on its domain name registrar at the hands of the Syrian Electronic Army, a group of hackers who support Syrian President Bashar Al Assad. The paper's website was down for several hours and, for some people, much longer. "In terms of the sophistication of the attack, this is a big deal," said Marc Frons, the Times' chief information officer. Ten months earlier, hackers stole the corporate passwords for every employee at the Times, accessed the computers of 53 employees, and breached the e-mail accounts of two reporters who cover China. "We brought in the FBI, and the FBI said this had all the hallmarks of hacking by the Chinese military," Frons said at the time. He also acknowledged that the hackers were in the Times system on election night in 2012 and could have "wreaked havoc" on its coverage if they wanted. Such cyber-intrusions threaten corporate America and the U.S. government every day. "Relentless assaults on America's computer networks by China and other foreign governments, hackers and criminals have created an urgent need for safeguards to protect these vital systems," the Times editorial page noted last year while supporting legislation encouraging the private sector to share cybersecurity information with the government. It cited General Keith Alexander, the director of the NSA, who had noted a 17-fold increase in cyber-intrusions on critical infrastructure from 2009 to 2011 and who described the losses in the United States from cyber-theft as "the greatest transfer of wealth in history." If a "catastrophic cyber-attack occurs," the Times concluded, "Americans will be justified in asking why their lawmakers ... failed to protect them." The Times editorial board is quite right about the seriousness of the cyber- threat and the federal government's responsibility to redress it. What it does not appear to realize is the connection between the domestic NSA surveillance it detests and the governmental assistance with cybersecurity it cherishes. To keep our computer and telecommunication networks secure, the government will eventually need to monitor and collect intelligence on those networks using techniques similar to ones the Times and many others find reprehensible when done for counterterrorism ends. The fate of domestic surveillance is today being fought around the topic of whether it is needed to stop Al Qaeda from blowing things up. But the fight tomorrow, and the more important fight, will be about whether it is necessary to protect our ways of life embedded in computer networks. Anyone anywhere with a connection to the Internet can engage in cyber-operations within the United States. Most truly harmful cyber-operations, however, require group effort and significant skill. The attacking group or nation must have clever hackers, significant computing power, and the sophisticated software—known as "malware"—that enables the monitoring, exfiltration, or destruction of information inside a computer. The supply of all of these resources has been growing fast for many years—in governmental labs devoted to developing

these tools and on sprawling black markets on the Internet.¶ Telecommunication networks are the channels through which malware typically travels, often anonymized or encrypted, and buried in the billions of communications that traverse the globe each day. The targets are the communications networks themselves as well as the computers they connect—things like the Times’ servers, the computer systems that monitor nuclear plants, classified documents on computers in the Pentagon, the nasdaq exchange, your local bank, and your social-network providers.¶ To keep these computers and networks secure, the government needs powerful intelligence capabilities abroad so that it can learn about planned cyber-intrusions. It also needs to raise defenses at home. An important first step is to correct the market failures that plague cybersecurity. Through law or regulation, the government must improve incentives for individuals to use security software, for private firms to harden their defenses and share information with one another, and for Internet service providers to crack down on the botnets—networks of compromised zombie computers—that underlie many cyber-attacks. More, too, must be done to prevent insider threats like Edward Snowden’s, and to control the stealth introduction of vulnerabilities during the manufacture of computer components—vulnerabilities that can later be used as windows for cyber-attacks.¶ And yet that’s still not enough. The U.S. government can fully monitor air, space, and sea for potential attacks from abroad. But it has limited access to the channels of cyber-attack and cyber-theft, because they are owned by private telecommunication firms, and because Congress strictly limits government access to private communications. “I can’t defend the country until I’m into all the networks,” General Alexander reportedly told senior government officials a few months ago.¶ For Alexander, being in the network means having government computers scan the content and metadata of Internet communications in the United States and store some of these communications for extended periods. Such access, he thinks, will give the government a fighting chance to find the needle of known malware in the haystack of communications so that it can block or degrade the attack or exploitation. It will also allow it to discern patterns of malicious activity in the swarm of communications, even when it doesn’t possess the malware’s signature. And it will better enable the government to trace back an attack’s trajectory so that it can discover the identity and geographical origin of the threat.¶ Alexander’s domestic cybersecurity plans look like pumped-up versions of the NSA’s counterterrorism-related homeland surveillance that has sparked so much controversy in recent months. That is why so many people in Washington think that Alexander’s vision has “virtually no chance of moving forward,” as the Times recently reported. “Whatever trust was there is now gone,” a senior intelligence official told Times.¶

