A disconcerting misconception has slipped into the U.S. Export-Import Bank debate about how America achieves its diplomatic goals. Some believe that a strong military and open dialogue are the solution to all our problems. Of course, diplomacy with world leaders has immense strategic value, but as equally important to maintaining our influence is economics. We are the largest economy in the world, and that's one of our biggest selling points. But being big isn't always enough. Foreign businesses want to transact with us and have a means to do so. Often the global marketplace is efficient enough where American businesses can win deals just by virtue of the value they provide. But the marketplace isn't level, and we can lose business by no fault of our own. That's why more than 7,300 companies rely on the Ex-Im Bank. Enough cannot be said of the role the Ex-Im Bank plays in securing American jobs simply by giving businesses an edge to win a piece of the huge overseas market. The Bank's function is relatively simple: foreign buyers need access to financing to purchase American goods, but sometimes can't get it from private sector lenders. This can happen for a number of reasons, which are rarely related to how much risk the borrower carries. There could be regulatory obstacles, or political factors, or the borrower needs official export credit guaranteed by a government. In these cases, the Ex-Im Bank is able to step in. But helping small and mid-sized businesses grow and expand is not the only value of the Ex-Im Bank. As important is the kind of influence we can have when our trading partners are making strategic decisions. We see this happen in several ways. First, the Ex-Im Bank is often involved in politically sensitive industries where goods and services have national security implications. When we export a nuclear reactor or a satellite or a power plant, we are integrating not just American products, but also American standards and protocols into the infrastructure of trading partners. Then there's good old-fashioned economic diplomacy, where our trading partners understand their economic prosperity is at stake in choosing to align against U.S. interests. This has been an important tool in international affairs for millennia, and is no less true today. The Ex-Im Bank plays no small part in preserving these interests and I've witnessed its influence, such as when Indian suppliers cut sales to Iran fearing consequences to Ex-Im Bank deals. The end of the Ex-Im Bank poses such severe consequences to U.S. interests abroad, 12 former national security officials, including myself, wrote to Congress urging them to reauthorize the Bank. The letter, with no exaggeration, concludes, "Our national security and economic interest depend upon it." Susan Rice, U.S. National Security Advisor, echoed our comments in April, adding, "when President Obama meets with foreign leaders, Ex-Im is an important part of our diplomacy." Rarely do you see an issue where all the facts point so clearly in one direction, and I'm inspired by the broad bipartisan, bicameral support to reauthorize the Bank. Unfortunately, a small group of lawmakers have hijacked the agency for their own ideological agenda. This political game now threatens not only our national security, but also the more than 1.4 million jobs the Bank supports. I am not a cynic, and believe Congress will do the right thing, but they must act now. Every missed day is a blow to our economy and our international standing.

Ex-Im is key to manufacturing and the economy

Peters 7/16 (Gary, US Senator, "Revive the Export-Import bank to keep Michigan competitive", http://www.mlive.com/opinion/index.ssf/2015/07/import-export_bank_is_lifeline.html Acc. 7/16/15 // yZ)

Last month, I had the opportunity to visit Mill Steel Company in Grand Rapids, one of hundreds of Michigan businesses that work with the Export-Import Bank of the United States to export their made-in-Michigan products across the globe. Mill Steel is one of North America's premier flat-rolled steel suppliers, and it's also a family-owned business that strives to reinvest in the community by making Michigan products and hiring Michigan workers. Human Trafficking Press Conference4 U.S. Sen. Gary Peters MLive.com By partnering with the Ex-Im Bank to secure loan guarantees, Mill Steel has been able to sell its steel to auto suppliers in Canada and continue hiring new employees and providing good-paying jobs right here in Michigan. But last month, a small, extreme partisan minority in Congress allowed the charter for the Ex-Im Bank to expire, risking billions of dollars in U.S. exports and hundreds of thousands of American jobs, and putting America's small businesses at a disadvantage in an increasingly competitive global marketplace. Over its 81-year history, the Ex-Im Bank has enabled American companies to sell their goods in foreign markets and grow their businesses by offering direct loans to businesses to start exporting, working with private lenders to fill gaps in financing and providing insurance to help businesses protect their bottom lines if a foreign buyer fails to pay. Simply put, the Ex-Im Bank helps close deals that would simply never happen without its support. This creates more demand here at home for parts, services and skilled workers, and opens new markets and new customers to American businesses. Most importantly, the Ex-Im Bank does all this while turning a profit for taxpayers. In fact, in 2014 alone, the Ex-Im Bank contributed their \$675 million surplus to reduce the federal budget deficit. The Ex-Im Bank also helps level the playing field for American companies in a tough global market. Last year, it supported more than \$27.4 billion in U.S. exports and 164,000 jobs. More than \$10 billion of that total — nearly 40 percent — represented exports by small businesses. Critics charge that the Ex-Im Bank supports corporate welfare, but 90 percent of its overall transactions directly supported small businesses, including many that serve as suppliers for larger companies. Here in Michigan, the Ex-Im Bank has supported 229 exporter businesses selling \$11 billion worth of goods to places like Saudi Arabia, Mexico and Canada. This support is particularly important for our manufacturing industry, and the majority of Michigan companies using the Ex-Im Bank are manufacturers of motor vehicles and parts, machinery and chemicals — the backbone of Michigan's economy. Renewing Ex-Im Bank's charter is especially critical as Michigan manufacturers fight to compete with countries using extreme and unfair measures, such as direct subsidies or currency manipulation, to boost their own manufacturing sectors. Many of our competitors, including China, Japan, South Korea, Canada and Germany, use their own export credit agencies to boost their countries' exports. China provided more financing through its export credit agency in the last two years than our own Ex-Im Bank has in its entire history. Without our own Export-Import Bank, American businesses will struggle to compete overseas, and our economy will suffer. That is why the Ex-Im Bank has broad bipartisan support in Congress from members of both parties, as well as organizations like the U.S. Chamber of Commerce, the National Small Business Association and the National Association of Manufacturers. Congress should focus on growing our economy and creating American jobs, and the Export-Import Bank is key to that mission. Congress must act now to renew the Ex-Im Bank's charter and help secure Michigan's economic competitiveness as a hub for manufacturing and trade, grow our economy and strengthen our middle class.

Export Import Bank key to Treasury, jobs, trade and trade-finance banks

Vianna 7/7 [Carla, business reporter, "Ex-Im Bank lapse leaves big trade gap," *Miami Today*, 7/7/15, < <http://www.miamitodaynews.com/2015/07/07/ex-im-bank-lapse-leaves-big-trade-gap/>> //eugchen

Log on to the Export-Import Bank of the United States website and users will be greeted with a message typed in 50-size-font capital letters: AUTHORIZATION HAS LAPSED. "Due to a lapse in EXIM Bank's authority, as of July 1 2015, the Bank is

unable to process applications or engage in new business or other prohibited activities,” a disclaimer reads. The authorization of the Export-Import Bank, an independent federal agency that aims to support jobs by facilitating the export of US goods and services, expired at the end of June and was not reauthorized by Congress. Therefore, the bank can only manage the about \$110 billion it has given out in loans but cannot take on any new loans until re-authorization occurs, said David Schwartz, president of the Florida International Bankers Association. “The Ex-Im Bank was one of the few profitable government agencies [last year \$675 million in fees back to the Treasury], and it is estimated that it helped to create 1.3 million jobs in the export business,” Guillermo Diaz-Rousselot, president and CEO of Miami’s Continental National Bank, told Miami Today. He said the bank played a large role in helping Florida exporters in the ’70s and ’80s, and helped Miami become a hub for international business. In Florida alone, there are about 58,000 exporters. Data show that total trade through Miami International Airport and PortMiami topped \$93.1 billion in 2013, according to the county’s most recent international trade report. In 2014, Miami Today reported that small- and medium-sized businesses make up more than 96% of Florida exporters and account for 68% of Florida exports, the highest among all 50 states. Mr. Schwartz called the decision, or lack of one, unfortunate. “[This] will make us the only industrialized nation that does not have this type of institution,” he said. A number of banks in Miami focus on export-import transactions, said Dennis Campbell with Campbell Law Firm. A lot of these trade-finance banks focus on trade with South and Central America. “Ex-Im assumed risks that trade finance banks are unable or unwilling to accept and guaranteed payment of the debt,” Mr. Campbell told Miami Today. “The lapse in Ex-Im’s authority could have a significant impact on trade-finance banks in South Florida and require these banks to change their business models.” Let’s say an exporter wants to finance trade with a foreign country. A local bank may look at that country’s risk factors, such as currency or political risk, and deem it an unsafe transaction. An Ex-Im bank might have more experience financing trade with that particular country, and is therefore more willing to take the risk. The Ex-Im bank is meant to benefit small- and medium-sized businesses, but critics say it’s being used by major manufacturers instead, said Richard Zelman, co-founder of the Sacher, Zelman, Hartman, Paul, Beiley & Sacher law firm. There have been discussions about reforming Ex-Im bank processes, perhaps in the form of a bill or amendment on a bill, but at present, Mr. Schwartz said, nothing is in the works. The hope is that the re-authorization will come attached to a bill that both the bank’s supporters and opponents want to pass. But as a standalone bill, he said, it won’t make it through.

Ex-Im critical to manufacturing and the economy

Minter 6/30 (Steve, “Manufacturers: Ex-Im Opponents “Don’t Have a Clue”,
<http://www.industryweek.com/legislation/manufacturers-ex-im-opponents-dont-have-clue> Acc.
7/16/15 // yZ)

Just as they tell you to do in the civics textbooks, Don Nelson has met with his congressman and others in Washington several times to explain how important a threatened government program is to his business. But Nelson, president of ProGauge Technologies in Bakersfield, Calif., says it has done him no good. Nelson’s congressman is House Majority Leader Kevin McCarthy, an influential critic of the Export-Import Bank of the United States, whose authorization is set to lapse today despite months of lobbying by the National Association of Manufacturers and other business groups. At a press call organized by NAM, Nelson said 65% to 70% of his business – steam generators and other equipment for the oil industry - involves exports and that he will have to forfeit millions in contracts if the bank’s charter expires. He noted that McCarthy and other critics have repeatedly argued that the Ex-Im Bank is unnecessary and that its financing services can be handled by private banks. “To me it shows that these critics have little conception of the realities of international trade and finance or the challenges that smaller businesses like us face competing for global customers and markets,” Nelson told reporters. “In fact, I’d say it’s clear that few of them have ever run a business or met a payroll.” He said McCarthy and his allies “don’t have a clue what they are doing or the damage they are going to inflict on small businesses in America by closing the Ex-Im Bank.” McCarthy and

other congressional critics "don't have a clue what they are doing or the damage they are going to inflict on small businesses in America by closing the Ex-Im Bank." The Ex-Im Bank was set to guarantee a long-term loan so the government of Ghana could purchase a bridge from his company, said Dick Rogovin, chairman and chief legal counsel at U.S. Bridge, a manufacturer of steel truss bridges headquartered in Cambridge, Ohio. He told reporters the contract was worth nearly \$100 million. "In the absence of Ex-Im Bank, there is no commercial U.S. bank that will perform the same service," Rogovin said. He added that he had asked McCarthy's office for a list of private banks that could provide the loan guarantee. By this morning, Rogovin said, they had not provided him a list. Rogovin said he had contacted several large U.S. banks and "there wasn't anybody who was willing to extend loan guarantees to third world countries for long terms. They just wouldn't do it." Both Nelson and Rogovin said failure to reauthorize the Ex-Im Bank would result in layoffs at their companies. Nelson said ProGauge currently was bidding on a large project in the Middle East. He said his company was proceeding as if the bank will be reauthorized. If it is not reauthorized before the bid is awarded, he said, ProGauge will have to forfeit the project, worth \$30 million. "The reality is we can't export any longer because we can't provide bank guarantees," said Nelson. "We'll be forced to reduce our workforce that feeds our export business." In Washington, the groups that have been battling over the trade bank kept up their lobbying efforts. Business groups such as NAM warned of dire consequences to U.S. businesses if the bank were to go out of business. "Today, a minority of lawmakers in Washington caused America to wave the white flag in the battle to keep selling U.S. products overseas," charged NAM CEO and President Jay Timmons. "Governments in Seoul, Berlin and Beijing are celebrating a clearing field of competition with the expiration of the Ex-Im Bank's charter, while American companies, including small and medium-sized businesses, are losing their shot at large-scale projects, and communities across the nation are at serious risk of losing stable, high-paying jobs." But Ex-Im Bank critic Veronique de Rugy, an economist and senior research fellow for the Mercatus Center at George Mason University, said the day would be remembered as "a day Americans stood up to powerful special interests and won." "Americans are sick of cronyism, and the Export-Import Bank is the epitome of cronyism," she added. "Activists from the Tea Party to Occupy Wall Street agree that it's time to put an end to the unhealthy marriage between government and big business." Congress is expected to take up bank reauthorization when it returns from its July 4 recess. Reauthorization could either be included with a bill such as highway funding or in a standalone bill, said Aric Newhouse, NAM's senior vice president for Policy and Government Relations. Newhouse said there was strong bipartisan support for the bank in both houses of Congress.

Loss of Ex-Im destroys aerospace and propels China forward economically- destroys heg

Melcher 7/15 (David, President and CEO of Aerospace Industries Association, "Ex-Im Bank foes hurt Ohio jobs, help China", http://www.cleveland.com/opinion/index.ssf/2015/07/ex-im_bank_foes_hurt_ohio_jobs.html Acc. 7/16/15 // yZ)

Last year, 124 Ohio companies did \$427 million worth of business selling transportation equipment, motor vehicle parts, manufactured chemicals, wood products and other goods to foreign purchasers with the help of financial assistance from the Export-Import Bank of the United States. Over an eight-year period, Ex-Im has led to more than \$3 billion in Ohio company export sales. And for 81 years, Ex-Im, supported by both political parties, has enabled U.S. businesses — small, medium and large — to compete for overseas sales against foreign companies that enjoy aggressive support from their countries' export credit agencies. Unfortunately, some lobbyists with a rigid ideological agenda want to kill off the bank without regard for the good Ohio jobs that will be lost in the process. They might just get their way. Sadly, these anti-bank lobbyists work for the same organizations that have been pouring thousands of dollars into ad buys meant to influence members of Congress. They've succeeded so far in blocking a congressional vote to continue the bank's operations, causing American firms to compete for foreign sales with one hand tied behind their backs since July 1. This deed was accomplished despite the fact that majorities in the House and Senate are ready to vote in favor of the bank. In fact, 65 members of the Senate just voted in support of the bank's operations. They know that America can't declare unilateral economic disarmament in the increasingly competitive international marketplace. Last year alone, the bank: Supported \$27.5 billion in U.S. manufacturing exports, including \$10.7 billion of exports from U.S. small businesses. Returned \$675 million dollars to the U.S. Treasury. Helped level the playing field for U.S. companies competing abroad against 60 foreign export credit agencies. Supported 164,000 private sector jobs, while indirectly supporting thousands more in the supply chains of the Bank's customers – generating economic growth in local communities in the form of jobs for restaurants, pharmacies, gas stations etc. The bank's opponents use clever slogans to claim they are economic purists. But capital markets don't operate with textbook perfection. Sometimes the private sector is unable or unwilling to assume credit risks, and the bank is needed to step in to fill gaps in the trade financing picture. Just ask those workers who benefited from Ex-Im financing during the 2007-2010 credit crunch, when even low-risk loans could not get financing from a paralyzed banking system. The aerospace industry is greatly dependent upon Ex-Im financing to allow American manufacturers of commercial, general aviation and business airplanes, helicopters, satellites, spacecraft and launch vehicles to sell our goods abroad and help maintain and expand the largest positive trade balance of any sector in the U.S. economy. And for every major aerospace product sold abroad, thousands of medium and small supply-chain companies throughout the country also benefit. Without the bank, many U.S. exporters will not be able to compete in the global marketplace, and good U.S. jobs will be the next critical item we export. To illustrate the competition we are up against, in 2013, the Export-Import Bank of China provided more than \$430 billion in loan guarantees for Chinese goods sold worldwide. Our Ex-Im Bank provided \$36 billion that year. Failure to allow a vote in Congress on the future of the bank will have only one result — losing business to China, Russia and other economically aggressive nations. Indeed, a senior Chinese official recently said Ex-Im going away would be "a good thing" for China. Ex-Im financing has helped Ohio boost jobs in difficult economic times when every new job is important. Contact your congressional representatives and tell them it's time they stopped playing D.C. politics and listening to ideologues. Ask them to support the bank, and make the statement that we are proud to build products for the global market in Ohio.

Export-Import Bank is vital to the fight against ISIS and the global economy

Stanley 6/29 [Kevin, BA in economics, CEO at Ventech Engineers, Inc., "Export-Import Bank critical to American strength," *Washington Examiner*, 6/29/15, <<http://www.washingtonexaminer.com/export-import-bank-critical-to-american-strength/article/2567131>>]//eugchen

There is a fight raging in Congress right now over the future of the Export-Import Bank. Not many people are familiar with this small federal agency, which provides loans and insurance to help American companies sell their products overseas. But it is vital to our economy and supports the industries, technologies and services that are important to America's national defense as well. For example, my company, Ventech Engineers International, designs and builds small oil refineries at our plant in Texas. We then export these largely pre-built facilities all over the world, supplying desperately needed fuel to some of the most impoverished and remote areas of the globe. Right now, our refineries are at work at three locations in the Kurdish area of Northern Iraq, processing almost 400,000 barrels of crude oil a day to fuel America's most vital and reliable ally in the region. It is no understatement to say that this oil is one of the foundations of the Kurds' fight against ISIS. The U.S. Consulate in Erbil, the Kurdish capital city, told us a few years ago that Ventech does more business in Iraq than any other private company – and we are extraordinarily proud of our small part in the effort to stabilize this region and support the struggle against the ISIS terrorists. Most of the discussion of the Ex-Im Bank deals with economic issues like the 150,000 American jobs that are attributed to the bank each year and its impact on America's GDP. Critics focus on ideological slogans like "crony capitalism" or the true but irrelevant point that government shouldn't "pick winners and losers" in the market. (Ex-Im does no such thing.) But here's a far more relevant fact — if Ex-Im shuts down at the end of June, we will not be able to build a critically-needed \$300 million facility to supply fuels required for the fight against ISIS. In the longer term, America's central role in the rebuilding of Iraq and the development of the entire region will be put at risk as foreign firms — fiercely backed by their own big-spending governments — rush in to seize business that right now is going to American companies backstopped by the Export-Import Bank. And the loss of those projects will also represent lost future business to support and maintain those American-supplied facilities for decades. That loss will have painful economic consequences, as export-oriented businesses pull back and American export workers lose their jobs by the tens of thousands. It will put in motion a costly "brain drain" as key export fields like aerospace, oil services and precision machinery all shift overseas. Last year, Ex-Im supported nearly \$30 billion in U.S. exports, all of which would be lost to U.S. business if the bank's attackers have their way. But the stakes are higher still. We learned during the Cold War how the spread of U.S. culture, products and businesses around the globe enhances our global strength. Anyone who sees America's free and open economic system at work ends up wanting to join with us, to take our side. Withdrawing from global economic engagement as the bank's critics would have us do would dangerously undermine this vital outreach tool. Bank critics are willing to sacrifice these interests because they believe any effort by the government to help American private industry succeed is an improper interference in the marketplace. But the bank is governed by strict regulations that forbid it from competing with the private sector and anyone who wants to use its services must show that no commercial alternative exists. And this is often the case, especially in destabilized regions like the Middle East. The charge of "corporate welfare" is even more far-fetched. Like any bank, Ex-Im charges interest and fees for its services, at market rates according to independent accountants. In fact, the bank actually pays for its own operations out of these fees, and in some years even runs a surplus. In 2014, it returned more than half a billion dollars to the U.S. Treasury. As a businessman, I don't have the luxury of debating fine points of ideology. All I know is that for every export we make to Iraq, Kazakhstan or Western Africa, there is a long line of foreign competitors hungry to replace us — and most of these are backed by export credit from their own governments that are up to ten times more than anything Ex-Im provides. The bank's conservative critics in Congress would never support unilateral disarmament for our military; why on earth are they pushing to unilaterally disarm our economy in this way? Right

now Texas politicians like Sen. Ted Cruz and Rep. Jeb Hensarling are leading the push to shut down the Ex-Im Bank. I urge them to reconsider and stand up for U.S. business and American strength by reauthorizing the Export-Import Bank.

2nc pc real

Political capital is real

Eshbaugh-Soha & Peake 10 (Matthew Eshbaugh-Soha: Texas Tech University & Jeffrey S. Peake: Bowling Green State University. *Routledge*: "Presidential Influence Over the Systemic Agenda." Published March 9th, 2010. Accessed July 20th, 2015.
<http://www.tandfonline.com/doi/citedby/10.1080/07343460409507704#.Va17sfIVhBc>)KaIM

One of the most widely accepted sources of presidential power is agenda setting. Being able to affect the media's agenda on key issues—influencing the systemic agenda and expanding the scope of conflict—has enormous consequences for the president's ability to govern effectively. Yet the literature to date has not conclusively determined the extent to which presidents consistently set agendas, especially over the media, because it has not explicitly considered variation in agenda setting influence by policy type. For these reasons, we test whether presidential public statements have increased the media's attention to three policy areas. Using Vector Autoregression (VAR) analysis, we demonstrate that presidents have some influence over the systemic agenda, at least in the short term, with policy type being an important predictor of presidential influence. Understanding when and why presidents may or may not be successful agenda setters is crucial to explaining the varying legislative impacts of presidential speech making. Agenda setting has long been viewed as a vital source of power in American politics. Whoever controls the agenda affects which issues are debated, how they are framed, and who may participate. Much work on agenda setting holds unequivocally that presidents have this power, and that they are uniquely situated to affect the national agenda. John Kingdon (1984, 25), in his seminal study on Washington agenda setting, maintained that "no other single actor in the political system has quite the capability of the president to set agendas." Baumgartner and Jones (1993, 241) surmised, "no single actor can focus attention as clearly, or change the motivations of such a great number of other actors, as the president." After all, these scholars assert, Congress, the public, and the news media regularly look to presidents for leadership on the nation's most pressing issues. Presidential influence over agenda setting arguably increases the president's ability to govern effectively. If the president dictates the issues that Congress debates each legislative session, he is more likely to succeed on his top legislative priorities (Bond and Fleisher 1990). Moreover, presidents who affect the systemic agenda—media attention to a policy or set of policies—may be able to "expand the scope of conflict" and enlist the public as an ally to further increase their legislative success. The "going public" argument, which structures much of the research examining the political effects of presidential rhetoric, maintains that presidents can use their rhetoric to expand the scope of conflict, and use subsequent public pressure to increase their success in Congress (see Kernell 1997). Although research shows that increased presidential attention to issues before Congress increases the president's success on those issues, it does not model the intervening impact that influence over the systemic agenda may have on the way in which presidential attention increases presidential success in Congress (Barrett 2004; Canes-Wrone 2001a; Fett 1994; Peterson 1990).¹ Moreover, because this research does not systematically differentiate agenda-setting effects by policy type, we are limited in our conclusions about if and when presidents may be successful agenda setters. Hence, we do not know conclusively whether presidents consistently influence the systemic agenda, or whether influence over the systemic agenda matters to the president's ability to govern.

US economy is on the brink

Whitefoot 7/8 [John, BA, financial writer since 90s, specialized in low-priced investment opportunities, "Economic Collapse Headed for U.S. in 2015," *Profit Confidential*, 7/8/15, <<http://www.profitconfidential.com/economic-analysis/economic-collapse-2015/>>]//eugchen

The last thing Wall Street is thinking about is an economic collapse in 2015. After all, the stock markets are at record highs, unemployment is down, and inflation is in check. But the fact of the matter is that these same indicators were also in check before the markets crashed in 1987, 2000, and 2008/09. Back in 2008/09, everyone on Wall Street, save for Michael Lombardi and Peter Schiff, was absolutely certain that the U.S. economy was the envy of the world and that it was rock solid. But we all know what happened. And if history is any indicator, it will happen again. By the looks of things, the U.S. could experience an economic collapse in 2015 and slip back into a recession. Or worse. When it comes to reading economic indicators, Wall Street is famous for looking at the surface. Instead of actually analyzing the data, they just regurgitate what they're spoon-fed. If you were to take a cursory glance at the state of the U.S. economy, you'd think everything was going according to plan. First, there are the stock markets. The U.S. markets have been marching steadily higher since bottoming in early 2009. The tech-heavy NASDAQ is up approximately 275% since March 2009, while the New York Stock Exchange (NYSE) is up 165%. The S&P 500 has climbed more than 200% and in August 2014, it closed above 2,000 for the first time ever. The Dow Jones Industrial Average has climbed 175%. And the stock market has been amazingly resilient. Even full-blown corrections are short-lived. On September 19, 2014, the U.S. markets started a three-week descent; both the NASDAQ and the NYSE fell by more than 11%, while the S&P 500 gave up more than 10% and the heavyweight Dow Jones Industrial Average fell 9.5%. Two weeks later, everything was back to normal. The stock markets were flying high and investor optimism was over the top. Back in the summer of 2014, 30% of investors were bullish. By mid-November, the number of investors with bullish sentiment had soared to almost 60%. Sentiment has retraced a little, but it's still exuberant at 50%.⁽¹⁾ But are investors too optimistic? And will this euphoria, and an economic collapse, come back to haunt them in 2015? Let's be blunt. Investors are overly optimistic about an overvalued stock market. Or at least they are relative to their 10-year price-to-earnings ratio. Today, stocks have a price-to-earnings ratio of 26.51. Over the last 10 years, that average has been 15. That means stocks are priced 76% higher than their 10-year average. Let's not forget that the stock market is a forward-looking indicator that reflects the state of the U.S. economy. So by all accounts, the U.S. economy is a lot healthier than it was before the recession. And certainly doesn't portend an economic collapse. Profits without Prosperity Case in point, the S&P 500 has advanced more than 200% since bottoming in early March 2009. The S&P 500 is a good overall indicator of the health of large-cap U.S. equities. The index includes 500 leading companies and covers approximately 80% of the available market capitalization. There is more than \$5.14 trillion benchmarked to the index, with assets accounting for approximately \$1.6 trillion of this total. So, if the S&P 500 is doing well, the entire U.S. economy must be doing well, right? Well, not necessarily. The S&P 500 and overall stock market have only done well because of the Federal Reserve's bond-buying program. By making interest rates artificially low, the Federal Reserve has made it easy and cheap to borrow. And with interest rates hovering near zero, there's nowhere for investors to turn but the stock market. In 2013, investors sent the S&P 500 up approximately 30%. That must mean the companies that made up the S&P 500 performed really well. But they didn't. Yet investors rewarded them for it. In each quarter of 2013, a larger percentage of companies revised their earnings guidance lower. During the first quarter of 2013, 78% of S&P 500 companies that provided preannouncements issued negative earnings guidance. That number climbed to 81% in the second quarter, 83% in the third quarter, and a new record of 88% in the fourth quarter. Borrow, Invest, Send Markets Higher, Repeat Instead of focusing on weak revenue and earnings, investors were distracted by financial engineering—also known as share repurchase programs. Because U.S. businesses couldn't impress investors with improved earnings, they propped up their results in other, more creative ways, namely cost-cutting measures and uncharacteristically generous share repurchase programs. In 2013, companies on the key stock indices logged a record-high for share buyback activity. In 2013, share buybacks amounted to \$460 billion—the highest amount since 2007.⁽²⁾ But 2013 wasn't an anomaly either. Let's consider the 449 companies on the S&P 500 that were publicly listed from 2003 to 2012. Over that timeframe, those companies used 54% of their earnings (\$2.4 trillion) to buy back their own shares. Dividends account for an additional 37% of earnings. Together, share buybacks and dividends accounted for 91% of earnings. That leaves very little for investment and improved wages.⁽³⁾ The stock market may be booming, but most Americans are not enjoying the recovery. In fact, most would be hard pressed to say the U.S. is even in a recovery. Like the stock market, the U.S. economy looks really good on paper, that is until you simply dig a little deeper and look at the underlying jobs data. The U.S. unemployment rate is under six percent, but at the same time, approximately

12% of the population remains underemployed. Wages are flat, personal debt levels remain elevated, and 15% of the population is still receiving food stamps.(4) Approximately a third (36%) of Americans have less than \$1,000 in savings and investments; 60% have less than \$25,000.(5) Meanwhile, 76% of Americans are living paycheck to paycheck.(6) This is not a recipe for sustained economic growth, especially for the world's largest economy and one that gets 71% of its gross domestic product (GDP) from consumer spending. America can't use credit cards to buy its way to prosperity. This might explain why U.S. economic growth has been underwhelming at best. In 2008, the U.S. reported GDP of -0.03%; in 2009, it retraced to -2.8%. Since then, growth has been unpredictable. In 2013, the year that the overall markets soared, U.S. GDP growth was a paltry 1.9%. The recent third-quarter GDP data was better than expected, but for 2014, U.S. GDP growth is forecast at just 2.2%. In 2015, the International Monetary Fund (IMF) thinks U.S. GDP will advance 3.1%—but it also says in the same breath that its outlook may be a little bit optimistic. The U.S. won't get much help from the rest of the world. The IMF cut its outlook for global growth to 3.8% from previous estimates of four percent. It noted that there is a 38% chance the eurozone, the world's biggest economic region, will fall back into a recession in 2015. Economic trajectories for China, Japan, and Russia are also an issue.(7) All of this could seriously damage the U.S. economy. That's because approximately 50% of the public companies that make up the S&P 500 get sales from Europe. Add it up. The stock market is sorely overvalued. The so-called U.S. recovery may have helped make Wall Street wealthier, but it has done little or nothing to benefit Main Street. The U.S. economy isn't as strong as we're being told it is. And the global economy is a mess. These are just a few reasons why the U.S. could experience an economic collapse in 2015.

Economic decline leads to a laundry list of consequences

Thomas 14 [Jeff, studied economics around 1990 from Sir John Templeton, Harry Schulz, Doug Casey and others, "A Glimpse into the Coming Collapse," *Casey Research*, 1/17/14, <<http://www.caseyresearch.com/articles/a-glimpse-into-the-coming-collapse>>]//eugchen

However, the number of people whose eyes have been opened seems to be growing, and many of them are asking what the collapse will look like as it unfolds. What will the symptoms be? Well, the primary events are fairly predictable: they would include major collapses in the bond and stock markets and possible sudden deflation (primarily of assets), followed by dramatic inflation, if not hyperinflation (primarily of commodities), followed by a crash of several major currencies, particularly the euro and the US dollar. The secondary events will be less certain, but likely: increased unemployment, currency controls, protective tariffs, severe depression, etc. But, along the way, there will be numerous surprises—actions taken by governments that may be as unprecedented as they would be unlawful. Why? Because, again, such actions are the norm when a government finds itself losing its grip over the people it perceives as its minions. Here are a few: Travel Restrictions. This will begin with restrictions on foreign travel, including suspension/removal of passports. (This has begun in a small way in both the EU and US.) Later, travel restrictions will be extended within the boundaries of countries (highway checkpoints, etc.) Confiscation of wealth. The EU has instituted the confiscation of bank accounts, which can be expected to become an international form of governmental theft. This does not automatically mean that other assets, such as precious metals and real estate will also be confiscated, but it does mean that the barrier for confiscation has been eliminated. There is therefore no reason to assume that any asset is safe from any government that approves theft through bail-ins. Food Shortages. The food industry operates on very small profit margins and survives only as a result of quick payment of invoices. With dramatic inflation, marginal businesses (suppliers, wholesalers, and retailers) will fall by the wayside. The percentage of failing businesses will be dependent upon the duration and severity of the inflationary trend. Squatters Rebellions. A dramatic increase in the number of home and business foreclosures will result in homelessness for anyone whose debt exceeds his ability to pay—even those who presently appear to be well-off. As numbers rise significantly, a new homeless class will be created amongst the former middle class. As they become more numerous, large scale ownership of property may give way to large scale "possession" of property. Riots. These will likely happen spontaneously due to the above conditions, but if not, governments will create them to justify their desire for greater control of the masses. Martial Law. The US has already prepared for this, with the passing of the 2012 National Defense Authorization Act (NDAA), which many interpret as declaring the US to be a "battlefield." The NDAA allows the suspension of habeas corpus, indefinite detention, and the assumption that any resident may be considered an enemy combatant. Similar legislation may be expected in other countries that perceive martial law as a solution to civil unrest. The above list is purposely brief—a sampling of eventualities that, should they occur, will almost definitely come unannounced. As the decline unfolds, they will surely happen with greater frequency. But the value in projecting what the collapsing governments may do to their citizens is not merely an exercise in speculation. By anticipating the likelihood of any of the above, the individual may find that it would be prudent to turn off the game on television tonight and spend his time musing on the possibility of what he would do if any of the above events were to take place. (And, again, these projections are not mere fancy; they are actions typically taken by governments as their declines play out.) Most importantly, if the reader concludes that there is a significant percentage of likelihood that any of the above are coming his way, he would be well-advised to assess whether they are developments that he feels he could live with. If not, he might wish to assess how much time he has before these events become a reality and what he may do to sidestep their impact on him. Whilst, throughout the First World, the comment, "The whole world is going to Hell," is becoming common, in fact, this is not the case. Although some countries are in decline, others are on the rise. It is left to the reader to decide whether he will fall victim to coming events, or will use them as an opportunity to internationalise himself.

US economy is key to the global economy

Bekiros 14 [Stelios D., Assistant Professor at the Athens University of Economics & Business and Research Professor at the IPAG Business School, "Contagion, decoupling and the spillover effects of the US financial crisis: Evidence from the BRIC markets," *International Review of Financial Analysis*: Volume 33, May 2014, Pages 58-69, <<http://www.sciencedirect.com/science/article/pii/S1057521913000872>>]]/eugchen

An interesting conclusion with respect to the globalization of the stock markets emerged from this study, in that all markets considered here have become more internationally integrated after the US financial crisis and the consequent Eurozone sovereign debt crisis. Moreover, it is evident from the results that mean and volatility spillover effects exist not only from the US market to the developed equity markets of Europe and Asia as shown in previous studies, but also between the US the BRIC economies. Another finding is that some differences exist between the persistence and strength of the causal linkages in the pre- and post-crisis periods. In view of the fact that BRICs pertain strong linkages with the global economy through trade and financial markets, a contagion effect was further substantiated due the transmission of the US subprime crisis to the BRIC equity markets. For instance, the post-crisis period exhibits highly significant feedback spillovers between the US market and the BRICs, with the exception of China which is always Granger caused by the US and the EU. Results from both periods show that India and Russian equity returns were highly affected by the movements in the US market. For Russia in particular, a clear evidence of contagion is established after the Lehman Brothers' bankruptcy. The leading role of the US market in the world financial system is visible throughout all causality tests and in all time periods, a fact that is consistent with earlier findings by Eun and Shim (1989). On the other hand, the Chinese market has relatively little influence on the stock price movements in the US and the EU, particularly once linear effects have been removed through VAR-filtering. This finding provides a relative support to the view that China plays a passive role in transmitting information to other stock markets. Moreover, the volatility of the US, Chinese, and Indian equity markets may be interrelated through investment, trade and macroeconomic fundamentals, so that news about the US economic conditions most likely has implications for the Chinese and Indian economies and financial markets. However, the trade linkages between the pairs US–Russia and US–Brazil are rather small. Nevertheless, their stock markets may be linked through the impact of world oil and energy demand, which most likely affects the Russian and to some extent the Brazilian economy. In general, the US, EU and the BRIC economies are also related through changes in currency markets which affect their relative competitiveness. In the financial sector foreign exchange volatility may also induce global portfolio managers to dynamically modify their investment positions among the six markets.¹³ One other reason of the remaining causalities could be that speculative movements driven by trader fads may be transmitted to and from the US, EU and the BRIC stock markets. Thus, speculative and noise trading may also lead to contagion effects across the investigated markets. Finally, beyond the contagious effects of the US crisis on the BRIC equity markets, the present study explored the so-called "decoupling" phenomenon. It seems that some evidence in support of the decoupling view was found based on the causality results. Specifically, the assumption that the emerging markets can be major drivers of world growth is partially validated by the detected feedback linkages. However, decoupling would have been plausible, especially after the financial crisis period, only if strong unidirectional links were detected from the BRICs to the US market and not of the opposite direction as well.

Surveillance reform kills bipartisanship – political fights

Diamond 6/2 Jeremy Diamond, reporter for CNN politics, “NSA surveillance bill passes after weeks-long showdown,” 6/2/2015, *CNN*, <http://www.cnn.com/2015/06/02/politics/senate-usa-freedom-act-vote-patriot-act-nsa//RA>

Washington (CNN)The National Security Agency lost its authority to collect the phone records of millions of Americans, thanks to a new reform measure Congress passed on Tuesday. President Barack Obama signed the bill into law on Tuesday evening. It is the first piece of legislation to reform post 9/11 surveillance measures. "It's historical," said Sen. Patrick Leahy, D-Vermont, one of the leading architects of the reform efforts. "It's the first major overhaul of government surveillance in decades." The weeks-long buildup to the final vote was full of drama. Kentucky Sen. Rand Paul assailed the NSA in a 10-hour speech that roused civil libertarians around the country. He opposed both renewing the post 9/11-Patriot Act and the compromise measure -- that eventually passed -- known as the USA Freedom Act. Meanwhile, Senate Majority Leader Mitch McConnell, and defense hawks such as Sens. John McCain and Lindsey Graham, had hoped to extend the more expansive Patriot Act, arguing it was essential for national security. NSA spying: Has the government lost important tool? NSA spying: Has the government lost important tool? 02:40 PLAY VIDEO RELATED: Are post 9/11 politics shifting? The Republican infighting broke out during two weeks of debate on Capitol Hill and on the presidential campaign trail. And in part thanks to Paul's objections, certain counterterrorism provisions of the Patriot Act expired late Sunday amid warnings of national security consequences. Obama welcomed the bill's final passage on Tuesday, but took a shot at those who held it up. "After a needless delay and inexcusable lapse in important national security authorities, my administration will work expeditiously to ensure our national security professionals again have the full set of vital tools they need to continue protecting the country," he said in a statement. No that Obama has signed the bill, his administration will get to work getting the bulk metadata collection program back up and running during a six-month transition period to the new data collection system. Senior administration officials described a two-step process: The first is the technical process -- essentially flipping the switches back and coordinating the databases of information stored by the government -- which takes a full day. White House slams Senate over lapse in spy measures White House slams Senate over lapse in spy measures 03:28 PLAY VIDEO RELATED: McConnell refuses to blast Rand Paul The second is a legal process that could take longer. The government needs to make a filing with the special secretive court -- which has authorized the bulk metadata collection program since 2006 -- to verify that the metadata programs are legal under the new law. It's unclear how long the process would take, but one official estimated the process could take three or four days. Final passage of the compromise bill was in question until Tuesday, until the Senate successfully rebuffed with three amendments which could have thrown a wrench into the works. The bill's passage is the culmination of efforts to reform the NSA that blossomed out of NSA leaker Edward Snowden's 2013 revelations. "This is the most important surveillance reform bill since 1978, and its passage is an indication that Americans are no longer willing to give the intelligence agencies a blank check," said Jameel Jaffer, deputy legal director at the American Civil Liberties Union. Congress had failed last year to pass a similar reform effort. The legislation will require the government obtain a targeted warrant to collect phone metadata from telecommunications companies, makes the Foreign Intelligence Surveillance Court (known as the FISA court) which reviews those warrant requests more transparent and reauthorizes Patriot Act provisions that lapsed early Monday. The bill, though, passed over the strong and impassioned objections of security hawks in the Republican Party and from some former members of the intelligence community. But as the June 1 deadline to renew expiring provisions of the Patriot Act closed in, and as NSA reform advocates refused to budge in the face of charges of damaging national security, top Senate Republicans led by Senate Majority Leader Mitch McConnell eventually relented, giving way to pressure from House Republicans, the Obama administration and reform advocates in their own body. McConnell and others realized that the USA Freedom Act, which passed the House three weeks earlier, was their only ticket to keeping counterterrorism provisions like data collection and roving wiretaps alive. But while McConnell kept up his protest into the final moments leading up to the vote, his fellow Kentucky senator who antagonized his every move to reauthorize provisions of the Patriot Act noticeably avoided the spotlight on Tuesday. Paul's weeks of staunch and unflinching opposition to reauthorizing the Patriot Act, and to the USA Freedom Act for not going far enough, ended Thursday with a simple "No" vote on that bill. He even relented in his plan to offer his own amendments to that piece of legislation and didn't make a prominent speech on the Senate floor on Tuesday. Paul chalked up his efforts as a win, though, succeeding in leading the bulk metadata collection program to its expiration on Sunday night.