Impact is heg, the economy, food prices, energy shocks, nuclear melt downs, and chemical industry

Sebastian 09

(Rohan,- research for the office of Virginia Senator Mark Warner CS Computer Science from UVA, 6-24 “The Federal Government’s Role in Preserving Cybersecurity for Critical Infrastructure”)

The intersection of critical infrastructure and cyberspace has presented many challenges to policymakers.

Critical infrastructure includes areas like the water and food supply, telecommunications, nuclear power, transportation, banking, and energy---areas crucial to the functioning of society. Eighty percent of this critical infrastructure is owned by the private sector. The continual delegation of control of critical infrastructure to cyberspace without regard to security has posed many vulnerabilities that malicious actors could exploit. To address these vulnerabilities, policymakers can utilize three options: strengthening partnerships between the public and private sectors, installing a White House official to deal solely with cyber security issues, and encouraging collaboration between critical infrastructure operators for coordinating best practices and crisis management. In conclusion, this analysis recommends that the federal government follow a course incorporating all three options because the effects could be mutually reinforcing. A long term solution to cybersecurity must take note of the private sector’s insight to be successful; a national dialogue on the importance of cyber security needs to take its cue from the White House; in the meanwhile, proprietors of critical infrastructure should ensure that they can reduce the damage caused by disasters or attacks by establishing clear lines of communication. [End of Abstract – Start of Intro] Critical Infrastructure Government and the private sector have reaped digital networking’s benefits by

using computer networks to control vital parts of critical infrastructure from cyberspace. However, remote access to critical infrastructure from cyberspace has placed these systems at risk of destruction by other countries, malicious actors, or terrorists. This analysis proposes three options that the federal government can implement: strengthening partnerships between the public and private sectors, integrating resources under a White House official, and increasing collaboration between levels of critical infrastructure. After scrutinizing these options under the criteria of political feasibility, industry acceptance, and efficacy, this analysis recommends that the federal government pursue a combination of all three policy options. Critical infrastructure includes areas such as transportation, water supplies, public health, telecommunications, energy, banking and finance, emergency and information services, nuclear facilities, food supplies, and defense and chemical industries (Moteff & Parfomak, 2004). According to the Department of Homeland Security's National Strategy for Homeland Security, critical infrastructure consists of "assets, systems, and networks, whether physical or virtual, so vital to the United States that their incapacitation or destruction would have a debilitating effect on security, national economic security, public health or safety, or any combination thereof" (Homeland Security Council, 2007). Figure 1 illustrates the myriad of infrastructures and their interdependencies with one another. Simply put, critical infrastructures comprise the foundation for the modern economy and national security, so the federal government shares responsibility for protecting them. However, the government rests in a precarious position because the private sector owns about eighty percent of critical infrastructure (Forest, 2006, p. 78). Furthermore, about eighty percent of all American commerce occurs on privately owned telecommunications networks, primarily the Internet (Theohary, 2009, p. 20). Even the most valuable national defense systems rely on privately owned telecommunications networks (National Security Agency, 2009). As digital networking proliferates through society, builders will delegate control of more and more parts of critical infrastructure to the realm of cyberspace. In fact, every piece of software added to a system expands the "attack surface" accessible to external actors (Welander, 2009, p. 42). Therefore, cybersecurity is necessary to safeguard this infrastructure. The Need for Cybersecurity Proprietors often control critical infrastructure from cyberspace. According to the National Security Presidential Directive 54 and Homeland Security Presidential Directive 23 issued by the George W. Bush Administration, cyberspace consists of the "interdependent network of information technology infrastructures, and includes the Internet, telecommunications networks, computer systems, and embedded processors and controllers in critical industries" (as cited in National Cyber Security Center, 2009, p. 11). The intersection of critical infrastructure and cyberspace means that policymakers should strive to establish security while retaining a relatively open cyberspace. Several government officials have emphasized the catastrophic effects of compromised cybersecurity. Paul Kurtz, an advisor on President Obama's transition team, warned of a "cyber Katrina," a cataclysm in which government agencies would fail to coordinate after a cyber attack and would subsequently collapse (Epstein, 2009). Mike McConnell, a former director of both the National Security Agency and National Intelligence, declared that if the September 11th, 2001, hijackers had launched a focused attack on an American bank, the economic ramifications would have been of "an order of magnitude greater" than the destruction of the World Trade Center (Harris, 2008). Former cyber security advisor Richard Clarke, who served in the Clinton and Bush Administrations, asserted that the primary target for a terrorist's cyber attack would be the economy whereas casualties and chaos would be secondary (as cited in Rollins & Wilson, 2007, p. 3). In fact, Director of National Intelligence Dennis Blair stated that cyber attacks against financial sectors and physical infrastructure could "severely impact the national economy" and disturb energy sources like oil and electricity for an indefinite period (Annual Threat Assessment, 2009). Beyond threatening the private sector, intruders have been specifically targeting the federal government's information technology infrastructure. A report by the International Business Machines Corporation revealed that of the 237 million security attacks carried out in the first half of 2005, more than twenty-two percent, the highest percentage against any given group, aimed for government agencies (Fitzgerald, 2006, p. 57). Between 2008 and March 2009, the number of attacks against federal computer networks swelled about forty percent (Smith, 2009). The Department of Defense dubbed the military's electronic information infrastructure the American military's "Achilles' heel" (Defense Science Board, 2008). Though these assorted officials would concur on the gravity of cybersecurity, they might dissent on the correct policy solution. As the White House's Cyberspace Policy Review pointed out, cyberspace policy envelops the following: security of and operations in cyberspace,....the full range of threat reduction, vulnerability reduction, deterrence, international engagement, incident response, resiliency, and recovery policies and activities, including computer network operations, information assurance, law enforcement, diplomacy, military, and intelligence missions as they relate to the security and stability of the global information and communications infrastructure (National Cyber Security Center, 2009, p. 5). This analysis will lay out three policy options to address these issues. Strengthening Partnerships between the Public and Private Sectors Any kind of long term solution to

cybersecurity threats must consider the private sector since it owns about eighty percent of the nation's critical infrastructure. Legislators cannot expect a law ignoring the private sector's input to succeed because business's efforts will ultimately determine effective cybersecurity policies. Thus, the government can continue encouraging the deepening of relationships with the private sector. Advocating a redefinition of government's relationship to the software business, General James Cartwright stated that government should treat "cyber security as a weapon system" (Rutherford, 2008). A paradigm shift to Gen. Cartwright's mindset would be favorable for government and business because the public sector widely uses private sector products. The Department of Defense, in particular, uses "Commercial-Off-the-Shelf" products since these packages are cheaper and more innovative than a government established standard. Communication between government and the private sector would be helpful for alleviating situations involving systemic software threats. For example, the Microsoft Windows operating system runs on "ninety-five percent of personal computers worldwide," so hackers often exploit its vulnerabilities. In 2003, the Blaster worm infected "some 400,000 host PCs" in a single day. Microsoft responded by permitting "several governments across the world to take a peek at the precious Windows source code" for input and disclosure (Taylor, 2003). Thus, government benefitted by receiving insight into the potential problems the Blaster worm posed; business benefitted by receiving the government's assistance with this problem. A number of forums already exist to serve as models for more formal mechanisms of public-private communication. Microsoft created a Security Response Center that works with the Department of Defense to secure its products (Information Technology in the 21st Century Battlespace, 2003). Learning from Carnegie Mellon University's public-private alliance model, the Department of Homeland Security in 2003 founded the United States-Computer Emergency Readiness Team, a group of government and industry experts compiling software vulnerabilities (Barnes, 2004, p. 327). Similarly, the Protected Critical Infrastructure Information Program in the Department of Homeland Security represents the federal government's first ever mechanism to collect and analyze data from private companies without fear of releasing that data to the public by the Freedom of Information Act (Grubestic & Murray, 2006, p. 65). In response to the government's creation of federal agencies like the Critical Infrastructure Assurance Office and National Infrastructure Protection Center in 1998, industry responded with the creation of the Partnership for Critical Infrastructure Security as well as the generation of Information Sharing Analysis Centers (Michel-Kerjan, 2003, p. 136). Industry agents staff these Centers, which specialize in areas like telecommunications, electricity, and finance (Michel-Kerjan, 2003, p. 136). This analysis evaluates this option under the aforementioned criteria. Industry acceptance and political obstacles could obstruct the way to success. Politically, the Freedom of Information Act, which could force the disclosure of details of infrastructure weaknesses to the public, may make private companies apprehensive about sharing their data with the government. Laws like the Critical Infrastructure Information Act of 2002 protect the private sector from such disclosures, but companies may be reluctant nonetheless (Pozen, 2005, p. 678). Industry acceptance also affects this option's efficacy. There are currently federal organizations like the United States-Computer Emergency Readiness Team bridging the communication gap between the public and private sectors, but only serious attention to these programs by both parties will evoke substantive results. Companies confront a tradeoff between security and efficiency as well as transparency and customer satisfaction. Noting this trend, Clay Wilson addressed studies revealing a low rate of cybercrime incident reporting because companies fear consumer backlash from "negative publicity" (Wilson, 2009, p. 24). According to a study conducted among Fortune 1000 companies, one of the most trenchant effects of compromised cyber security is damage to 6 reputation among consumers (Hansen, 2001, p. 1161). This option's effectiveness is directly tied to political feasibility and industry acceptance.