Surveillance reform causes partisan backlash

Kelly 7/8 [Erin, "New privacy debate focuses on government access to emails, texts, calls," *USA Today*, 7/8/15, <<http://www.usatoday.com/story/news/politics/2015/07/08/patriot-act-section-702-privacy-debate/29823349/>>]//eugchen

Now that Congress has ended the National Security Agency's controversial dragnet of Americans' phone records, privacy advocates are pushing to curb a lesser-known surveillance power that allows the government to read the content of Americans' emails, cellphone conversations and other electronic communication. Rep. Thomas Massie, R-Ky., said the power, which comes from Section 702 of the 2008 FISA Amendments Act, was supposed to be aimed at foreign nationals living outside the USA but has ended up being used to collect massive amounts of personal communication from Americans. That data, which can also include photos, texts and instant messages, can be gathered by U.S. intelligence agencies without a warrant as long as it crosses the U.S. border electronically at some point. Given the fluid nature of electronic communications and data storage, that happens all the time, Massie said. "Your email may go to a server in Canada or Iceland, and that's the loophole that allows the government into your communications," Massie told USA TODAY. "It's really troubling, and it's a clear violation of the Fourth Amendment prohibition against unreasonable searches and seizures." A majority of House members agreed, voting 255-174 in June for legislation by Massie and Rep. Zoe Lofgren, D-Calif., to prohibit intelligence agencies from using federal funds to search the data they collect under Section 702 for information about Americans. It was the second time in two years that the House has voted for the measure as part of its passage of a sweeping defense spending bill. The vote came shortly after Congress passed the USA Freedom Act, which will end the NSA's mass collection of Americans' phone records under Section 215 of the Patriot Act anti-terrorism law. But security hawks in Congress and the Obama administration are pushing back, vowing to fight any effort to weaken government surveillance programs at a time when terrorist threats from the Islamic State and other terrorist groups are on the rise. House Intelligence Chairman Devin Nunes, R-Calif., recently took the unusual step of writing letters to House Republicans who voted for the Massie-Lofgren amendment asking them to publicly renounce their vote. That would not actually rescind the outcome of the original vote, but supporters of the surveillance program hope it would help stop the legislation from being passed by the Senate or approved again in the House. "Despite the threats that face us, Congressman Massie's amendment ... would end the use of a vital tool for identifying and disrupting terrorist plots at home and abroad," Nunes wrote. National Intelligence Director James Clapper provided Nunes with a letter in an effort to change lawmakers' minds about Section 702. He said the prohibition on searching the data for information about U.S. residents could hamper investigations. "These queries can, among other things, enable analysts to identify terrorists plots ... alert potential victims of impending danger or locate hostages," Clapper said in a letter to House Intelligence Committee members the day after the Massie-Lofgren amendment passed the House. Lofgren said the intent of the letters was "to try to scare people into abandoning the Constitution." "It's hard to say that our current situation is more threatening than World War II, but we didn't throw out the Fourth Amendment during that war," she said in an interview. Under Section 702, an American citizen living in the United States could become the subject of an investigation for merely contacting a human rights organization in London that opposes the use of military drones, said Neema Singh Guliani, legislative counsel for the American Civil Liberties Union. "The government could say that the group has foreign intelligence information and collect the contents of your call or email with the group," she said. Massie said he has a simple answer for government agents who want to target Americans for surveillance. "Get a warrant," Massie said. "We're not taking away a tool for the people who are keeping us safe. We're just telling them 'get a warrant if you want to spy on Americans.'"

to flourish unabated.

Google DA HSS

Notes

This is a DA that links to affs that increase privacy regulations of some sort. The evidence on government privacy regulations spilling over and hurting private companies' abilities (specifically, Google) to collect data/operate efficiently is pretty good.

The 1NC impact is the oil dependence scenario, but we have cards that talk about innovation/economy.

Good luck! Let us know if we can update/cut/change anything ~Myles, Aameek, Clare, Rishika 😊

Privacy regulations directly inhibit private sector data collection and innovation

Goldfarb and Tucker 12 — Avi Goldfarb, Professor of Marketing in the Rotman School of Management at University of Toronto, has published over 50 articles in a variety of outlets in economics, marketing, statistics, computing, and law, holds a PhD from Northwestern, MA from Northwestern, and BAH from Queens University, with Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2012 (“Privacy and Innovation,” Innovation Policy and the Economy, Chicago Journals, The National Bureau of Economic Research, Vol. 12, No. 1, pp. 65-90, January, Available Online via Subscribing Institutions at JStor, Accessed 7/21/15)

The relationship between innovation and privacy policy runs deeper than this superficial similarity suggests. This paper argues that ultimately **privacy policy is interlinked with innovation policy and consequently has potential consequences for innovation and economic growth.** Drawing on empirical analysis of privacy regulations in online advertising and health care, we summarize evidence that **privacy regulations directly affect the usage and efficacy of emerging technologies in these sectors.** Furthermore, because these impacts are heterogeneous across firms and products, regulations affect the direction of innovation.

This linkage sets up a tension between the economic value created by the use of personal data and the need to safeguard consumers’ privacy in the face of the use of such data. As discussed by Hui and Png (2006), it is not straightforward to incorporate notions of privacy into economic models, because such notions are often based on consumer emotions as well as on strict economic concerns. As such, it is important for regulators to balance consumer uneasiness with (or repugnance toward) data collection and usage with the consequences such regulations may have on certain types of innovation.

More broadly, the extent of privacy regulation should represent a trade-off between the benefits of data-based innovation and the harms caused by violations of consumer privacy. Much of the policy discussion appears to assume **substantial** harms, perhaps citing survey evidence that people do not like to be tracked (FTC 2010). It is important to measure the size of these harms carefully, ideally in a real-world revealed-preference setting where the costs and benefits can be explicitly traded off. These studies should be conducted across many industries and settings, because such harms likely affect different sectors in different ways. The fact that there may be differential effects in terms of both harm and incentives to innovate across different sectors means that **there may be potential adverse consequences of using a single policy tool to regulate all sectors.** These adverse consequences should be set against the benefits of simplicity and uniformity of comprehensive cross-sector privacy regulation.

Data collection is key to enhanced Google revenues and operations

Goldfarb and Tucker 12 — Avi Goldfarb, Professor of Marketing in the Rotman School of Management at University of Toronto, has published over 50 articles in a variety of outlets in economics, marketing, statistics, computing, and law, holds a PhD from Northwestern, MA from Northwestern, and BAH from Queens University, with Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2012 (“Privacy and Innovation,” *Innovation Policy and the Economy*, Chicago Journals, The National Bureau of Economic Research, Vol. 12, No. 1, pp. 65-90, January, Available Online via Subscribing Institutions at JStor, Accessed 7/21/15)

It is not new for companies to collect information about their customers. For decades, firms have been able to buy data from external parties (such as magazine subscription and car ownership data) and integrate it into their mailing lists. What is new about the collection of online data is the scope of the data collected, the precision with which the company can associated an action with a specific customer, and the sheer quantity of information. Before online purchasing, stores rarely observed abandoned shopping carts, statements of customer preferences, or a complete list of all past purchases.

The quantity and precision of the data collected mean that **there are benefits to firms that offer services online from the retention and use of customer clickstream data** beyond the example of advertising described earlier. One common innovative application is the use of data to tailor products automatically to a consumers’ needs and interests. Data can also be used for immediate feedback. **Google**, for example, retains user clickstream data to **continuously improve both its search algorithms and online product services**, such as youtube.com, partly on the basis of terminated user queries and actions.

Online data have also allowed the development of recommender systems that use customers’ purchase decisions to offer recommendations about products of interest to another customer. If, for example, a website observes a customer buying a DVD of the television series “Lost,” it uses the purchase histories of other customers who have also bought “Lost” to suggest other DVDs that the customer might also enjoy. Dias et al. (2008) suggest that **such systems can increase revenues by 0.3%. This increase is economically significant** given the relatively low cost of implementing such systems and the high costs of increasing revenues through alternative marketing actions. Recommender systems can also be designed to move sales toward higher-margin items (Fleder and Hosanagar 2009).

So far, our discussion has focused on how the sharing of information collected online has been used by firms to improve the accuracy of their efforts to increase demand and customer satisfaction. However, **improvements in information and communication technologies** allow a wide-scale collection of consumer data that **can also enhance a firm’s operational efficiency.** At Walt Disney World, a new operations center is designed to use detailed customer surveillance

data to minimize wait times in lines (Barnes 2010). Many financial services companies use data to predict credit risk and to determine promotions and interest rate offers.

Another valuable type of data for operational efficiency is information about consumer trends that enables firms to manage their supply chains more effectively. For example, companies use data from wishlists, grocery lists, and registries online to project future demand for certain products. Search data are also useful for predicting demand. Choi and Varian (2009) show that data about who is searching for what on search engines can predict travel and retail demand reasonably accurately. Again, the collection and analysis of information, facilitated by recent advances in information and communications technologies, has led to innovation in the operations of firms from online retailers to theme parks to financial services companies.

Google Self-Driving cars are key to revitalizing the economy, reducing dependence on oil, and a more sustainable future.

Dallegro 14 — Joseph A. Dallegro is a journalist and advertising copywriter living in the New York area. He has covered business and finance, automobiles and local interest stories for publications such as Institutional Investor, ConsumerSearch and the Jersey City Independent. His advertising work has been profiled in CBS News, The Huffington Post, and Adweek, 2014 ("How Google's Self-Driving Car Will Change Everything," Investopedia, April 2014, Available Online at <http://www.investopedia.com/articles/investing/052014/how-googles-selfdriving-car-will-change-everything.asp>, Accessed 7-21-2015)//CM

Imagine getting in your car, typing or speaking a location into your vehicle's interface, then letting it drive you to your destination while you read a book, surf the web or nap. Self-driving vehicles – the stuff of science fiction since the first roads were paved – are coming, and they're going to radically change what it's like to get from point A to point B. Basic Technology Already In Use "The building blocks of driverless cars are on the road now," explained Russ Rader, senior v.p. of communications at the Insurance Institute for Highway Safety. He pointed to the front-crash prevention systems that for several years have been able to warn drivers of an impending obstacle and apply the brakes if they don't react fast enough. These systems were quickly followed by technology allowing cars to self-park by sizing up a free spot and automatically steering into it, with the driver only controlling the accelerator and brake pedals. Mercedes-Benz took autonomous driving even further with last year's unveiling of a steering system that works on the highway, in certain circumstances. The first big leap to fully autonomous vehicles is due in 2017, when Google Inc. (GOOG) said it would have an integrated system ready to market. Every major automotive manufacturer is likely to follow by the early 2020s, though their systems could wind up being more sensor-based, and rely less on networking and access to map information. Google probably won't manufacture cars. More likely, it'll license the software and systems. A Drastic Change As with the adoption of any new revolutionary technology, there will be problems for businesses that don't adjust fast enough. Futurists estimate that hundreds of billions of dollars (if not trillions) will be lost by automakers, suppliers, dealers, insurers, parking companies, and many other car-related enterprises. And think of the lost revenue for governments via licensing fees, taxes and tolls, and by personal injury lawyers and health insurers. Who needs a car made with heavier-gauge steel and eight airbags (not to mention a body shop) if accidents are so rare? Who needs a parking spot close to work if your car can drive you there, park itself miles away, only to pick you up later? Who needs to buy a flight from Boston to Cleveland when you can leave in the evening, sleep much of the way, and arrive in the morning? Indeed, Google's goal is to increase car utilization from 5-10% to 75% or more by facilitating sharing. That means fewer cars on the road. Fewer cars period, in fact. Who needs to own a car when you can just order a shared one and it'll drive up minutes later, ready to take you wherever you want? "This [has the potential to] dramatically reduce the number of cars on the street, 80% of which have people driving alone in them, and also a household's cost of transportation, which is 18% of their income – around \$9,000 a year – for an asset that they use only 5% of the time," said Robin Chase, the founder and CEO of

Buzzcar, a peer-to-peer car sharing service, and co-founder and former CEO of Zipcar. In 2030, self-driving cars are expected to create \$87 billion worth of opportunities for automakers and technology developers, said a report by Boston-based Lux Research. Software developers stand to win big. A Car Manufacturing Revolution If you're an automaker, such as Ford Motor Co. (F), General Motors Co. (GM), Chrysler Group LLC, Toyota Motor Corp. or Honda Motor Co., Ltd. (HMC), which account for about 70% of the U.S. market, you could see an initial surge in the \$600 billion in annual new and used car sales in the U.S. But as soon as the technology takes hold, sales could fall off significantly as sharing popularizes. Cars will always need steel, glass, an interior, a drivetrain and some form of human interface (even if that interface is little more than a wireless connection to your smartphone). But much of everything else could change. As an example, take front-facing seats; they could become an option, not a requirement. Automakers that see change coming, such as how the big profits are secured downstream by car servicers, insurers and more, are focusing on services as much as on what and how they manufacture.

Infrastructure Transformation With fewer cars around, parking lots and spaces that cover roughly a one-third of the land area of many U.S. cities can be repurposed. That could mean temporary downward pressure on real estate values as supply increases. It could also mean greener urban areas, as well as revitalized suburbs, as longer commutes become more palatable. And if fewer cars are on the road, the federal and state governments may be able to reallocate a good portion of the roughly \$30 billion spent annually on highways. Changing Oil Demand If you're in the business of finding, extracting, refining and marketing hydrocarbons, such as Exxon Mobil Corp. (EOX), Chevron Corp. (CVX) or BP plc (BP), you could see your business fluctuate as use changes. "These vehicles should practice very efficient eco-driving practices, which is typically about 20% better than the average driver," said Chase "On the other hand, if these cars are owned by individuals, I see a huge rise in the number of trips, and vehicle miles traveled. People will send out their car to run errands they would never do if they had to be in the car and waste their own time. If the autonomous cars are shared vehicles and people pay for each trip, I think this will reduce demand, and thus (vehicle miles traveled)." Safety Dividend Autonomous vehicles are also expected to be safer. "These cars won't get drunk or high, drive too fast, or take unnecessary risks – things people do all the time," Chase said. "Over 90% of accidents today are caused by driver error," said Professor Robert W. Peterson of the Center for Insurance Law and Regulation at Santa Clara University School of Law. "There is every reason to believe that self-driving cars will reduce frequency and severity of accidents, so insurance costs should fall, perhaps dramatically." "Cars can still get flooded, damaged or stolen," notes Michael Barry, the v.p. of media relations at the Insurance Information Institute. "But this technology will have a dramatic impact on underwriting. A lot of traditional underwriting criteria will be upended." Barry said it's too early to quantify exactly how self-driving vehicles will affect rates, but added that injured parties in a crash involving a self-driving car may choose to sue the vehicle's manufacturer, or the software company that designed the autonomous capability. Initially, insurers such as State Farm Insurance, Allstate Corp. (ALL), Liberty Mutual Group, Berkshire Hathaway Inc.'s (BRK-A) GEICO, Citigroup Inc.'s (C) Travelers Group could see a huge benefit from lower accident liabilities, but wind up losing a big portion of the \$200 billion in personal auto premiums they write every year as fewer cars take to the road. Some have even speculated that mandatory insurance for cars could be dropped. And as long as we're talking about financial services, what of the multitude of banks and creditors that lend buyers money in about 70% of car purchases if sales volume falls? According to a University of Texas report, if only 10% of the cars on U.S. roads were autonomous, more than \$37 billion of savings could be realized via less wasted time and fuel, as well as fewer injuries and deaths. At 90%, the benefit rises to almost \$450 billion a year. Closer to Home Self-driving cars could have a substantial impact on the taxi and limousine industries and could create new ones. Chase noted that they could be used to share specific trips as a kind of pay-as-you-go small-scale public transportation – taking a disparate bunch of Manhattanites to the beach in the Hamptons, for instance. One study found that a fleet of 9,000 driverless taxis could serve all of Manhattan at about 40 cents per mile (compared to about \$4-6 per mile now). There are licenses for over 13,000 taxis in the Big Apple now. Self-driving cars may also challenge train lines. "A self-driving car offers much of the convenience of rail service with the added convenience that the service is portal-to-portal rather than station-to-station," Peterson said. "On the other hand, a fleet of self-driving cars available at the station may make rail service more palatable. "The technology has already been adopted in closed systems, such as campuses, air-terminals and mining," he noted. "Rio Tinto Group (RIO), a large mining company, uses enormous self-driving trucks in its mining operations. European countries are experimenting with the platooning of trucks. Among other things, this saves about 18% in fuel." Risks, Hurdles and the Unknown There are regulatory and legislative obstacles to widespread use of self-driving cars, and substantial concerns about privacy (who will have access to any driving information these vehicles store?). There's also the question of security, as hackers could theoretically

take control of these vehicles, and are not known for their restraint or civic-mindedness. The Bottom Line However it plays out, these vehicles are coming – and fast. Their full adoption will take decades, but their convenience, cost, safety and other factors will make them ubiquitous and indispensable. Such as with any technological revolution, the companies that plan ahead, adjust the fastest and imagine the biggest will survive and thrive. And companies invested in old technology and practices will need to evolve or risk dying.

Oil dependence diminishes US hegemony — key to combating WMD spread, terrorism, Gulf instability

Deutch and Schlesinger 6 — John Deutch, served as Deputy Secretary of Defense, Director of Central Intelligence, Director of Energy Research, Acting Assistant Secretary for Energy Technology, and Undersecretary of the Department, emeritus Institute Professor at the Massachusetts Institute of Technology, holds a B.A. in history and economics from Amherst College, and both the B.S. in chemical engineering and Ph.D. in physical chemistry from M.I.T, and James R. Schlesinger, served as Secretary of Defense under Nixon and Ford, America's first Secretary of Energy, Director of Central Intelligence, earned a B.A., M.A., and Ph.D. in economics from the Horace Mann School and Harvard University, 2006 (“National Security Consequences of U.S. Oil Dependency,” Report of an Independent Task Force, Available Online at http://pages.ucsd.edu/~dgvictor/publications/Faculty_Victor_Chapter_2006_National%20Security%20Consequences_CFR.pdf, Accessed 7/22/15)

The Task Force has identified five major reasons why dependence on energy traded in world markets is a matter of concern for U.S. foreign policy. We have also examined a sixth, the relationship of military force structure to oil dependence.

First, the control over enormous oil revenues gives exporting countries the flexibility to adopt policies that oppose U.S. interests and values. Iran proceeds with a program that appears to be headed toward acquiring a nuclear weapons capability. Russia is able to ignore Western attitudes as it has moved to authoritarian policies in part because huge revenues from oil and gas exports are available to finance that style of government. Venezuela has the resources from its oil exports to invite realignment in Latin American political relationships and to fund changes such as Argentina’s exit from its International Monetary Fund (IMF) standby agreement and Bolivia’s recent decision to nationalize its oil and gas resources. **Because of their oil wealth, these and other producer countries are free to ignore U.S. policies and to pursue interests inimical to our national security.**

Second, oil dependence causes political realignments that constrain the ability of the United States to form partnerships to achieve common objectives. Perhaps the most pervasive effect arises as **countries dependent on imports subtly modify their policies to be more congenial to suppliers.** For example, China is aligning its relationships in the Middle East (e.g., Iran and Saudi Arabia) and Africa (e.g., Nigeria and Sudan) because of its desire to secure oil supplies. France and Germany, and with them much of the European Union, are more reluctant to confront difficult issues with Russia and Iran because of their dependence on imported oil and gas as well as the desire to pursue business opportunities in those countries.

These new realignments have further diminished U.S. leverage, particularly **in the Middle East and Central Asia.** For example, Chinese interest in securing oil and gas supplies challenges U.S. influence in central Asia, notably in Kazakhstan. And Russia’s influence is likely to grow as it exports oil and (within perhaps a decade) large amounts of natural gas to Japan and China.

All consuming countries, including the United States, are more constrained in dealing with producing states when oil markets are tight. To cite one current example, concern about losing Iran's 2.5 million barrels per day of world oil exports will cause importing states to be reluctant to take action against Iran's nuclear program.

Third, **high prices and seemingly scarce supplies create fears**— especially evident in Beijing and New Delhi, as well as in European capitals and in Washington—**that the current system of open markets is unable to ensure secure supply.** The present competition has resulted in **oil and gas deals** that **include political arrangements in addition to commercial terms.** Highly publicized Chinese oil investments in Africa have included funding for infrastructure projects such as an airport, a railroad, and a telecommunications system, in addition to the agreement that the oil be shipped to China. Many more of these investments also include equity stakes for state-controlled Chinese companies. Another example is Chinese firms taking a position in Saudi Arabia, along with several Western firms, in developing Saudi Arabia's gas infrastructure.

At present, these arrangements have little effect on world oil and gas markets because the volumes affected are small. However, **such arrangements are spreading.** These arrangements are worrisome because **they lead to special political relationships that pose difficulties for the United States.** And **they allow importers to believe that they obtain security through links to particular suppliers rather than from the proper functioning of a global market.**

We note that **the United States, in the past, has also taken decisions to restrict markets partly due to similar concerns about energy security.** For example, when the trans-Alaska pipeline opened, it included a prohibition against exporting the oil. **The hostility toward proposals** by the Chinese National Overseas Oil Company (CNOOC) to purchase Union Oil of California **is seen by some as denying investment opportunity in the U.S. market in a similar manner to what the United States decries about other nations' conduct.** The Task Force believes that foreign entities should be able to purchase U.S. assets provided that the acquisitions meet the criteria established by the Committee on Foreign Investment in the United States (CFIUS).¹²

Opening a dialogue with rapidly growing consumers, notably China and India, can help those consumers gain confidence that will lead to a greater willingness to allow markets to operate. (We return to this policy recommendation later.) The United States and other consuming countries have a tremendous interest in maintaining the present open market oil commodity trading rules.

Fourth, **revenues from oil and gas exports can undermine local governance.** The United States has an interest in promoting good governance both for its own sake and because it encourages investment that can increase the level and security of supply. **States that are politically unstable and poorly governed often struggle with the task of responsibly managing the large revenues that come from their oil and gas exports.** The elements of good governance include democratic accountability, low corruption, and fiscal transparency. Production in fragile democracies, such as in Nigeria, can be undermined when politicians or local warlords focus on ways to seize oil and gas rents rather than on the longer-term task of governance. **Totalitarian governments that have control over those revenue flows can entrench their rule.**

When markets are tight, large oil consumers have tended to become especially focused on securing supply and ignore the effects of their investments on corruption and mismanagement. In Sudan, for example, despite civil war and widespread human rights abuses, the Chinese government and its oil enterprises are funding extensive oil supply and 12 Alan P. Larson and David M. Marchick, Foreign Investment and National Security: Getting the Balance Right, a Council Special Report (New York: Council on Foreign Relations Press, 2006). Findings: How Dependence on Imported Energy Affects U.S. Foreign Policy 29 infrastructure projects. China has used its threat of a veto in the UN Security Council to thwart collective efforts by other countries to manage the Darfur crisis in Sudan. Similarly, China, India, and several Western European countries continue to invest in Iran despite the need to contain its nuclear aspirations.

Fifth, **a significant interruption in oil supply will have adverse political and economic consequences in the United States and in other importing countries.** When such a disruption occurs, **it upends all ongoing policy activity in a frantic effort to return to normal conditions.** Inevitably, **those**

efforts include matters of foreign policy, such as coordination with other countries to find measures that will mitigate the consequences of the supply disruption. Some of these responses may be preplanned, such as the coordinated release of strategic reserves, but other **responses will be hurried, ineffectual, or even counterproductive.**

Sixth, some observers see a direct relationship between the dependence of the United States on oil, especially from the Persian Gulf, and the size of the U.S. defense budget. Such a relationship invites the inference that **if it were not dependent on this oil, the United States and its allies would have no interest in the region, and hence it would be possible to achieve significant reductions in the U.S. military posture.** In the extreme, this argument says that **if the nation reduced its dependence, then the defense budget could be reduced as well.**

U.S. strategic interests in reliable oil supplies from the Persian Gulf are not proportional with the percent of oil consumption that is imported by the United States from the region. Until very low levels of dependence are reached, the United States and all other consumers of oil will depend on the Persian Gulf. Such low levels will certainly not be reached during the twenty-year time frame of this study.

Even if the Persian Gulf did not have the bulk of the world's readily available oil reserves, there would be reasons to maintain a substantial military capability in the region. **The activities of Iran today and Iraq,** especially prior to 1991, **underline the seriousness of threats from weapons of mass destruction. Combating terrorism also requires a presence in the Gulf.** In addition to military activities, **a U.S. presence in the region can help to improve political stability.**

At least for the next two decades, the Persian Gulf will be vital to U.S. interests in reliable oil supply, nonproliferation, combating 30 National Security Consequences of U.S. Oil Dependency terrorism, and encouraging political stability, democracy, and public welfare. Accordingly, the United States should expect and support a strong military posture that permits suitably rapid deployment to the region, if required.

It is worthwhile to explain what should and should not be expected from this military force, and how it serves U.S. interests. Most importantly, **the conventional force of the United States deters aggression in the region. Any nation** (or subnational group) **that contemplates violence on any scale must take into account the possibility of U.S. preemption, intervention, or retaliation.** Deterrence is powerful, but it does not always work (especially if the possibility of a military response is not raised). For example, deterrence did not prevent the Iran-Iraq war of the early 1980s. Because no clear and credible signal was sent of a possible response in 1990, Saddam Hussein was not deterred from invading Kuwait. Nevertheless, **the U.S. military posture with its capacity to intervene,** if managed wisely, **can play a role in stabilizing this highly fragile region and make many countries in the region more secure from hostile action by their neighbors.**

2NC/1NR Uniqueness

They Say: “Regulations Key”

Status quo privacy regulations should solve their advantage — any more results in a loss of data collection capabilities

Goldfarb and Tucker 12 — Avi Goldfarb, Professor of Marketing in the Rotman School of Management at University of Toronto, has published over 50 articles in a variety of outlets in economics, marketing, statistics, computing, and law, holds a PhD from Northwestern, MA from Northwestern, and BAH from Queens University, with Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2012 (“Privacy and Innovation,” Innovation Policy and the Economy, Chicago Journals, The National Bureau of Economic Research, Vol. 12, No. 1, pp. 65-90, January, Available Online via Subscribing Institutions at JStor, Accessed 7/21/15)

Concerns over the use of data for targeted advertising have also led to a number of regulations designed to offer privacy protection. The first major legislation on the issue was the European ePrivacy Directive (EC/2002/58), which predominantly addressed the telecommunications sector. However, several provisions of the ePrivacy Directive limited the ability of companies to track user behavior on the Internet. **These changes made it more difficult** for a specific advertiser to collect and use data about consumer browsing behavior on other websites.

The interpretation of EC/2002/58 has been somewhat controversial as it relates to behavioral targeting. For example, it is not clear to what extent companies need to obtain opt-in consent: the provision says only that companies who use invisible tracking devices such as web bugs require the “knowledge” of consumers, and the definition of “knowledge” has been extensively debated. This is one reason why, in the recent “Telecoms Reform Package,” the European Union (EU) amended the current regulation to clarify what practices are allowed. However, in general, the limitations the current EU regulation impose on data collection by online advertisers are widely seen as stricter than in the United States and elsewhere. Baumer, Earp, and Poindexter (2004, 410) emphasize that the privacy laws that resulted from the ePrivacy Directive are far stricter than in the United States and that **“maintaining full compliance with restrictive privacy laws can be costly, particularly since that adherence can result in a loss of valuable marketing data.”**

There are also proposals for legislation in the United States. In particular, FTC (2010) suggests a move to implement a “do not track” policy that would allow consumers to enable persistent settings on their web browsers and prevent firms from collecting clickstream data. A specific privacy office within the Department of Commerce has also been suggested to monitor and regulate the use of data by firms (USDOC 2010).

Consequences.—However, such regulation will impose costs. As set out by Evans (2009) and Lenard and Rubin (2009), **there is a trade-off between the use of online customer data and the effectiveness of advertising.**

Google Revenue High

Google has an extremely high revenue now – even after spending money on driverless cars, revenues will be sustainable

Womack 7/16 — Brian Womack is a Reporter at Bloomberg News, 7-16-2015 ("Google stock soars to record high on earnings beat," Globe and Mail, 7-16-2015, Available Online at <http://www.theglobeandmail.com/report-on-business/international-business/us-business/google-profit-tops-analyst-estimates-as-company-curbs-costs/article25536408/>, Accessed 7-26-2015)//CM

Google stock soars to record high on earnings beat Google Inc.'s stock rallied in Europe trading after new Chief Financial Officer Ruth Porat signaled plans to bring more restraint to spending at the Internet search giant. Profit and sales topped analysts' estimates in the second quarter, and operating expenses rose at the slowest pace since 2013. On a conference call after the results were released Thursday, Porat -- who joined the company in May from Morgan Stanley -- said she was focused on cost controls. Reuters Jul. 16 2015, 6:15 PM EDT Video: Google's earnings beat expectations As the company seeks ways to boost revenue growth in its main Web search-advertising business and beyond, Chief Executive Officer Larry Page has been investing in new -- and sometimes expensive - - projects, from driverless cars to fast Internet service. Porat has bolstered investor confidence that the company will balance spending on such initiatives with the need to keep a tighter rein on expenses. "People are realizing it's a new era," said Colin Gillis, an analyst at BGC Financial LP. "She's coming in and she's expressing what investors wanted -- that's there's going to be cost rationalization, a degree of discipline." Google shares rose about 12 percent to the equivalent of \$672.88 at 8:47 a.m. in Frankfurt. The stock gained 3.1 percent to \$601.78 at the close in New York Thursday, and has soared 11 percent since the start of July. Porat's Priorities Profit before certain items in the recent period was \$6.99 a share, the company said in a statement. Sales, minus revenue passed on to partners, rose 13 percent to \$14.4 billion. Analysts on average projected \$6.73 a share in profit on \$14.3 billion in sales, according to data compiled by Bloomberg. "The priority is revenue growth," Porat said on the call, her first at Google, after the report. "We have a breadth of opportunity, but pursuing revenue growth is obviously not inconsistent with expense management." Second-quarter net income was \$3.93 billion, compared with \$3.35 billion a year earlier, Mountain View, California-based Google said. Revenue would have been \$1.1 billion higher had foreign-exchange rates stayed constant, the company said. Porat said Google is still investing in new businesses, just as it always has under co-founders Page and Sergey Brin. Pursuits have included the introduction of a new wireless-phone service and tests of delivery drones and Google Glass wearable computer, as well as forays into products like contact lenses that can track glucose levels and kites designed to deliver clean energy. "The founders are still in control and that dynamic still exists, so she'll have to deal with that going forward," said Josh Olson, an analyst at Edward Jones & Co. "The fact that she was hired indicates that Larry and Sergey are looking for a change in the approach around expenses." Advertising Business Google also has devoted money to improving its core advertising services, including new tools to enable purchases directly from ads and features that aim to make the buying process simpler for marketers. The company has a wide lead in the digital-advertising market over rivals such as Facebook Inc., Apple Inc. and Twitter Inc. In the recent quarter, the number of clicks on ads rose 18 percent, compared with a 13 percent increase in the first quarter, while the average cost per click fell 11 percent after dropping 7 percent in the prior period. Google's mobile cost- per-click is climbing, helping to close the gap with desktop ads, Porat said on the call. Watch time on YouTube, the company's video-sharing site, was up 60 percent, with mobile watch time more than doubling, she said.

Google's revenue is at a record high

Hall 7/16 — Stephen Hall is a Senior Editor of 9to5Google, 7-16-2015 ("Google announces Q2 2015 earnings: \$17.7 billion revenue, \$3.93 billion net income," 9to5Google, 7-16-2015, Available Online at <http://9to5google.com/2015/07/16/google-announces-q2-2015-earnings-17-7-billion-revenue-3-93-billion-net-income/>, Accessed 7-26-2015)//CM

Google today has posted its earnings for Q2 2015. The company reports revenue of \$17.7 billion, which is up 11% or \$15.9 billion year over year. Net income for Q2 2015 was \$3.93 billion. Of its total revenue, advertising consisted of right about \$16 billion, with Google's own websites accounting for \$12.4 billion. Advertising revenue is up 11% year over year, while that of Google's own sites are up 13 percent year over year. Aggregate paid clicks rose 18 percent in Q2, while cost-per-click rates fell 11 percent compared to Q2 of 2014. Google is holding a webcast at 1:30PST/4:30EST further discussing its earnings for the first quarter of 2015, and you can find that stream embedded above.

Google's revenue is on an upward spiral – sustainable growth and improving margins prove

Cardenal 7/21 — Andrés Cardenal, CFA, is a tenacious researcher of the best investment opportunities around the world. Andres is an economist and CFA Charterholder living in Buenos Aires, Argentina, 7-21-2015 ("Google Stock at Record Highs: Time to Take Profits, or More Growth Ahead?," Motley Fool, 7-21-2015, Available Online at <http://www.fool.com/investing/general/2015/07/21/google-stock-at-record-highs-time-to-take-profits.aspx>, Accessed 7-26-2015)//CM

Google (NASDAQ:GOOG) (NASDAQ:GOOGL) stock was having an uninspiring year in 2015. Shares of the online search giant were basically flat, as investors were getting disappointed with Google's financial performance over the past several quarters. However, things took a dramatic turn when Google reported rock-solid earnings for the second quarter of 2015 last week, gaining a staggering 16% in a single day and making new historical records for Google stock. Let's look at the main reasons Google delivered such an explosive gain in a relatively short period of time, and, more importantly, whether the company still offers upside potential from current levels or if the best is already in the past for investors in Google stock. Google is still growing rapidly Google is in the midst of a transformation. The online advertising industry is going through major changes because of powerful emerging trends such as the rise of mobile computing and increasing online video consumption, factors that are changing industry dynamics. Transformations are seldom easy, and Google's revenue growth has been hurt by declining ad prices, since channels such as mobile and YouTube typically mean lower average prices per ad. Besides, rising costs, as the company invests huge sums of money on all kind of growth initiatives, have taken their toll on profit margins. But Google dissipated a lot of concerns when it announced financial results for the second quarter of 2015. Not only did earnings come in ahead of Wall Street expectations, but management also highlighted some remarkably encouraging trends, which bode well for investors in Google stock over the years ahead. Total revenue during the second quarter of 2015 came in at \$17.7 billion, an 11% year-over-year increase. Unfavorable currency movements were a major headwind during the period, since total revenue in constant currency jumped by an impressive 18% versus the same quarter in the prior year. This growth rate is nothing short of extraordinary for a company as big as Google. Margins are improving, too: Traffic acquisition costs declined to 19% of revenue from 21% in the second quarter of 2014, and the company managed to contain operating costs at reasonable levels, so adjusted operating margin rose from 32% of sales to 34% of revenue in the last quarter. Promising trends The latest quarter was the first time ever that Google's new CFO, Ruth Porat, led the company's earnings conference call, and what she had to say sounded like music to investors' ears. To begin with, Google is being more disciplined when it comes to investments and expenditures, which

should drive higher profit margins over the coming quarters. In Porat's own words: The sequential deceleration in expense growth achieved in the second quarter reflects in part the benefit of expense discipline discussed in prior calls. A key focus is on the levers within our control to manage the pace of expenses while still ensuring and supporting our growth. We will do this while we continue to invest in engineering talent to keep us preeminent in innovation globally. The company is also making big inroads in mobile, reducing the price gap between desktop and mobile ads via an improved user experience and enhanced ad quality. This is another major positive for investors, since it indicates that Google will be able to sustain its enormously profitable business model under the mobile computing paradigm. According to management, more Google searches are taking place on mobile devices than on desktop in 10 countries, including the U.S. and Japan, two of Google's biggest markets. The company calculates that 30% of mobile queries are related to a specific location, which provides plenty of opportunities for growth and monetization in local search. Also, YouTube is firing on all cylinders and consolidating Google's position as a top player in online video. Watch time on YouTube was up by a staggering 60% year over year during the last quarter, the fastest growth rate the platform has seen in the past couple of years. YouTube mobile watch time more than doubled from the same period in 2014, so YouTube is rapidly expanding on mobile devices, too. Advertising dollars are going in the same direction as consumers' eyeballs. As more viewers are increasingly going online for their video content, advertisers are jumping in to capitalize on the opportunity. The number of advertisers running video ads on YouTube is up more than 40% year over year, and the average spend among the 100 top advertisers is up by 60% versus the same quarter last year. The stock is priced at a moderate premium versus the overall market: Google stock trades at a forward P/E ratio near 21, while the average company in the S&P 500 carries a forward P/E ratio in the neighborhood of 18. Still, this doesn't sound like an excessive price tag to pay for such a leading growth company. The way things are going, it looks like Google is well positioned for sustained growth over the years ahead, and current valuation levels provide attractive upside room for investors in Google stock.

Collection High

Google largest collector of data and uses data to enhance experience

Aronsky, '14 Eugene Aronsky is a Sr. SEO specialist at NetLZ and holds a Masters Degree in International Relations from Seton Hall University, ("What does Google Know about Me?", Feb. 14 2014, Available online at <http://commonseoquestions.com/2014/02/14/what-does-google-know-about-me/>, Accessed online at 07-20-15)

The Internet works great when it comes to collecting information and putting the information into our command. The privacy that was once known in America is long gone, taken away by various different websites.

Surprisingly, the biggest collector of information is Google. With so many services offered by Google, they are able to collect a large amount of data on users. Here is a taste of what Google knows about you and how they got the information. Data Collection Services Google collects information through its many services. Gmail sends what information it can find to Google for safe keeping. They even index and analyze the e-mails that you throw away. Why it collects this information is to serve as the relevant ads that Google presents you with. Google also collects information about what you buy, where you buy it, how much of it you buy, and how you pay for it. Google explains that this data is for the analytics and demographics data that can be derived from the material. Powerful Data Collection Tools If you own an Android Smartphone, you would be surprised what data Google has about you. They likely have your whole contact list, what phone numbers you called when, and even who you call often. On top of that, they have information stored about your Mobile network as well as your ISP. Chrome OS is another powerful data collection tool of Google. So, What do They Have? Google most definitely has your full name if you have signed up for any kind of service through them. They keep this information and store it for future reference. Your physical street address is also likely known by Google. Your Google Maps could have shared this information, or services like AdSense or Checkout. Having a Gmail account grants Google your phone number. Google can tell when you are online, what your latest IP address was, and even your interests. Google gets information from Google Reader as well as your Google Bookmarks. Your bookmarks can contain a massive amount of information. More? Google Web History and the Google Toolbar keeps track of every website that you go to. Google Notebook contains your "To Do" list. Google Calendar contains information about your most important appointments. Through your Gmail Contacts, Google gains information about everyone that you know. Gmail and Google Talk know what you are saying. Google finances keeps a record of what stocks that you own. Google has access to your bank account and your routing number. Google Analytics If you have a blog, Google Analytics is able to track a large variety of stats. Google knows when you publish a blog, how popular it is, and even who is reading it. By having personal pictures in Picasa Web Albums, Google knows what you look like. Google can plug your information into a search database and come up with every site that you have an account at. Google's Privacy Policy Google's Privacy Policy states that everyone's privacy is important to them. They now only save 18 months worth of search data. This data is also completely anonymous. A large amount of data can be learned from behaviors online. By combining a large body of data with Google's massive computer power, they can get an excellent idea of how to shape products that meet user's needs. Information Technology Google gains more and more information from users every day. Questions about how big Google is allowed to get and whether the government needs to step in and regulate this overwhelming amount of data that gets collected should be on the tips of everyone's tongues. Having this amazing collection of data is great, but if used by the wrong hands, the information could be used in a lot of different bad ways. If you want to know what information Google has on you, it is easy to find out. The first step is to sign in to your account with Google. Once signed in, visit <https://www.google.com/dashboard>. This will show you some of the information that they have collected about you already. Google is not going anywhere and their reign at the top of the internet world is just beginning. They are able to collect a large amount of data about the users of their products. Google knows more about you than you think.

2NC/1NR Links/ILs

They Say: "Regulations Don't Hurt"

Privacy protections undermine Google's ability to function.

ElectroSpaces, 9/15/14 ("What if Google was an Intelligence Agency?", Available Online at <http://electrospace.blogspot.com/2014/08/what-if-google-was-intelligence-agency.html>, Accessed online at 07-21-15

Google security practices are generally considered state of the art and the company recently announced support for end-to-end encryption in GMail, but the body of messages will remain unencrypted on Google's servers and accessible to the company's bots. In October 2013, Google became aware of a covert network penetration lead by the NSA, targeting communications links connecting the company's data centers, which were not encrypted.* The exact amount of user data which may have been collected by the NSA during the operation is still unclear. - Google privacy policy is sometimes cloudy, and users trying to get informed about what data they release to Google, how this data will be used and how long it will be retained, have to sift through disclaimer pages scattered on Google's websites. - As a major stakeholder in the worldwide web, Google has to bring more accountability and transparency about what is shared from its users. The user data that could potentially be provided to law enforcement agencies should be clearly and precisely marked as such. It should become clear to all users that some of their data, whether it's personal information, files, e-mails, messages, metadata from network traffic or phone calls, or even recorded communications may become available to intelligence services. - Also, Google should clarify if this information can be provided only to the law enforcement agencies of the user's country of residence or also to United States government agencies, as Google is an American company with most of its servers and activities in the US. - American web companies and cloud operators are facing growing critics about their vulnerability to US intelligence operations. Some in Europe advocates for sovereign "national clouds" restricting data retention and traffic between secured servers and users, forbidding access to the American government. During an hearing before the United States Senate in November 2013, Richard Salgado, Google's director for law enforcement and information security, stated that "in the wake of press reports about the so-called "PRISM" program", he was concerned by the trend of "data localization" that could result in the creation of a "splinternet" and the "effective Balkanization of the Internet". Data localization would also probably cost more to Google, and would place the company under the law of each country where the company processes user data. In many cases Google argued that it was established in the United States and therefore was not subjected to the law of European countries, as all data processing occurs in the USA. However in France, Google was imposed a (small) financial penalty as the administrative authority made clear that the company had to comply with the French Data Protection Act. - Google cannot condone a systematic breach of confidentiality and privacy of its users. A call to reform US government surveillance laws cannot be considered enough. Google must implement proactive measures, reinforcing its network security, offer end-to-end encryption for all of its services, securely distribute users' files hosting in their countries of residence and better inform its users of privacy risks. These measures could be seen as costly, but are necessary to maintain the trust of Google's user base and main source of revenue. Google has massive technical capabilities for user data retention, metadata collection, telecommunications monitoring, localization, mapping and imaging, all which could allow it to act as an intelligence agency. The main difference is that Google has a different goal (commercial) than an intelligence agency, but this also makes that Google gathers far more data than an intelligence agency is legally allowed to do.

They Say: “Data Not Key to Google”

Data is key Google’s advancement as a company — increasing privacy protections eliminates that data hindering technological innovation.

Harris 11 — Derrick Harris, Senior Writer and Technology Journalist at Gigaom, 2011 (“Will a Crackdown on Privacy Kill Big Data Innovation?,” *Gigaom*, May 16th, Available Online at <https://gigaom.com/2011/05/16/will-a-crackdown-on-privacy-kill-big-data-innovation/>, Accessed on 07-22-15)

As the report’s authors note, policymakers will play an important role in enabling future big data advances, both technologically and strategically. They point out and briefly discuss six issues facing policymakers:

1. Build human capital for big data
2. Align incentives to promote data sharing for the greater good
3. Develop policies that balance the interests of companies wanting to create value from data and citizens wanting to protect their privacy and security
4. Establish effective intellectual property frameworks to ensure innovation
5. Address technology barriers and accelerate R&D in targeted areas
6. Ensure investments in underlying information and communication technology infrastructure

I’ve given this issue a lot of thought over the past few months, and I think No. 3 is the key issue — not just for the future of big data, but for the future of the web in general. Unless there’s a well-reasoned balance developed between consumer privacy and business interests, goals such as information sharing and an increased pace of innovation could fall victim to the federal government’s heavy hand. As I explained in January, Congress is considering its strategy for regulating online privacy, but it’s an issue strewn with pitfalls. Here are a couple of thoughts I’ve been mulling lately:

Proposed federal regulations could hamstring technological innovation: For example, two proposed federal regulations — the Federal Trade Commission’s Do Not Track policy (which has just been endorsed by several senators in the form of the “Do-Not-Track Online Act of 2011”) and the Department of Commerce’s Fair Information Practice Principles — have the potential to seriously hamper big data and analytics innovations, illustrating the importance of striking the right balance. The regulations are fairly complex in their current states, but they strive for two separate but interrelated goals, respectively: giving consumers the ability to proactively opt out of certain data-tracking practices and giving consumers all the information — upfront and crystal-clear — about how sites are using their data. Both limit to some degree what sites can track, how they can do it, and impose penalties for violations. My concern — and one echoed by **Google** in its recent opposition to California’s proposed Do Not Track legislation — is that customer data has driven the innovation of numerous key big data technologies by major web sites, including Hadoop (within Facebook and Yahoo, especially), NoSQL databases and many of Google’s tools and projects. McKinsey highlights many of these among the list of technologies

enabling big data. **Will putting companies' analytics efforts at the mercy of consumers, and under the thumb of the federal government, reduce desire to innovate because they fear penalties or because they simply don't have the relevant data required to do so?**

Social media and the personalized could be jeopardized. This is directly related to the above concern, but is more wide-reaching. Social media sites such as Facebook, Twitter and Foursquare, and larger-scope web sites such as Google, innovate on big data technologies because their services rely on data. The only way to optimize and create a better user experience is to draw better insights into customers' activities, interests and connections. And the only way (or, at least, the primary way) to make money from such services is via targeted advertising. It's the data that drives Google's huge advertising revenues, which pay for its myriad free services, and Facebook to an \$80 billion valuation. I'm not suggesting Facebook or Google are going to fold in the face of proposed regulations, just that their services could suffer. **Less data and more regulations means less innovation and fewer risks taken.** This might be a boon for privacy, but it's a hindrance in the fast-moving web world, where major changes come from rewriting code as opposed to physically building a new project, and where services can be improved on the fly as issues arise.

Don't get me wrong, consumers deserve more information and the federal government is right to attempt to give it to them, but everyone needs to get educated on the connection between data collection and usage and the benefits they provide. If consumers value their social media and personalized web experiences, and if the government is serious about pushing analytics as a major skill set for the next-generation economy, they need to consider the issue of big data in terms of its pros as well as in terms of its obvious cons such as privacy and security implications. It might be tempting to clamp down on data practices or to click "do not track" and shut off the personal-data firehose, but such decisions could have far greater implications than meets the eye.

They Say: “No Spillover”

The plan builds on the virtuous cycle for privacy to create more reforms.

Ozer 12 — Nicole Ozer, the Technology and Civil Liberties Policy Director at the ACLU of Northern California (ACLU-NC), where she developed the organization's Demand Your dotRights online privacy campaign, 2012 (“Putting Online Privacy Above The Fold: Building A Social Movement And Creating Corporate Change” *New York University Review of Law & Social Change*, Lexis)

As noted in Part I, n226 one of the primary challenges of establishing a privacy social movement is sustainability. While the privacy community has had success in the past in addressing specific incidents, these successes did not initially lead to a coherent and sustainable privacy social movement. n227 More recently, however, advocates have successfully leveraged the environmental changes discussed in Part II to win specific battles to protect individual privacy. The privacy community has also used those victories to reinforce the climate for change and support the discussion necessary to sustain the nascent social movement. **This has helped to create a much-needed “virtuous cycle” n228 in which each successful advocacy effort reinforces awareness of the ongoing issues concerning online privacy and makes it easier both to challenge specific practices in the future and to lay the groundwork for broader-reaching change.**

Privacy protections from the government spillover into the private sector and inhibit services

Anderson 14 — Dan Anderson, staff writer for E-Net News, Elon University’s academic newspaper, 2014 (“Elon University & Pew Research Center report on the future of privacy,” December 16th, Available Online at <https://www.elon.edu/e-net/Article/105454>, Accessed on 07-20-15)

Mark Rotenberg, president of the Electronic Privacy Information Center (EPIC), said, “Within 10 years, there will be much more contentious battles over the control of identity, mobility, communications and private life. The appropriation of personal facts for commercial value—an issue that began to emerge this year with Google and Facebook’s sponsored stories—are a small glimpse of what lies ahead.” Bob Briscoe, chief researcher in networking and infrastructure for British Telecom, observed, “Society’s memory is short—Stalinism, Maoism, Nazism, and McCarthyism happened too long ago to worry about.” Jeff Jarvis, director of the Tow-Knight Center at the City University of New York, wrote, “Government, threatened by the redistribution of power brought by the Net, could succeed in claiming sovereignty over it, throttling its freedoms. Business could overstep its trust with consumers and bring regulation into place. Media could succeed in breeding moral panic—technopanic—over anything that could go wrong. But, I hope that enlightened self-interest will prevail.” Andrew Bridges, a partner and Internet law litigator and policy analyst at Fenwick & West LLP, wrote, “There will be no trusted privacy-rights infrastructure that is effective against government surveillance. Unless government surveillance of all aspects of society and of all individuals gets under control, all norms about privacy will become hollow, and the expectation of privacy will be nil. We will have

to reorder all our actions to reflect the reality that there is no privacy except for the secrecy associated with the 'Security Class,' namely those persons who get to know about others without their own actions and knowledge being known." Alex Halavais, a social sciences professor at Arizona State, said, "Our language around privacy may evolve. The word, on its own, is too broad to encapsulate the broad range of concerns. Until the issue of 'privacy' is appropriately segmented, we will have a tough time either talking about it or addressing it." Vint Cerf, Google vice president and chief Internet evangelist, responded, "Corporations and service providers will feel pressure to implement practices including two-factor authentication and end-to-end cryptography. Users will insist on having the ability to encrypt their email at need. They will demand much more transparency of the private sector and, especially, their governments. Privacy conventions will evolve in online society—violations of personal privacy will become socially unacceptable. Of course, there will be breaches of all these things, but some will be accompanied by serious social and economic downsides and, in some cases, criminal charges." Craig Newmark, founder of Craigslist, wrote, "If capable people of good will—on both policy and tech sides—can connect, then this can happen." Alice Marwick, author of "Status Update," predicted, "It will be quite difficult to create a popularly-accepted and trusted privacy rights infrastructure. This is for a number of reasons. First, countries, regions, and cultures differ in their approaches to privacy." Alf Rehn of Abo Akademi University wrote, "As privacy is becoming increasingly monetized, the incentive to truly protect it is withering away, and with so much of policy run by lobbyists, privacy will be a very expensive commodity come 2025. Some of us will be able to buy it, but most will not. Privacy will be a luxury, not a right—something that the well-to-do can afford, but which most have learnt to live without."

Privacy restrictions on governments shift the debate to corporate privacy rules

Langenderfer and Miyazaki 9 — Jeff Langenderfer, Vice President at Fifth Third Bank, previous District Manager at Huntington National Bank, holds a Bachelors Degree in Business and Finance from the University of Toledo, and ANTHONY D. MIYAZAKI, Anthony D. Miyazaki, Chair Head and Professor of the Department of Marketing in the College of Business at Florida International University, holds a PhD in Business Administration from University of South Carolina, holds a Bachelor of Arts in Business Administration from the University of Utah, 2009 ("Privacy in the Information Economy," The Journal of Consumer Affairs, Volume 43, Issue No. 3, pp. 380-388, Fall, Available Online via Subscribing Institutions to JStor, Accessed 7/20/15)

Relatively early in the computer age, it became apparent to U.S. law makers that the ability to assemble vast amounts of electronic information implicated privacy rights. The Privacy Act of 1946 controls the use of information held in federal government records by restricting disclosure of personally identifiable data, granting individuals the right to access information about them held in governmental records, allowing individuals the opportunity to amend federal records upon a demonstration of inaccuracy, and requiring federal agencies to adhere to particular standards of record keeping and maintenance.⁷ The Act was later amended to establish standards when federal agencies exchange computer records through matching programs under the Computer Matching and Privacy Protection Act.⁸

Although these statutes accomplished a great deal to ensure the fairness of governmental record keeping within the United States, federal regulation of private information practices is uneven at best and applies only to certain kinds of records. Educational,⁹ medical,¹⁰ and credit data¹¹ are all subject to specific legislative provisions as are video rental records,¹² but for many areas of record keeping in private hands, federal regulation is minimal or absent.

Largely free from federal control are such potentially sensitive areas as purchases histories for consumer products, web surfing history, employment records, and many types of insurance data. Even financial records, some of the most sensitive of any kind of privately held personal information, is only minimally federally regulated, with financial institutions required to provide consumers with opt-out options from information sharing among unaffiliated companies. In other words, it is possible, if a person takes the affirmative step, to prevent a financial institution from selling a customer's bank balance, loan payment history, and debt level to other interested companies willing to buy the data.¹³ But few customers take actually opt out, most don't even read the privacy notices (Winkler 2001), and many have little knowledge regarding the privacy regulations affecting various types of firms (Turow, Hennessy and Bleakley 2008). The onus is on the customers to control data sharing— the institution owns the data, not the customer—and information flow is largely unimpeded.

The consequence of this regulatory void is that as private data collection has grown— commensurate with the development of inexpensive computing power—**concern about the privacy implications of nongovernmental data sharing has grown also.** A May 20, 2009 ABI/Inform Global search for "privacy" in the title of a scholarly journal articles published since January 1, 2003 reveals 568 papers. Of these, virtually all of them deal with the threat to privacy posed by private data collection or the mechanics of information safeguarding. One hundred fifty-eight articles focused on computer security, 108 on electronic commerce, 144 dealt with governmental privacy regulation, 46 focused on medical data, 23 on privacy in the workplace, and 11 on identity theft. Only 32 dealt in any way with consumer responses to the current commercial data explosion, and of those, all but 10 were devoted to online privacy. In a world that relies largely on consumers to manage their own privacy, **privacy concern has evolved from a fear of intrusion to a generalized unease regarding the power that comes from easily accessible, personally identifiable data, with each area of sensitive information the subject of separate scrutiny.**

To be sure, intrusion has not disappeared completely from the radar of privacy advocates, particularly in the wake of heightened governmental security practices put into place following the events of September 11, 2001. But the lion's share of the attention is surely on information gathering and exchange and the felt intrusion that comes with the knowledge that anyone can easily discover a great deal about anyone else, from their desktop, with a modicum of skill, at little or no cost.

Against this backdrop of shifting privacy attention comes this special issue on privacy literacy. Because federal lawmakers have adopted, in the main, a hands-off approach with respect to private data collection and exchange, it has become increasingly incumbent upon individuals to take an active role in the ways they safeguard their own personal information. Privacy literacy is the understanding that consumers have of the information landscape with which they interact

and their responsibilities within that landscape. It is an area that demands understanding in a climate where the responsibility for privacy rests largely in the hands of the consuming public, and lack of literacy may have important implications.

A series of articles focusing on privacy literacy highlight the Fall 2009 issue of the Journal of Consumer Affairs. Youn writes insightfully and eloquently about student privacy concerns and their coping behavior (Youn 2009). Podar, Mosteller, and Ellen (2009) explore, through a series of depth interviews, the ways in which consumers protect themselves online. Using a more quantitative approach, Milne, Labrecque and Cromer (2009) also examine privacy protection practices in risky environments. And Stanaland, Lwin and Leong (2009) detail the responses that web sites make to different regulatory environments. To finish the special issue, an intuitive article by Norberg, Home and Home (2009) calls for the inclusion of the self in the privacy debate, an alert that may help set the agenda for the privacy debates to come. But to where from here? Though state legislators and, in some cases, state courts have periodically stepped into the regulatory void, the state of information control remains an uneven regulatory patchwork (Langenderfer and Cook 2001).

The debate has changed from government invasion to private information sharing, with intrusion and loss of privacy experienced not from police entering the sanctity of the home, but from corporate entities compiling long and accurate dossiers regarding virtually every aspect of our existence. Indeed, it seems that, given the ubiquity of private data sharing and the importance of the accuracy of many data centers, we are increasingly defined by the information that databases store about us. For celebrities, being defined by others may seem normal. For most citizens who have yet to experience their 15 minutes of fame, self-definition would seem to be an inalienable right.

Distrust toward government surveillance leads to distrust toward the private sector.

Diaz 13 — Claudia Diaz, Assistant professor at the KU Leuven Department of Electrical Engineering, COSIC (Computer Security and Industrial Cryptography) in Belgium, 2013 ("SYMPOSIUM: The Second Wave of Global Privacy Protection: Hero or Villain: The Data Controller in Privacy Law and Technologies," *74 Ohio St. L.J.* 923, Available Online at Subscribing Institutions via LexisNexis, Accessed on 07-20-15)

Constitutional privacy protections treat centralized power with distrust and require effective checks, balances, and safeguards against government surveillance. Over the past two decades, as individuals' daily lives have become increasingly mediated by technologies, government institutions have enhanced their surveillance powers through tightening collaboration with private sector entities, to create a "surveillant assemblage." Findings about the extent of government and private sector surveillance have recently reached the zenith with the constant drumbeat of revelations about the NSA and GCHQ. Information privacy law, a legal framework arising in the 1970s to protect individuals' data privacy, provides little protection against such surveillance risks. This relatively new legal framework bridges two distinct trust paradigms: one assuming that data controllers are trusted entities, the other assuming that, in a similar vein to

the constitutional framework, data controllers should be treated with suspicion and distrust. Over the past few years, the legal framework has shifted from focusing on data minimization, a cornerstone of the untrusted controller model, to imposing information stewardship obligations on data controllers who are increasingly viewed as custodians of individuals' rights. These obligations, typically grouped under the title "accountability," are based on a notion of the data controller as a trusted party. In stark contrast, the technological community researching PETs proceeds from a diametrically opposed perception of a data controller, that of an adversary. Under this approach, information disclosed to a data controller is compromised and can no longer be viewed as private, given that a data controller itself may subject individuals to persistent surveillance.

Inter users will soon demand privacy from the private sector, not just the government.

Rainie and Anderson 14 — Lee Rainie, Director of Internet, Science, and Technology at the Pew Research Center, Janna Anderson, Director of the Imaging the Internet Center at Elon University, 2014 ("The Future of Privacy," *Pew Research Center*, Available Online at http://www.pewinternet.org/files/2014/12/PI_FutureofPrivacy_1218141.pdf, Accessed on 7-21-15)

A variety of views in regard to this issue are reflected in these big thinkers' imaginings of what may happen by 2025.

'Social punishment may have to be accompanied by legislation'

Vint Cerf, Google vice president and chief Internet evangelist, responded, "The public will become more sophisticated about security and safety. Corporations and service providers will feel pressure to implement practices including two-factor authentication and end-to-end cryptography. Users will insist on having the ability to encrypt their email at need. They will demand much more transparency of the private sector and, especially, their governments. Privacy conventions will evolve in online society—violations of personal privacy will become socially unacceptable. Of course, there will be breaches of all these things, but some will be accompanied by serious social and economic downsides and, in some cases, criminal charges. By 2025, people will be much more aware of their own negligent behavior, eroding privacy for others, and not just themselves. The uploading and tagging of photos and videos without permission may become socially unacceptable. As in many other matters, the social punishment may have to be accompanied by legislation—think about seat belts and smoking by way of example. We may be peculiarly more tolerant of lack of privacy, but that is just my guess."

Since intelligence agencies rely on private companies for the data, the private sector's relationship with consumers are also at risk.

EFF 14 — Electronic Frontier Foundation, leading non-profit organization defending privacy and civil liberties, 2014 ("Big Data in Private Sector and Public Sector Surveillance," *EFF*, April 8th,

Available Online at <https://www.eff.org/files/2014/04/08/eff-big-data-comments.pdf>, Accessed on 7-21-15, NYL)

How should the policy frameworks or regulations for handling big data differ between the government and the private sector? Please be specific as to the type of entity and type of use (eg, law enforcement, government services, commercial, academic research, etc.).

First, government use of big data is inherently subject to constitutional constraints, while private sector use of big data is typically subject only to statutory constraints, with two significant caveats. In California, for example, private actors are subject to the state constitutional privacy right. And even under the federal constitution, private actors can in some circumstances violate individual rights under the state action doctrine. Of particular importance are the predication and particularity values of the Fourth Amendment, the due process values of the Fifth Amendment, the reasoned elaboration values of Article III courts and the democratic accountability of the Constitution itself.

Second, the policy framework for law enforcement and intelligence uses of big data is distinguishable from most other contexts by its lack of transparency. Obviously, law enforcement and intelligence agencies typically collect data in secret and without the consent of the people being surveilled. Secrecy also interferes with public knowledge about these surveillance practices and technologies. Particularly in the intelligence realm, **the system of classified information and the state secrets privilege distorts normal processes of democratic accountability essential to legitimate constitutional government. And because these law enforcement and intelligence agencies often rely on data collected by the private sector, these distortions also directly affect individuals' trust relationships with business.**

They Say: “Privacy Violations are Intrusive”

Google’s data collection for the purpose of online advertising is not invasive and increases innovation.

Goldfarb and Tucker 12 — Avi Goldfarb, Professor of Marketing in the Rotman School of Management at University of Toronto, has published over 50 articles in a variety of outlets in economics, marketing, statistics, computing, and law, holds a PhD from Northwestern, MA from Northwestern, and BAH from Queens University, with Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2012 (“Privacy and Innovation,” Innovation Policy and the Economy, Chicago Journals, The National Bureau of Economic Research, Vol. 12, No. 1, pp. 65-90, January, Available Online via Subscribing Institutions at JStor, Accessed 7/21/15)

Online advertising is perhaps the most familiar example of how firms use the rich data provided by users of information and communication technology. Online advertising is also distinctive among advertising media in its application of detailed data collection. Key to this data collection effort are two important differences between online advertising and offline advertising — “targetability” and “measurability.” Targetability reflects the collection and use of data to determine which kind of customers are most likely to be influenced by a particular ad. Measurability reflects the collection and use of data to evaluate whether the advertising has actually succeeded (Goldfarb and Tucker 2011a). Targetability and measurability have helped make advertising-supported Internet companies, such as Google and Facebook, among the fastest growing and most innovative in the U.S. economy.

Targeting occurs when an advertiser chooses to show an ad to a particular subset of potential viewers and displays the ad online to that subset rather than to everyone using the media platform. An example would be choosing to advertise cars to people who have recently browsed web pages devoted to car reviews and ratings. No newspaper or television station can offer this level of targeting. The targetability of online advertising can be thought of as reducing the search costs to advertisers of identifying consumers. Targeting advertising has always been known to be desirable, but Internet advertising has two primary advantages over offline advertising. First, the online setting makes it virtually costless for advertisers to collect large amounts of customer data. Second, Internet technology makes it relatively easy to serve different customers different ads because packets are sent to individual computers. In contrast, with current technology, targeting individual customers with newspaper or TV ads is prohibitively expensive.

These innovative targeting methods require media platforms to collect comprehensive data about the web pages that customers have browsed. Typically, advertisers and website owners track and identify users using a combination of cookies, flash cookies, and web bugs. Many advertising networks have relationships with multiple websites that allow them to use these

technologies to track users across websites and over time. By examining past surfing and click behavior, firms can learn about current needs as well as general preferences. Reflecting the value of this behavioral targeting to firms, Beales (2010) documents that in 2009 the price of behaviorally targeted advertising was 2.68 times the price of untargeted advertising. Lambrecht and Tucker (2011) further show that the performance of behavioral targeting can be improved when combined with clickstream data that help to identify the consumer's degree of product search.

Increasing Privacy Protections will result in decreased operation efficiency.

Google's surveillance is not a massive violation of privacy.

Lenard and Rubin '09 , Thomas M. Lenard, Professor and Senior Fellow at Tech Policy Institute and Paul Rubin, Professor of Economics at Emory University and Ph. D for Purdue University ("IN DEFENSE OF DATA: INFORMATION AND THE COSTS OF PRIVACY", Tech Policy Institute, May 2009, Available online at <https://www.techpolicyinstitute.org/files/in%20defense%20of%20data.pdf>, Accessed 07-16-2015)

At the highest level of data collection, users can opt in for Google's "Web History" service for users with Google accounts (those who use Gmail, Google Documents, Google Reader, or most other Google services), which tracks, indexes, and archives search history. Data are available both to the user for future reference and to Google itself for analysis. Yahoo! offers and uses data collected by these applications for behavioral targeting in advertising. Users concerned about ensuring personal privacy when using search engines have a variety of technological tools at their disposal to choose a level of activity-monitoring with which they are comfortable. Search engines provide some of these themselves; for example, users can opt out of Google's Web History (which is opt-in to begin with), pause monitoring, or delete their collected search and browsing history altogether. Yahoo!, AOL, and MSN also allow users to opt out of similar behavioral targeting systems. Other privacy protections rely on client-side techniques. Users of Internet Explorer and Firefox can easily delete Google's tracking cookie, which is essential for tying together separate personal data streams. In addition, several free browser extensions and utilities can clear the cookie or require Google to provide a new one at the start of each browsing session. Web proxies and anonymizing applications like Tor easily conceal user IP addresses, although because of their architecture they often reduce bandwidth speeds. At the most basic level, a dedicated user could potentially even —spoof|| TCP source addresses to prevent Google from monitoring immediately previous search results. The costs in time and difficulty of these solutions tend to increase as the desired level of privacy increases, but minor actions can have huge marginal effects on privacy protection—for example, opting out of Web History takes only a few clicks but prevents collection of a significant amount of personal data, whereas browsing entirely anonymously requires more effort to set up. Finally, all major search engines offer privacy policies in compliance with the requirements of both United States and European data security laws. These policies disclose the 22 companies' use of personal information and require user notification and consent before transferring personal information to others. Users of search engines essentially face a tradeoff between protecting their personal privacy and the speed and relevance of their search results. As personalized search algorithms and behavioral targeting techniques grow in popularity and precision, this tradeoff will likely become more and more evident to the everyday user of search technology. Considering the current availability and ease of use of tools for protecting personal information, **the greatest threat to individual privacy is not search engines themselves, but the governments that may seek their records.**

Companies vary in the degree to which they have protected data from government requests. In 2006, Google resisted a Justice Department subpoena for millions of user search records, while Yahoo!, AOL, and MSN complied and handed over detailed server

logs. It is unclear whether search engines have aided government agencies in other surveillance efforts. Google declared publicly in March 2008 that it —was not part of the NSA’s Terrorist Surveillance program,|| but this statement does not rule out the possibility of collaboration in other monitoring schemes. Could search engines exist and organize information without collecting any personal information? They could—consider Google’s early years, when search rankings were based primarily on analysis of incoming links. However, Google attributes much of its success in developing better search algorithms to careful analysis of consumer behavior that is stored in its logs. Going forward, it is likely that user information will continue to be useful in providing searchers with relevant results and sustaining the business model that makes free search engines viable.

They Say: “Private Sector Bad”

Private sector data collection allows for innovation and more – restricting that would detrimental for society

New 2/5, (Joshua, a policy analyst at the Center for Data Innovation. He has a background in government affairs, policy, and communication. Prior to joining the Center for Data Innovation, Joshua graduated from American University with degrees in C.L.E.G. (Communication, Legal Institutions, Economics, and Government) and Public Communication, “A Lot of Private-Sector Data is Also Used for Public Good”, Center for Data Innovation, 2/5/2015, <http://www.datainnovation.org/2015/02/a-lot-of-private-sector-data-is-also-used-for-public-good/>) BBer

The unprecedented collection of data by the private sector has been a boon for the average citizen, but **government restrictions could have a chilling effect. As the private sector continues to invest in data-driven innovation, the capacity for society to benefit from this data collection grows as well.** Much has been said about how the private sector is using the data it collects to improve corporate bottom lines, but positive stories about how that data contributes to the greater public good are largely unknown. This is unfortunate, because data collected by the private sector is being used in a variety of important ways, including to **advance medical research, to help students make better academic decisions and to provide government agencies and nonprofits with actionable insights.** However, **overzealous actions by government to restrict the collection and use of data by the private sector are likely to have a chilling effect on such data-driven innovation.** Companies are working to advance medical research with data sharing. Personal genetics company 23andMe, which offers its customers inexpensive DNA test kits, has obtained consent from three-fourths of its 800,000 customers to donate their genetic information for research purposes. 23andMe has partnered with pharmaceutical companies, such as Genentech and Pfizer, to advance genomics research by providing scientists with the data needed to develop new treatments for diseases like Crohn’s and Parkinson’s. The company has also worked with researchers to leverage its network of customers to recruit patients for clinical trials more effectively than through previous protocols.

Private-sector data is also helping students make more informed decisions about education.

With the cost of attending college rising, data that helps make this investment worthwhile is incredibly valuable. The social networking company LinkedIn has built tools that provide prospective college students with valuable information about their potential career path, field of study and choice of school. By analyzing the education tracks and careers of its users, LinkedIn can offer students critical data-driven insights into how to make the best out of the enormous and costly decision to go to college. Through LinkedIn’s higher-education tools, students now have an unprecedented resource to develop data-supported education and career plans. **Government agencies and nonprofits, which often lack the capacity to do their own large-scale collection and analysis, are using data from the private sector to advance their own missions.** The nonprofit organization GiveDirectly discovered that the materials used for housing, such as metal roofs versus cheaper, homemade thatched roofs, are a good indicator of economic status in rural Africa. The group now analyzes satellite imagery from Google Maps to identify the poorest households in Uganda to prioritize aid delivery. Elsewhere in Uganda, a United Nations project has begun mining Facebook data to better understand perceptions surrounding contraception and teenage pregnancy in an effort to improve public health outcomes. By analyzing the content of Facebook posts, UN workers have begun to better understand attitudes towards condom use, abstinence, teen pregnancy and HIV/AIDS — incredibly valuable information in a country where one in four girls between the age of 15 and 19 are pregnant and 7.2% of adults have HIV — and increase the efficacy of the policies and programs to address these public

health concerns. Finally, in the United States a researcher at the Food and Drug Administration mined 1.4 million electronic health records from health insurer Kaiser Permanente to determine that the popular arthritis and pain drug Vioxx posed serious health risks and should be withdrawn from the market. **These beneficial uses of private-sector data are not just one-off, isolated occurrences — just this past month two major tech companies have offered to put valuable and even potentially life-saving data to good use for the public.** Facebook will now start matching users' location data to Amber Alerts to rapidly spread awareness about missing children, and Uber will be donating its anonymized transportation data to city governments to help reduce congestion and enable better city planning. However, **it is important to keep in mind that many of these success stories could have been blocked by rules limiting data collection or unnecessarily restricting data reuse.** If researchers had not been allowed to analyze data from the electronic health records of Kaiser's patients, it might have taken more time to prove the harmful effects of Vioxx. The takeaway for policymakers should be **that data, even or perhaps especially in the hands of the private sector, has enormous potential to improve societal welfare, and so government should be cautious about implementing well-intended restrictions that limit data-driven innovation.**

They Say: “No Adoption”

Google’s cars will get adopted – efficiency and current adoption is increasing
Fancher 14, Lou Fancher is a Reporter for the SF Weekly, 2014 (“Hard Drive: Self-Driving Cars Are Closer Than They Appear “, February 2014, Available at <http://www.sfweekly.com/2014-02-19/news/google-self-driving-cars-center-for-automotive-research-darpa/>, Accessed 07-26-15)

Before 2009, it was a secret. In 2010, it became an announcement. And from 2011 on, Google's self-driving car program has been an intriguing spectacle. Now, five years on, Google cars regularly traverse Bay Area byways, sensing their surroundings and operating off internalized maps. At a late-January lecture at Livermore's Bankhead Theater, Google senior staff engineer Mike Montemerlo played a video compilation. A windshield-mounted camera showed faultless journeys: through dark mountain roads filled with big rigs and leaping deer; a residential, stroller-infested Mountain View neighborhood; a FasTrak toll booth; and highway construction sites. And what Bay Area driving test would be complete without a meander down pedestrian-rich Lombard Street? Throughout 10 challenging routes and 1,000 miles, the self-driving phenomenon performed like a robotic Galileo. Originally composed of a tiny fleet of toaster-topped Priuses and one Audi TT, the program now boasts a dozen Lexus SUVs sporting Silicon Valley tech company Velodyne's Light Detection and Ranging system (LIDAR). Spinning at up to 900 rpm, the 64-laser rooftop whirlygig creates a 360-degree point cloud — an enhanced "driver's" view. Other than the vehicles' high-tech hats, Google's autonomous cars hide their hardware: algorithm-loaded computers in the trunk, radar under the front hood, Vestigial Actuators where they always are (VAs are code for brake, accelerator, steering wheel). In the car's interior, the only aberrant features are a passenger with a data-collecting laptop and a Big Red Button (known as the BRB) — a clown-sized, electronics interruption knob to punch in a crisis. (Self-driving car language is rife with acronyms, applied to everything from roadkill to potholes to the car's sensitive circuitry.) Beyond the geeky fascination, Google's program wields enough clout to earn commentary from transportation experts all over the Bay Area. At a sustainable transportation conference sponsored by Chevron in Concord in late January, Oakland-based Cambridge Systematics partner and ITS-Midwest Vice President Christopher Hedden said the interesting part isn't the technology, it's how we will live in the smart-car future. "Google's goal is to reduce the number of cars on the road. This will impact where you choose to live," he said. "Imagine an autonomous Winnebago. Get in after work at 7 p.m. and say, 'Take me to L.A.'" Turning to more serious matters, Hedden said connected vehicles and self-driving cars will greatly reduce drunken driver-related accidents. Self-driving cars trace their origin to a Defense Advanced Research Project Agency invention, the DARPA Grand Challenge. Frustrated in its efforts to develop self-operating vehicles, the Department of Defense in 2004 dangled a \$1 million prize (subsequently \$2 million) for inventing a car capable of traveling 132 miles in the desert without a driver or remote control. The first year's winner managed to cover only 7.5 miles. But bright minds at places like Carnegie Mellon University and Stanford were turned on. In 2005, the second year, Montemerlo's Stanford team completed the course and won with "Stanley," a VW Touareg stuffed with computers. After 2007, DARPA's focus turned to robotics; the corporate world had taken the self-driving car challenge and run with it. Safety, Montemerlo says, is the No. 1 reason "you need this car in your driveway." With 32,778 auto-related fatalities in 2010 — 1.5 million worldwide, on average, per year — he said, "anything we can do to make driving safer can potentially save thousands of lives." Smart cars save lives, he argues, by reducing human error. An autonomous vehicle doesn't get mad, drink and drive, fall asleep, text illegally, become legally blind or too old to drive responsibly — but remain too independent to stop — or practice playing trombone. Montemerlo showed actual photographic evidence of a driver practicing his instrument, earning a big laugh, but statistics from

the American Automobile Association prove the sobering truth: Ninety-three percent of the 6 million annual crashes are attributable to human error. Improved safety and economics also come from autonomous driving's efficiency. Total lane capacity on a freeway is estimated by experts to be 2,000 vehicles per hour. At peak capacity, only 15 percent of the space is used, according to Montemerlo. But that would change if sensors were allowed to command a car and decrease the "cushion" needed to drive safely. "If we could use more of the space, we could double the capacity of the road," Montemerlo said. Instead of adding lanes to handle congestion (costly construction), smart cars could operate more cars on existing roads, leaving more funds for road maintenance. Plus, greater efficiency would reduce the amount of time (and fuel) people burn up on the road: 30 billion hours per year, studies show.

Revenue Internal Link

Advertising revenue is a driving factor for internet companies profits, especially Google.