Meltdowns independently cause extinction

Lendman 11

Research Associate of the Centre for Research on Globalization (Stephen, 03/13, "Nuclear Meltdown in Japan," <http://www.thepeoplesvoice.org/TPV3/Voices.php/2011/03/13/nuclear-meltdown-in-japan>)

Reuters said the 1995 Kobe quake caused \$100 billion in damage, up to then the most costly ever natural disaster. This time, from quake and tsunami damage alone, that figure will be dwarfed. Moreover, under a worst case core meltdown, all bets are off as the entire region and beyond will be threatened with permanent contamination, making the most affected areas unsafe to live in. On March 12, Stratfor Global Intelligence issued a "Red Alert: Nuclear Meltdown at Quake-Damaged Japanese Plant," saying: Fukushima Daiichi "nuclear power plant in Okuma, Japan, appears to have caused a reactor meltdown." Stratfor downplayed its seriousness, adding that such an event "does not necessarily mean a nuclear disaster," that already may have happened - the ultimate nightmare short of nuclear winter. According to Stratfor, "(A)s long as the reactor core, which is specifically designed to contain high levels of heat, pressure and radiation, remains intact, the melted fuel can be dealt with. If the (core's) breached but the containment facility built around (it) remains intact, the melted fuel can be...entombed within specialized concrete" as at Chernobyl in 1986. In fact, that disaster killed nearly one million people worldwide from nuclear radiation exposure. In their book titled, "Chernobyl: Consequences of the Catastrophe for People and the Environment," Alexey Yablokov, Vassily

Nesterenko and Alexey Nesterenko said: "For the past 23 years, it has been clear that there is a danger greater than nuclear weapons concealed within nuclear power. Emissions from this one reactor exceeded a hundred-fold the radioactive contamination of the bombs dropped on Hiroshima and Nagasaki." "No citizen of any country can be assured that he or she can be protected from radioactive contamination. One nuclear reactor can pollute half the globe. Chernobyl fallout covers the entire Northern Hemisphere." Stratfor explained that if Fukushima's floor cracked, "it is highly likely that the melting fuel will burn through (its) containment system and enter the ground. This has never happened before," at least not reported. If now occurring, "containment goes from being merely dangerous, time consuming and expensive to nearly impossible," making the quake, aftershocks, and tsunamis seem mild by comparison. Potentially, millions of lives will be jeopardized. Japanese officials said Fukushima's reactor container wasn't breached. Stratfor and others said it was, making the potential calamity far worse than reported. Japan's Nuclear and Industrial Safety Agency (NISA) said the explosion at Fukushima's Daiichi No. 1 facility could only have been caused by a core meltdown. In fact, 3 or more reactors are affected or at risk. Events are fluid and developing, but remain very serious. The possibility of an extreme catastrophe can't be discounted. Moreover, independent nuclear safety analyst John Large told Al Jazeera that by venting radioactive steam from the inner reactor to the outer dome, a reaction may have occurred, causing the explosion. "When I look at the size of the explosion," he said, "it is my opinion that there could be a very large leak (because) fuel continues to generate heat." Already, Fukushima way exceeds Three Mile Island that experienced a partial core meltdown in Unit 2. Finally it was brought under control, but coverup and denial concealed full details until much later. According to anti-nuclear activist Harvey Wasserman, Japan's quake fallout may cause nuclear disaster, saying: "This is a very serious situation. If the cooling system fails (apparently it has at two or more plants), the super-heated radioactive fuel rods will melt, and (if so) you could conceivably have an explosion," that, in fact, occurred. As a result, massive radiation releases may follow, impacting the entire region. "It could be, literally, an apocalyptic event."

2NC Impact Wall (ONLY READ IF 1NC IMPACT)

Devastating cyber attacks on nation's critical infrastructure coming now- destroys food supply- triggers WW3 as countries fight over remaining food supply- draws in all major powers and escalates to nuclear use. Most probably and on brink- Wilhusen study shows cyber attacks have increased by 650% in the past 5 years and we're being attacked every day.

And—

a) Food shortages lead to World War III

Calvin 98

William Calvin, theoretical neurophysiologist at the University of Washington, Atlantic Monthly, January, The Great Climate Flip-Flop, Vol 281, No. 1, 1998, p. 47-64)

The population-crash scenario is surely the most appalling. **Plummeting crop yields would cause some powerful countries to try to take over their neighbors or distant lands -- if only because their armies, unpaid and lacking food, would go marauding, both at home and across the borders. The better-organized countries would attempt to use their armies, before they fell apart entirely, to take over countries with significant remaining resources, driving out or starving their inhabitants if not using modern weapons to accomplish the same end: eliminating competitors for the remaining food. This would be a worldwide problem -- and could lead to a Third World War --**

but Europe's vulnerability is particularly easy to analyze. The last abrupt cooling, the Younger Dryas, drastically altered Europe's climate as far east as Ukraine. Present-day Europe has more than 650 million people. It has excellent soils, and largely grows its own food. It could no longer do so if it lost the extra warming from the North Atlantic.

b) Competitive chemical industry solves extinction

ICCA 2

(International Council of Chemical Associations), June 20, "SUSTAINABLE DEVELOPMENT AND THE CHEMICAL INDUSTRY," online: http://www.cefic.be/position/icca/pp_ico10.htm

The key finding of "Our Common Future", (the 1987 report of the United Nations' World Commission on Environment and Development), is that **environmental, economic and social concerns must be integrated if the world's peoples are to advance and develop without jeopardizing the natural environment on which all life depends.** Although today we cannot define the needs of future generations, **the challenge for today's leaders is to pursue policies that will leave available an array of choices for future generations to meet their own needs.** Sustainable Development will only come about if three goals - economic, environmental and society-related - can be reconciled. To determine the limits of acceptability and scope for action requires a set of conventions which society at large accepts as valid. Sustainability in economic terms means the efficient management of scarce resources as well as a prospering industry and economy. **Sustainability in the environmental sense means not placing an intolerable load on the ecosphere and maintaining the natural basis for life.** Seen from society's viewpoint, **sustainability means that human beings are the centre of concern.** In view, particularly, of the population increase worldwide, there needs to be provided as large a measure of equal opportunities, freedom, social justice and security as possible. The chemical industry views Sustainable Development as a challenge put before all parts of society. In the advances made in its own operations, its improved performance and **in the improvements**

to the human condition made through its products, the chemical industry sees cause for optimism and believes that Sustainable Development can be the intellectual framework around which the chemical industry, other industries and other sectors of society can reach consensus on how to improve living standards and the environment. The main challenges facing the world include:- * Optimizing the benefits obtained from depleting resources * Assuring against excessive strains placed on the eco-system * The dynamic growth of the world population * Remedying social and economic inequalities These are challenges on a global scale. It follows, therefore, that the attainment of Sustainable Development will call for action on the part of the people, governments, businesses and organisations around the world. The global chemical industry has realized this challenge. CONTRIBUTION OF THE CHEMICAL