Investopedia 15 — Investopedia is a popular financial website that includes a wide variety of financial voices, 2015 ("How important is advertising revenue in the Internet sector?," Early 2015, Available Online at <http://www.investopedia.com/ask/answers/041015/how-important-advertising-revenue-internet-sector.asp>, Accessed 7-21-2015)//CM

Advertising revenue is extremely important to the Internet sector, though reliance on advertising revenue varies among industry participants. Certain Internet firms such as Amazon, eBay and Priceline operate online marketplaces and derive revenue from premium postings and commissions from sales on their respective platforms, reducing the importance of advertisements. Companies such as Salesforce generate revenue by charging users for services. This model is becoming increasingly popular as software-as-a-service providers proliferate, especially for enterprise solutions. Media companies such as Netflix or the Wall Street Journal can charge users for subscription memberships because they offer unique, high-quality content. E-commerce retailers generate income through retail sales in the same manner as traditional brick and mortar retailers. Advertising generates the vast majority of revenue in the search and social media portions of the Internet industry. Google, Yahoo and Baidu all rely heavily on income from advertising. According to Search Engine Watch, 47% to 64% of total website traffic comes through search engines. This allows search providers to charge vendors for display ad placement or sponsored search results. Popular social networks such as Facebook and Twitter have become common mediums for communication and entertainment, resulting in heavy traffic and access to substantial user data. User volume and targeted advertising are attractive to businesses that are trying attract customers, and social networks have exploited this advantage substantially. To illustrate these points, consider the 2014 annual filings for the largest Internet firms. According to Pricewaterhouse Cooper, the ten largest U.S. companies in terms of digital ad revenues control 71% of the market, and the next 15 companies hold an additional 11% market share. The largest companies provide an excellent gauge of overall industry conditions. For the online marketplace operators Amazon, eBay, Alibaba and Priceline, advertising revenues contributed 7%, 16%, 1.6% and 5% respectively. These advertising contributions also include revenue from marketing solutions and other services, meaning that the actual ad revenues are even lower than the available figures. Salesforce derives substantial income from subscription fees and support services, and advertising income is not even mentioned in its 2014 10-K. Netflix similarly generates substantial revenues from membership fees, and it does not publish figures related to ad sales. Advertising contributed 90% of Google's total revenue, 79% of Yahoo's total revenue and 99% of Baidu's total revenue. Digital advertising accounted for 92% and 90% of Facebook's and Twitter's total revenues, respectively. The importance of advertising revenue will continue to grow as technology advances. According to a 2014 report by Pricewaterhouse Cooper, U.S. online advertising revenues grew 15.1% year over year to \$23.1 billion in the first half of 2014. During this same period, mobile ad spending grew 76%. As mobile devices become ubiquitous, local, real-time and precisely targeted advertising will become increasingly valuable for businesses.

Advertising makes up the majority of google's revenue

Bott 14, (Ed, an award-winning technology writer with more than two decades' experience writing for mainstream media outlets and online publications. He has served as editor of the U.S. edition of PC Computing and managing editor of PC World; both publications had monthly paid circulation in excess of 1 million during his tenure, "Apple, Google, Microsoft: Where does the money come from?", Zdnet, 2/6/2014, <http://www.zdnet.com/article/apple-google-microsoft-where-does-the-money-come-from/>)

GOOGLE Two years ago, Google was a one-trick pony, with its revenues coming almost entirely from advertising. According to its 2011 annual report, "Advertising revenues made up 97 percent of our revenues in 2009 and 96 percent of our revenues in 2010 and 2011." That picture changed slightly with Google's attempt to move into hardware manufacturing via its acquisition of Motorola Mobility, as you can see in this chart. But the pending sale of Motorola Mobility to Lenovo will shift things back to nearly the way they were. The "Other" category, which includes digital content and non-Motorola hardware products, is still a tiny fraction of the company's revenues. After the Lenovo transaction closes, Google's advertising revenues will go back to being more than 90 percent of its total.

PRISM Link

Google's intelligence will reduce if PRISM is curtailed

,Available online at <http://thedailyjournalist.com/wp-content/uploads/2014/06/rja-privacy-v-spying.pdf>, Accessed online at 07-14-15

However they do help explain many effects beyond mere information security. A further set of examples comes from studying dependability in network industries, from the power industry to the ISPs and other firms that provide the Internet itself [4]. Here again there are other externalities; for example, a utility that suffers an outage faces the cost of lost customer minutes, while the social costs are very much greater. But in many utilities, network effects play a role in industry dynamics, along with technical lock-in and marginal costs. Curiously, scholars of government appear to have paid little attention to these factors. Experts in public choice study how people act within institutions, while the international relations community observes the interaction between them. The latter school is divided between realists (Thucydides, Machiavelli, Hobbes, Kissinger ...) who see relations between states as a cynical zero-sum game, and liberals who believe in international institutions, global norms and interdependence (Kant, Wilson, Keohane, Clinton ...) – but even the liberals pay little or no attention to network effects. There is some specialist literature on whether governments should interfere in markets with network effects, or with behaviours that have a social-network component such as smoking and obesity, but this tends to focus on the likely effectiveness of intervention; its takeaway message is the pessimistic one that regulating networked industries is hard, and behaviours with entrenched social-network support can be hard to change. The Snowden papers reveal an **international surveillance network** whose scale **surprised even industry insiders and security experts**. In order to understand how this might be brought under appropriate political, judicial and social control, we need to understand its dynamics. **Of course these depend hugely on the economics of the communications service industries; it was the existence of large service firms like Google, Facebook, Yahoo and Microsoft which control the personal information of many millions of people that enabled the intelligence agencies to gain cheap and convenient access via PRISM**, while the relatively small number of international cable operators facilitates TEMPORA. But that is not all.

2NC/1NR Impacts

Innovation Module

Google has significant influence on the world – a loss of revenue would preclude future innovations that can change the shape of our future

McFarland 14— Matt McFarland is the editor of Innovations at the Washington Post, 1-14-2014 ("7 reasons why Google is the most fascinating company in the world," Washington Post, 1-14-2014, Available Online at <http://www.washingtonpost.com/blogs/innovations/wp/2014/01/14/7-reasons-why-google-is-the-most-fascinating-company-in-the-world/>, Accessed 7-21-2015)//CM

Just Google it. The word is synonymous with searching the Web. But given the sweeping goals of the company, the word Google might come to mean something else in pop culture. Google made a big move Monday, announcing plans to acquire Nest Labs for \$3.2 billion. With Nest on board Google continues to position itself to change the world on a grand scale. Here are seven reasons why Google's future will be incredibly interesting: Tony Fadell has a proven track record. What will he do next? (Marcio Jose Sanchez/AP) 1. They now have a key player behind the iPod and iPhone on their side. Before he was CEO of Nest, Tony Fadell led the Apple team that developed the iPod. He's sometimes called "the Podfather" and had a hand in the iPhone as well. This is huge for Google, a company that has lacked a hip, aesthetic touch. Google Glass looks like something for cyborgs. Apple has long had talent for making beautiful objects that can win mainstream acceptance. Take one look at the Nest Thermostat or Nest Protect and you'll be struck by its looks. With at least 100 former Apple employees now joining Google, a lack of elite design instincts is addressed. Meet the Nest Thermostat. (Justin Sullivan/Getty Images) 2. The Internet of Things is exploding, and Google has its hottest products. Not long ago, a phone was something you simply placed calls on. Now, a smartphone can be used as flashlight, alarm clock, pocketwatch, calculator, GPS, camera and more. The gadgets smartphones don't kill off will be reinvented too with computer chips and online access. We're realizing the potential of the Internet of Things, in which everyday objects harness the power of digital chips and Internet access. Nest's two products — a thermostat and smoke detector — have received near universal praise. Fadell's team has a secret sauce and an advantage over everyone else in this space. Whatever unloved household device they seek to reinvent next will likely be a hit. Driving may be fun, but it isn't healthy. (Chris Ratcliffe/Bloomberg) 3. The self-driving car may be the most important innovation of the 21st century. Motorized vehicles kill 1.24 million people per year worldwide. That number is on pace to triple to 3.6 million by 2030. Self-driving cars offer a solution. Who happens to be a key player in this space? Google. 4. They're hoarding robots for who knows what. Google bought eight robotics companies in 2013 to pursue what it admits is a "moonshot." One of those companies won the DARPA robotics challenge in December, which suggests that Google has a leg up on competitors. It's been reported that its early robotics efforts will focus on electronics assembly and manufacturing. Instead of limiting itself to its core business of Web search, Google has expanded its tentacles into whatever it finds interesting or potentially world changing. It even bought a company that makes airborne wind turbines. A Google Fiber technician gets supplies out of his truck to install Google Fiber in a residential home in Provo, Utah. (George Frey/Reuters) 5. Google is quietly building a telecom network. Google controls more than 100,000 miles of fiber-optic cables around the world, according to the Wall Street Journal. For comparison's sake, that's more than twice the size of Sprint's network. They're experimenting with Google Fiber, which brings uncommonly fast Internet to a nation that is lagging behind the world in Internet speeds. While Google Fiber's current reach is limited, its existence is a reminder to consumers and rival Internet providers that better service can and should exist. If the country that invented the Internet is going to lead the world in Internet speeds, Google Fiber will nudge us forward. 6. They'd like to cheat death. You've heard the expression — nothing is certain but death and taxes. But it may not even be a certainty if Google has its way. Its funding Calico, which will tackle aging and related diseases. 7. Google doesn't care for convention or

precedent. Companies, individuals and armies falter when they expect the future to resemble the past. Because the past is all we know, imagining the future is a challenge. "We look at the present through a rear-view mirror. We march backwards into the future," media theorist Marshall McLuhan once wrote. Google doesn't have this problem. "Don't be surprised if we invest in projects that seem strange or speculative compared with our existing Internet businesses," Google CEO Larry Page wrote in September. He's open to radical and different thinking. His idea as a Stanford grad student of downloading the entire Web onto a computer may have seemed crazy, but it was the foundation of Google. As Yahoo CEO Marissa Mayer once put it, "Larry's superpower is asking 'Why not? Why does it have to be this way?'" Page's outlook is the perfect fit for leading a company in an era of revolutionary technology. Google says its mission is to organize the world's information and make it universally accessible and useful. With these new ventures a more accurate — and appropriately shorter — slogan might be "reorganizing the world." Eventually our planet will see a company with a market cap of \$1 trillion. If Google can put all the pieces together and keep innovating, they have a good chance. Whether they succeed or not, the road ahead will be exciting.

Innovations in business are key to competition in the future.

Macfarland 13 — Scott Macfarland is a Digital marketer and brand strategist, 2013 ("Why Is Innovation Management So Important to Compete?," Huffington Post, 10-30-2013, Available Online at http://www.huffingtonpost.com/scott-macfarland/why-innovation-management-is-important_b_4174482.html, Accessed 7-21-2015)//CM

In reality, innovation management is really just a form of looking into the future, being creative and imaginative so that you can carve out a new niche before your competitors. Business must look ahead, not behind. It's not just the big companies that need to do this. Every business must innovate to compete. They must create new products and services for new markets. They must be creative, and come up with new ideas that never would have been thought of before. This is the new management paradigm. Get used to it, it's not going away anytime soon. Here's what will happen. Everything will speed up. Processes, functions, data, inventory turns and speed to market, will force employees to learn a whole new language called innovation. Business as usual doesn't cut it any more. Enter innovation management. The proven management tools, techniques and clichés once embraced, are being challenged and shelved for a new set of rules and a new way of doing business. The management style of the future is no longer command and control. That ship has sailed. Today, in order for businesses to succeed, management must trust in the technologies and open leadership styles that are sweeping boardrooms, the C-suite, office suites and cubicles everywhere. In fact, today's companies are implementing new job titles that are rapidly appearing on business cards and office doors. So, which one will you hire next? Chief Innovation Officer, Chief Ideation Officer or Chief Digital Officer? Ten years ago, you would have been laughed out of the building if these were printed on your business card. Not today. According to Idris Mootee who wrote the book Design Thinking for Strategic Innovation, Innovation Management is about more than just planning new products, services, brand extensions, or technology inventions. It's about imagining, mobilizing, and competing in new ways. I couldn't agree more. This may sound like it's just another day in the office, however, it's clear that imagining new ideas and competing in new ways is extremely challenging, even for the biggest and best of companies. So, how do companies forge ahead so they can be change agents for the next generation? I believe one way is to immerse themselves in the benefits of what the internet offers. The world as we know it has actually become smaller as a result of the convenient connectedness of the internet. Some businesses have fully embraced the global online economy and real time, digital, interactive communication we now have at our fingertips, all of which didn't exist that long ago. Consequently, a massive paradigm shift in how business is conducted has paved the way for an environment that desires more and demands more. In the online environment, everyone communicates more, and in more ways, shares more information, creates more content, trashes more, stores more, and buys more of just about everything a human or business could possibly want. People and businesses also have more friends in their contact list. Based on the trends, we are addicted to more, and it's embedded in the business

environment. Expectations are now rising at alarming rates, and the speed of business is no longer fast enough to keep up with the speed of innovation. Guess what? There is no end in sight. Businesses around the world are more connected than ever before. Just ask any company how many smartphones they have, how many tablets and laptops they have, how many virtual meetings are held with clients, and how many emails and text messages are sent. Oh, and we haven't even talked about the use of social technologies. Being connected is probably the most powerful influencer of innovation. There are many reasons for this. The immediacy and accuracy of real-time data transfer has become the norm. We now have the ability to share and connect with people, groups, and companies around the world. The quality and ease of use of digital media is not just for professionals any longer. Online learning and the global reach of it have changed the face of learning. Mobile technologies, cloud based storage, computing, medicine and space have continued to amaze us year after year. The list could go on. Some form of innovation touches every aspect of our life. In my opinion, innovation is also required to be competitive today and tomorrow. Managing that expectation and deliverable is critical for sustainable growth to OCCUR. In thinking about sustainable growth, I spoke with Kevin Wells, Executive Vice President, Global Market Development for Reach Analytics. Kevin's comments were quite telling when discussing how to predict innovation for growth purposes. How do you predict innovation, and also leverage predictive analytics so that your business can use that information to create growth? Predicting innovation has always been part science, part black magic and part luck. The world of data gives us the ability to maybe leverage the science and luck parts of that equation a little more. We are a predictive analytics firm so we have to eat our own dog food so to speak. We look at the trends the data uncovers and then we look at the variables that are more difficult to quantify. And then we make what we think are good business decisions. But they are based on facts more than gut. Big data uncovers things humans would overlook -- if you know how to look for them. The future is not like the past It's no longer the speed of business that creates challenges. It's the speed of disruption that is permeating our business models in seemingly every possible way that is causing businesses to rethink how they operate. The speed of disruption is also the trigger that is causing entire industries to think about how to re-purpose what they have, and redefine a new sense of the brand. They are realizing their current model may not be sustainable. Welcome to the new business paradigm. Welcome to innovation management.

Competitiveness among businesses is key to stimulate the economy — 4 warrants

Kolasky 2 — William J. Kolasky, Deputy Assistant Attorney General in the Antitrust Division for the U.S. Department of Justice, 2002 ("The Role Of Competition In Promoting Dynamic Markets And Economic Growth," Address Before the TokyoAmerica Center, November 12, Available Online at <http://www.justice.gov/atr/speech/role-competition-promoting-dynamic-markets-and-economic-growth>, Accessed 7/16/15)

The most obvious benefit of competition is that **it results in goods and services being provided to consumers at competitive prices.** But what people often forget is that producers are also consumers. They must buy raw materials and energy to produce their products, telecommunications services to communicate with their suppliers and customers, computer equipment to keep track of their inventories, construction services to build their plants and warehouses, and so forth. To the extent that prices for these goods and services are higher than those of their foreign competitors because of a lack of competition in those markets, firms will be less competitive and will suffer in the marketplace.

A second benefit of competition is its effect on efficiency and productivity. **Companies that are faced with vigorous competition are continually pressed to become more efficient and more productive.** They know that their competitors are constantly seeking ways to reduce costs, in

order to increase profits or gain a competitive advantage. With that constant pressure, firms know that if they do not keep pace in making efficiency and productivity improvements, they may well see their market position shrink, if not evaporate completely. It is exactly this process of fierce competition between rivals that leads firms to strive to offer higher quality goods, better services and lower prices.

A third benefit of competition is its positive effects on innovation. In today's technology-driven world, innovation is crucial to success. Innovation leads to new products and new production technologies. It allows new firms to enter into markets dominated by incumbents, and is critical for incumbent firms who want to continue their previous market successes and stimulate consumer demand for new products. Competition drives innovation. Without competition, there would be little pressure to introduce new products or new production methods. Without this pressure, an economy will lag behind others as a center of innovation and will lose international competitiveness

A fourth benefit of competition is that it fosters restructuring in sectors that have lost competitiveness. It is difficult for governments to determine which sectors of the economy need to be restructured, which firms in those sectors should remain or should cease to exist, and when it is best to engage in such restructuring. Governments are subject to political constraints and pressures, which more often than not lead to sub-optimal decisions. The competitive process, on the other hand, is unbiased. It forces decisions to be based on market factors, such as demand, product uses, costs, technologies, rather than the incomplete information in the possession of government bureaucrats. The competition for capital and other resources by firms throughout the economy leads to money and resources flowing away from weak, uncompetitive sectors and firms and towards the strongest, most competitive sectors, and to the strongest and most competitive firms within those sectors. In these ways, the very operation of the competitive process makes decisions on restructuring clear, and leads to the strongest and most competitive economy possible.

US economy is still the lynchpin of the global economy — most recent evidence

Brett 15 — Shane Brett, author of "The Future of Hedge Funds", founder of "Global Perspectives", co-founder of "Gecko", received his Bachelor of Business Studies (Hons), Accounting & Finance from Dundalk Institute of Technology, received his MBA in Management Consulting from the University of Wales, has 19 years experience in hedge fund /asset management operations, consultancy & technology, including programme & product management at top fund managers & administrators worldwide, 2015 ("The Global Economy In 2015 - 5 Key Trends," Seeking Alpha, January 11, Available Online at <http://seekingalpha.com/article/2811155-the-global-economy-in-2015-5-key-trends>, Accessed 7/16/15)

The US economy created 7,000 jobs per day in 2014 and this remarkable rate of employment growth is set to escalate in 2015.

The perceived decline of American power has been greatly exaggerated.

Commentators confuse the current US unwillingness to wield hard power, for a lack of underlying real power. They also confuse deadlock in Washington with the underlying dynamism of many US regions and States.

The US still controls the global economy, all the world's oceans, its trade routes and its reserve currency. It spends nearly as much on defence as the rest of the world put together. **This will not change anytime soon.**

In 2015, the US will continue to be the global engine for growth, enterprise and innovation, as it has been for most of the last century.

This should not be surprising. The English-speakers (i.e. the USA/UK) have run the world for 3 centuries now. They have consistently defeated all challengers to world hegemony that have appeared over this time (Philip II, Louis XIV, Napoleon, Kaiser Wilhelm II, Hitler, Stalin etc.).

Despite the chorus of BRIC hysteria over the last few years, the economic growth in these countries has taken place because **they adopted US policies of trade liberalization, economic freedom and a free market.** In 2015, they will endure a major emerging market crisis. Their power will not surpass the US for decades (if ever).

Oil Dependence Module

Google Self-Driving cars are key to revitalizing the economy, reducing dependence on oil, and a more sustainable future.

Dallegro 14 — Joseph A. Dallegro is a journalist and advertising copywriter living in the New York area. He has covered business and finance, automobiles and local interest stories for publications such as Institutional Investor, ConsumerSearch and the Jersey City Independent. His advertising work has been profiled in CBS News, The Huffington Post, and Adweek, 2014 ("How Google's Self-Driving Car Will Change Everything," Investopedia, April 2014, Available Online at <http://www.investopedia.com/articles/investing/052014/how-googles-selfdriving-car-will-change-everything.asp>, Accessed 7-21-2015)//CM

Imagine getting in your car, typing or speaking a location into your vehicle's interface, then letting it drive you to your destination while you read a book, surf the web or nap. Self-driving vehicles – the stuff of science fiction since the first roads were paved – are coming, and they're going to radically change what it's like to get from point A to point B. Basic Technology Already In Use "The building blocks of driverless cars are on the road now," explained Russ Rader, senior v.p. of communications at the Insurance Institute for Highway Safety. He pointed to the front-crash prevention systems that for several years have been able to warn drivers of an impending obstacle and apply the brakes if they don't react fast enough. These systems were quickly followed by technology allowing cars to self-park by sizing up a free spot and automatically steering into it, with the driver only controlling the accelerator and brake pedals. Mercedes-Benz took autonomous driving even further with last year's unveiling of a steering system that works on the highway, in certain circumstances. The first big leap to fully autonomous vehicles is due in 2017, when Google Inc. (GOOG) said it would have an integrated system ready to market. Every major automotive manufacturer is likely to follow by the early 2020s, though their systems could wind up being more sensor-based, and rely less on networking and access to map information. Google probably won't manufacture cars. More likely, it'll license the software and systems. A Drastic Change As with the adoption of any new revolutionary technology, there will be problems for businesses that don't adjust fast enough. Futurists estimate that hundreds of billions of dollars (if not trillions) will be lost by automakers, suppliers, dealers, insurers, parking companies, and many other car-related enterprises. And think of the lost revenue for governments via licensing fees, taxes and tolls, and by personal injury lawyers and health insurers. Who needs a car made with heavier-gauge steel and eight airbags (not to mention a body shop) if accidents are so rare? Who needs a parking spot close to work if your car can drive you there, park itself miles away, only to pick you up later? Who needs to buy a flight from Boston to Cleveland when you can leave in the evening, sleep much of the way, and arrive in the morning? Indeed, Google's goal is to increase car utilization from 5-10% to 75% or more by facilitating sharing. That means fewer cars on the road. Fewer cars period, in fact. Who needs to own a car when you can just order a shared one and it'll drive up minutes later, ready to take you wherever you want? "This [has the potential to] dramatically reduce the number of cars on the street, 80% of which have people driving alone in them, and also a household's cost of transportation, which is 18% of their income – around \$9,000 a year – for an asset that they use only 5% of the time," said Robin Chase, the founder and CEO of Buzzcar, a peer-to-peer car sharing service, and co-founder and former CEO of Zipcar. In 2030, self-driving cars are expected to create \$87 billion worth of opportunities for automakers and technology developers, said a report by Boston-based Lux Research. Software developers stand to win big. A Car Manufacturing Revolution If you're an automaker, such as Ford Motor Co. (F), General Motors Co. (GM), Chrysler Group LLC, Toyota Motor Corp. or Honda Motor Co., Ltd. (HMC), which account for about 70% of the U.S. market, you could see an initial surge in the \$600 billion in annual new and used car sales in the U.S. But as soon as the technology takes hold, sales could fall off significantly as sharing popularizes. Cars will always need steel, glass, an interior, a drivetrain and some form of human interface (even if that interface is little more than a wireless connection to your smartphone). But much of everything else could change. As an example, take front-facing seats; they could become an option, not a requirement. Automakers that see change coming, such as how the big profits are secured downstream by car servicers, insurers and more, are focusing on services as much as on what and how they manufacture. Infrastructure Transformation With fewer cars around, parking lots and spaces that cover roughly a one-third of the land area of many U.S. cities can be repurposed. That could mean temporary downward pressure on real estate values as supply increases. It could also mean greener urban

areas, as well as revitalized suburbs, as longer commutes become more palatable. And if fewer cars are on the road, the federal and state governments may be able to reallocate a good portion of the roughly \$30 billion spent annually on highways. Changing Oil Demand If you're in the business of finding, extracting, refining and marketing hydrocarbons, such as Exxon Mobil Corp. (EOX), Chevron Corp. (CVX) or BP plc (BP), you could see your business fluctuate as use changes. "These vehicles should practice very efficient eco-driving practices, which is typically about 20% better than the average driver," said Chase "On the other hand, if these cars are owned by individuals, I see a huge rise in the number of trips, and vehicle miles traveled. People will send out their car to run errands they would never do if they had to be in the car and waste their own time. If the autonomous cars are shared vehicles and people pay for each trip, I think this will reduce demand, and thus (vehicle miles traveled)." Safety Dividend Autonomous vehicles are also expected to be safer. "These cars won't get drunk or high, drive too fast, or take unnecessary risks – things people do all the time," Chase said. "Over 90% of accidents today are caused by driver error," said Professor Robert W. Peterson of the Center for Insurance Law and Regulation at Santa Clara University School of Law. "There is every reason to believe that self-driving cars will reduce frequency and severity of accidents, so insurance costs should fall, perhaps dramatically." "Cars can still get flooded, damaged or stolen," notes Michael Barry, the v.p. of media relations at the Insurance Information Institute. "But this technology will have a dramatic impact on underwriting. A lot of traditional underwriting criteria will be upended." Barry said it's too early to quantify exactly how self-driving vehicles will affect rates, but added that injured parties in a crash involving a self-driving car may choose to sue the vehicle's manufacturer, or the software company that designed the autonomous capability. Initially, insurers such as State Farm Insurance, Allstate Corp. (ALL), Liberty Mutual Group, Berkshire Hathaway Inc.'s (BRK-A) GEICO, Citigroup Inc.'s (C) Travelers Group could see a huge benefit from lower accident liabilities, but wind up losing a big portion of the \$200 billion in personal auto premiums they write every year as fewer cars take to the road. Some have even speculated that mandatory insurance for cars could be dropped. And as long as we're talking about financial services, what of the multitude of banks and creditors that lend buyers money in about 70% of car purchases if sales volume falls? According to a University of Texas report, if only 10% of the cars on U.S. roads were autonomous, more than \$37 billion of savings could be realized via less wasted time and fuel, as well as fewer injuries and deaths. At 90%, the benefit rises to almost \$450 billion a year. Closer to Home Self-driving cars could have a substantial impact on the taxi and limousine industries and could create new ones. Chase noted that they could be used to share specific trips as a kind of pay-as-you-go small-scale public transportation – taking a disparate bunch of Manhattanites to the beach in the Hamptons, for instance. One study found that a fleet of 9,000 driverless taxis could serve all of Manhattan at about 40 cents per mile (compared to about \$4-6 per mile now). There are licenses for over 13,000 taxis in the Big Apple now. Self-driving cars may also challenge train lines. "A self-driving car offers much of the convenience of rail service with the added convenience that the service is portal-to-portal rather than station-to-station," Peterson said. "On the other hand, a fleet of self-driving cars available at the station may make rail service more palatable. "The technology has already been adopted in closed systems, such as campuses, air-terminals and mining," he noted. "Rio Tinto Group (RIO), a large mining company, uses enormous self-driving trucks in its mining operations. European countries are experimenting with the platooning of trucks. Among other things, this saves about 18% in fuel." Risks, Hurdles and the Unknown There are regulatory and legislative obstacles to widespread use of self-driving cars, and substantial concerns about privacy (who will have access to any driving information these vehicles store?). There's also the question of security, as hackers could theoretically take control of these vehicles, and are not known for their restraint or civic-mindedness. The Bottom Line However it plays out, these vehicles are coming – and fast. Their full adoption will take decades, but their convenience, cost, safety and other factors will make them ubiquitous and indispensable. Such as with any technological revolution, the companies that plan ahead, adjust the fastest and imagine the biggest will survive and thrive. And companies invested in old technology and practices will need to evolve or risk dying.

Driverless cars have the potential to substantially cut oil dependence and make traveling more efficient.

Plumer 13 — Brad Plumer is a reporter focusing on energy and environmental issues at The Washington Post. He was previously an associate editor at The New Republic, 2013 ("Will

driverless cars solve our energy problems — or just create new ones?," Washington Post, 3-30-2013, Available Online at

<http://www.washingtonpost.com/blogs/wonkblog/wp/2013/03/30/will-self-driving-cars-solve-all-our-energy-problems-or-create-new-ones/>, Accessed 7-22-2015)//CM

Self-driving cars are all the rage these days. Companies like Google are building vehicles that can drive themselves with sensors and algorithms. Futurists are raving about how this will revolutionize transportation: fewer accidents, easier parking... It's reached the point where even Newt Gingrich is offering a "short course" on driverless cars. Wait a minute, who's driving this thing? (Getty Images) And that got us wondering. If self-driving cars ever do become the future of transportation, what would that mean for energy, oil use and climate change in the decades ahead? Some backdrop: Last week, the National Academy of Sciences released a big report on how the United States could cut gasoline use and transport emissions 80 percent by 2050 — a key step toward addressing global warming and U.S. oil dependency. It would be difficult, the report said, but a big push on electric vehicles, advanced biofuels and efficiency could get us there. In a follow-up post, David Roberts criticized the NAS for thinking too prosaically. The report assumed our transportation system would look basically the same in 2050, only with somewhat cleaner vehicles. And that might well be wrong. What if self-driving cars become ubiquitous and utterly transform the way we get around? The task of getting off oil and curbing emissions could be much easier — or much harder — than anyone thinks. Now, a future filled with driverless cars might be far-fetched, but it's interesting to ponder. So here are a few very speculative thoughts on how self-driving cars could conceivably affect energy use in the decades ahead — assuming they ever catch on: How driverless cars could curb energy use and be great for the environment: Driverless cars will be far more fuel-efficient. That's the idea, anyway, laid out in this report from KPMG. Once we no longer need clumsy human drivers, then self-driving cars and trucks will be able to bunch close together at steadier speeds. Traffic jams and accidents will become a thing of the past. The robots will be driving as efficiently as possible. The hope is that this could save thousands of lives. It could also have massive effects on energy use. The Rocky Mountain Institute estimates that the reduction in wind drag alone from vehicles traveling closely together could reduce fuel use 20 percent to 30 percent: 012513-DriverlessCars2-image2-courtesyPATH Driverless vehicles could also, in theory be much, much lighter — since collisions will no longer be a big concern. Cars that currently weigh 4,000 pounds could one day weigh just 750 pounds. That development alone there would nearly double energy efficiency. Driverless cars will waste less fuel on things like looking for parking. One MIT study found that in congested urban areas, about 40 percent of total gasoline use in cars is spent as drivers look for parking. Presumably, intelligent self-driving cars wouldn't have this problem. Driverless cars will make car-sharing more popular, which will mean fewer vehicles on the road. Lots of self-driving-car enthusiasts have argued that car-sharing will be a popular model — after all, most privately owned cars are currently parked and idle 90 percent of the time. Wouldn't it make more sense for the self-driving car to make itself useful during that period? Car-sharing could mean fewer cars overall. Driverless cars will make the transition to electric vehicles easier. Lighter, more efficient cars will be able to go much farther on a single battery charge, which means that "range anxiety" will be less of an issue for plug-ins. Driverless cars will increase the appeal of walking and biking. Since self-driving cars will (in theory) be much, much safer than human drivers, it'll be less dangerous to bike on the road. At the margins, that could be a boon to pedestrians. Cities will become more appealing. If traffic gets less crazy, if walking and biking become more attractive, and if parking is no longer a huge hassle, denser urban living might become more attractive. Since cities tend to be more energy-efficient than the suburbs, that could reduce energy use. (Although see below for a counterpoint.) The flip side: How driverless cars could lead to a huge surge in energy demand. More and more people will drive. Think about all the people who are not allowed to drive right now. Everyone under 16. The elderly. The disabled. People who are intoxicated or on medication. People who are sleeping. That's a huge portion of the population. And all of those people will be able to ride in driverless cars. And that means we could see many more car trips. That's a huge plus for mobility. But it also has big energy implications. At the moment, vehicle miles-traveled in the United States appears to have peaked back in 2005 — in part because fewer and fewer young people are getting their licenses and driving. Could self-driving cars reverse that trend? Doug-Short-chart-VMT Public transportation could lose its appeal. If driverless cars or driverless taxis catch on, then trains and buses could find themselves displaced. You can read or zone out in a driverless car just as easily as you can on the subway. Depending on how this all shakes out, it could mean more driving and higher energy demands. Urban sprawl could greatly expand. Arielle Duhaime-Ross has a good post on this. Right now, there's a serious limit to how sprawled-out a city can get — people tend to prefer to keep their commutes under an hour. But if driverless cars can offer quick, efficient transportation, then we could see more people spread out to the suburbs. It's possible this could mean bigger environmental effects. (That said, it would be a big gain for public health if commuting became less stressful and arduous.) Cars might need to be

replaced more frequently. If car-sharing became widespread, then driverless cars would be on the road and in motion far more often. This might mean cars would have a lifespan similar to that of police vehicles, about three to five years, rather than their current 11 years. It's hard to say what this would mean for energy use — cars could be upgraded more quickly as new technology became available — but it's another angle here. No doubt there are a million other possibilities I haven't thought of or missed, so feel free to add more in comments.

Self-driving cars have serious implications for the future of the environment

Elkind 12 — Ethan Elkind is the Associate Director of the Climate Change and Business Program at UC Berkeley, 4-10-2012 ("Could Self-Driving Cars Help The Environment?," No Publication, 4-10-2012, Available Online at <http://legal-planet.org/2012/04/10/could-self-driving-cars-help-the-environment/>, Accessed 7-22-2015)//CM

As companies like Google pioneer technologies to allow cars to drive themselves, futurists have been imagining a world where autonomous vehicles rule the roadway. Using computer programs, map data, complex sensors, and soon the ability to “see” all vehicles within miles, these cars hold the promise of averting the vast majority of car accidents caused by human error, while passengers in the driver’s seat can nap, work, and do anything but concentrate on driving. The future is here to some extent: self-parking technologies are already in use with more coming soon, and Google’s autonomous car program has made internet waves (video here), sparking enabling legislation in Nevada and a bill in California. In another few decades, we may have a driving revolution on our hands (and the idea of dying in a car accident may seem as foreign to our grandchildren as dying of small pox). But what could this technology mean for the environment? We know that cars are responsible for significant greenhouse gas emissions and toxic air pollution. Self-driving vehicles hold the potential to reduce these emissions by driving more efficiently, including the possibility of not having to stop at intersections or even red lights as cars seamlessly avoid each other.

Vehicles may also be able to tailgate like train cars, adding more capacity and enabling efficient speeds for existing roads and highways. Cars may also become extremely lightweight and fuel efficient, as consumers no longer need heavy cars to survive collisions. But as the video below suggests, overall vehicle miles traveled may increase as driving becomes possible for those currently unable to drive, such as the elderly, the physically disabled or impaired, and of course the inebriated. Self-driving vehicles may also outcompete public transit for those who can afford to drive, as their cars would provide the same benefits as transit (such as the ability to work while commuting) without the hassles. In addition, self-driving vehicles may clog the road as households share vehicles that drive themselves around to pick up multiple people, such as spouses driving the same car to work at different times. At this point, proponents of self-driving cars are more interested in issues like insurance liability than environmental law. And the technology still requires more research and development. But as the cars become more common, policy makers and clean air advocates could benefit from studying the impacts of these cars to see how they might mitigate our pressing air pollution problems.

Oil independence is key to a sustainable economy

Anderson 14 — Richard Anderson is a business Reporter for BBC News, 2014 ("How American energy independence could change the world," BBC News, 4-1-2014, Available Online at <http://www.bbc.com/news/business-23151813>, Accessed 7-22-2015)//CM

No-one is suggesting America will stop importing power overnight, but being largely self-sufficient in energy could have widespread implications not just for the US, but for the rest of the world. US economy Last year, the United States spent about \$300bn (£180bn) on importing oil. This represented almost two-thirds of the country's entire annual trade deficit. Oil imports are, therefore, sucking hundreds of billions of dollars a year out of the US economy. As the IEA says, a persistent trade deficit can act as a drag on economic growth, manufacturing and employment. If the US achieved energy independence, not only would the country spend far less on cheaper, domestically generated

power, but the money would be going primarily to US-owned energy producers. The US's oil import bill also constitutes about 2% of the country's annual economic growth. As the US economy averages about 2% growth a year, the country would, in effect, be getting a year's growth for free. Paul Dales, at Capital Economics, argues that as this would be spread out over the next 10-20 years, the annual benefits would be much smaller - in this instance, 0.2%-0.1%. True, but comparing now with energy independence, the boost to the US economy of ending oil imports would be significant.

Oil dependence diminishes US hegemony — key to combating WMD spread, terrorism, Gulf instability

Deutch and Schlesinger 6 — John Deutch, served as Deputy Secretary of Defense, Director of Central Intelligence, Director of Energy Research, Acting Assistant Secretary for Energy Technology, and Undersecretary of the Department, emeritus Institute Professor at the Massachusetts Institute of Technology, holds a B.A. in history and economics from Amherst College, and both the B.S. in chemical engineering and Ph.D. in physical chemistry from M.I.T, and James R. Schlesinger, served as Secretary of Defense under Nixon and Ford, America's first Secretary of Energy, Director of Central Intelligence, earned a B.A., M.A., and Ph.D. in economics from the Horace Mann School and Harvard University, 2006 (“National Security Consequences of U.S. Oil Dependency,” Report of an Independent Task Force, Available Online at http://pages.ucsd.edu/~dgvictor/publications/Faculty_Victor_Chapter_2006_National%20Security%20Consequences_CFR.pdf, Accessed 7/22/15)

The Task Force has identified five major reasons why dependence on energy traded in world markets is a matter of concern for U.S. foreign policy. We have also examined a sixth, the relationship of military force structure to oil dependence.

First, the control over enormous oil revenues gives exporting countries the flexibility to adopt policies that oppose U.S. interests and values. Iran proceeds with a program that appears to be headed toward acquiring a nuclear weapons capability. Russia is able to ignore Western attitudes as it has moved to authoritarian policies in part because huge revenues from oil and gas exports are available to finance that style of government. Venezuela has the resources from its oil exports to invite realignment in Latin American political relationships and to fund changes such as Argentina's exit from its International Monetary Fund (IMF) standby agreement and Bolivia's recent decision to nationalize its oil and gas resources. **Because of their oil wealth, these and other producer countries are free to ignore U.S. policies and to pursue interests inimical to our national security.**

Second, oil dependence causes political realignments that constrain the ability of the United States to form partnerships to achieve common objectives. Perhaps the most pervasive effect arises as **countries dependent on imports subtly modify their policies to be more congenial to suppliers.** For example, China is aligning its relationships in the Middle East (e.g., Iran and Saudi Arabia) and Africa (e.g., Nigeria and Sudan) because of its desire to secure oil supplies. France and Germany, and with them much of the European Union, are more reluctant to confront difficult issues with Russia and Iran because of their dependence on imported oil and gas as well as the desire to pursue business opportunities in those countries.

These new realignments have further diminished U.S. leverage, particularly **in the Middle East and Central Asia**. For example, Chinese interest in securing oil and gas supplies challenges U.S. influence in central Asia, notably in Kazakhstan. And Russia's influence is likely to grow as it exports oil and (within perhaps a decade) large amounts of natural gas to Japan and China.

All consuming countries, including the United States, are more constrained in dealing with producing states when oil markets are tight. To cite one current example, **concern about losing Iran's 2.5 million barrels per day of world oil exports will cause importing states to be reluctant to take action against Iran's nuclear program.**

Third, **high prices and seemingly scarce supplies create fears**— especially evident in Beijing and New Delhi, as well as in European capitals and in Washington—**that the current system of open markets is unable to ensure secure supply.** The present competition has resulted in **oil and gas deals** that **include political arrangements in addition to commercial terms.** Highly publicized Chinese oil investments in Africa have included funding for infrastructure projects such as an airport, a railroad, and a telecommunications system, in addition to the agreement that the oil be shipped to China. Many more of these investments also include equity stakes for state-controlled Chinese companies. Another example is Chinese firms taking a position in Saudi Arabia, along with several Western firms, in developing Saudi Arabia's gas infrastructure.