INDUSTRY TO SUSTAINABLE DEVELOPMENT The chemical industry is a key industry. Its products and services are instrumental in meeting the needs of mankind. It is present in all areas of life, from food and clothing, housing, communications, transport - right through to leisure activities. In addition, it helps to solve the problems of other sectors of industry, such as the energy sector, information technologies, environmental industries and the waste disposal sector, as examples. Due to its size, the chemical industry is an important supplier to a broad range of downstream industries and is, as well, a customer of a broad range of products and services from other industries. It follows, therefore, that the chemical industry plays a major role in providing/ supporting performance improvements, research and development progress and, last but not least, employment in other industries. In itself, it is a large-scale provider of jobs and makes a significant contribution to wealth creation and, hence, to the financing of both public works and the exercise of public responsibilities. Since living standards are determined to a large degree by material considerations, it is clear that the chemical industry with its unique capabilities is in a position to make a decisive contribution to Sustainable Development.

Commitment by the world chemical industry to the concept of Sustainable Development requires words to be transposed into company-specific action programmes in order to provide a framework for all those working in the sector. Its "Responsible Care" initiative, self-monitoring systems and other voluntary programmes such as Sustainable Technology (SUSTECH), Education-Industry Partnerships, Energy Efficiency Programmes are also part of this framework. Thereby, companies are also confronted with new challenges and must act responsibly. They must take account of the consequences of their actions upon society and future generations. The global chemical industry believes that the key to improving the performance of the industry is both its commitment to achieving environmentally sound Sustainable Development and improved performance and transparency. Under the concept of "Responsible Care", chemical companies are committed, in all aspects of safety, health and protection of the environment, to seek continuous improvement in performance, to educate all staff and work with customers and communities regarding product use and overall operation. Through these efforts the industry is improving its efficiency, reducing risks to health and the environment and making better products which, in turn, help individual and industry customers.

THE CHEMICAL INDUSTRY'S LEADERSHIP IN INNOVATION The very notion of Sustainable Development will require new approaches in a number of areas. Innovation at all levels and in all fields of activity is the most effective instrument for ensuring that the economic, and environmental goals, as well as those of society, are being advanced. The chemical industry's contribution is to continue innovation of new products that meet customer needs and manufacturing processes that reduce risks to health and the environment. This contribution is based upon the knowledge and experience the industry has acquired from applying innovation not only to making, handling and use of chemical compounds, but also to reprocessing, recycling and solving environmental problems. The challenge facing the chemical industry is to maximize innovation, which can contribute to society meeting its goals for Sustainable Development. The chemical industry is firmly convinced that leadership in innovation represents the best way of attaining Sustainable Development. For the individual company, this means:- * a consistent orientation towards products, technologies and solutions which offer the greatest promise for the future * development of new integrated environmental technologies * a close cooperation with the customers of the chemical industry * adaptation to the conditions of global competition * bringing the most promising products quickly on the market * strengthening the R&D effort which requires resources which can only be financed from profitable earnings * actively contributing ideas and suggestions to the policy debates taking place in society * improving process yield (efficiency). APPROACH TO THE ECONOMIC GOAL OF SUSTAINABLE DEVELOPMENT The internationalization of the economy at large, in conjunction with a growing trend towards global competition, is becoming more and more apparent. This is being manifested by:- * an increase of imports and exports of goods as well as services * growing outward and inward flows of direct investment * an ever increasing exchange of technology transfers * globalization of monetary and financial schemes. The inter-relation of economic systems

is complex, with a variety of relationships among countries. Multi-national chemical companies apply common standards in spreading investment capital and stimulating markets around the globe, thus setting the scene for the world market. What they need, in order to play a constructive role in Sustainable Development, is, first and foremost, freedom and fairness in international trade. Trade as an engine of economic growth is essential for Sustainable Development. A climate needs to be fostered within which such growth may take place on the basis of a clear set of rules with predictable consequences, by which investors may be guided in their long-term decision-making process. This includes bringing to a halt the growing intervention by governments in industry and their ever increasing demands to raise income by taxation, thus imposing a disproportionate load on the business community. Wealth creation and profits are fundamental to Sustainable Development. They sustain economies (not just the chemical industry), and contribute, via re-investment and R&D, to new technologies and environmental improvements. Profits are needed to create flexible company structures oriented towards economic, environmental and society-related requirements. The chemical industry is a major industrial sector and an essential contributor to welfare and employment on a global scale. In order to maintain this position under the imperative of Sustainable Development, the long-term future of the industry must be rooted in a dynamic policy, whereby continual innovation and re-engineering of companies result in an increase of productivity and, thus, keeping up international competitiveness as a pre-requisite of sustainable job creation.

c) Water scarcity will be the source of all future conflicts Solomon '11

Steven, writer for the NYT, Business Week, Forbes, Esquire, Commentator for NPR's Marketplace, also author of "The Confidence Game" 1995, warning of the dangers of global financial instability, "Water: The Epic Struggle for Wealth, Power, and Civilization," p. 4 google books

Every era has been shaped by its response to the great water challenge of its time. And so it is unfolding—on an epic scale—today. An impending global crisis of freshwater scarcity is fast emerging as a defining fulcrum of world politics and human civilization. For the first time in history, modern society's unquenchable thirst, industrial technological capabilities, and sheer population growth from 6 to 9 billion is significantly outstripping the sustainable supply of fresh, clean water available from nature using current practices and technologies. Previously, man's impact on ecosystems had been localized and modest. Across heavily populated parts of the planet today, much of the rivers, lakes, and groundwater on which growing societies depend are becoming dangerously depleted by overuse and pollution. As a result, an explosive new political fault line is erupting across the global landscape of the twenty-first century between water Haves and water Have-Nots: internationally among regions and states, but just as significantly within nations among domestic interest groups that have long competed over available water resources. Simply, water is surpassing oil itself as the world's scarcest critical resource. Just as oil conflicts were central to twentieth-century history, the struggle over freshwater is set to shape a new turning point in the world order and the destiny of civilization. Humanitarian crises, epidemic disease, destabilizing violence, and corrupt, failed states are already rife in the most water-deprived regions, where 20 percent of humanity lacks access to sufficient clean freshwater for drinking and cooking and 40 percent to adequate sanitation. Those who have predicted that the wars of the twenty-first century will be fought over water have foremost in mind the water-starved, combustible Middle East, where water looms omnipresently over every conflict and peace negotiation, and where those with oil are desperately trying to postpone their day of reckoning by burning it to pump dry aquifers and desalinate seawater in order to sustain farms and modern cities in the desert. Freshwater is an Achilles' heel of fast-growing giants China and India, which both face imminent tipping points from unsustainable water practices that will determine whether they lose their ability to feed themselves and cause their industrial expansions to prematurely sputter. The buffering global impact will be especially far-reaching for the fates of water-distressed developing nations that are reliant on food imports to feed their swelling, restive populations. While the West, too, has some serious regional water shortages, its

relatively modest population pressures and generally moist, temperate environments make it an overall water power possessing significant water resource advantages. If aggressively exploited, these advantages can help relaunch its economic dynamism and world leadership.

Water wars go nuclear Weiner 90

Prof. Princeton, The Next 100 Years p.270

If we do not destroy ourselves with the A-bomb and the H-bomb, then we may destroy ourselves with the C-bomb, the Change Bomb. And **in a world as interlinked as ours, one explosion may lead to the other.** **Already in the Middle East, from North Africa to the Persian Gulf and from the Nile to the Euphrates, tensions over dwindling water supplies and rising populations are reaching what many experts describe as a flashpoint.** **A climate shift in that single battle-scarred nexus might trigger international tensions that will unleash some of the 60,000 nuclear warheads the world has stockpiled** since Trinity.

d) turns case—

Cyber attacks disrupt oil pipelines, ignite Middle East war, and trigger US/Russia retaliation- US not prepared for attack now Clarke 2-16

Richard, Faculty Affiliate, Belfer Center for Science and International Affairs, board of the Middle East Institute, "Cyber Attacks Can Spark Real Wars", Op-Ed, Wall Street Journal, Belfer Center Programs or Projects: Explorations in Cyber International Relations; Information and Communications Technology and Public Policy; Science, Technology, and Public Policy,

http://belfercenter.ksg.harvard.edu/publication/21741/cyber_attacks_can_spark_real_wars.html?utm_source=feedburner&utm_medium=feed&utm_campaign=Feed%253A+belfer%252Fpublications+%2528Belfer+Center+for+Science+and+International+Affairs+-+Latest+Publications%2529&utm_content=Google+Reader