At present, these arrangements have little effect on world oil and gas markets because the volumes affected are small. However, **such arrangements are spreading.** These arrangements are worrisome because **they lead to special political relationships that pose difficulties for the United States.** And **they allow importers to believe that they obtain security through links to particular suppliers rather than from the proper functioning of a global market.**

We note that **the United States**, in the past, **has also taken decisions to restrict markets partly due to similar concerns about energy security.** For example, when the trans-Alaska pipeline opened, it included a prohibition against exporting the oil. **The hostility toward proposals** by the Chinese National Overseas Oil Company (CNOOC) to purchase Union Oil of California **is seen by some as denying investment opportunity in the U.S. market in a similar manner to what the United States decries about other nations' conduct.** The Task Force believes that foreign entities should be able to purchase U.S. assets provided that the acquisitions meet the criteria established by the Committee on Foreign Investment in the United States (CFIUS).¹²

Opening a dialogue with rapidly growing consumers, notably China and India, can help those consumers gain confidence that will lead to a greater willingness to allow markets to operate. (We return to this policy recommendation later.) The United States and other consuming countries have a tremendous interest in maintaining the present open market oil commodity trading rules.

Fourth, **revenues from oil and gas exports can undermine local governance.** The United States has an interest in promoting good governance both for its own sake and because it encourages investment that can increase the level and security of supply. **States that are politically unstable and poorly governed often struggle with the task of responsibly managing the large revenues that come from their oil and gas exports.** The elements of good governance include democratic accountability, low corruption, and fiscal transparency. Production in fragile democracies, such as in Nigeria, can be undermined when politicians or local warlords focus on ways to seize oil and gas rents rather than on the longer-term task of governance. **Totalitarian governments that have control over those revenue flows can entrench their rule.**

When markets are tight, large oil consumers have tended to become especially focused on securing supply and ignore the effects of their investments on corruption and mismanagement. In Sudan, for example, despite civil war and widespread human rights abuses, the Chinese government and its oil enterprises are funding extensive oil supply and 12 Alan P. Larson and David M. Marchick, Foreign Investment and National Security: Getting the Balance Right, a Council Special Report (New York: Council on Foreign Relations Press, 2006). Findings: How Dependence on Imported Energy Affects U.S. Foreign Policy 29 infrastructure projects. China has used its threat of a veto in the UN Security Council to thwart collective efforts by other countries to manage the Darfur crisis in Sudan. Similarly, China, India, and several Western European countries continue to invest in Iran despite the need to contain its nuclear aspirations.

Fifth, **a significant interruption in oil supply will have adverse political and economic consequences in the United States and in other importing countries.** When such a disruption occurs, **it upends all ongoing policy activity in a frantic effort to return to normal conditions.** Inevitably, **those efforts include matters of foreign policy, such as coordination with other countries to find measures that will mitigate the consequences of the supply disruption.** Some of these responses may be preplanned, such as the coordinated release of strategic reserves, but other **responses will be hurried, ineffectual, or even counterproductive.**

Sixth, some observers see a direct relationship between the dependence of the United States on oil, especially from the Persian Gulf, and the size of the U.S. defense budget. Such a relationship invites the inference that **if it were not dependent on this oil, the United States and its allies would have no interest in the region, and hence it would be possible to achieve significant reductions in the U.S. military posture.** In the extreme, this argument says that **if the nation reduced its dependence, then the defense budget could be reduced as well.**

U.S. strategic interests in reliable oil supplies from the Persian Gulf are not proportional with the percent of oil consumption that is imported by the United States from the region. Until very low levels of dependence are reached, the United States and all other consumers of oil will depend on the Persian Gulf. Such low levels will certainly not be reached during the twenty-year time frame of this study.

Even if the Persian Gulf did not have the bulk of the world's readily available oil reserves, there would be reasons to maintain a substantial military capability in the region. **The activities of Iran today and Iraq,** especially prior to 1991, **underline the seriousness of threats from weapons of mass destruction. Combating terrorism also requires a presence in the Gulf.** In addition to military activities, **a U.S. presence in the region can help to improve political stability.**

At least for the next two decades, the Persian Gulf will be vital to U.S. interests in reliable oil supply, nonproliferation, combating 30 National Security Consequences of U.S. Oil Dependency terrorism, and encouraging political stability, democracy, and public welfare. Accordingly, the United States should expect and support a strong military posture that permits suitably rapid deployment to the region, if required.

It is worthwhile to explain what should and should not be expected from this military force, and how it serves U.S. interests. Most importantly, **the conventional force of the United States deters aggression in the region. Any nation** (or subnational group) **that contemplates violence on any scale must take into account the possibility of U.S. preemption, intervention, or retaliation.** Deterrence is powerful, but it does not always work (especially if the possibility of a military response is not raised). For example, deterrence did not prevent the Iran-Iraq war of the early 1980s. Because no clear and credible signal was sent of a possible response in 1990, Saddam Hussein was not deterred from invading Kuwait. Nevertheless, **the U.S. military posture with its capacity to intervene,** if managed wisely, **can play a role in stabilizing this highly fragile region and make many countries in the region more secure from hostile action by their neighbors.**

Oil dependence entrenches existing conflicts and has a laundry list of potential escalation scenarios

Colgan 13 —Jeff D. Colgan is the Richard Holbrooke Assistant Professor in the Department of Political Science and Watson Institute for International Studies at Brown University. His research focuses on two main areas: (1) the causes of war and (2) global energy politics, 2013 ("Oil, Conflict, and U.S. National Interests," Policy Brief, Belfer Center for Science and International Affairs, Harvard Kennedy School, 10-21-2013, Available Online at

http://belfercenter.ksg.harvard.edu/publication/23517/oil_conflict_and_us_national_interests.html, Accessed 7-22-2015)//CM

Although the threat of "resource wars" over possession of oil reserves is often exaggerated, the sum total of the political effects generated by the oil industry makes oil a leading cause of war. Between one-quarter and one-half of interstate wars since 1973 have been connected to one or more oil-related causal mechanisms. No other commodity has had such an impact on international security. The influence of oil on conflict is often poorly understood. In U.S. public debates about the 1991 and 2003 Iraq wars, both sides focused excessively on the question of whether the United States was fighting for possession of oil reserves; neither sought a broader understanding of how oil shaped the preconditions for war. Oil fuels international conflict through eight distinct mechanisms: (1) resource wars, in which states try to acquire oil reserves by force; (2) petro-aggression, whereby oil insulates aggressive leaders such as Saddam Hussein or Ayatollah Ruhollah Khomeini from domestic opposition, and therefore makes them more willing to engage in risky foreign policy adventurism; (3) the externalization of civil wars in oil-producing states ("petrostates"); (4) financing for insurgencies—for instance, Iran funneling oil money to Hezbollah; (5) conflicts triggered by the prospect of oil-market domination, such as the United States' war with Iraq over Kuwait in 1991; (6) clashes over control of oil transit routes, such as shipping lanes and pipelines; (7) oil-related grievances, whereby the presence of foreign workers in petrostates helps extremist groups such as al-Qaida recruit locals; and (8) oil-related obstacles to multilateral cooperation, such as when an importer's attempt to curry favor with a petrostate prevents multilateral cooperation on security issues. These mechanisms can contribute to conflict individually or in combination. The linkages between oil and international conflict are growing increasingly important in light of three transitions under way in global energy markets. The first is the shift in patterns of global oil production away from traditional suppliers in the Middle East and toward (1) suppliers of unconventional oil reserves in North America and (2) new suppliers of conventional oil, especially in Africa. As many as sixteen developing countries will become oil exporters in the near future, creating a swath of new international security concerns. Second, the low oil prices of the 1990s have given way to higher and more volatile prices, increasing the magnitude of the consequences one can expect from oil-conflict linkages. Third, the relative decline of U.S. hegemony may reduce the provision of public goods such as security of shipping lanes and pipelines. Although these transitions alter some of the ways in which the oil industry contributes to international conflict, none eliminates linkages between the two or allows the United States to disengage from global markets. THE ROLE OF FRACKING Understanding the eight mechanisms linking oil to international security can help policymakers think beyond the much-discussed goal of energy security, defined as reliable access to affordable fuel supplies. Achieving such an understanding is important in light of recent changes in the United States. As hydraulic fracturing—"fracking"—of shale oil and gas accelerates, energy imports are projected to decline, and North America could even achieve energy independence, in the sense of low or zero net overall energy imports, in the next decade. Yet the United States will continue to import large volumes of oil, and the world price of oil will continue to affect it. Moreover, so long as the rest of the world remains dependent on global oil markets, the fracking revolution will do little to reduce many oil-related threats to international security. The emergence of aggressive, revolutionary leaders in petrostates would likely continue to pose threats to regional security. Petrostates will continue to be weakly institutionalized and thus subject to civil wars, creating the kind of security problems that demand responses by the international community, as occurred in Libya in 2011. Petro-financed insurgent groups such as Hezbollah will persist, as will threats to the shipping lanes and oil transit routes that supply important U.S. allies, such as Japan. In sum, energy autarky is not the answer. Self-sufficiency will bring economic benefits to the United States, but few gains for national security. So long as the oil market remains globally integrated, national oil imports matter far less than total consumption. Rather than viewing energy self-sufficiency as a panacea, the United States should contribute to international security by making long-term investments in research and development to reduce

oil consumption and provide alternative fuel sources in the transportation sector. In addition to the economic and environmental benefits of reducing oil consumption, substantial evidence exists that military and security benefits will accrue from such investments. UNEXPECTED SOURCES OF CONFLICT Policymakers must also think systematically about oil-security linkages when monitoring emerging security threats as the global oil industry transforms itself. With sixteen additional countries potentially exporting oil in the near future, new international dynamics will materialize, especially in Africa. Furthermore, if oil prices remain high, incentives for resource grabs will grow. Resource wars are most likely to occur in unpopulated territories or naval zones, as oil can be extracted from these areas without the need to manage a populated, potentially hostile territory. Thus, policymakers should be most concerned about disputed territories in the East China and South China Seas and naval borders in the Caspian Sea. There are already competing sovereignty claims to territory in those regions, and considerable uncertainty about the magnitude of the energy resources located there, creating conditions ripe for miscalculation and mutual suspicion. Policymakers should be especially concerned about security threats that arise from unexpected sources, such as allies' energy needs or seemingly benign actions that prompt hostile responses from rivals.

Electronic Medical Records DA HSS

Notes

This is a DA that links to affs that increase privacy regulations of some sort. The evidence on government privacy regulations spilling over and hurting private companies' abilities to collect data/operate efficiently is pretty good.

The 1NC impact is disease, but you can read the economy module in the block as well.

A lot of the cards for uniqueness/internal link section of the Google DA apply here — I recommend using them for extensions in the block.

These cards are simply those cards but specific to electronic medical records.

Also, probably some of the generic disease impact cards/big data solves health care cards may apply here as well.

Good luck! Let me know if I can update/cut/change anything ~Rishika 😊

1NC — Electronic Medical Records DA

Privacy regulations impose costs on hospitals that prevent them from adopting EMR systems

Miller and Tucker 9 — Amalia R. Miller, Associate Professor of Economics at the University of Virginia, holds a Ph.D. in Economics from Stanford University and an S.B. in Economics from Massachusetts Institute of Technology, and Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2009 (“Privacy Protection and Technology Diffusion: The Case of Electronic Medical Records,” *Management Science*, Vol. 55, No. 7, July, Available Online to Subscribing Institutions via JStor, Accessed 7/22/15)

At the same time, privacy laws may impose additional network costs on hospitals who wish to transfer information electronically, for example, by demanding more of a paper trail, or by requiring more robust software. The design of networked EMR systems with strong security and confidentiality protections involves well-known challenges. Individual consent requirements that can be limited to particular types of information and provider destinations demand a flexibility that is costly to implement (Win and Fulcher 2007). It is more expensive to design a system that has the additional flexibility to limit the flow of information by the type of detail in a patient medical record and by the type of external destination, irrespective of how many patients refuse to have their records shared. **Confidentiality protection** that demands prior patient consent, which can be revoked at any time, also increases the costs of information exchange. McCarthy et al. (1999) give details of how privacy legislation that requires subjects to give their consent for each study used in research led to lower response rates. When individual consent was required by state law, it was granted by 19% of individuals, as opposed to 93% of patient records made available directly by providers in states without this privacy protection. Finally, in addition to the fixed costs that are added to the complexity of designing the EMR system, the laws require additional documentation, and that burden increases with the flow of information between providers. Theoretically, therefore, **privacy regulation can affect the fixed or the variable costs of EMR adoption,** and without detailed breakdowns of the costs involved, we cannot distinguish between the two.

Privacy protection inhibits EMR diffusion not by creating a different legal requirement for different record types, but by raising compliance costs. **Complying with privacy laws increases the costs of electronic record systems and,** in particular, **the costs of sharing information.** This is particularly important if one of the key benefits of EMRs is the reduced costs of sharing information as compared with paper records. In this sense, the laws may pose an institutional barrier to information flow, which in turn reduces the potential benefits to hospitals from the adoption of EMRs, a technology that would otherwise reduce the physical barriers to information exchange. Although it would be desirable to estimate the effects of privacy regulation on network costs and benefits separately, we observe neither of these outcomes.

Using data on adoption decisions, we can identify only the net effect of privacy law on network benefits.

Privately collected data is the backbone of effective health care systems — reduces costs and mortality rates

Goldfarb and Tucker 12 — Avi Goldfarb, Professor of Marketing in the Rotman School of Management at University of Toronto, has published over 50 articles in a variety of outlets in economics, marketing, statistics, computing, and law, holds a PhD from Northwestern, MA from Northwestern, and BAH from Queens University, with Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2012 (“Privacy and Innovation,” *Innovation Policy and the Economy*, Chicago Journals, The National Bureau of Economic Research, Vol. 12, No. 1, pp. 65-90, January, Available Online via Subscribing Institutions at JStor, Accessed 7/21/15)

The 2009 Health Information Technology for Economic and Clinical Health (HITECH) Act, part of the American Recovery and Reinvestment Act, devoted \$19.2 billion to increase the use of electronic medical records (EMRs) by health care providers. Underlying this substantial public subsidy is a belief that creating an electronic rather than a paper interface between patient information and health care providers can improve health care quality, facilitate the adoption of new technologies, and also save money.

EMRs are the backbone software system that allows health care providers to store and exchange patient health information electronically. As EMRs diffuse to more medical practices, they are expected to reduce medical costs and improve patient care. For example, they may reduce medical costs by reducing clerical duplication; however, there are no universally accepted estimates concerning how much money EMRs will save. Hillestad et al. (2005) suggest that EMRs could reduce America’s annual health care bill by \$34 billion through higher efficiency and safety, assuming a 15-year period and 90% EMR adoption.

In contrast, the clinical benefits from EMR systems have been demonstrated in recent empirical work (Miller and Tucker 2011a).¹ This research examines effects of the digitization of health care on neonatal outcomes over a 12-year period. Neonatal outcome is a measure commonly used to assess the quality of a nation’s health care system and is important in its own right. As we discuss in depth later, Miller and Tucker (2011a) is also directly relevant to the current chapter, as it measures the relationships among health care outcomes, hospitals’ adoption of information technology, and state-level privacy regulation.

Miller and Tucker (2011a) find that a 10% increase in basic EMR adoption would reduce neonatal mortality rates by 16 deaths per 100,000 live births, roughly 3% of the annual mean (521) across counties. Furthermore, they find that a 10% increase in hospitals that adopt both

EMRs and obstetric-specific computing technology reduces neonatal mortality by 40 deaths per 100,000 live births. This finding suggests **there are increasing gains from the digitization of health care.** The paper shows that the reduction in deaths is driven by a decrease in deaths from conditions that can be treated with careful monitoring and data about patient histories. There is no such decrease for conditions where prior patient data are not helpful from a diagnostic standpoint.

Overall, Miller and Tucker (2011a) document that the use of patient data by hospitals helps to improve monitoring and the accuracy of patient medical histories. More broadly, even basic EMR systems can improve the quality of data repositories and ease access to relevant patient information. Adoption of technologies that facilitate data collection and analysis can help hospitals to improve outcomes and perhaps to reduce costs.

Diseases coming now and risk extinction – effective healthcare is key to check
Naish 12 (Reporter for Daily Mail, “The Armageddon virus: Why experts fear a disease that leaps from animals to humans could devastate mankind in the next five years Warning comes after man died from a Sars-like virus that had previously only been seen in bats Earlier this month a man from Glasgow died from a tick-borne disease that is widespread in domestic and wild animals in Africa and Asia” <http://www.dailymail.co.uk/sciencetech/article-2217774/The-Armageddon-virus-Why-experts-fear-disease-leaps-animals-humans-devastate-mankind-years.html#ixzz3E5kqxjQI>)

The symptoms appear suddenly with a headache, high fever, joint pain, stomach pain and vomiting. As the illness progresses, patients can develop large areas of bruising and uncontrolled bleeding. In at least 30 per cent of cases, Crimean-Congo Viral Hemorrhagic Fever is fatal. And so it proved this month when a 38-year-old garage owner from Glasgow, who had been to his brother's wedding in Afghanistan, became the UK's first confirmed victim of the tick-borne viral illness when he died at the high-security infectious disease unit at London's Royal Free Hospital. It is a disease widespread in domestic and wild animals in Africa and Asia — and one that has jumped the species barrier to infect humans with deadly effect. But the unnamed man's death was not the only time recently a foreign virus had struck in this country for the first time. Last month, a 49-year-old man entered London's St Thomas' hospital with a raging fever, severe cough and desperate difficulty in breathing. He bore all the hallmarks of the deadly Sars virus that killed

nearly 1,000 people in 2003 — but blood tests quickly showed that this terrifyingly virulent infection was not Sars. **Nor was it any other virus yet known to medical science** Worse still, the gasping, sweating patient was rapidly succumbing to kidney failure, a potentially lethal complication that had never before been seen in such a case. As medical staff quarantined their critically-ill patient, fearful questions began to mount. The stricken man had recently come from Qatar in the Middle East. What on earth had he picked up there? Had he already infected others with it? Using the latest high-tech gene-scanning technique, scientists at the Health Protection Agency started to piece together clues from tissue samples taken from the Qatari patient, who was now hooked up to a life-support machine. **The results were extraordinary. Yes, the virus is from the same family as Sars. But its make-up is completely new** It has come not from humans, but from animals. Its closest known relatives have

been found in Asiatic bats. The investigators also discovered that the virus has already killed someone. Searches of global medical databases revealed the same mysterious virus lurking in samples taken from a 60-year-old man who had died in Saudi Arabia in July. Scroll down for video Potentially deadly: The man suffered from CCHF, a disease transmitted by ticks (pictured) which is especially common in East and West Africa Potentially deadly: The man suffered from CCHF, a disease transmitted by ticks (pictured) which is especially common in East and West Africa When the Health Protection Agency warned the world of this newly-emerging virus last month, it ignited a stark fear among medical experts. Could this be the next bird flu, or even the next “Spanish flu” — the world's biggest pandemic, which claimed between 50 million and 100 million lives across the globe from 1918 to 1919? **In all these outbreaks, the virus responsible came from an animal.** Analysts

now believe that the Spanish flu pandemic originated from a wild aquatic bird. The terrifying fact is that viruses that manage to jump to us from animals — called zoonoses — can wreak havoc because of their astonishing ability to catch us on the hop and spread rapidly through the population when we least expect it. The virus's power and fatality rates are terrifying One leading British virologist, Professor **John Oxford** at Queen Mary Hospital, University of London, and **a world authority on epidemics, warns that we must expect an animal-originated pandemic to hit the world within the next five years with potentially cataclysmic effects on the human race.** Such a

contagion, he believes, **will be a new strain of super-flu,** a highly infectious virus that may originate in some far-flung backwater of Asia or Africa, and be contracted by one person from a wild animal or domestic beast, such as a chicken or pig. By the time the first victim has succumbed to this unknown, unsuspected new illness, they will have spread it by coughs and

sneezes to family, friends, and all those gathered anxiously around them. **Thanks to our crowded, hyper-connected world, this doomsday virus will already have begun crossing the globe by air, rail, road and sea** before even the best brains in medicine have begun to chisel at its genetic secrets. Before it even has a name, it will have started to cut its lethal swath through the world's population. The high security unit where the man was treated for the potentially fatal disease but later died if this new virus follows the pattern of the pandemic of 1918-1919, it will cruelly reap mass harvests of young and fit people. **They die because of something called a 'cytokine storm' — a vast overreaction of their strong and efficient immune systems that is prompted by the virus.** This uncontrolled response burns them with a fever and wracks their bodies with nausea and massive fatigue. **The hyper-activated immune system actually kills the person, rather than killing the super-virus.** Professor Oxford bases his prediction on historical patterns. The past century has certainly provided us with many disturbing precedents. For example, the 2003 global outbreak of Sars, the severe acute respiratory syndrome that killed nearly 1,000 people, was transmitted to humans from Asian civet cats in China. More... Man, 38, dies from deadly tropical disease after returning to the UK from Afghanistan. Nine-year-old who turns YELLOW with anger: Brianna must spend 12 hours a day under UV lights because of rare condition. In November 2002, it first spread among people working at a live animal market in the southern Guangdong province, where civets were being sold. **Nowadays, the threat from such zoonoses is far greater than ever, thanks to modern technology and human population growth.** Mass transport such as airliners can quickly fan outbreaks of newly-emerging zoonoses into deadly global wildfires. The Sars virus was spread when a Chinese professor of respiratory medicine treating people with the syndrome fell ill when he travelled to Hong Kong, carrying the virus with him. By February 2003, it had covered the world by hitching easy lifts with airline passengers. Between March and July 2003, some 8,400 probable cases of Sars had been reported in 32 countries. It is a similar story with H1N1 swine flu, the 2009 influenza pandemic that infected hundreds of millions throughout the world. It is now believed to have originated in herds of pigs in Mexico before infecting humans who boarded flights to myriad destinations. **Once these stowaway viruses get off the plane, they don't have to learn a new language or new local customs. Genetically, we humans are not very diverse, an epidemic that can kill people in one part of the world can kill them in any other just as easily.** On top of this, **our risk of catching such deadly contagions from wild animals is growing massively, thanks to humankind's relentless encroachment into the world's jungles and rainforests, where we increasingly come into contact for the first time with unknown viral killers that have been evolving and incubating in wild creatures for millennia.** This month, an international research team announced it had identified an entirely new African virus that killed two teenagers in the Democratic Republic of the Congo in 2009. The virus induced acute hemorrhagic fever, which causes catastrophic widespread bleeding from the eyes, ears, nose and mouth, and can kill in days. A 15-year-old boy and a 13-year-old girl who attended the same school both fell ill suddenly and succumbed rapidly. A week after the girl's death, a nurse who cared for her developed similar symptoms. He only narrowly survived. The new microbe is named Bas-Congo virus (BASV), after the province where its three victims lived. It belongs to a family of viruses known as rhabdoviruses, which includes rabies. **A report in the journal PLoS Pathogens says the virus probably originated in local wildlife and was passed to humans through insect bites or some other as-yet unidentified means. There are plenty of other new viral candidates waiting in the wings, guts, breath and blood of animals around us** You can, for example, catch leprosy from armadillos, which carry the virus in their shells and are responsible for a third of leprosy cases in the U.S. Horses can transmit the Hendra virus, which can cause lethal respiratory and neurological disease in people. In a new book that should give us all pause for thought, **award-winning U.S. natural history writer David Quammen points to a host of animal-derived infections that now claim lives with unprecedented regularity. The trend can only get worse,** he warns. Quammen highlights the Ebola fever virus, which first struck in Zaire in 1976. The virus's power is terrifying, with fatality rates as high as 90 per cent. The latest mass outbreak of the virus, in the Congo last month, is reported to have killed 36 people out of 81 suspected cases. According to Quammen, Ebola probably originated in bats. The bats then infected African apes, quite probably through the apes coming into contact with bat droppings. The virus then infected local hunters who had eaten the apes as bushmeat. Quammen believes a similar pattern occurred with the HIV virus, which probably originated in a single chimpanzee in Cameroon. **It is inevitable we will have a global outbreak** Studies of the virus's genes suggest it may have first evolved as early as 1908. It was not until the Sixties that it appeared in humans, in big African cities. By the Eighties, it was spreading by airlines to America. Since then, Aids has killed around 30 million people and infected another 33 million. There is one mercy with Ebola and HIV. They cannot be transmitted by coughs and sneezes. 'Ebola is transmissible from human to human through direct contact with bodily fluids. It can be stopped by preventing such contact,' Quammen explains. **If HIV could be transmitted by air, you and I might already be dead. If the rabies virus — another zoonosis — could be transmitted by air, it would be the most horrific pathogen on the planet.** Viruses such as Ebola have another limitation, on top of their method of transmission. They kill and incapacitate people too quickly. In order to spread into pandemics, zoonoses need their human hosts to be both infectious and alive for as long as possible, so that the virus can keep casting its deadly tentacles across the world's population. **But there is one zoonosis that can do all the right (or wrong) things. It is our old adversary, flu.** It is easily transmitted through the air, via sneezes and coughs. Sars can do this, too. **But flu has a further advantage.** As Quammen points out: 'With Sars, symptoms tend to appear in a person before, rather than after, that person becomes highly infectious. Isolation: **Unlike Sars the symptoms of this new disease may not be apparent before the spread of infection** Isolation: Unlike Sars the symptoms of this new disease may not be apparent before the spread of infection 'That allowed many Sars cases to be recognised, hospitalised and placed in isolation before they hit their peak of infectivity. **But with influenza and many other diseases, the order is reversed. Someone who has an infectious case of a new and potentially lethal strain of flu can be walking about innocently spluttering it over everyone around them for days before they**

become incapacitated. Such reasons lead Professor Oxford, a world authority on epidemics, to warn that a new global pandemic of animal-derived flu is inevitable. And, he says, the clock is ticking fast. Professor Oxford's warning is as stark as it is certain: 'I think it is inevitable that we will have another big global outbreak of flu', he says. 'We should plan for one emerging in 2017-2018.' But are we adequately prepared to cope? Professor Oxford warns that vigilant surveillance is the only real answer that we have. 'New flu strains are a day-to-day problem and we have to be very careful to keep on top of them,' he says. 'We now have scientific processes enabling us to quickly identify the genome of the virus behind a new illness, so that we know what we are dealing with. The best we can do after that is to develop and stockpile vaccines and antiviral drugs that can fight new strains that we see emerging.' But the Professor is worried our politicians are not taking this certainty of mass death seriously enough. Such laxity could come at a human cost so unprecedentedly high that it would amount to criminal negligence. The race against newly-emerging animal-derived diseases is one that we have to win every time. **A pandemic virus needs to win only once and it could be the end of humankind.**

2NC/1NR Uniqueness

Adoption High

EMR adoption high in the status quo

Health and Human Services 14 — U.S. Department of Health & Human Services, HHS Press Office, 2014 (“More physicians and hospitals are using EHRs than before: CDC data provides baseline for EHR adoption among health care providers,” Health and Human Services, August 7, Available Online at <http://www.hhs.gov/news/press/2014pres/08/20140807a.html>, Accessed 7/26/15)

Significant increases in the use of electronic health records (EHRs) among the nation’s physicians and hospitals are detailed in two new studies published today by the HHS Office of the National Coordinator for Health Information Technology (ONC).

The studies, published in the journal Health Affairs, found that in 2013, **almost eight in ten (78 percent) office-based physicians reported they adopted some type of EHR system.** About half of all physicians (48 percent) had an EHR system with advanced functionalities in 2013, **a doubling of the adoption rate in 2009.**

About 6 in 10 (59 percent) hospitals had adopted an EHR system with certain advanced functionalities in 2013, **quadruple the percentage for 2010.** Unlike the physician study, the hospital study does not have an equivalent, established measure of adoption of some type of EHR system; it only reports on adoption of EHRs with advanced functionalities.

“**Patients are seeing the benefits of health IT as a result of the significant strides that have been made in the adoption and meaningful use of electronic health records,**” said Karen DeSalvo, M.D., M.P.H., national coordinator for health information technology. “We look forward to working with our partners to ensure that people’s digital health information follows them across the care continuum so it will be there when it matters most.”

The information in the studies was collected by the Centers for Disease Control and Prevention’s National Center for Health Statistics and the American Hospital Association in 2013.

These data provide an early baseline understanding of provider readiness to achieve **Stage 2 Meaningful Use of the Medicare and Medicaid EHR Incentive programs.** Stage 2 will begin later this year for providers who first attested to Stage 1 Meaningful Use in 2011 or 2012. About 75 percent of eligible professionals and more than 91 percent of hospitals have adopted or demonstrated Stage 1 Meaningful Use of certified EHRs.

Adoption rates of EMRS are high in the status quo

Pettit 13 — Lorren Pettit, holds an MBA in Business, Vice President of HIMSS, a global, cause-based, not-for-profit organization focused on better health through information technology, Market Researcher, 2013 (“Pace of EMR Adoption During the Past 5 Years,” HIMSS, October 14, Available Online at <http://www.himss.org/News/NewsDetail.aspx?ItemNumber=22845>, Accessed 7/26/15)

A lot of attention over the past five years has been focused on the adoption of electronic medical record (EMR) technologies in U.S. hospitals. The interest is understandable given all the money the government is spending to incent providers to use these technologies in a meaningful way, but the idea of EMR adoption in a hospital is a little more complex than how it is typically presented in the press. For one thing, there is no such thing as a singular “EMR application.” The EMR is a suite of tools comprised of distinct applications. To really understand a hospital’s EMR adoption status, we need to understand the hospital’s progression in building out an EMR.

Fortunately, the HIMSS Analytics EMR Adoption Model (EMRAM) provides an eight-stage framework for monitoring the development of a robust EMR system. First introduced into the market in 2006, HIMSS Analytics has been monitoring, on a quarterly basis, the array of hospitals amongst the various EMRAM stages. While it is fairly common knowledge that **the bulk of U.S. hospitals have been progressively moving toward advanced EMRAM stages,** the unknown concerns the “pace” at which these organizations are moving.

HIMSS Analytics staff recently analyzed the quarterly EMRAM progression of 4,811 hospitals during the last five years (Q2 2008 and Q2 2013). As was expected, **the vast majority of all U.S. hospitals (73.7 percent) have advanced at least EMRAM stage during this period.** Not surprising as this observation aligns with the shifting distribution the EMRAM profile discussed above. What we found most interesting was that **almost half of those organizations showing some advancement reflected a fairly progressive adoption posture** advancing by two or three stages during this period, **with another 20 percent assuming an aggressive EMR adoption pace,** advancing four or more stages in five years.

They Say: “Doesn’t Affect Health Care”

Privacy restrictions on privately collected data hurt health care effectiveness

Goldfarb and Tucker 12 — Avi Goldfarb, Professor of Marketing in the Rotman School of Management at University of Toronto, has published over 50 articles in a variety of outlets in economics, marketing, statistics, computing, and law, holds a PhD from Northwestern, MA from Northwestern, and BAH from Queens University, with Catherine Tucker, Professor of Marketing at MIT Sloan, Chair of the MIT Sloan PhD Program, received an NSF CAREER Award for her work on digital privacy, the Erin Anderson Award for Emerging Marketing Scholar and Mentor, the Paul E. Green Award for contributions to the practice of Marketing Research and a Garfield Award for her work on electronic medical records, holds a PhD in economics from Stanford University, and a BA from the University of Oxford, 2012 (“Privacy and Innovation,” Innovation Policy and the Economy, Chicago Journals, The National Bureau of Economic Research, Vol. 12, No. 1, pp. 65-90, January, Available Online via Subscribing Institutions at JStor, Accessed 7/21/15)

Consequences.—Although EMRs were invented in the 1970s, by 2005 only 41% of U.S. hospitals had adopted a basic EMR system. Anecdotal evidence suggests that privacy protection may partially explain this slow pace of diffusion. Expensive state-mandated privacy filters may, for example, have played a role in the collapse of the Santa Barbara County Care Data Exchange in 2007.

Miller and Tucker (2009) examine the empirical consequences of **privacy regulation** and, in particular, how it **suppresses network effects in adoption of medical information technology.** Network effects may shape the adoption of EMRs because hospitals derive network benefits from EMRs when they can electronically exchange information about patient histories with other providers such as general practitioners. Exchanging EMRs is quicker and more reliable than exchanging paper records by fax, mail, or patient delivery. It is especially useful for patients with chronic conditions when a new specialist requires access to previous tests. Emergency room patients whose records (containing information about previous conditions and allergies) are stored elsewhere also benefit.

EMRs key to better health care — 4 warrants

Guerriere 15 — Dr. Michael Guerriere, Chief Medical Officer and Vice-President, Transformation Services at TELUS Health, 2015 (“Four reasons you should care about EMRs,” TELUS, March 24, Available Online at <http://blog.telus.com/telus-health/four-reasons-you-should-care-about-emrs/>, Accessed 7/26/15)

Here are four reasons we as patients, healthcare providers and taxpayers should care about, and advocate for, full EMR adoption in Canada.

1) Convenient, high quality healthcare

When all authorized caregivers can access your complete medical history anywhere, anytime, it means less time repeating your medical history and pacing in waiting rooms. It means more efficiency, better decisions and ultimately, healthier outcomes.

2) Secure interactions

Unlike paper records, EMRs are not in danger of getting lost, damaged or destroyed. Your health details are not only backed up, they are protected from theft and tampering through the Canadian government's strict privacy regulations and procedures.

3) Better management of our own health

Good EMRs will have portals that let patients contribute data like blood pressure readings to their overall health picture. Through portals, patients take a much more active role in health, collaborating with doctors to track the impact of treatments and adjust behaviours to prevent disease. This is especially critical when managing chronic disease.

4) Collaborative care

EMRs give the whole team – doctors, specialists, pharmacists, technicians – complete and secure access to accurate and up-to-date information on your health. Imagine!

They Say: “Data Doesn’t Solve”

EMRs key to preventing short term and chronic disease and saves over \$10B

Hillestad et. al. 15 — Richard Hillestad, policy expert RAND Corporation, holds a Ph.D. in engineering and applied science and an M.S. and B.S. in electrical engineering; James Bigelow, Associate Professor in the Department of Pharmaceutical Sciences, holds a B.S. degree in Microbiology and Ph.D. in Biochemistry; Anthony Bower, researcher at Synageva BioPharma with degrees in Business Economics and Microeconomics; Federico Girosi, Associate Professor in Population Health at the School of Medicine, holds a Ph.D. in Health Policy from Harvard and a Ph.D. in Physics; Robin Meili, senior management systems analyst and director of International Programs at the RAND Corporation, holds an M.B.A. from NYU; Richard Scoville, Adjunct Associate Professor at UNC, holds a BA, MA in Education, and a PhD in Psychology; Roger Taylor, holds a Bachelor of Science (BSc), Politics, Philosophy and Economics, 2015 (“Can Electronic Medical Record Systems Transform Health Care? Potential Health Benefits, Savings, And Costs,” Health Affairs, Available Online at <http://content.healthaffairs.org/content/24/5/1103.full>, Accessed 7/22/15)

Using HIT for near-term chronic disease management.

The U.S. burden of chronic disease is extremely high and growing. In one study, fifteen chronic conditions accounted for more than half of the growth in health care spending between 1987 and 2000, and just five diseases accounted for 31 percent of the increase.²⁸ Disease management programs identify people with a potential or active chronic disease; target services to them based on their level of risk (sicker patients need more-tailored, more-intensive interventions, including case management); monitor their condition; attempt to modify their behavior; and adjust their therapy to prolong life, minimize complications, and reduce the need for costly acute care interventions.

EMR systems can be instrumental throughout the disease management process. Predictive-modeling algorithms can identify patients in need of services. EMR systems can track the frequency of preventive services and remind physicians to offer needed tests during patients’ visits. Condition-specific encounter templates implemented in an EMR system can ensure consistent recording of disease-specific clinical results, leading to better clinical decisions and outcomes. Connection to national disease registries allows practices to compare their performance with that of others. Electronic messaging offers a low-cost, efficient means of distributing reminders to patients and responding to patients’ inquiries. Web-based patient education can increase the patient’s knowledge of a disease and compliance with protocols.

For higher-risk patients, case management systems help coordinate workflows, including communication between multiple specialists and patients. In what may prove to be a transformative innovation, remote monitoring systems can transmit patients’ vital signs and other biodata directly from their homes to their providers, allowing nurse case managers to respond quickly to incipient problems. Health information exchange via RHINs or personal **health records promises great benefits for patients with multiple chronic illnesses,** who receive care from multiple providers in many settings.

We examined disease management programs for four conditions: asthma, congestive heart failure (CHF), chronic obstructive pulmonary disease (COPD), and diabetes (Exhibit 4) and estimated the effects of 100 percent participation of people eligible for each program.²⁹ By controlling acute care episodes, these programs greatly reduce hospital use at the cost of increased physician office visits and use of prescription drugs. As shown, **the programs could generate potential annual savings of tens of billions of dollars.** Keeping people out of the hospital is, of course, a health benefit, but we can also expect important outcomes such as reductions in days lost from school and work and in days spent sick in bed.

Data driven healthcare is the critical factor in disease prevention – revolutionizes planning and treatment

Marr 15 — Bernard Marr, contributor to Forbes, he also basically wrote the book on internet data – called Big Data – and is a keynote speaker and consultant in strategic performance, analytics, KPIs and big data, 2015 (“How Big Data Is Changing Healthcare”, Forbes, April 21, Available Online at <http://www.forbes.com/sites/bernardmarr/2015/04/21/how-big-data-is-changing-healthcare/>)

If you want to find out how Big Data is helping to make the world a better place, there’s **no better example** than the uses being found for it in healthcare. The last decade has seen huge advances in the amount of data we routinely generate and collect in pretty much everything we do, as well as our ability to use technology to analyze and understand it. The intersection of these trends is what we call “Big Data” and it is helping businesses in every industry to become more efficient and productive. Healthcare is no different. Beyond improving profits and cutting down on wasted overhead, Big Data in healthcare is being used to predict epidemics, cure disease, improve quality of life and avoid preventable deaths. With the world’s population increasing and everyone living longer, models of treatment delivery are rapidly changing, and many of the decisions behind those changes are being driven by data. The drive now is to understand as much about a patient as possible, as early in their life as possible – hopefully picking up warning signs of serious illness at an early enough stage that treatment is far more simple (and less expensive) than if it had not been spotted until later. So to take a journey through Big Data in healthcare, let’s start at the beginning – before we even get ill. Wearable blood pressure monitors send data to a smartphone app, then off to the doctor. (Photo by John Tlumacki/The Boston Globe via Getty Images) Prevention is better than cure Smart phones were just the start. With apps enabling them to be used as everything from pedometers to measure how far you walk in a day, to calorie counters to help you plan your diet, millions of us are now using mobile technology to help us try and live healthier lifestyles. More recently, a steady stream of dedicated wearable devices have emerged such as Fitbit, Jawbone and Samsung Gear Fit that allow you to track your progress and upload your data to be compiled alongside everyone else’s. In the very near future, you could also be sharing this data with your doctor who will use it as part of his or her diagnostic toolbox when you visit them with an ailment. Even if there’s nothing wrong with you, access to huge, ever growing databases of information about the state of the health of the general public will allow problems to be spotted before they occur, and remedies – either medicinal or educational – to be prepared in advance This is leading to ground breaking work, often by partnerships between medical and data professionals, with the potential to peer into the future and identify problems before they happen. One recently formed example of such a partnership is the Pittsburgh Health Data Alliance – which aims to take data from various sources (such as medical and insurance records, wearable sensors, genetic data and even social media use) to draw a comprehensive picture of the patient as an individual, in order to offer a tailored healthcare package. That person’s data won’t be treated in isolation. It will be compared and analyzed alongside thousands of others, highlighting specific threats and issues through patterns that emerge during the

comparison. This enables sophisticated predictive modelling to take place – a doctor will be able to assess the likely result of whichever treatment he or she is considering prescribing, backed up by the data from other patients with the same condition, genetic factors and lifestyle. Programs such as this are the industry’s attempt to tackle one of the biggest hurdles in the quest for data-driven healthcare: The medical industry collects a huge amount of data but often it is siloed in archives controlled by different doctors’ surgeries, hospitals, clinics and administrative departments. Another partnership that has just been announced is between Apple and IBM. The two companies are collaborating on a big data health platform that will allow iPhone and Apple Watch users to share data to IBM’s Watson Health cloud healthcare analytics service. The aim is to discover new medical insights from crunching real-time activity and biometric data from millions of potential users.

EMRs provide faster and more complete patient data analysis and diagnosis

Wilson and Bock 12 — John Wilson, MD, Vice President of Clinical Analytics, OptumInsight, and Adam Bock, MD, Chief Medical Information Officer at Minneapolis Veterans Hospital, 2012 (“The benefit of using both claims data and electronic medical record data in health care analysis,” Optum, February, Available Online at <https://www.optum.com/content/dam/optum/resources/whitePapers/Benefits-of-using-both-claims-and-EMR-data-in-HC-analysis-WhitePaper-ACS.pdf>, Accessed 7/26/15)

More complete condition identification

There are a variety of reasons that physicians may fail to completely record on a claim all the diagnoses from a visit. For one thing, physicians are constantly pressed for time, and every second spent recording billing codes is a second that takes them away from direct patient care. Additionally, in a fee-for-service setting, the payment that a physician receives for an office visit is not directly related to the number or type of conditions for which the physician codes (see Appendix A for more detail). Hence, in many cases, **the EMR will have a more complete set of diagnoses** for a given patient than claims data.

Because of this, claims data is often an imperfect reflection of the actual status of a patient. Several studies support this.

One study examined how often people with the condition of chronic kidney disease (CKD) had a claims-based diagnosis code for this condition over a one-year period. In this study,³ results of a blood test (the estimated glomerular filtration rate or eGFR) were used to determine whether or not kidney disease existed. If this test was abnormal on at least two separate occasions over a year, the patients met the definition CKD. The authors then examined all claims data for the patients who had CKD diagnosed by virtue of lab testing. They found that only 20–42 percent of these patients had a diagnosis code for CKD on a claim over the one-year period. Put another way, if one year of claims data was all that had been present, 58–80 percent of people with CKD would not have been identified.

Another study published in the Journal of the American Medical Association (JAMA)⁴ showed that of children with EMR blood pressure values that were high on at least three separate doctor visits, only 26 percent of them had a claim with a diagnosis of hypertension on it.

In addition to showing the shortcomings of claims data in identifying conditions, these data suggest another powerful conclusion: **Use of clinical data from the EMR can significantly**

improve condition identification. The use of lab result data elements can support identification of people with CKD even without a coded diagnosis. In addition, the use of vital sign data can allow identification of people with hypertension despite the lack of a claim-based diagnosis of this condition.

In fact, there are a variety of data elements that might be available in the EMR which, when analyzed, can allow the identification of a condition that was either not recognized or not coded for by the physician. So, one way in which EMR data enables better condition identification is by providing access to data elements (e.g., lab results and vital signs) that allow one to impute a diagnosis—even if that diagnosis was never made.

Allowing for imputed diagnosis is just one way in which EMR data improves condition identification over and above the use of claims data. The EMR also has something which claims data do not: the concept of a ‘problem list’.

Claims data is, by its nature, temporally limited. Meaning the claim reflects only the diagnoses and services that occurred on the date when the claim was submitted. It is not designed to convey information about what happened in the past. So for a patient who had heart surgery or an appendectomy two years ago, there is no reason that those items will appear on a claim today. Similarly, if a patient had a diagnosis of heart failure two years ago, that diagnosis may not appear on a claim during a subsequent time period, even if the condition persists. The EMR, however, has a way to transcend the concept of time by which claims data are constrained: the problem list.

The problem list is an area in the electronic record where providers can keep track of the list of medical problems affecting a patient. The EMR maintains this list independently from any particular medical visit/encounter. Hence, use of the EMR problem list allows identification of conditions which may not be identified via claims data.

More timely

In addition to the ability of EMR data to enhance condition identification as discussed above, EMR data has another advantage: timeliness. Sometimes we would like to understand that a patient has experienced a certain event as soon as that event has occurred. For example, we might like a nurse to provide a follow-up call to a patient the day after an emergency room visit. If we are dependent on claims data alone to identify the emergency room visit, there may be a delay (sometimes of months) until a claim for this visit is received and processed. However, providers interact with the EMR during (or soon after) the patient encounter. Hence, EMR data is generated in real time, and a system which evaluates data from the EMR can allow a much more rapid response.

Obamacare I/L

Explanation of this alternate internal link: EMRs fall under the Obamacare act; given that Republicans hate Obamacare, they will use the plan's privacy restrictions to get rid of EMRs and Obamacare.

EMRs are based in Obamacare

Hughes 15 — Jane Lindell Hughes, M.D., F.A.C.S., Clinical Professor in the Department of Ophthalmology at the University of Texas Health Science Center, 2015 (“Obamacare: Why Washington wants your medical file,” Washington Times, February 11, Available Online at <http://www.washingtontimes.com/news/2015/feb/11/electronic-medical-records-government-medicine-101/>, Accessed 7/26/15)

Medicare and Medicaid have served as the template for Obamacare and government-controlled medicine. This began with price controls on doctors and hospitals resulting in cost-shifting to the private sector and spiraling health care costs. Politicians used this predictable outcome to clamor for healthcare overhaul. **The crucial cost-control piece in the final implementation of Obamacare is the centrally connected EMR database.** It is to be the vehicle by which the patients' conditions are monitored and their treatment options elucidated based on centrally determined “best practices” and factors such as age and pre-existing pathology.

Physician compliance with recommended treatments will be monitored and corrected when necessary. People the likes of Jonathan Gruber and Ezekiel Emmanuel will be deciding these parameters as appointees to the Council for Comparative Effectiveness Research and the Independent Payment Advisory Board (IPAB).

Republicans hate Obamacare and will do anything to end it

Bouie 15 — Jamelle Bouie, Slate staff writer covering politics, policy, and race, 2015 (“Dead Letter Office,” Slate, February 5, Available Online at http://www.slate.com/articles/news_and_politics/politics/2015/02/republicans_want_to_repeal_obamacare_the_gop_has_a_harder_time_replacing.html, Accessed 7/26/15)

To be an elected Republican in the age of Obamacare is to have a single, endless mantra: **“Repeal and replace.”** Of the two parts, Republicans have had the easiest time with “repeal.” Since winning the majority in 2010, House Republicans have held 56 votes to repeal the Affordable Care Act, with the latest attempt on Tuesday, a courtesy for the new members who haven't had a chance to voice their ritual distaste for the law.

If you're feeling charitable, you can treat this focus on “repeal” as a consequence of circumstances. House Republicans could have crafted a bill to replace Obamacare, but then they would have had to make the compromises and pay the costs of building an alternative without the benefit of bringing it to law—as soon as any bill reached the Senate, Democrats would have killed it.

But now, **Republicans have all of Congress. If they want to replace Obamacare, they can.** And on Wednesday, they took a step in that direction. With little fanfare, Sens. Orrin Hatch of Utah, Richard Burr of North Carolina, and Rep. Fred Upton of Michigan unveiled their blueprint for Republican health reform. Called the “Patient Choice, Affordability, Responsibility and Empowerment Act,” it is mostly identical to an outline released last year by Hatch, Burr, and now-retired Sen. Tom Coburn.

Republicans are pushing for privacy restrictions

Miller 14 — Zeke J. Miller, 2014 (“Exclusive: Republican Party Calls For End To NSA Domestic Phone Records Program” Time, January 24, Available Online at <http://time.com/2156/exclusive-republican-party-calls-for-investigation-into-nsa-snooping/>, Accessed 7/26/15)

In the latest indication of a growing libertarian wing of the GOP, the Republican National Committee passed a resolution Friday calling for an investigation into the **“gross infringement of Americans’ rights by National Security Agency** programs that were revealed by Edward Snowden.

The resolution also calls on Republican members of Congress to enact amendments to the Section 215 law that currently allows the spy agency to collect records of almost every domestic telephone call. The amendment should make clear that “blanket surveillance of the Internet activity, phone records and correspondence — electronic, physical, and otherwise — of any person residing in the U.S. is prohibited by law and that violations can be reviewed in adversarial proceedings before a public court,” the resolution reads.

The measure, the “Resolution to Renounce the National Security Agency’s Surveillance Program,” passed by an **“overwhelming majority” by voice vote**, along with resolutions calling for the repeal of the Foreign Account Tax Compliance Act and reaffirming the party’s pro-life stance, according to Reince Priebus, the RNC chairman.

Among other points, the resolution declares “the mass collection and retention of personal data is in itself **contrary to the right of privacy protected by the Fourth Amendment** of the United States Constitution,” a claim embraced by civil libertarians of both parties.

2NC/1NR Impact

Disease Module

EMRs key to preventing disease — increased research, diagnosis and treatment capabilities

Exscribe 13 — Exscribe Orthopaedic Healthcare Solutions, a team of orthopedists and IT professionals to develop and address the unique needs of Orthopaedic practices, 2013 ("EMRs may help boost knowledge of DNA and disease," Exscribe, December 31, Available Online at <http://www.exscribe.com/orthopedic-e-news/ehremr/emrs-may-help-boost-knowledge-of-dna-and-disease>, Accessed 7/26/15)

For decades researchers have been working to link DNA to certain diseases in order to better prevent, diagnose and treat various medical issues. This has resulted in many genome-wide association studies that have proven to be very informative, but also have limitations. Recently, researchers from Vanderbilt University Medical Center and four other U.S. institutions from the Electronic Medical Records and Genomics Network discovered that **EMRs may be able to help overcome these limitations and allow scientists to learn even more about the connection between DNA and disease.**

The researchers used a combination of genetic data and electronic medical records to conduct the first large-scale phenome-wide association study, known as PheWAS. The scientists explained that while traditional genetic studies would start with one phenotype and then examine one or several genotypes, this type of study does the opposite by looking at a number of diseases for one genetic variant or genotype.

"This study broadly shows that we can take decades of off-the-shelf electronic medical record data, link them to DNA, and quickly validate known associations across hundreds of previous studies," said lead author Josh Denny, M.D., M.S., Vanderbilt associate professor of biomedical informatics and medicine. "And, at the same time, we can discover many new associations. A third important finding is that our method does not select any particular disease – it searches simultaneously for more than a thousand diseases that bring one to the doctor. By doing this, **we were able to show some genes that are associated several diseases or traits, while others are not.**"

Denny explained that this method will not be replacing traditional genetic research, but it does offer a cost efficient way to examine many different diseases over time.

"PheWAS opens up important avenues in understanding why certain diseases can present differently in different people, or how drugs might produce unpredicted effects in some patients," said senior author Dan Roden, M.D., assistant vice chancellor for Personalized Medicine, and principal investigator for the Vanderbilt eMERGE site.

The New York Times spoke to Robert Green from Harvard Medical School, who explained that this study has shown that **EMRs could be a reliable source of scientific information.** This is particularly exciting considering that these systems were not even designed with this purpose in mind, adding to the long list of benefits of EMRs.

Moving forward with EMRs and DNA

Healthcare Informatics published an article explaining that precision medicine – the goal of which is to look into the molecular basis of disease using information from people's DNA and linking it to information in their EMR – is a growing field. The news source spoke to Michael Blum, M.D., the leader of the new Center for Digital Health Innovation at the University of California, San Francisco, who explained that he believes that the key to advancing this type of medicine is to utilize the new technology available in the health care industry to create a knowledge network and information commons to link sources together.

EMRs can help diagnose diseases

Along with helping to connect DNA to certain diseases, EMRs have also been shown to help doctors avoid making costly diagnostic errors. According to HealthIT.gov, EMRs do not just contain patient information, they can also help compute it. This means that they can present information in a way that will help doctors better diagnose and treat patients. For example, whenever a doctor prescribes a new medication to a patient and enters it into an EMR, the system will automatically alert him or her if the new meds could interact negatively with a drug the patient is currently taking.

New zoonotic diseases cause extinction – different from past diseases. Health care key to predict and check them

Quammen 12 — award-winning science writer, long-time columnist for *Outside* magazine, writer for National Geographic, Harper's, Rolling Stone, the New York Times Book Review and others, 9/29/2012 (David, "Could the next big animal-to-human disease wipe us out?," The Guardian, pg. 29, Lexis)

Infectious disease is all around us. It's one of the basic processes that ecologists study, along with predation and competition. Predators are big beasts that eat their prey from outside. Pathogens (disease-causing agents, such as viruses) are small beasts that eat their prey from within. Although infectious disease can seem grisly and dreadful, under ordinary conditions, it's every bit as natural as what lions do to wildebeests and zebras. **But conditions aren't always ordinary.** Just as predators have their accustomed prey, so do pathogens. And just as a lion might occasionally depart from its normal behaviour - to kill a cow instead of a wildebeest, or a human instead of a zebra - so a pathogen can shift to a new target. **Aberrations occur.** When a pathogen leaps from an animal into a person, and succeeds in establishing itself as an infectious presence, sometimes causing illness or death, the result is a zoonosis. It's a mildly technical term, zoonosis, unfamiliar to most people, but it helps clarify the biological complexities behind the ominous headlines about swine flu, bird flu, Sars, emerging diseases in general, and the threat of a global pandemic. It's a word of the future, destined for heavy use in the 21st century. Ebola and Marburg are zoonoses. So is bubonic plague. So was the so-called Spanish influenza of 1918-1919, which had its source in a wild aquatic bird and emerged to kill as many as 50 million people. All of the human influenzas are zoonoses. As are monkeypox, bovine tuberculosis, Lyme disease, West Nile fever, rabies and a strange new affliction called Nipah encephalitis, which has killed pigs and pig farmers in Malaysia. Each of these zoonoses reflects the action of a pathogen that can "spillover", crossing into people from other animals. Aids is a disease of zoonotic origin caused by a virus that, having reached humans through a few accidental events in western and central Africa, now passes human-to-human. This form of interspecies leap is not rare; about 60% of all human infectious diseases currently known either cross routinely or have recently crossed between other animals and us. Some of those - notably rabies - are familiar, widespread and still horrendously lethal, killing humans by the thousands despite centuries of efforts at coping with their effects. Others are new and inexplicably sporadic, claiming a few victims or a few hundred, and then disappearing for years. **Zoonotic pathogens can hide.** The least conspicuous strategy is to lurk within what's called a reservoir host: a living organism that carries the pathogen while suffering little or no illness. When a disease seems to disappear between outbreaks, it's often still lingering nearby, within some reservoir host. A rodent? A bird? A butterfly? A bat? To reside undetected is probably easiest wherever biological diversity is high and the ecosystem is relatively undisturbed. The converse is also true: ecological disturbance causes diseases to emerge. Shake a tree and things fall out. Michelle Barnes is an energetic, late 40s-ish woman, an avid rock climber and cyclist. Her auburn hair, she told me cheerily, came from a bottle. It approximates the original colour, but the original is gone. In 2008, her hair started falling out; the rest went grey "pretty much overnight". This was among the lesser effects of a mystery illness that had nearly killed her during January that year, just after

she'd returned from Uganda. Her story paralleled the one Jaap Taal had told me about Astrid, with several key differences - the main one being that Michelle Barnes was still alive. Michelle and her husband, Rick Taylor, had wanted to see mountain gorillas, too. Their guide had taken them through Maramagambo Forest and into Python Cave. They, too, had to clamber across those slippery boulders. As a rock climber, Barnes said, she tends to be very conscious of where she places her hands. No, she didn't touch any guano. No, she was not bumped by a bat. By late afternoon they were back, watching the sunset. It was Christmas evening 2007. They arrived home on New Year's Day. On 4 January, Barnes woke up feeling as if someone had driven a needle into her skull. She was achy all over, feverish. "And then, as the day went on, I started developing a rash across my stomach." The rash spread. "Over the next 48 hours, I just went down really fast." By the time Barnes turned up at a hospital in suburban Denver, she was dehydrated; her white blood count was imperceptible; her kidneys and liver had begun shutting down. An infectious disease specialist, Dr Norman K Fujita, arranged for her to be tested for a range of infections that might be contracted in Africa. All came back negative, including the test for Marburg. Gradually her body regained strength and her organs began to recover. After 12 days, she left hospital, still weak and anaemic, still undiagnosed. In March she saw Fujita on a follow-up visit and he had her serum tested again for Marburg. Again, negative. Three more months passed, and Barnes, now grey-haired, lacking her old energy, suffering abdominal pain, unable to focus, got an email from a journalist she and Taylor had met on the Uganda trip, who had just seen a news article. In the Netherlands, a woman had died of Marburg after a Ugandan holiday during which she had visited a cave full of bats. Barnes spent the next 24 hours Googling every article on the case she could find. Early the following Monday morning, she was back at Dr Fujita's door. He agreed to test her a third time for Marburg. This time a lab technician crosschecked the third sample, and then the first sample. The new results went to Fujita, who called Barnes: "You're now an honorary infectious disease doctor. You've self-diagnosed, and the Marburg test came back positive." The Marburg virus had reappeared in Uganda in 2007. It was a small outbreak, affecting four miners, one of whom died, working at a site called Kitaka Cave. But Joosten's death, and Barnes's diagnosis, implied a change in the potential scope of the situation. That local Ugandans were dying of Marburg was a severe concern - sufficient to bring a response team of scientists in haste. But if tourists, too, were involved, tripping in and out of some python-infested Marburg repository, unprotected, and then boarding their return flights to other continents, the place was not just a peril for Ugandan miners and their families. It was also an international threat. The first team of scientists had collected about 800 bats from Kitaka Cave for dissecting and sampling, and marked and released more than 1,000, using beaded collars coded with a number. That team, including scientist Brian Amman, had found live Marburg virus in five bats. Entering Python Cave after Joosten's death, another team of scientists, again including Amman, came across one of the beaded collars they had placed on captured bats three months earlier and 30 miles away. "It confirmed my suspicions that these bats are moving," Amman said - and moving not only through the forest but from one roosting site to another. Travel of individual bats between far-flung roosts implied circumstances whereby Marburg virus might ultimately be transmitted all across Africa, from one bat encampment to another. It voided the comforting assumption that this virus is strictly localised. And it highlighted the complementary question: why don't outbreaks of Marburg virus disease happen more often? Marburg is only one instance to which that question applies. Why not more Ebola? Why not more Sars? In the case of Sars, the scenario could have been very much worse. Apart from the 2003 outbreak and the aftershock cases in early 2004, it hasn't recurred. . . so far. Eight thousand cases are relatively few for such an explosive infection; 774 people died, not 7 million. Several factors contributed to limiting the scope and impact of the outbreak, of which humanity's good luck was only one. Another was the speed and excellence of the laboratory diagnostics - finding the virus and identifying it. Still another was the brisk efficiency with which cases were isolated, contacts were traced and quarantine measures were instituted, first in southern China, then in Hong Kong, Singapore, Hanoi and Toronto. If the virus had arrived in a different sort of big city - more loosely governed, full of poor people, lacking first-rate medical institutions - it might have burned through a much larger segment of humanity. One further factor, possibly the most crucial, was inherent in the way Sars affects the human body: symptoms tend to appear in a person before, rather than after, that person becomes highly infectious. That allowed many Sars cases to be recognised, hospitalised and placed in isolation before they hit their peak of infectivity. With influenza and many other diseases, the order is reversed. That probably helped account for the scale of worldwide misery and death during the 1918-1919 influenza. And that infamous global pandemic occurred in the era before globalisation. Everything nowadays moves around the planet faster, including viruses. When the Next Big One comes, it will likely conform to the same perverse pattern as the 1918 influenza: high infectivity preceding notable symptoms. That will help it move through cities and airports like an angel of death. The Next Big One is a subject that disease scientists around the world often address. The most recent big one is Aids, of which the eventual total bigness cannot even be predicted - about 30 million deaths, 34 million living people infected, and with no end in sight. Fortunately, not every virus goes airborne from one host to another. If HIV-1 could, you and I might already be dead. If the rabies virus could, it would be the most horrific pathogen on the planet. The influenzas are well adapted for airborne transmission, which is why a new strain can circle the world within days. The Sars virus travels this route, too, or anyway by the respiratory droplets of sneezes and coughs - hanging in the air of a hotel corridor, moving through the cabin of an aeroplane - and that capacity, combined with its case fatality rate of almost 10%, is what made it so scary in 2003 to the people who understood it best. Human-to-human transmission is the crux. That capacity is what separates a bizarre, awful, localised, intermittent and mysterious disease (such as Ebola) from a global pandemic. Have you noticed the persistent, low-level buzz about avian influenza, the strain known as H5N1, among disease experts over the past 15 years? That's because avian flu worries them deeply, though it hasn't caused many human fatalities. Swine flu comes and goes periodically in the human population (as it came and went during 2009), sometimes causing a bad pandemic and sometimes (as in 2009) not so bad as expected; but avian flu resides in a different category of menacing possibility. It worries the flu scientists because they know that H5N1 influenza is extremely virulent in people, with a high lethality. As yet, there have been a relatively low number of cases, and it is poorly transmissible, so far, from human to human. It'll kill you if you catch it, very likely, but you're unlikely to catch it except by butchering an infected chicken. But if H5N1 mutates or reassembles itself in just the right way, if it adapts for human-to-human transmission, it could become the biggest and fastest killer disease since 1918. It got to Egypt in 2006 and has been especially problematic for that country. As of August 2011, there were 151 confirmed cases, of which 52 were fatal. That represents more than a quarter of all the world's known human cases of bird flu since H5N1 emerged in 1997. But here's a critical fact: those unfortunate Egyptian patients all seem to have acquired the virus directly from birds. This indicates that the virus hasn't yet found an efficient way to pass from one person to another. Two aspects of the situation are dangerous, according to biologist Robert

Webster. The first is that Egypt, given its recent political upheavals, may be unable to staunch an outbreak of transmissible avian flu, if one occurs. His second concern is shared by influenza researchers and public health officials around the globe: with all that mutating, with all that contact between people and their infected birds, the virus could hit upon a genetic configuration making it highly transmissible among people. "As long as H5N1 is out there in the world," Webster told me, "**there is the possibility of disaster**." . . . There is the theoretical possibility that it can acquire the ability to transmit human-to-human." He paused. "And then God help us." We're unique in the history of mammals. No other primate has ever weighed upon the planet to anything like the degree we do. In ecological terms, we are almost paradoxical: large-bodied and long-lived but grotesquely abundant. **We are an outbreak. And here's the thing about outbreaks: they end**. In some cases they end after many years, in others they end rather soon. In some cases they end gradually, in others they end with a crash. In certain cases, they end and recur and end again. Populations of tent caterpillars, for example, seem to rise steeply and fall sharply on a cycle of anywhere from five to 11 years. The crash endings are dramatic, and for a long while they seemed mysterious. What could account for such sudden and recurrent collapses? One possible factor is infectious disease, and viruses in particular.

Economy Module

EMRs facilitate cost-effective health care systems

Whitney and Wilkinson 9 — Elisa Whitney, earned a PharmD degree at Lake Erie College of Osteopathic Medicine, and Julie J. Wilkinson, associate professor and chair in the Department of Pharmacy Practice at LECOM, holds PharmD and BCPS degrees, 2009 (“Improving Patient Care with Access to EMRs,” Pharmacy Times, August 15, Available Online at <http://www.pharmacytimes.com/publications/issue/2009/august2009/techfeatureemrs-0809#sthash.q2CauCgL.dpuf>, Accessed 7/26/15)

The demand for health care services in the United States will increase in the coming years because of the aging population. The majority of Americans aged 65 years or older suffer from at least one chronic disease, which could be prevented with proper changes in lifestyle or managed with appropriate drug therapy.⁴ **About 75% of the national health expenditure is on chronically ill patients.**² Unless chronic diseases are well managed and preventive care measures become part of our daily routine, the cost of health care will continue to rise. Better coordination and communication across providers dealing with chronically ill patients and patients seeking preventive care could yield a better health care delivery system.

EMRs could grant community pharmacists access to a patient’s diagnosis, lab results, vital signs, allergies, treatment plans, desired treatment outcomes, clinical progress notes, and social, health, and medication history. They could also provide room for documenting counseling sessions, observations, assessments, and recommendations, which can be instantaneously accessed by other authorized health care providers. Because community pharmacists encounter multiple patients daily, many of whom are regular, chronically ill visitors, they can use EMRs to more effectively screen, monitor, and provide counseling sessions. Additionally, they can provide appropriate recommendations to other health care providers.

Access to a patient’s social history could enable community pharmacists to practice preventive care measures by helping formulate plans that meet patients’ specific needs. For example, if a pharmacist wishes to provide smoking cessation counseling sessions to a patient who has tried to quit several times, it is more likely that the pharmacist will be successful if he is aware of previous difficulties or addiction tendencies recorded by other health care providers during past encounters with the same patient. The same could be said for pharmacists who wish to provide counseling services for the prevention of hypoglycemia, diabetes, obesity, and hypertension.

EMRs will facilitate the adoption and utilization of electronic prescribing (eprescribing). This system is expected to improve the quality of patient care by reducing handwriting based errors and by providing warnings and alerts at point of prescribing. It will also provide prescribers with information about medications a patient is already taking, including those prescribed by other health care providers. This will help ensure that prescribers are aware of possible drug–drug and drug–allergy interactions, drug appropriateness, correct dosage, contraindications, and duplications.⁵

It has been estimated that **eprescribing could save \$27 billion annually and could prevent more than 2 million adverse drug events, from which more than 130,000 are life-threatening.**⁶ This estimate does not take into consideration the time that could be saved in community

pharmacies by reducing clarification callbacks to prescribers, paper based prescription drop offs, fax or telephone refill requests, and interpretation of handwritten prescriptions. Freeing pharmacists from these tasks could eventually result in better patient care quality and reduced health care costs.

Health care costs kill the economy

Callahan 8 — Daniel Callahan, cofounder and president emeritus of The Hastings Center, holds a PhD, 2008 (“Health Care Costs and Medical Technology,” From Birth to Death and Bench to Clinic: The Hastings Center Bioethics Briefing Book for Journalists, Policymakers, and Campaigns, Available Online at <http://www.thehastingscenter.org/Publications/BriefingBook/Detail.aspx?id=2178>, Accessed 7/26/15)

Almost everyone knows that this country has a scandalously large number of people who lack health insurance, now up to 46 million and growing. That number is vivid and evocative. But it has overshadowed another, more serious issue—that of the steady escalation of health care costs. Largely due to the use of medical technology, **those costs are now increasing at an annual rate of 7% a year.** The **Medicare** program as a consequence **is projected to go bankrupt in nine years,** and overall health care cost to go from its present \$2.1 trillion annually to \$4 trillion in 10 years.

Those rising costs are an important reason why the number of uninsured keeps going up. Business finds it harder and harder to pay for employee health benefits, and only 61% of employers even provide them now (from a high a decade ago of close to 70%); and the employers who do provide benefits are cutting them and forcing employees to pay more themselves in the form of copayments and deductibles. The 15% who are uninsured are surely faced with both health and financial threats. But **the cost problem now threatens everyone else as well,** including those using the Medicare and Medicaid programs.

Yet even if most people are now aware of the dangers of cost escalation (and many know it from personal experience), the problem has not gripped the imagination of the public, the presidential candidates, or the media with the force of the uninsured (even though recent public opinion polls indicate it is catching up). There are a number of proposed and detailed schemes for universal care, but nothing comparable for cost control, which is implicitly unpopular. That’s because cost control will mean that just about everyone will be forced to give up something and accept a different, more austere kind of health care.

Consider what serious cost control will require: moving from a 7% annual cost growth down to 3%, which is an inflation of health care costs that is no greater than that of the per annum rise in general inflation. That amounts to a cost reduction of \$1.5 trillion over the next decade, so that health care costs settle in at \$2.5 trillion in a decade. This would represent an **enormous and unprecedented drop in annual costs for a health care system** that has never since World War II seen anything more than a short, temporary decline from time to time.

Inflated health care costs kill the economy

Holland 13 — Joshua Holland, senior digital producer and author of *The Fifteen Biggest Lies About the Economy (and Everything Else the Right Doesn't Want You to Know about Taxes, Jobs and Corporate America)*, host of Politics and Reality Radio, 2013 (“Rip-Off: How Private-Sector Health Costs Are Killing the American Dream,” Moyer, November 1, Available Online at <http://billmoyers.com/2013/11/01/rip-off-how-private-sector-health-costs-are-killing-the-american-dream/>, Accessed 7/26/15)

Part one of this series, “The High Cost of Low Taxes,” noted that while Americans enjoy a tax burden lower than that of other wealthy countries, we also pay four times as much as they do, on average, for out-of-pocket “social costs” in the private sector – on health care, retirement security, disability and unemployment insurance, and the rest of the safety net. When you add up what we pay in taxes and what we pay out of pocket, the US spends about the same amount on social costs overall as some of the most generous, heavily taxed social democracies, but we get a far less secure safety net in return.

The federal government doesn't have a deficit problem. **Its fiscal issues are entirely related to the bloated cost of American health care.** If we paid the same amount for health care per person as people do in other wealthy countries with longer average life expectancies, we'd have a balanced budget now and surpluses projected for the future.

But those are just numbers on a spreadsheet. Fran and Randy Malott understand those costs more viscerally. The Whittier, Calif., couple aren't living the American dream right now. They haven't for a while. They were slammed when Wall Street's house of cards came tumbling down, and now they're feeling the squeeze of the Great American Rip-off.

Fran lost her job as a customer service representative in 2009, at the height of the Great Recession. “A lot of companies are getting rid of customer service these days,” explains Randy. He lost his job managing a temp agency a year or so later. The Malotts are two of what Paul Krugman called “the forgotten millions” – the long-term unemployed who face unique barriers to reentering the workforce, including discrimination by potential employers just because they've been out of work for an extended period. “And our age doesn't help either,” says Randy. He's 59 and she's 60. “There was unemployment for a while,” Randy says, “and now we're getting by on savings.”

He tells Moyers & Company, “we live pretty frugally,” but the \$1,600 a month they're forking over for health insurance represents about half their total spending. The Malotts are a healthy couple, yet they're watching their life savings drain away, in large part due to their health insurance company. The \$140,000 the Malotts had socked away for retirement is now down to around \$45,000. “We've got quite a ways to go before Social Security and Medicare kick in,” says Randy.

The Malotts are in a tough spot, like a lot of people who find themselves in similar circumstances. Studies have shown that long-term unemployment causes stress and illness. In

the rest of the world's highly developed countries, the Malotts' health care would be covered by their government – the risk of long-term unemployment would be spread across an entire society – which means they'd have one less serious stressor, and around \$45,000 more in the bank than they do today.

When Competition Drives Up Costs

The US system is a stark testament to the fact that, at least when it comes to health care, more competition doesn't lead to lower prices or better outcomes.

Three facts are indisputable. First, the \$8,500 we spent per person on health care in 2011 was around \$5,000 more than the average among developed countries in the Organization for Economic Cooperation and Development (OECD) — and almost \$3,000 more than the average in Switzerland, which was the next highest spender.

Second, multiple studies have found that we have significantly poorer health outcomes than most developed countries (see here, and here) – by some measures, **we rank dead last.** And it's not just because we have higher rates of poverty and inequality — a study conducted by the National Research Council and the Institute for Medicine accounted for those factors and found that, as Grace Rubenstein summarized for The Atlantic, “even white, well-off Americans live sicker and die sooner than similarly situated people elsewhere.” (American men are also becoming shorter relative to men in other highly developed countries – the average height of a population is a proxy for the quality of prenatal health care and nutrition.)

Finally, we rely much more heavily on the private sector to finance our health care than any other wealthy country. Every developed state finances health care through a mix of private and public spending, but the balance between private and public health care in the US looks different from the rest of the wealthy world. Across the OECD countries, governments pick up 72 percent of the tab for health care, but our government finances just under 48 percent – only the Chilean government covers a smaller share (XL). (In the eight social democracies with the highest tax burdens in the OECD — Denmark, Sweden, Norway, Belgium, Italy, France, Austria and Finland — 79 percent of health costs are financed through the public sector.)

There are several reasons why our outsized reliance on the private sector ends up costing us so dearly. The first is a simple matter of scale. In 2009, at the height of the debate over Obamacare, economist Josh Bivens wrote that “health care is an area where the more costs are loaded up on the federal government, the more efficiently care tends to be delivered overall.” This is a big reason why costs in America's public health care programs, with their purchasing clout, have grown more slowly than they have in the private sector.

When a single-payer system covers a vast pool of people, it has more bargaining power to negotiate with providers. It needs significantly less administrative overhead to figure out who will pay which bill (a question which is regularly litigated). A 2003 study published in the New England Journal of Medicine found that **three out of every 10 health care dollars spent in the US goes to administrative costs rather than care.**

US economy is still the lynchpin of the global economy — most recent evidence

Brett 15 — Shane Brett, author of "The Future of Hedge Funds", founder of "Global Perspectives", co-founder of "Gecko", received his Bachelor of Business Studies (Hons), Accounting & Finance from Dundalk Institute of Technology, received his MBA in Management Consulting from the University of Wales, has 19 years experience in hedge fund /asset management operations, consultancy & technology, including programme & product management at top fund managers & administrators worldwide, 2015 ("The Global Economy In 2015 - 5 Key Trends," Seeking Alpha, January 11, Available Online at <http://seekingalpha.com/article/2811155-the-global-economy-in-2015-5-key-trends>, Accessed 7/16/15)

The US economy created **7,000 jobs per day** in 2014 and **this remarkable rate of employment growth is set to escalate** in 2015.

The perceived decline of American power has been greatly exaggerated.

Commentators confuse the current US unwillingness to wield hard power, for a lack of underlying real power. They also confuse deadlock in Washington with the underlying dynamism of many US regions and States.

The US still controls the global economy, all the world's oceans, its trade routes and its reserve currency. It spends nearly as much on defence as the rest of the world put together. **This will not change anytime soon.**

In 2015, the US will continue to be the global engine for growth, enterprise and innovation, as it has been for most of the last century.

This should not be surprising. The English-speakers (i.e. the USA/UK) have run the world for 3 centuries now. They have consistently defeated all challengers to world hegemony that have appeared over this time (Philip II, Louis XIV, Napoleon, Kaiser Wilhelm II, Hitler, Stalin etc.).

Despite the chorus of BRIC hysteria over the last few years, the economic growth in these countries has taken place because **they adopted US policies of trade liberalization, economic freedom and a free market.** In 2015, they will endure a major emerging market crisis. Their power will not surpass the US for decades (if ever).

Global economic decline causes nuclear war

Auslin 9 — Michael Auslin, Resident Scholar – American Enterprise Institute, and Desmond Lachman – Resident Fellow – American Enterprise Institute, 2009 ("The Global Economy Unravels", Forbes, 3-6, Available Online at <http://www.aei.org/article/100187>)

What do these trends mean in the short and medium term? The Great Depression showed how social and **global chaos followed** hard on **economic collapse**. The mere fact that parliaments across the globe, from America to Japan, are unable to make responsible, economically sound recovery plans suggests that they do not know what to do and are simply hoping for the least disruption. Equally worrisome is the adoption of more statist economic programs around the

globe, and the concurrent decline of trust in free-market systems. The threat of instability is a pressing concern. China, until last year the world's fastest growing economy, just reported that 20 million migrant laborers lost their jobs. Even in the flush times of recent years, China faced upward of 70,000 labor uprisings a year. A sustained downturn poses grave and possibly immediate threats to Chinese internal stability. The regime in Beijing may be faced with a choice of repressing its own people or diverting their energies outward, leading to conflict with China's neighbors. Russia, an oil state completely dependent on energy sales, has had to put down riots in its Far East as well as in downtown Moscow. Vladimir Putin's rule has been predicated on squeezing civil liberties while providing economic largesse. If that devil's bargain falls apart, then wide-scale repression inside Russia, along with a continuing threatening posture toward Russia's neighbors, is likely. Even apparently stable societies face increasing risk and the threat of internal or possibly external conflict. As Japan's exports have plummeted by nearly 50%, one-third of the country's prefectures have passed emergency economic stabilization plans. Hundreds of thousands of temporary employees hired during the first part of this decade are being laid off. Spain's unemployment rate is expected to climb to nearly 20% by the end of 2010; Spanish unions are already protesting the lack of jobs, and the specter of violence, as occurred in the 1980s, is haunting the country. Meanwhile, in Greece, workers have already taken to the streets. Europe as a whole will face dangerously increasing tensions between native citizens and immigrants, largely from poorer Muslim nations, who have increased the labor pool in the past several decades. Spain has absorbed five million immigrants since 1999, while nearly 9% of Germany's residents have foreign citizenship, including almost 2 million Turks. The xenophobic labor strikes in the U.K. do not bode well for the rest of Europe. A prolonged global downturn, let alone a collapse, would dramatically raise tensions inside these countries. Couple that with possible protectionist legislation in the United States, unresolved ethnic and territorial disputes in all regions of the globe and a loss of confidence that world leaders actually know what they are doing. The result may be a series of small explosions that coalesce into a big bang.

Economic decline risks global nuclear conflicts – studies confirm.