For most of this year, Arab-Israeli tensions have been spilling off the streets and airwaves and onto the region's fiber optic cables. Citizen hackers on both sides have engaged in tit-for-tat raids on Israeli, Saudi and other regional computer networks. Stock exchanges, airlines, government offices and even hospitals have had their websites defaced or shut down. Credit-card numbers and personal emails have been stolen and posted on the Internet. One Israeli official has labeled the escalating cyber hostility "terrorism" and called for it to be dealt with as such. It has not been terrorism. No one has died and, so far, nothing has blown up as a result. Indeed, most of the activity has involved the use of relatively commonplace hacker tools and techniques. This ongoing cyber "hactivism" has, however, demonstrated three things that should cause nations to act. First, the ease with which the hacktivists have been able to steal data and to shut down Web pages suggests that companies (and perhaps governments) in the region have not yet taken cyber security seriously. Governments in other regions (Asia, Europe, North America) have been educating, assisting and regulating companies to improve their cyber security. There has been a notable lack of such government activity in the Middle East, and that inactivity has opened the way for citizen hackers to cause the mischief we see today. **If the hackers turn their attention to disruption and destruction, as some have threatened, they are likely to find the controls for electric power grids, oil pipelines and precious water systems inadequately secured. If a hacker causes real physical damage to critical systems in that region, it could quickly involve governments retaliating against each other with both cyber and conventional weapons.** Middle Eastern governments need to get their citizen hackers under control and better protect their own critical networks, or they will eventually be dragged into unwanted conflict. Second, the Arab-Israeli hacker exchanges have demonstrated again the lack of any effective international organization to assist in

preventing cyber crime and de-escalating tensions among nations in cyberspace. The Budapest Convention on Cyber Crime, which entered into force in July 2004 and has been ratified by more than 40 countries including the U.S., does require nations to assume responsibilities for any attacks that originate in their cyberspace. But there is still no operations center that a nation can call to get another nation to stop its citizens (or servers in its country) from causing problems. Nations, if they talk at all about these cyber attacks, do so at 19th-century speed with embassies requesting assistance either in person or through a letter. An international Cyber Risk Reduction Center could be modeled on the Nuclear Risk Reduction Center (NRRC), which I once led at the end of the Cold War. It was created in 1987 to link Washington and Moscow operation centers so the two superpowers could immediately talk with someone on the other side when there appeared to be a nuclear threat or an event that could lead to one. The success of the centers depended on the ability of the two sides to act quickly to stop their own risky activity once they learned about it from the other side. Now Washington and Moscow are beginning to explore using their NRRC channels to discuss cyber concerns, but neither side yet has the authority or capability quickly to stop malicious cyber activity originating in their own nation. Moreover, there is no international counterpart center. If, as happened last month, Saudi Arabia's stock market is again knocked offline by a cyber attack originating in Israel (or vice versa), the Saudis should be able to call an international center and seek assistance. Israel, as a member of the international center, should be able to act promptly to see the attack and shut it down. All of that should happen in a few hours. Implicit in such a system would be an "obligation to assist" other members of the international system and to identify and prosecute the culprits. Failure to assist should have consequences such as financial damages or even outside filtering of message traffic to search for attack programs. The recent hacker exchange should also remind us that just as hacking could escalate to the use of conventional force in the Middle East, the reverse is also true. Bombing Iran, for example, could unleash an Iranian government cyber attack. Israelis say they could handle that, despite the recent evidence to the contrary. Unfortunately, much of the critical infrastructure in the U.S. is still not ready for a sophisticated nation-state cyber attack either.

A2: Nuke War Outweighs

Cyber attacks from terrorist groups or rivals are bigger danger than nuclear weapons

McCleskey, 11

(3/29/2011, Clayton M., "More questions than answers on cyber security," <http://dallasmorningviewsblog.dallasnews.com/archives/2011/03/worried-that-yo.html>)