Ferguson 9 — Niall Ferguson, Laurence A. Tisch Professor of History at Harvard University, 2009 (“The Axis of Upheaval,” *Foreign Policy*, February 16th, Available Online at http://www.foreignpolicy.com/articles/2009/02/16/the_axis_of_upheaval)

The Bush years have of course revealed the perils of drawing facile parallels between the challenges of the present day and the great catastrophes of the 20th century. Nevertheless, there is reason to fear that the biggest financial crisis since the Great Depression could have comparable consequences for the international system. For more than a decade, I pondered the question of why the 20th century was characterized by so much brutal upheaval. I pored over primary and secondary literature. I wrote more than 800 pages on the subject. And ultimately I concluded, in *The War of the World*, that three factors made the location and timing of lethal organized violence more or less predictable in the last century. The first factor was ethnic disintegration: Violence was worst in areas of mounting ethnic tension. The second factor was economic volatility: The greater the magnitude of economic shocks, the more likely conflict was. And the third factor was empires in decline: When structures of imperial rule crumbled, battles

for political power were most bloody. In at least one of the world's regions—the greater Middle East—two of these three factors have been present for some time: Ethnic conflict has been rife there for decades, and following the difficulties and disappointments in Iraq and Afghanistan, the United States already seems likely to begin winding down its quasi-imperial presence in the region. It likely still will. Now the third variable, economic volatility, has returned with a vengeance. U.S. Federal Reserve Chairman Ben Bernanke's "Great Moderation"—the supposed decline of economic volatility that he hailed in a 2004 lecture—has been obliterated by a financial chain reaction, beginning in the U.S. subprime mortgage market, spreading through the banking system, reaching into the "shadow" system of credit based on securitization, and now triggering collapses in asset prices and economic activity around the world. After nearly a decade of unprecedented growth, the global economy will almost certainly sputter along in 2009, though probably not as much as it did in the early 1930s, because governments worldwide are frantically trying to repress this new depression. But no matter how low interest rates go or how high deficits rise, there will be a substantial increase in unemployment in most economies this year and a painful decline in incomes. Such economic pain nearly always has geopolitical consequences. Indeed, we can already see the first symptoms of the coming upheaval. In the essays that follow, Jeffrey Gettleman describes Somalia's endless anarchy, Arkady Ostrovsky analyzes Russia's new brand of aggression, and Sam Quinones explores Mexico's drug-war-fueled misery. These, however, are just three case studies out of a possible nine or more. In Gaza, Israel has engaged in a bloody effort to weaken Hamas. But whatever was achieved militarily must be set against the damage Israel did to its international image by killing innocent civilians that Hamas fighters use as human shields. Perhaps more importantly, social and economic conditions in Gaza, which were already bad enough, are now abysmal. This situation is hardly likely to strengthen the forces of moderation among Palestinians. Worst of all, events in Gaza have fanned the flames of Islamist radicalism throughout the region—not least in Egypt. From Cairo to Riyadh, governments will now think twice before committing themselves to any new Middle East peace initiative. Iran, meanwhile, continues to support both Hamas and its Shiite counterpart in Lebanon, Hezbollah, and to pursue an alleged nuclear weapons program that Israelis legitimately see as a threat to their very existence. No one can say for sure what will happen next within Tehran's complex political system, but it is likely that the radical faction around President Mahmoud Ahmadinejad will be strengthened by the Israeli onslaught in Gaza. Economically, however, Iran is in a hole that will only deepen as oil prices fall further. Strategically, the country risks disaster by proceeding with its nuclear program, because even a purely Israeli air offensive would be hugely disruptive. All this risk ought to point in the direction of conciliation, even accommodation, with the United States. But with presidential elections in June, Ahmadinejad has little incentive to be moderate. On Iran's eastern border, in Afghanistan, upheaval remains the disorder of the day. Fresh from the success of the "surge" in Iraq, Gen. David Petraeus, the new head of U.S. Central Command, is now grappling with the much more difficult problem of pacifying Afghanistan. The task is made especially difficult by the anarchy that prevails in neighboring Pakistan. India, meanwhile, accuses some in Pakistan of having had a hand in the Mumbai terrorist attacks of last November, spurring yet another South Asian war scare. Remember: The sabers they are rattling have nuclear tips. The democratic governments in Kabul and Islamabad are two of the weakest anywhere. Among the biggest risks the world faces this year is that one or both will break down amid escalating violence. Once again, the

economic crisis is playing a crucial role. Pakistan's small but politically powerful middle class has been slammed by the collapse of the country's stock market. Meanwhile, a rising proportion of the country's huge population of young men are staring unemployment in the face. It is not a recipe for political stability. This club is anything but exclusive. Candidate members include Indonesia, Thailand, and Turkey, where there are already signs that the economic crisis is exacerbating domestic political conflicts. And let us not forget the plague of piracy in Somalia, the renewed civil war in the Democratic Republic of the Congo, the continuing violence in Sudan's Darfur region, and the heart of darkness that is Zimbabwe under President Robert Mugabe. The axis of upheaval has many members. And it's a fairly safe bet that the roster will grow even longer this year. The problem is that, as in the 1930s, most countries are looking inward, grappling with the domestic consequences of the economic crisis and paying little attention to the wider world crisis. This is true even of the United States, which is now so preoccupied with its own economic problems that countering global upheaval looks like an expensive luxury. With the U.S. rate of GDP growth set to contract between 2 and 3 percentage points this year, and with the official unemployment rate likely to approach 10 percent, all attention in Washington will remain focused on a nearly \$1 trillion stimulus package. Caution has been thrown to the wind by both the Federal Reserve and the Treasury. The projected deficit for 2009 is already soaring above the trillion-dollar mark, more than 8 percent of GDP. Few commentators are asking what all this means for U.S. foreign policy. The answer is obvious: The resources available for policing the world are certain to be reduced for the foreseeable future. That will be especially true if foreign investors start demanding higher yields on the bonds they buy from the United States or simply begin dumping dollars in exchange for other currencies. Economic volatility, plus ethnic disintegration, plus an empire in decline: That combination is about the most lethal in geopolitics. We now have all three. The age of upheaval starts now

Decline magnifies the severity of other conflicts – WWII proves

Miller 8 — G. Robert M. Miller, journalist for Digital Journal, 2008 ("Guns vs. Shovels – The Central Question Behind Our Next Economy," Digital Journal, October 25, Available Online at <http://www.digitaljournal.com/article/261595>)

But before we look at the modern 'Guns versus Butter' model, it first has to be noted that this phrase was originally popularized in a time where securing economic prosperity was a primary concern in nearly every nation. More importantly, when these nations did experience economic collapse, nearly all of them chose Guns. There is no question that Nazi aggression spawned World War II, however, what was happening in Europe became a world war for a purpose as central to the heart of the capitalist as was the instantaneous end of the holocaust to the heart of the compassionate; economic prosperity. Simply said, big wars are big money; and to truly break from the embrace of the Great Depression, a big commitment to the economy was necessary. And due to the leadership that guided the balance between 'Guns and Butter' in the US through World War II, the economy was considerably improved; this was true for many western nations.

Economic decline cause nuclear war

Bearden 2k — Lieutenant Colonel in the U.S. Army, 2000 (“The Unnecessary Energy Crisis: How We Can Solve It”, Yahoo, Available Online at <http://groups.yahoo.com/group/Big-Medicine/message/642>)

Bluntly, we foresee these factors - and others { } not covered - converging to a catastrophic collapse of the world economy in about eight years. **As the collapse of the Western economies nears, one may expect catastrophic stress** on the 160 developing nations as the developed nations are forced to dramatically curtail orders. International Strategic Threat Aspects History bears out that **desperate nations take desperate actions**. Prior to the final economic collapse, **the stress on nations will have increased the intensity and number of their conflicts, to the point where the arsenals of** weapons of mass destruction (**WMD**) now possessed by some 25 nations, **are almost certain to be released**. As an example, suppose a starving North Korea launches nuclear weapons upon Japan and South Korea, including U.S. forces there, in a spasmodic suicidal response. Or suppose a desperate China - whose long range nuclear missiles can reach the United States - attacks Taiwan. In addition to immediate responses, the mutual treaties involved in such scenarios will quickly draw other nations into the conflict, escalating it significantly. Strategic nuclear studies have shown for decades that, under such extreme stress conditions, once a few nukes are launched, adversaries and potential adversaries are then compelled to launch on perception of preparations by one's adversary. The real legacy of the MAD concept is his side of the MAD coin that is almost never discussed. Without effective defense, **the only chance a nation has to survive at all, is to launch immediate full-bore pre-emptive strikes** and try to take out its perceived foes as rapidly and massively as possible. As the studies showed, **rapid escalation to full WMD exchange occurs**, with a great percent of the WMD arsenals being unleashed. **The resulting great Armageddon will destroy civilization as we know it**, and perhaps most of the biosphere, at least for many decades.

1NC Russia D.A.

A. Obama subtly pushing for HR protection in Russia now, but is careful with his strategy – overt attempts at HR promotion are perceived in Russia as regime change and cause massive backlash that undermine relations

Weitz 3/3/15

(Richard Weitz is a senior fellow at the Hudson Institute and a World Politics Review senior editor. “Nemtsov Killing Puts Human Rights in Spotlight of U.S.-Russia Tensions,” pg online @ [//ghs-ef\)](http://www.worldpoliticsreview.com/articles/15203/nemtsov-killing-puts-human-rights-in-spotlight-of-u-s-russia-tensions)

The assassination last week of Boris Nemtsov, a former Russian deputy prime minister and opposition political leader, in downtown Moscow, just a stone's throw from the Kremlin, presents a challenge for Washington. **The current tensions in U.S.-Russia relations over crises ranging from Ukraine to Syria make a successful engagement with Moscow on human rights even more unlikely. Yet the U.S. must somehow find ways to support the democratic vision for Russia** advocated by Nemtsov and other political and civil society activists. Nemtsov's murder is in some ways reminiscent of 1990s-era Russia under then-President Boris Yeltsin. At the time, law and order had broken down on many levels, with an increase in assassinations being one prominent illustration. Many of these murders involved business deals gone awry, as in the absence of a functioning court system at the time, commercial disputes were routinely settled through coercion. Ironically perhaps, given the current state of rule of law in Russia, President Vladimir Putin initially won popularity in part for cracking down on such violent crimes in Moscow and other major Russian cities, as well as for boosting Russia's economy and global status. **If Putin's human rights record has always been problematic, his post-2010 presidency has seen increased constraints on Russians' freedom of expression,** assembly and access to the media. **Russian authorities regularly harass the political opposition and other independent civil society actors.** The government has adopted legislation to criminalize actions designed to “insult religious feelings” or that “promote lesbian, gay and transsexual values.” And a new law has designated all Russian civil society activists receiving any foreign funding as “foreign agents,” even when they pursue nonpolitical goals like environmental protection. **Putin's policies have also become strongly anti-Western.** He blames the West for the current tensions between Russia on one side and Europe and the U.S. on the other, citing NATO's membership enlargement; U.S. military operations in Kosovo, Iraq and Libya without Moscow's approval; and the U.S. decision to deploy strategic missile defenses close to Russia as the causes of these tensions. **But Putin's nationalist stance also aims to enhance his authority at home by exploiting Russian patriotism.** Nemtsov challenged this agenda, advocating for a more democratic line at home and a less confrontational stance abroad, but his assassination is still hard to explain. While Nemtsov was Putin's main rival to become Russia's second president in the late 1990s, Putin's policies have since deprived Nemtsov of popularity and other resources. U.S. President Barack Obama may be correct that, over time, Western sanctions and other blows to the Russian economy will lead more Russians to demand a new course, but Nemtsov was hardly a political threat to Putin at the time of his death. Meanwhile, the assassination will certainly further damage relations between Russia and the U.S., serving as a reminder of the many journalists and other Kremlin critics who have met violent—and unexplained—demises under Putin. Moreover, Nemtsov was a respected figure in Washington. Of note, he was the sole Russian to testify in a June 2013 Senate hearing on Russia's deteriorating human rights situation. Sen. John McCain presciently ended that session by warning Nemtsov, who had just explained why Putin had not imprisoned him, about the potential personal costs of his anti-regime agitation. The **Obama** administration **tried during its first term to compartmentalize the U.S.-Russia human rights dialogue** and opposed linking its progress to negotiations on other areas of greater mutual interest, such as Afghanistan and arms control. **The administration also limited the application of the 2012 Magnitsky Law, which sanctions Russian officials responsible for the death of Russian lawyer Sergei Magnitsky and other gross human rights violations, by keeping the number of individuals on its target list small. But Russia's human rights problems exerted an increasingly unavoidable drag on relations.** For example, Obama declined to attend the 2014 Olympic Games in Sochi, a high-profile event for Putin, partly to protest Russian government policies toward gays and lesbians. For their part, **Russian leaders have attacked the United States for encouraging popular protests to overthrow Russia-friendly regimes in post-Soviet states** like Georgia and Ukraine, as well as in the Arab world. **Fearing a similar approach in Russia itself, Russian officials launched a sustained campaign to curtail U.S. government ties with Russian civil society,** end cooperation between Russian and U.S. NGOs, and derail various academic exchange programs. The Obama administration has sought to minimize ties with Russia's political opposition to avoid making the latter appear like a U.S.-sponsored fifth column that could justify countermeasures by the Russian government. Nonetheless, **Russian officials have attacked Russian democracy advocates as foreign stooges and denounced U.S. interference in Russia's internal affairs while**

depicting U.S. efforts to support Russian civic activists as subversive interference aimed at regime change. At the end of 2013, Putin briefly adopted a softer line on some human rights issues. For instance, he released some high-profile prisoners, including the oligarch-turned-critic Mikhail Khodorkovsky and the punk rock band Pussy Riot. However, **the war in Ukraine has blocked further human rights dialogue between both governments.** Further confrontations between Russia and the U.S. over human rights during the remainder of the Obama administration, and beyond, now seem unavoidable. **American values and domestic politics require some U.S. government support for democracy and human rights** in foreign countries, while the Russian political system will not evolve into a genuine multiparty democracy as long as Putin remains president. In addition, **the Kremlin has increasingly appealed to conservative Russian values regarding sexual orientation and other issues, while Americans have become more tolerant regarding such issues. In denouncing U.S. double standards on human rights and democracy issues, Russian officials correctly complain that Washington holds Russia to a higher standard on these issues** than it does with its Middle East and Persian Gulf allies or China. But influential Americans see Russia as essentially a European country that would have evolved into a Western-style democracy, more open and attractive to Western investors and other partners, were it not for Putin's policies. The Obama administration should demand a complete and independent investigation not only of those who shot Nemstov, but also those who orchestrated his killing. Washington also should send the U.S. ambassador to Russia to Nemstov's funeral to underscore the event's importance. In any eventual oration, the ambassador and other U.S. officials would do well to remind listeners of Nemstov's positive vision of a liberal democratic Russia joined in partnership with the Western world. Over the long term, the United States can promote Russia's positive political evolution by resuming efforts to integrate Russians more deeply into international institutions that uphold liberal democratic values. The current suspension of official bilateral contacts as well as multinational engagement through the suspended NATO-Russia Council and the Group of Eight, though justified as a short-term response to Russian aggression in Ukraine, is helping Putin build alternative multinational structures with China and other non-Western partners based on authoritarian values. One can doubt that the Russian authorities will ever bring those who ordered Nemstov's killing to justice, but **human rights and democracy issues will certainly remain an enduring element of the U.S.-Russia relationship. The challenge for Washington remains finding channels to engage Russian civil society while continuing to steadfastly oppose Putin's creeping authoritarianism at home and adventurism abroad.**

B. The plan is a reversal of HR hypocrisy – ensures an effective coalition that will pressure Russia and China

Roth 9

(Kenneth, Kenneth Roth is executive director of Human Rights Watch, Graduate of Yale Law School and Brown University, "Taking Back the Initiative from the Human Rights Spoilers," pg online @ <http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers> //um-ef)

Shifts in global power have emboldened spoiler governments in international forums **to challenge human rights as a "Western" or "imperialist" imposition.** The force of China's authoritarian example and the oil-fueled muscle of Russia have made it easier to reject human rights principles. The moral standing of a country like South Africa by virtue of its own dark past means that its challenge to the international human rights agenda is influential. **Nevertheless, governments that care about human rights worldwide retain enough clout to build a broad coalition to fight repression** if they are willing to use it. **Instead, these governments have** largely abandoned the field. **Succumbing to** competing interests and **credibility problems of their own making**, they have let themselves be outmaneuvered and sidelined in UN venues such as the Security Council and the Human Rights Council, and in the policy debates that shape multilateral diplomacy toward Burma, Darfur, Sri Lanka, Zimbabwe, and other trouble spots. **For the U**nited States, **that withdrawal is the logical consequence of the** Bush administration's decision to combat terrorism without regard to the basic rights not to be subjected to torture, "disappearance," or detention without trial. Against that backdrop, **Washington's periodic efforts to discuss rights have been undercut by justifiable accusations of hypocrisy.** Reversing that ugly record must be a first priority for the new administration of Barack **Obama if the US government is to assume a credible leadership**

role on human rights. Washington's frequent abdication has often forced the European Union to act on its own. Sometimes it has done so admirably, such as after the Russia-Georgia conflict, when its deployment of monitors eased tensions and helped protect civilians, or in eastern Chad, where it sent 3,300 troops as part of a UN civilian protection mission. But the EU did a poor job of projecting its influence more broadly, to places like Burma, Somalia, or the Democratic Republic of Congo. It often sought to avoid the political fallout of doing nothing by hiding behind a cumbersome EU decision-making process that favors inaction. Moreover, its frequent **reluctance to stand up** to the Bush administration **in protest against abusive counterterrorism policies opened the EU to charges of double standards that poisoned the global debate on human rights and made it easier for spoilers to prevail.** The US and the EU are not the only ones promoting human rights abroad. Increasingly, some governments in Latin America, Africa, and Asia can be looked to for support on international rights initiatives. Those that stand out include Argentina, Chile, Costa Rica, Mexico, and Uruguay in Latin America, and Botswana, Ghana, Liberia, and Zambia in Africa. In Asia, Japan and South Korea tend to be sympathetic to rights but are generally reluctant to take strong public positions. Yet forced to act without the firm and consistent backing of the major Western democracies, these important voices are rarely able to mount on their own a major international diplomatic effort to address serious human rights abuses. Even the best-intentioned middle-sized powers cannot forge a solution to the world's most repressive situations without the partnership of the larger Western powers that still dominate the United Nations, have large and active diplomatic corps, and can deploy substantial military and economic resources. So by default, **those often setting the human rights agenda in international forums are opponents of human rights enforcement-governments of nations such as** Algeria, **China**, Egypt, India, Pakistan, **and Russia.** They want to return to an era when the defense of human rights was left to the discretion of each government, and violations carried little international cost. To resist that aspiration will take a determination that too often has been lacking. First, **because the most effective human rights advocacy is by example, governments hoping to defend human rights elsewhere must commit themselves to respect those rights in their own conduct.** As described in more detail below, **that means** in **the counterterrorism realm, a definitive end to such abuses** as the use of torture and other coercive interrogation techniques, the "disappearance" of suspects in secret detention facilities, and the long-term detention of suspects without trial-as well as a willingness to speak out immediately if any government, including a close ally, resumes these practices. **It also means addressing such persistent abuses as racism** in the criminal justice system, **mistreatment of migrants**, or use of the death penalty. Second, as in the case of any serious human rights violation, offenders must be held to account. For example, only by investigating, acknowledging, and repudiating the wrongdoing that has occurred, prosecuting serious crimes, and taking remedial steps to ensure that these abuses never recur, will Washington begin to build credibility as a government that practices what it preaches in the human rights realm. Third, **serious efforts must be undertaken to build a broad global coalition in support of human rights.** In the case of the United States, it should seek to rejoin multilateral institutions such as the UN Human Rights Council and ratify key treaties such as those on women's and children's rights, enforced disappearances, cluster munitions, and antipersonnel landmines. It should adopt a policy of embracing the rule of law by re-signing the International Criminal Court treaty, actively supporting the court, and initiating a process for ultimate ratification. And it should actively support-politically, financially, and militarily-multilateral efforts to protect civilians from mass atrocities. In the case of both the European Union and the United States, vigorous efforts should be made to reach out to governments of the global South, especially those that largely respect human rights at home but continue to resist the defense of human rights in their foreign policy. **That requires addressing issues of particular concern to Southern governments, such as economic and social rights, racism, and the rights of migrants. It also requires avoiding double standards** and remaining open to dialogue and appropriate political compromise. Governments of the global South, in turn, must reconsider their reflexive stand shoulder to shoulder with the oppressors of the world rather than their victims. This misguided solidarity is particularly disappointing in the case of governments such as India and South Africa, which today are democracies that on balance respect the rights of their own people but pursue a foreign policy suggesting that others do not deserve similar rights. Bloc solidarity should not become a substitute for embracing the more fundamental values of human rights. Finally, the new **Obama** administration **must abandon the Bush administration's policy of hyper-sovereignty. It is music to the ears of the governments of China, Russia,** and India **to hear Washington deflect human rights criticism on sovereignty grounds.** That approach effectively pushes back the clock to an era before the Universal Declaration of Human Rights and the many legal and institutional mechanisms it has spawned. **A radical reappraisal of US policy is urgently needed.** President Obama has promised such changes, and none too soon. The test will be whether he can resist pressures to sustain the Bush-led status quo.

C. [insert plan increases U.S. HR Cred here if necessary]

D. U.S.-Russia War

Cohen 14

(Roger, "Yes, It Could Happen Again," pg online @

<http://m.theatlantic.com/magazine/archive/2014/08/yes-it-could-happen-again/373465/> //um-ef)

Pessimism is a useful prism through which to view the affairs of states. Their ambition to gain, retain, and project power is never sated. **Optimism, toward which Americans are generally inclined, leads to rash predictions of history's ending in global consensus and the banishment of war** Such rosy views accompanied the end of the Cold War. They were also much in evidence a century ago, on the eve of World War I. Then, as now, Europe had lived through a long period of relative peace, after the end of the Napoleonic Wars. Then, too, rapid progress in science, technology, and communications had given humanity a sense of shared interests that precluded war, despite the ominous naval competition between Britain and Germany. Then, too, wealthy individuals devoted their fortunes to conciliation and greater human understanding. Rival powers fumed over provocative annexations, like Austria-Hungary's of Bosnia-Herzegovina in 1908, but world leaders scarcely believed a global conflagration was possible, let alone that one would begin just six years later. The very monarchs who would consign tens of millions to a murderous morass from 1914 to 1918 and bury four empires believed they were clever enough to finess the worst. **The unimaginable can occur** That is a notion at once banal and perennially useful to recall. Indeed, it has just happened in Crimea, where a major power has forcefully changed a European border for the first time since 1945. Russia's act of annexation and its evident designs on eastern Ukraine constitute a reminder that NATO was created to protect Europe after its pair of 20th-century self-immolations. NATO's core precept, as the Poles and other former vassals of the Soviet empire like to remind blithe western Europeans, is Article 5, by which the Allies agreed that "an armed attack against one or more of them in Europe or North America shall be considered an attack against them all," triggering a joint military response. This has proved a powerful deterrent against potential adversaries. Vladimir Putin, the Russian president, has been most aggressive in the no-man's-lands of Georgia and Ukraine, nations suspended between East and West, neither one a member of NATO. Had Ukraine been a member of NATO, the annexation of Crimea would have come only at the (presumably unacceptable) price of war. Article 5, until demonstrated otherwise, is an ironclad commitment. When a 19-year-old Bosnian Serb nationalist, Gavrilo Princip, assassinated the heir to the Austro-Hungarian throne in Sarajevo, on June 28, 1914, he acted to secure Serbia's liberty from imperial dominion. He could not have known that within weeks, Austria-Hungary would declare war on Serbia, goading Russia (humiliated in war a decade earlier by Japan) to mobilize in defense of its Slavic ally, which caused the kaiser's ascendant Germany to launch a preemptive attack on Russia's ally France, in turn prompting Britain to declare war on Germany. **Events cascade** It is already clear that **the nationalist fervor unleashed by Putin** after a quarter century **of Russia's perceived post-Cold War decline is far from exhausted.** **Russians are sure that the dignity of their nation has been trampled by an American and European strategic advance to their border dressed up in talk of democracy, the rule of law, and human rights.** Whether this is true is irrelevant; they believe it. **National humiliation, real or not, is a tremendous catalyst for war.** That was the case in Germany after the Treaty of Versailles imposed **reparations and territorial concessions,** so, too, in Serbia more than 70 years later, after the breakup of Yugoslavia, a country Serbia had always viewed as an extension of itself. **Russia, convinced of its lost greatness, is gripped by a Weimar neurosis resembling Germany's post-World War I longing for its past stature and power** The **Moscow-backed separatists taking over government buildings in eastern Ukraine** and proclaiming an independent "Donetsk People's Republic" **demonstrate the virulence of Russian irredentism** Nobody can know where it will stop. Appetite, as the French say, grows with eating.

1NC Russia-China Alliance D.A.

- A. Current methods of HR promotion are ineffective due to a lack of U.S. credibility on Human Rights – only the plan’s increase in U.S. credibility can restore effective HR promotion**

Cihangir-Tetik 14

(Damla Cihangir-Tetik is a Ph.D Candidate in Political Science, Sabanci University/Istanbul as well as Project Coordinator for Transparency International Turkey, pg online @ <http://idsmagazine.org/human-rights-and-democracy-promotion-as-foreign-policy-tools-of-transatlantic-partners-by-damla-cihangir-tetik/> //um-ef)

Regarding human rights protection and democracy promotion, the “discrepancy of the West” argument reached its peak with the “war on terrorism” policy of the US after the 9/11 terrorist attacks. Western democracy promotion and human rights norms deteriorated with the US-led operation in Afghanistan in order to fight against global terrorism and with the invasion of Iraq by the US and Britain. Additionally, the treatment of prisoners by the US officials in Guantanamo Bay, Bagram in Afghanistan and Abu Ghraib was perceived as aggressive, paternalistic, neo-imperialist and a combination of all those by the rest of the international community (Burnell 2010, 2). Importantly, the EU and especially **the US are faced with an important credibility problem at the moment concerning their efforts towards international human rights protection** and democracy promotion in the rest of the world. “Credibility refers to the fact that democratization is hardly ever the only foreign policy goal of those governments who provide democracy assistance” (Burnell 2010). As Bermeo explains, even though the US has spent hundreds of millions of dollars on democracy and good governance in Egypt, its military aid, which is much more higher than the ones for democratization, increases the scepticism towards the priority of the US in Egypt (Bermeo 2009). **Democracy promotion can therefore only succeed if** it is embedded within the overall set of foreign policies of the promoting country and if **the promoting country itself adheres to the rules, norms and values it claims to want to become more widespread** (Burnell 2010). Similarly, concerning international human rights protection, the US fails to accede to the ICC with others – including China, India, Indonesia, Saudi Arabia – and this discourages these states and also the others from engaging in activities that promote human rights (Muftuler-Bac and Peterson 2014). As a result, **at the moment it is not expected from the US to be a global leader of human rights protection** and democracy promotion internationally. However, one has to keep in mind that the US under President Wilson’s administration was leading both bilateral and multilateral means of democracy promotion at the beginning of the 20th century. The US has established USAID in 1961 and the National Endowment for Democracy as its main democracy promotion instruments. In the mission statement of the State Department, democracy promotion is underlined as a political purpose for the US; “...advance freedom for benefit of the American people and the international community by helping to build and sustain a more democratic, secure and prosperous world composed of well-governed states that respond to the needs of their people, reduce widespread poverty, and act responsibly within the international system” (US Department of State 2007). As Babayan mentions, different US administrations have different modes of democracy promotion and human rights protection. While in the 1990s President Clinton made democracy promotion one of the three main pillars of his foreign policy, President George W. Bush adopted a different democracy promotion rhetoric, which is combined with military means and which President Obama later distanced himself from (Babayan 2013, Babayan and Huber 2012, 3). **Even though he continues to apply human rights and democracy promotion policies, he is much more cautious than his predecessors because of** increasing multipolarity in global security environment and **increasing domestic pressures**. According to discussed outcomes of diverse Western-led human rights protection and democracy promotion policies there is no certain, clear answer to the question of “do human rights protection and democracy promotion policies of the West work?” The answer is both “yes” and “no”. As Gravingholt et. al. mention, the foremost reason for this blurriness is the unknown precise rules of democratization (Gravingholt et. al. 2009). It is the same for human rights protection, an area where international legal norms and rules are not specified, internationalized and applicable until now, even though some improved steps regarding the creation of enforceable rules of International Criminal Court (ICC) and International Criminal Tribunals for the former Yugoslavia and Rwanda. Even the US and the EU have different approaches regarding human rights protection and democracy promotion and several

disagreements on some issues, ranging from counterterrorism policies to private data collection and their shared security measures. As mentioned above, even though there is a continuation of the “discrepancy of the West” and/or the “credibility problem of the West”, the transatlantic partners still lead human rights protection and democracy promotion internationally. Therefore, they have been pushing other states, IOs and non-state actors for the creation of international norms in the multilateral framework. **However, this leadership perception is now insufficient to abolish the question: Has the West dropped human rights protection** and democracy as a norm in response to the emergence of alternative political regimes to the Western democracy, especially by the rise of China and Russia as global powers?

B. Increased HR promotion causes backlash from Russia and China – they’ll create an alliance to oppose the U.S. and counterbalance against U.S. strategy

Migranyan 14

(Andranik Migranyan is the director of the Institute for Democracy and Cooperation in New York, which works closely with the Russian Presidential administration, “Washington's Creation: A Russia-China Alliance?,” pg online @ <http://nationalinterest.org/feature/washingtons-creation-russia-china-alliance-10843> //um-ef)

Despite internal concerns in both Russia and China that prevent both countries from announcing loudly and decidedly their support for each other—as was in the case of China’s restraint in recognizing the independence of Abkhazia and South Ossetia or the reincorporation of Crimea, and as in the reciprocal case when Russia has not voiced outright support for China in Chinese territorial disputes with neighbors—the two countries act as allies on a host of issues in world politics. These issues include stabilizing Syria, the Iranian nuclear program, U.S. regime change around the world, and **the hard attempts of the U_{nited} S_{tates} to interfere in Chinese and Russian internal affairs masked as support for human rights. Russian-Chinese relations are entering a qualitatively new stage.** They are more than merely partnership relations, but are not quite those of allies. However, it is entirely possible that increasing U.S. sanctions on Russia and attempts to contain China will push the two countries into a full-blown alliance. The present situation in trilateral U.S.-Chinese-Russian relations is at odds with the strategy articulated by Henry Kissinger during the Nixon Administration, which held that American relations with either Russia or China had to be substantially better than the bilateral relations between Russia and China themselves. Today the opposite is occurring. U.S. relations with either of the other two countries are considerably worse than bilateral Russia-China relations. Therefore, the potential for America pitting one against the other is decidedly smaller than the potential of the two countries uniting their efforts and resources to oppose American pressure in the spheres each country considers most sensitive. In both the U.S. and in Russian liberal circles, it is not uncommon to hear the tired assertions that further rapprochement between Russia and China will render Russia a junior partner in the Russo-Chinese relationship and that Russia should keep this in mind when choosing between China and the West. I believe such pronouncements stem more from their authors’ ideological convictions than from real political facts. They are meant to scare Moscow and to cow it into avoiding the strategic alliance with a growing China that is asserting its interests against the status quo in the face of American containment, particularly in the Asia-Pacific region, where it faces conflicts with virtually all of its neighbors—Japan, the Philippines, South Korea, Vietnam, India—and needs an alliance with Russia, with whom it lacks any potential conflicts in the foreseeable future. In talking about the threat of Moscow becoming Beijing’s junior partner, and in pressuring Moscow to choose the West over China, our Western partners have never articulated their vision of Russia in the world, the character of Russian relations with the West and especially with the United States. We are, of course, grateful to our Western partners for their espoused worry that Russia may “inadvertently” become a junior partner to China. But they have never articulated the place of Russia in the Western world, particularly in the Western economic and security frameworks. Since the 1990s, Western, and especially American, policy towards Russia followed a clear line according to which Moscow was to be treated as a whipping boy. Since the collapse of the USSR, the United States has not once, in words or deeds, demonstrated its readiness for an equal partnership with Russia. And by the way, in the context of the Ukrainian crisis, the West, and U.S. politicians and military officials, hurried to place Russia not in the role of a partner, but that of an adversary, which, in their understanding, is practically indistinguishable from that of an enemy. Recently, various analysts have been busy using statistics to prove

yet another unsubstantiated claim frequently invoked to discourage Russo-Chinese relations, namely, the alleged prospect of large Chinese populations pouring into Siberia and the Far East, thereby presenting a threat to Russia's territorial integrity. As we can see from migratory tendencies in the northern border regions of China, the vast majority of migrants flock not to Russia's Siberia and the Far East, but rather to the central regions of China and the new large cities, where lifestyle conditions are more comfortable. And, thanks to China's demographic policies during last decades, the population in the border regions close to Russia is projected to decline rather than grow. In the foreseeable future, Russia has plenty of space for maneuver in its relations with China. Russia's next steps with regard to Beijing will largely depend on Washington's readiness to impose tougher sanctions because of Ukraine. Russo-Chinese relations have great potential for development. We cannot exclude the possibility that Russia and China will enter into a military-political alliance that can shift the global balance of power. The military, technological, and resource potential of Russia propped up by the economic and colossal labor resources of China would allow the two countries to make decisions on many global issues in a way that would rattle the current balance of power in international relations. Apparently, there is some sort of instinctive understanding of this in Washington, which is why the U.S. is not pushing Japan to adopt strict sanctions against Russia. Should Japan impose such sanctions, Prime Minister Shinzo Abe would have to forget his ambition to solve the question of the "Northern territories" in his relations with Russia, as he might force Russia's hand in supporting China's claim over the contentious Senkaku islands. A potential alliance of Russia and China can present many new and unexpected developments for both Washington and Brussels in economic and military-political relations. Today, there are many politicians and analysts in Washington who, on the one hand, desperately thirst to punish Russia and China, and on the other, consciously or not, avoid calculating the consequences of their actions and remain blind to the real preconditions for a closer partnership between Russia and China on all leading global problems. A continued refusal to contemplate such a partnership could have profound consequences for the U.S. foreign policy.

C. [insert plan increases U.S. HR Cred here if necessary]

D. A China-Russia alliance would cause nuclear war

Shukla 5/13

(Vikas, reporter, quotes Paul Craig Roberts, head of the Institute of Political Economy, "Russia, China Challenge U.S. Hegemony; Nuclear War 'Likely Future', <http://www.valuewalk.com/2015/05/russia-china-challenge-u-s-nuclear-war-likely-future/>, 5/13/15/VZ)

Russia and China are conducting naval exercises in the Mediterranean Sea. The naval exercises commenced just a couple of days after Chinese President Xi Jinping attended the grand Victory Day celebrations in Moscow. They include live-fire exercises in the backyard of Western Europe. Russia and China have started flexing their muscles together to challenge the U.S. hegemony as they look to change the current world order. U.S. determined to block Russia and China Dr Paul Craig Roberts, the former U.S. Assistant Secretary of the Treasury for Economic Policy, said in a blog post that the United States was determined to block the rise of Russia and China. But neither of them will join the "world's acceptance of Washington's hegemony." Roberts notes that the US' attempt to contain Russia is the key reason for the crisis "Washington has created in Ukraine." Paul Craig Roberts, head of the Institute of Political Economy, said that Washington's aggression and propaganda have convinced Moscow and Beijing that Washington intends war. It has prompted Russia and China to form a strategic alliance to counterbalance the U.S. might. Dr Roberts believes that Russia and China will not accept the "vassalage status" that Germany, France, the UK, Canada, Japan, Australia and many other countries have accepted. 'Nuclear war is our likely future' Washington's arrogance of its self-image as an "exceptional, indispensable" country with hegemonic rights over other nations

has laid the groundwork for a war. Unless the U.S. dollar and power collapses, **"nuclear war is our likely future,"**
said Dr Roberts. Besides military exercises, Russia and China have been stitching economic alliances to
move closer to each other.

1NC Bahrain D.A.

A. Good Bahrain relations now and key to provide a safe haven for the US Navy – however the US’s silence on human rights policies is crucial to maintain those good relations

Abrams 2/27, (Elliott Abrams, *Elliott Abrams is a senior fellow for Middle Eastern Studies at the Council on Foreign Relations in Washington, DC. He served as deputy assistant to the president and deputy national security advisor in the administration of President George W. Bush, where he supervised U.S. policy in the Middle East for the White House. Mr. Abrams was educated at Harvard College, the London School of Economics, and Harvard Law School. After serving on the staffs of Sens. Henry M. Jackson and Daniel P. Moynihan, he was an assistant secretary of state in the Reagan administration and received the secretary of state’s Distinguished Service Award from Secretary George P. Shultz. In 2012. “How Obama Caved on Bahrain,” <http://foreignpolicy.com/2015/02/27/how-obama-caved-on-bahrain-manama-human-rights/>, 2/27/15, //VZ)*

Once upon a time, President Barack Obama’s administration not only followed the crisis in Bahrain closely, but spoke loudly about it. American policy was clearly to press for a compromise between the Sunni royal family and the majority Shiite population. After all, the U.S. Fifth Fleet is based in Bahrain, allowing the United States to project its naval power across the Gulf, and roughly 8,500 Americans live there. Violence and instability in Manama are obviously something the United States wishes to avoid. Way back in 2011, when the Arab Spring began and protests spread across the country, demanding more democracy and better representation for Shiites, Obama himself pressed for change in Bahrain. In February 2011, as protesters massed in the tens of thousands at Manama’s Pearl Roundabout, the president issued a statement welcoming reform plans – which, alas, were never really carried through – announced by King Hamad bin Isa Al Khalifa. Obama reaffirmed that it was the U.S. position that Bahrain’s stability would be ensured through “respecting the universal rights of the people of Bahrain and reforms that meet the aspirations of all Bahrainis.” The king, however, answered Obama’s call for reform with more repression. On March 14, he invited in troops from Saudi Arabia and the United Arab Emirates to help put down the protests. Thousands of security forces stormed the Pearl Roundabout demonstrations on March 16, clearing the protest camp and arresting its leaders. Two days later, the Pearl Monument at the center of the roundabout, which had become an icon of the protests, was demolished, and closed the area off to the public. In the aftermath of the crackdown, Obama’s tone on Bahrain noticeably toughened. The message was clear: Stability must depend on respecting the rights of the people, not on foreign troops. When the president gave a major speech on the Middle East in May 2011, he was even more critical of Bahrain and its policy of repression: “We have insisted both publicly and privately that mass arrests and brute force are at odds with the universal rights of Bahrain’s citizens, and ... such steps will not make legitimate calls for reform go away.” Later in that speech, he said that Shiites “must never have their mosques destroyed in Bahrain,” raising one of the most explosive aspects of how the Sunni government has attempted to suppress protests by the Shiite majority. In Obama’s September 2011 address to the U.N. General Assembly, the tiny country got a whole paragraph. The president said that the United States “will continue to call on the government and the main opposition bloc — the Wifaq — to pursue a meaningful dialogue that brings peaceful change that is responsive to the people.” He also said that reforms had been made, but that “more is required” — three words that amounted to a clear message that the monarchy was falling short. The White House was not about to let the king off the hook — and the president himself was raising the issue, not some spokesperson. **What has happened since then? Not much. There has been little or no progress in Bahrain — domestic tensions have instead risen higher.** Everything President Obama demanded has been refused. In June 2011, an independent commission was established to examine the events during the early months of the uprising, and in November it reported its findings to the king. Its recommendations, however, were roundly ignored: In 2012, the commission’s chairman, law professor Cherif Bassiouni, delivered what George Washington University’s Marc Lynch termed a “scathing critique of its failure to undertake any deeper political or social reforms.” Bassiouni has given the government credit for taking a number of his recommendations — even as he laid out Manama’s failings to resolve the underlying grievances of the protests. “There are very, very fundamental social and economic issues involved in the Shiite population that need to be addressed, and have not been addressed,” he said in a 2014 interview. “When you have people who do not have the hope of seeing themselves as equal citizens, as having equal opportunities in a particular country, living in mostly economic underprivileged areas in high-density population areas, they explode.” Others are even more critical. In May 2014, Human Rights Watch issued a report finding that, despite the king’s promised reforms, “members of security forces are rarely prosecuted for unlawful killings, including in detention, and the few convictions have carried extremely light sentences.” **The Bahraini government has also adopted new methods to silence opposition voices.** In January 2015, it stripped 72 citizens of their nationality, rendering many of them stateless. As Amnesty International pointed out, the authorities included human rights and political activists on the same list as Bahrainis who allegedly went to fight with the Islamic State (IS). so the government of Bahrain is trying to equate

peaceful protest with jihadi terrorism. While the government is painting all protesters as “terrorists” who support the Islamic State, its own policy appears to be one of promoting sectarian divisions. As the human rights activist Ala’a Shehabi wrote in Foreign Policy last year, the monarchy has been “nurturing and nourishing extremist groups and their sectarian ideology to counter the so-called ‘Shiite threat’ posed by the pro-democracy uprising.” For the government, Sunni solidarity appears to trump the need to act against Sunni extremism. “Bahrain’s public stance on the war against IS contrasts sharply with its lack of action at home,” Shehabi continued.

‘So far there doesn’t appear to have been any documented trial of any person on charges of IS-related terrorist activity despite government vows to pursue and monitor their activities.’ All of this is not to offer roses to the conduct of the Bahraini opposition, which some observers see as having missed several opportunities to gain ground. It has said no when it should have said yes to occasional government offers, some close students of Bahraini politics have argued, and has a habit of seeing compromise as betrayal. Not every movement has a Nelson Mandela at its head: Many opposition leaders around the world could probably make a good case that the leadership of al-Wefaq, the main Shiite opposition group in Bahrain, has made tactical errors. Yet it is hard to agree to compromise when you or your family are in jail, being beaten, or being called a terrorist. In the case of al-Wefaq, its leader, Sheikh Ali Salman, has been thrown in jail yet again and charged with plotting a coup and inciting violence against the security forces. As the Bahrain

situation has worsened in the years since 2011, what has been the Obama administration’s reaction? After the tough language and the demands made by the president in 2011, what has come next? The answer is: near silence — accompanied by steps that make it clear to the royal family that there will be no real American pressure for reform. After the firm language in his 2011 U.N. General Assembly speech, Obama’s only mention of the worsening situation in his U.N. address two years later was a one-line reference to the need for efforts “to resolve sectarian tensions that continue to surface in places like Iraq, Bahrain, and Syria.” No doubt the Bahraini monarchy was unhappy to see Bahrain compared to Iraq and Syria, but there was no blame — and no call for action. In 2012, the president didn’t mention Bahrain in his U.N. speech, and that year the White House issued just one statement about Bahrain — from the press secretary rather than from the president. It blamed both the government and the opposition for the continuing violence, urged the government “to redouble its ongoing efforts to implement the recommendations of the Bahrain Independent Commission of Inquiry,” and called for “genuine dialogue” and “meaningful reforms.” We do not need to wonder whether the government of Bahrain viewed those comments in 2011 and 2012 as real pressure. In May 2011, it orchestrated a campaign against the human rights officer at the U.S. Embassy in Manama, Ludovic Hood, and the State Department pulled him out for his own safety. “It is unacceptable that elements within Bahrain would target an individual for carrying out his professional duties,” said the State Department — but Bahrain paid no price. Throughout his term as ambassador to Bahrain, from 2011 until early this year, Tom Krajeski was subject to the same sort of abuse in the press. Krajeski was no hot-head, and said repeatedly that he placed the blame on the lack of political reconciliation in Bahrain on both sides. But the veteran diplomat’s mere recognition of serious human rights and political problems in Bahrain was too much for the government, which made sure he was vilified in the press. In May 2013, the Bahraini cabinet

approved a parliamentary proposal to “put an end to the interference of U.S. Ambassador Thomas Krajeski in Bahrain’s internal affairs.” Then in July 2014, Bahrain’s government actually expelled U.S. Assistant Secretary of State for Human Rights Tom Malinowski for meeting with members of the country’s political opposition — an extraordinary and

unprecedented act for a U.S. ally to take. What price did Bahrain pay for this? Zero. It gets worse. An American citizen named Tagi Abdalla al-Maidan has been in jail in Bahrain since 2012. He’s accused of violent acts, and the government claims he confessed; he denies the accusations and says the confession was obtained by torture. He was held in prison for almost an entire year before a court

hearing, and then handed a 10-year prison sentence. Last year, the U.N. Working Group on Arbitrary Detention declared that the court had violated a whole series of substantive and procedural rights that rendered his imprisonment a violation of international and Bahraini law. What has the U.S. government reaction been to the imprisonment of one of its citizens in a faulty legal process? As CNN pointed out in November, the United States “has said little” about Maidan’s case. State Department spokesman Jeff Rathke said that the United States was following the case closely, and that “this is a matter of ongoing concern.” Were I in a foreign prison, those words — “this is a matter of ongoing

concern” — would not seem to me a tough and energetic demand for my freedom. It’s hard to believe the United States could not spring Maidan if it pushed hard enough.

The United States maintains considerable leverage in Manama. Even a small drawdown of U.S. military personnel would reverberate loudly there, as would moving — or even announcing a study of moving — any piece of the U.S. military presence out of Bahrain. Perhaps more important, there’s a great struggle over whose “narrative” will prevail in Bahrain: the government’s, arguing that its crackdown is designed to oppose terrorism and maintain stability; or that of the opposition, arguing that the country is becoming increasingly repressive toward peaceful protests and human rights. If the United States were to side publicly, and loudly, with the opposition, the outcome of the argument would be affected. More public pressure might well force the royals to think

harder about compromises, and strengthen the hand of those who are privately arguing for reform. Instead, the United States has not only remained largely silent on human rights abuses, but has acted in ways that can only convince the Bahraini government to ignore any quiet protests that are actually made. In 2012, when Congress objected to arms sales to Bahrain because of the repression there, the Obama administration used a loophole to continue the sales. As Foreign Policy reported, the State Department is required to formally notify Congress of any arms sales over \$1 million. According to a congressional source, rather than going through the notification process, the administration divided up

an arms sales package into multiple sales, each of which was less than \$1 million — thereby dodging congressional oversight. That was 2012. In 2013, the Navy announced that it was adding five more coastal patrol ships to American forces in Bahrain. Last year, the Obama administration went forward with a more than half-billion-dollar expansion of the U.S. presence in Bahrain, which will cement the U.S. presence in the country for decades to come. Now, what signal does that send the royals? “With each passing day, the Bahrain government’s self-fulfilling prophecy of a sectarian war is becoming more and more the reality,” Reza Aslan wrote in 2013. “If that happens — if the Bahrain uprising descends into the kind of regional holy war between Sunni and [Shiite] — the United States will not be able to avoid the consequences.” That message holds true for the U.S. Navy’s Fifth Fleet, which makes one wonder why it is smart to assume that the facilities the United States has in Bahrain will in fact be available — or safe to use — in the coming decades. Meanwhile, the announcement of the expansion can only be read one way

by the Bahraini authorities: The American protests about human rights conditions are not serious. It didn't have to be this way — nobody forced the United States to turn a blind eye to Bahrain's explosive domestic situation. Consider an alternative path: Suppose a top-level messenger, such as the chief of naval operations or chairman of the Joint Chiefs of Staff, had been sent to Bahrain to say, "Look, I personally would like this base expansion. But there's no way it's going to happen until the repression stops. In fact, we are going to announce that naval facilities elsewhere in the Gulf will be examined for future expansion to replace Bahrain, because Bahrain is viewed as increasingly unstable. Guys, you've got three months to start showing us something." Such a message — and if necessary, a public statement a few months later — would have had a huge impact. It would have shown the Bahraini government and its supporters the risks they face; it would have made the business community nervous, and perhaps more supportive of reform; and

above all, it might have given additional ammunition to those in the royal family who favor reconciliation over repression. **Instead, the Obama administration is sending the clear message that its loud protests are over, the president won't speak about Bahrain, and the monarchy can relax.** In fact, no one should relax about Bahrain. It is on a path toward increasing

instability, featuring growing Sunni extremism, growing Shiite outrage, and ever-widening sectarian divisions. **The Fifth Fleet is a hostage, and the Obama administration is spending hundreds of millions of dollars there as if America's welcome will be permanent.** That's a suspect assumption: As the majority of Bahrainis conclude that the United States is indifferent to the crackdown

and siding with the most regressive elements of the royal family, **support for the Fifth Fleet's presence will start to disappear.** As will Bahrain's very sovereignty, as it is caught up in the regional rivalry between Iran and Saudi Arabia. Once upon a time, Bahrain was an outpost of civility and moderation in the Middle East. Now, it is coming to share the pathologies of its neighbors. That's tragic, and it is in part the result of weak American policy. By placing security matters — Bahrain's minuscule participation in the anti-Islamic State coalition and its hosting of the Fifth Fleet — above all other considerations, the Obama administration is putting that very security relationship at risk. Once upon a time, Bahrain was also an example of a sensible Obama human rights policy. Today, one can sadly say that it's a good example of how that human rights policy has vanished into thin air.

B. [insert plan increases U.S. HR Cred here if necessary]

C. The US's stronghold in Bahrain is crucial to Middle East stability and preventing Iran's control of the Strait of Hormuz

McDaniel 13, (Richard, a Commander of the US Navy, Foreign Policy at Brookings, "No "Plan B" U.S. Strategic Access in the Middle East and the Question of Bahrain,"

<http://www.brookings.edu/~media/research/files/papers/2013/06/24-us-strategic-access-middle-east-bahrain-mcdaniel/24-us-strategic-access-middle-east-bahrain-mcdaniel.pdf>, June 2013, //VZ)

To say that Bahrain holds immense strategic and operational value is an understatement. Functionally and geographically, the small island state serves as the strategic centerpiece for U.S. maritime strategy, security, and stability in the Persian Gulf. As mentioned earlier, the base serves numerous purposes. **First and foremost it serves as home to U.S. Naval Forces Central Command and Fifth Fleet. The Fifth Fleet Area of Operations is immense and covers approximately "2.5 million square miles with three critical choke points: the Suez Canal, the Bab al Mandeb, and the Strait of Hormuz."**¹ **The value of its close proximity to the Strait of Hormuz cannot be overemphasized. The short distance to the Strait acts as a deterrent to Iran, which has threatened to close this critical waterway.** Lying only 300 miles to the southwest of the Strait, **U.S. and coalition ships can routinely patrol the area to ensure safe passage for international maritime traffic on a daily basis.** These routine patrols are essential; **over a fifth of the world's oil supply passes through the Strait each year, and if Iran ever attempted to close the critical chokepoint, the price of oil would skyrocket and global markets would plummet. Finally, basing in Bahrain sustains U.S. and coalition naval forces operating in international waters of the Persian Gulf, particularly off the coast of Iran, and provides the United States Navy with a convenient logistics and maintenance hub.**

D. Middle East instability causes Nuclear War – miscalc, offensive posturing, and escalation – deterrence doesn't check

Warren 13, (Roslyn, is an M.A. candidate in Georgetown University's Security Studies Program, "Miscalculating Nuclear Deterrence in the Middle East: Why Kenneth Waltz Gets It Wrong," <http://georgetownsecuritystudiesreview.org/2013/12/19/miscalculating-nuclear-deterrence-in-the-middle-east-why-kenneth-waltz-gets-it-wrong/>, 12/19/13, //VZ)

In his Foreign Affairs article, "Why Iran Should Get the Bomb," Kenneth Waltz suggests that a nuclear-armed Iran is nothing to fear. Indeed, he goes so far as to claim that Iran's membership in the nuclear club will actually increase stability in the Middle East. However, Waltz misses an essential point: nuclear deterrence does not rule out the potential for conventional escalation, which can destabilize regions in unpredictable and potentially catastrophic ways. When it comes to nuclear-armed adversaries, the outbreak of "full-scale war"[1] cannot be the only definition of instability. Tense relations between nuclear-armed foes, be they offensive posturing or limited conventional conflict, create opportunities for miscalculation and escalation to the nuclear level. A closer examination of relations between India and Pakistan reveals that nuclear weapons embolden revisionist nuclear states – i.e., states dissatisfied with the existing regional balance of power – and raises the propensity for and incidence of conventional conflict. Taking Pakistan as a model, a weaponized Iran, believing it has a significant deterrent capability, will, at a minimum, increasingly antagonize Israel without fear of nuclear reprisal. Another, more frightening, side effect of Iranian weaponization runs contrary to Waltz's deterrence model: Both Israel and Iran could each believe a preemptive strike lay in its favor. For these reasons, Waltz's assertion that a nuclear Iran will increase stability in the Middle East is wrong. Waltz neorealists claim that states are rational actors seeking, above all, security within an anarchical international system. States maximize their own security by attempting to balance their power against the status quo power; i.e., a state content with the existing, regional balance of power. Security imbalances spur instability. For Waltz, such is currently the case in the Middle East. Because of Israel's nuclear dominance, it can project undeterred hostility towards its neighbors.[2] The defensive realist remedy for this type of instability is nuclear balance. Waltz suggests that, "By reducing imbalances in military power, new nuclear states generally produce more regional and international stability, not less." [3] Given that all states are rational actors seeking to maximize their relative security, Waltz argues that fear of nuclear reprisal vis-à-vis a second-strike capability acts as a sufficient deterrent between two nuclear-armed adversaries.[4] Hence, if Iran developed nuclear weapons, relations between the two most powerful actors in the Middle East would become more stable. In contrast, many nuclear proliferation experts use the stability-instability paradox to explain how regions with rival nuclear powers become increasingly unstable. The stability-instability paradox posits that two nuclear-armed, adversarial states, believing that neither will initiate a nuclear strike, can and will increasingly engage in offensive posturing and limited conflict with one another. [5] The newly-weaponized, revisionist state – for example, Pakistan or potentially Iran – feels emboldened, and more freely resorts to adventurism in the form of enhanced offensive posturing, increasing low-level conflict, and perhaps stronger support for terrorists. On the other hand, the status quo state – India or Israel in these cases – perceives its freedom of action constrained by its adversary's new status.[6] Instability at the conventional level in the form of more pronounced aggressive posturing and/or limited conflict heightens tensions between major regional powers, and leaves the door open for escalation and miscalculation at the nuclear level. For Waltz, India and Pakistan prove his point: These two nuclear-armed adversaries have not launched a nuclear war against one another because they fear a reciprocal strike, thereby balancing each other and stabilizing their relations. However, Waltz's analysis only explains why India and Pakistan have not yet launched a calculated nuclear attack against one another. He fails to consider how tensions across the conflict spectrum have increased since India and Pakistan both weaponized, which could inadvertently escalate to the nuclear level. Flashpoints between India and Pakistan highlight the stability-instability paradox clearly. S. Paul Kapur reveals how Pakistan's weaponization has "encouraged aggressive Pakistani behavior," whereby it can challenge India "without fearing catastrophic Indian retaliation." [7] In the Kashmir crisis, Pakistan supported a violent insurgency in Kashmir and the Indian state of Jammu. While the extent to which Pakistan involved itself in the initial fighting remains unclear, Pakistani forces did engage in their "largest-ever peacetime military exercise" and announced a strategic shift to a "policy of offensive defense" in relations with India.[8] Former Pakistani Prime Minister Benazir Bhutto acknowledged, "Nuclear weapons 'came out' as an important tool in that struggle," allowing Pakistan to "provide extensive support for 'a low-scale insurgency'...while insulat[ing it] from a full-scale Indian response." [9] Similarly, in the Kargil crisis, the Pakistani military "marshaled a substantial body of forces" and crossed the Line of Control (the military border between the Indian and Pakistani-controlled parts of the disputed region), resulting in Indian air and ground mobilization and significant casualties on both sides.[10] Sumit Ganguly explains, "Absent nuclear weapons, Pakistan would not have undertaken the...misadventure." [11] Relations between India and Pakistan reveal that weaponization emboldens revisionist nuclear states and raises the propensity for conventional conflict. While exhibiting nuclear restraint in both of these situations, India has made "aggressive changes" to its "conventional military posture." [12] India's new Cold Start doctrine, for example, "enable[s] India to rapidly launch a large-scale attack against Pakistan." [13] Responding to this, the director-general of Pakistan's military intelligence agency, Inter-Services

Intelligence (ISI), illustrates how conventional instability can escalate to the nuclear level: Cold Start “is destabilizing; it is meant to circumvent nuclear deterrence [...]. If it becomes too threatening we [Pakistan] will have to rely on our nuclear capability.”[14] While the line at which Pakistan would employ nuclear weapons remains unclear, this statement suggests that Pakistan’s strategic calculations in responding to conventional conflicts with India now include a nuclear contingency plan. Equally disconcerting, Indian officials believe they can “calibrate” their actions relative to Pakistan’s tolerance, “stopping short of Pakistan’s strategic nuclear thresholds.”[15] Erroneously appraising another country’s red lines could have catastrophic effects, leading to unintended drastic escalation.[16] The India-Pakistan relationship displays how the stability-instability paradox subjects the region to escalation and miscalculation on a nuclear scale. The stability-instability paradox also holds true for the Israel-Iran case. Colin Kahl, Melissa Dalton, and Matthew Irvine point out that **a nuclear-armed Iran could stir regional conflict, producing high-stakes miscalculations with “some inherent risk of inadvertent escalation to nuclear war.”**[17] A Middle East where “conflict below the nuclear threshold seem[s] ‘safe’” will likely “encourage **Iranian adventurism**, reduce Israeli freedom of action, and increase aggressive actions by Iranian proxies.”[18] Geographic proximity and mutual distrust could lead “Israel and Iran [to] adopt ‘launch-on-warning’” doctrines for their nuclear arsenals, increasing the chances that “false warnings of an impending attack by one side” could unravel into an “accidental nuclear war.”[19] When it comes to a weaponized Iran, Waltz’s contention fails to follow its own rational deterrence logic. In this scenario, **it is not fear of a second strike that deters Israel and Iran, but vulnerability to a first strike that could lead one side or the other to initiate a nuclear attack.** Kahl notes, “Reciprocal fears of surprise attack could produce incentives for either side to launch a deliberate pre-emptive attack.”[20] Israel, with its nuclear superiority, fearing a nuclear-armed Iran, could seek to annihilate Iran’s small arsenal by initiating a first strike. Even if Iran only feared an Israeli conventional attack, Iran’s nascent nuclear arsenal, extremely vulnerable to an Israeli strike, could generate an Iranian “use them or lose them” sentiment, where Iran could also calculate that a first strike lay in its favor.[21] This would leave two nuclear-armed adversaries without diplomatic relations living in close proximity to one another, both feeling vulnerable and potentially believing a first strike could work to its advantage.[22] **In the Middle East, even the prospect of a weaponized Iran heightens the potential for conflict to escalate to nuclear levels.** While no one can know with certainty what the regional security environment will look like if Iran joins the nuclear club, **one thing is certain: nuclear weapons sustain the possibility of nuclear war.** The Waltzian deterrence model may hold true in a Cold War retrospective, but unintended accidents and escalation are still possible. **When adversarial states both possess a nuclear second-strike capability, relative security gains cannot be achieved at the nuclear level.** Waltz concedes that because states seek to maximize their relative security, nuclear states may choose to develop a massive conventional weapons arsenal as well. In this way, even Waltz acknowledges the paradoxical nature of nuclear weapons, admitting heightened aggression and limited war is possible even when both states are nuclear-armed.[23] As demonstrated by the nuclear standoff between India and Pakistan, **nuclear weapons generate increasingly aggressive behavior, creating greater opportunities for conflict, not fewer.** A likely scenario between Israel and a nuclear Iran involves increased low-intensity conflict where low-level skirmishes **could lead to unintended escalation or accidental nuclear detonation.** At worst, nuclear-armed foes could decide that a first strike is worth the risk.

1NC China D.A.

A. Current U.S. HR Pressure on China Low – they have the upper hand and can deflect criticism

Chen 15

(Dingding Chen, Assist Professor of Govt and Public Admin @ University of Macau, and Katrin Kinzelbach, Assoc. Dir. of Global Public Policy Institute, “Democracy promotion and China: blocker or bystander?” pg Taylor and Francis)

The US and the EU continue to support Chinese human rights activists through financial grants, quiet diplomacy, and public statements, but both actors have scaled down their ambitions in recent years. This is not only because financial regulations have changed. **China's rapidly increasing international weight,** which was further accelerated by the subprime mortgage crisis in the US and the sovereign debt crisis in Europe, **changed the dynamics of international politics, and significantly decreased the party-state's vulnerability to international pressure.** Accordingly, **high-ranking leaders in Beijing now dismiss Western criticism of China's governance model rather confidently.** For example, according to confidential accounts of EU officials, Wu Hailong (since 2014 China's Representative at the UN in Geneva) noted repeatedly in closed-door meetings that **China was no longer willing to be lectured on human rights and democracy because “times have changed”.**¹⁴ As this brief summary shows, the **Chinese party-state has sought to countervail external and domestic democracy promotion by using a wide range of tactics, ranging from domestic repression, counter-discourse at home and abroad, to sticks and carrots at the international level.** To what extent this policy extends beyond the borders of mainland China will be discussed in the following two sections on Myanmar and Hong Kong.

B. The plan is a reversal of HR hypocrisy – ensures an effective coalition that will pressure Russia and China

Roth 9

(Kenneth, Kenneth Roth is executive director of Human Rights Watch, Graduate of Yale Law School and Brown University, “Taking Back the Initiative from the Human Rights Spoilers,” pg online @ [http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers //um-ef](http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers//um-ef))

Shifts in global power have emboldened spoiler governments in international forums to challenge human rights as a "Western" or "imperialist" imposition. The force of China's authoritarian example and the oil-fueled muscle of Russia have made it easier to reject human rights principles. The moral standing of a country like South Africa by virtue of its own dark past means that its challenge to the international human rights agenda is influential. **Nevertheless, governments that care about human rights worldwide retain enough clout to build a broad coalition to fight repression** if they are willing to use it. **Instead, these governments have largely abandoned the field.** **Succumbing to competing interests and credibility problems of their own making,** they have let themselves be outmaneuvered and sidelined in UN venues such as the Security Council and the Human Rights Council, and in the policy debates that shape multilateral diplomacy toward Burma, Darfur, Sri Lanka, Zimbabwe, and other trouble spots. **For the United States, that withdrawal is the logical consequence of the Bush administration's decision to combat terrorism without regard to the basic rights** not to be subjected to

torture, "disappearance," or detention without trial. Against that backdrop, **Washington's periodic efforts to discuss rights have been undercut by justifiable accusations of hypocrisy. Reversing that ugly record must be a first priority for** the new administration of Barack **Obama if the US government is to assume a credible leadership role on human rights.** Washington's frequent abdication has often forced the European Union to act on its own. Sometimes it has done so admirably, such as after the Russia-Georgia conflict, when its deployment of monitors eased tensions and helped protect civilians, or in eastern Chad, where it sent 3,300 troops as part of a UN civilian protection mission. But the EU did a poor job of projecting its influence more broadly, to places like Burma, Somalia, or the Democratic Republic of Congo. It often sought to avoid the political fallout of doing nothing by hiding behind a cumbersome EU decision-making process that favors inaction. Moreover, its frequent **reluctance to stand up** to the Bush administration **in protest against abusive counterterrorism policies opened the EU to charges of double standards that poisoned the global debate on human rights and made it easier for spoilers to prevail.** The US and the EU are not the only ones promoting human rights abroad. Increasingly, some governments in Latin America, Africa, and Asia can be looked to for support on international rights initiatives. Those that stand out include Argentina, Chile, Costa Rica, Mexico, and Uruguay in Latin America, and Botswana, Ghana, Liberia, and Zambia in Africa. In Asia, Japan and South Korea tend to be sympathetic to rights but are generally reluctant to take strong public positions. Yet forced to act without the firm and consistent backing of the major Western democracies, these important voices are rarely able to mount on their own a major international diplomatic effort to address serious human rights abuses. Even the best-intentioned middle-sized powers cannot forge a solution to the world's most repressive situations without the partnership of the larger Western powers that still dominate the United Nations, have large and active diplomatic corps, and can deploy substantial military and economic resources. So by default, **those often setting the human rights agenda in international forums are opponents of human rights enforcement-governments of nations such as** Algeria, **China,** Egypt, India, Pakistan, **and Russia.** They want to return to an era when the defense of human rights was left to the discretion of each government, and violations carried little international cost. To resist that aspiration will take a determination that too often has been lacking. First, **because the most effective human rights advocacy is by example, governments hoping to defend human rights elsewhere must commit themselves to respect those rights in their own conduct.** As described in more detail below, **that means** in **the counterterrorism realm, a definitive end to such abuses** as the use of torture and other coercive interrogation techniques, the "disappearance" of suspects in secret detention facilities, and the long-term detention of suspects without trial-as well as a willingness to speak out immediately if any government, including a close ally, resumes these practices. **It also means addressing such persistent abuses as racism** in the criminal justice system, **mistreatment of migrants** or use of the death penalty. Second, as in the case of any serious human rights violation, offenders must be held to account. For example, only by investigating, acknowledging, and repudiating the wrongdoing that has occurred, prosecuting serious crimes, and taking remedial steps to ensure that these abuses never recur, will Washington begin to build credibility as a government that practices what it preaches in the human rights realm. Third, **serious efforts must be undertaken to build a broad global coalition** in support of human rights. In the case of the United States, it should seek to rejoin multilateral institutions such as the UN Human Rights Council and ratify key treaties such as those on women's and children's rights, enforced disappearances, cluster munitions, and antipersonnel landmines. It should adopt a policy of embracing the rule of law by re-signing the International Criminal Court treaty, actively supporting the court, and initiating a process for ultimate ratification. And it should actively support-politically, financially, and militarily-multilateral efforts to protect civilians from mass atrocities. In the case of both the European Union and the United States, vigorous efforts should be made to reach out to governments of the global South, especially those that largely respect human rights at home but continue to resist the defense of human rights in their foreign policy. **That requires addressing issues of particular concern to Southern governments, such as economic and social rights, racism, and the rights of migrants. It also requires avoiding double standards** and remaining open to dialogue and appropriate political compromise. Governments of the global South, in turn, must reconsider their reflexive stand shoulder to shoulder with the oppressors of the world rather than their victims. This misguided solidarity is particularly disappointing in the case of governments such as India and South Africa, which today are democracies that on balance respect the rights of their own people but pursue a foreign policy suggesting that others do not deserve similar rights. Bloc solidarity should not become a substitute for embracing the more fundamental values of human rights. Finally, the new **Obama** administration **must abandon the Bush administration's policy of hyper-sovereignty. It is music to the ears of the governments of China, Russia** and India **to hear Washington deflect human rights criticism on sovereignty grounds.** That approach effectively pushes back the clock to an era before the Universal Declaration of Human Rights and the many legal and institutional mechanisms it has spawned. **A radical reappraisal of US policy is urgently needed.** President Obama has promised such changes, and none too soon. The test will be whether he can resist pressures to sustain the Bush-led status quo.

C. Effective US HR Pressure on China backfires – Collapses Relations and Causes mass chaos in China

Wyne 13 Ali, contributing analyst at Wikistrat and a global fellow at the Project for the Study of the 21st Century. "Some Thoughts on the Ethics of China's Rise." 08/14/13. Accessed 6/26/14. http://www.carnegiecouncil.org/publications/ethics_online/0084

The more contentious topic, of course, is the role that human rights should play in U.S.-China relations. While the United States should neither hesitate to articulate its differences with China on issues of human rights, nor refrain from encouraging those trends within China that are promoting greater citizen empowerment, it should not urge China to democratize or condition its interactions with China on the leadership's acceptance of core American values. A country that is not yet 250 years old should appreciate the possibility that a country several millennia old may have its own strain of exceptionalism. Furthermore, attempts to democratize China could backfire. One of the foremost China watchers, former prime minister of Singapore Lee Kuan Yew, declares that it will not "become a liberal democracy; if it did, it would collapse." While the Chinese Communist Party (CCP) is willing to experiment with democratic reforms in "villages and small towns," he explains, it fears that large-scale democratization "would lead to a loss of control by the center over the provinces, like [during] the warlord years of the 1920s and '30s.³ Whatever challenges an increasingly capable and assertive China might pose, a weak China in the throes of chaos would be even more problematic, especially now that its growth is vital to the health of the global economy. It is China's ongoing integration into the international system and attendant exposure to information technology that hold the greatest promise for improvements to its human rights climate. Since the late 1970s, the CCP has implicitly conditioned its delivery of rapid growth to the Chinese people on their acquiescence to its rule. The problem is that citizens' priorities become more sophisticated as their day-to-day situations grow less exigent. Those in dire poverty are quite likely to censor themselves in exchange for food, shelter, and other necessities. As they enter the middle class, however, and become less preoccupied with the demands of survival, they naturally think more about critiquing government policy. Within this transition lies a fundamental challenge for the CCP: the very bargain that it implemented to forestall challenges to its rule is enabling greater numbers of Chinese to pose such challenges. There were only 20 million Internet users in China in 2000; today, there are more than 560 million.⁴

D. Relations collapse causes US China War

Goldstein 13

(2013, Avery, Professor of Global Politics and International Relations, Director of the Center for the Study of Contemporary China, University of Pennsylvania, "First Things First: The Pressing Danger of Crisis Instability in U.S.-China Relations," International Security, vol. 37, no. 4, Spring, muse)

Two concerns have driven much of the debate about international security in the post-Cold War era. The first is the potentially deadly mix of nuclear proliferation, rogue states, and international terrorists, a worry that became dominant after the terrorist attacks against the United States on September 11, 2001.¹ The second concern, one whose prominence has waxed and waned since the mid-1990s, is the potentially disruptive impact that China will have if it emerges as a peer competitor of the United States, challenging an international order established during the era of U.S. preponderance.² Reflecting this second concern, some analysts have expressed reservations about the dominant post-September 11 security agenda, arguing that China could challenge U.S. global interests in ways that terrorists and rogue states cannot. In this article, I raise a more pressing issue, one to which not enough attention has been paid. For at least the next decade, while China remains relatively weak, the gravest danger in Sino-American relations is the possibility the two countries will find themselves in a crisis that could escalate to open military conflict. In contrast to the long-term prospect of a new great power rivalry between the United States and China, which ultimately rests on debatable claims about the intentions of the two countries and uncertain forecasts about big shifts in their national capabilities, the danger of instability in a crisis involving these two nuclear-armed states is a tangible, near-term concern.³ Even if the probability of such a war-

threatening crisis and its escalation to the use of significant military force is low, the potentially catastrophic consequences of this scenario provide good reason for analysts to better understand its dynamics and for policymakers to fully consider its implications. Moreover, **events**

since 2010—especially those relevant to disputes **in the East and South China Seas**—suggest that **the danger of a military confrontation in the Western Pacific that could lead to a U.S.-China standoff may be on the rise**.

In what follows, I identify not just pressures to use force preemptively that pose the most serious risk should a Sino-American confrontation unfold, but also related, if slightly less dramatic, incentives to initiate the limited use of force to gain bargaining leverage—a second trigger for potentially devastating instability during a crisis.⁴

My discussion proceeds in three sections. The first section explains why, during the next decade or two, **a serious U.S.-China crisis may be more likely** than is currently recognized. The second section examines the features of plausible Sino-American crises that may make them so dangerous.

The third section considers general features of crisis stability in asymmetric dyads such as the one in which a U.S. superpower would confront an increasingly capable but still thoroughly overmatched China—the asymmetry that will prevail for at least the next decade. This more stylized discussion clarifies the inadequacy of focusing one-sidedly on conventional forces, as has much of the current commentary about the modernization of China's military and the implications this has for potential conflicts with the United States in the Western Pacific,⁵ or of focusing one-sidedly on China's nuclear forces, as a smaller slice of the commentary has.⁶ An assessment considering the interaction of

conventional and nuclear forces indicates why escalation resulting from crisis instability remains a devastating possibility. **Before proceeding**, however, I

would like to clarify my use of the terms "crisis" and "instability." For the purposes of this article, I **define a**

crisis as a confrontation between states involving a serious threat to vital national interests for both sides, in which there is the expectation of a short time for resolution, and in which there is understood to be a sharply increased risk of war.⁷ This definition distinguishes crises from many situations to which the label is

sometimes applied, such as more protracted confrontations; sharp disagreements over important matters that are not vital interests and in which military force seems

irrelevant; and political disputes involving vital interests, even those with military components, that present little immediate risk of war.⁸ I **define instability as**

the temptation to resort to force in a crisis.⁹ Crisis stability is greatest when both sides strongly prefer to continue bargaining; instability is greatest when they are strongly tempted to resort to the use of military force. **Stability**, then, **describes a spectrum**—from one extreme in which neither side sees much advantage to using force, through a range of situations in which the balance of costs and benefits of using force varies for each side, to the other extreme in which the benefits of using force

so greatly exceed the costs that striking first looks nearly irresistible to both sides. **Although the incentives to initiate the use of force**

may not reach this extreme level in a U.S. China crisis, the capabilities that the two countries possess raise concerns that escalation pressures will exist and that they may be highest early in a crisis, compressing the time frame for diplomacy to avert military conflict.

Russia Version 2NC Link Wall

Extend 1NC Roth – the plan allows the U.S. to re-build its credibility on Human Rights and re-start its international strategy to promote freedom world-wide that has been stalled due to ineffective policies like surveillance that are perceived as hypocritical positions by the U.S. -

And, that increase in prestige and status will be perceived by Russia as a DIRECT TRADE-OFF with Russian Influence and attempts to build its own soft power – the plan will be perceived as a direct attempt to CHALLENGE Russia – star this card

Bugajski, 13

(Janusz, policy analyst and chairs the Foreign Service Institute of the U.S. Department of State, “Russia’s Soft Power Wars”, <http://ukrainianweek.com/World/71849>)

The stark contrast between Western and Russian understanding of “soft power” has become evident during President Vladimir Putin’s third presidency. For the Kremlin, “soft power” is part of its arsenal of foreign policy tools designed to re-integrate Russia’s neighbors around a Moscow orbit. Western “soft power” influences are therefore viewed as a form of geostrategic competition that must be curtailed and eventually eliminated. As a result, in recent months Moscow has mounted a campaign to sever links between Russian NGOs and Western institutions and is encouraging its neighbors to do likewise. Simultaneously to its anti-Western offensive, Moscow deploys its own “soft power” weaponry to achieve specific regional integrationist ambitions. These have ranged from diplomatic offensives and informational warfare to energy blackmail and the exploitation of ethnic disputes. President Putin is also injecting a new form of “soft power” pressure by pursuing claims that Russian culture, language, history, and values should all predominate among the post-Soviet states.

SOFT POWER BATTLEGROUND In Moscow’s calculations, Russia and the West are embroiled in a long-term competition over zones of dominance in the wider Europe and in Central Asia, despite the fact that the US and its European allies have refused to acknowledge or legitimize such a “great game.” Russia’s drive for its own sphere in a “multipolar” world contributes to retarding the formation of stable democratic states along its borders. Governments in these countries turn to authoritarianism to maintain the integrity and stability of the state or simply to cling to power. Such a process is invariably supported by Moscow as it contributes to disqualifying these countries from the process of Western integration. Moscow opposes any “encroachment” by outside powers in its self-proclaimed “privileged” zone of interests or the further expansion of NATO, EU, and US influence. Russia views itself as a regional integrator, expecting neighbors to coalesce around its leadership, rather than a country to be integrated in multi-national institutions in which its own sovereignty is diminished. In this context, Russian “soft power” in all its manifestations is understood as a means for supplementing Russia’s own foreign policy objectives and enhancing regional integration under Moscow’s tutelage. In marked contrast, the West’s “soft power” approach is intended to generate reform, internal stability, external security, democratic development, and open markets to make targeted states compatible with Western systems and institutions. In the case of the EU, the prospect of membership itself has been the primary “soft power” tool as it entices governments to meet the necessary legal, economic, and regulatory standards to qualify for Union accession. However, EU or NATO membership remain voluntary and are not pressured by inducements and threats, as is the case with Moscow-centered organizations. While the West promotes the pooling of sovereignty among independent states, Russia pushes for the surrender of sovereignty within assorted “Eurasian” organizations. To advance its strategic goals, the Kremlin needs to demonstrate that it is in competition with the West and that Washington and Brussels are seeking to impose their political structures and value system on the gullible Eurasian countries. This is a classic form of psycho-political projection, with Russia’s leaders acting as if Western objectives were similar to their own in undermining national independence and eliminating countervailing foreign influences. Putin launched a blistering attack on Western “soft power” in an article in *Moskovskiy Novosti* (Moscow News) in February 2012. He claimed that this weapon was being increasingly used as a means for achieving foreign policy goals without the

use of force, but by exerting informational and other levers of influence. According to Putin, Western "soft power" is deployed to "develop and provoke extremist, separatist, and nationalistic attitudes, to manipulate the public and to conduct direct interference in the domestic policy of sovereign countries." Evidently, for the Kremlin, democratic pluralism is a form of extremism, national independence is a form of separatism, and state sovereignty is a form of nationalism. Putin contends that there must be a clear division between "normal political activity" and "illegal instruments of soft power." Hence, he engages in scathing attacks on "pseudo-NGOs" inside Russia and among the post-Soviet neighbors that receive resources from Western governments and institutions, viewing this as a form of subversion. In reality, the Kremlin is envious that Western values are often more appealing to educated and ambitious segments of the population than traditional Russian values. The global human rights agenda is berated by Putin as a Western plot, because the US and other Western states allegedly politicize human rights and use them as a means for exerting pressure on Russia and its neighbors. Human rights campaigns are depicted as a powerful form of "soft power" diplomacy intended to discredit governments that are more easily influenced by Moscow. Russia supposedly offers a legitimate political alternative to these countries - a quasi- authoritarian "sovereign democracy" and a statist-capitalist form of economic development. "Sovereign democracy" is presented as a viable option to the alleged Western export of democratic revolutions. Russia's support for strong-arm governments is intended to entice these countries under its political and security umbrella and delegitimize the West for its criticisms of autocratic politics. MOSCOW'S SOFT POWER INSTRUMENTS In Putin's version of "soft power," an assortment of tools can be deployed to achieve strategic goals. These include culture, education, media, language, minority protection, Christian Orthodoxy, pan-Slavism, and Russo-focused assimilation. All these elements can supplement institutional instruments, economic incentives, energy dependence, military threats, and the political pressures applied by the Kremlin. In a landmark article on 23 January 2012 in Nezavisimaya Gazeta (The Independent Newspaper) Putin promoted his plan for uniting Russia's multi-ethnic society and stressed the central importance of Russian culture for all former Soviet states. In sum, for Eastern Slavs Russia is supposed to be the model "older brother," while for non-Slavs it is evidently the enlightened "father figure." The stress is on uniting various ethnic communities in the Russian Federation and former USSR under the banner of Russian culture and values. Putin criticizes multiculturalism as a destabilizing force and instead supports integration through assimilation, a veiled term for Russification. According to Putin, Russian people and culture are the binding fabric of this "unique civilization." He extolls the virtues of "cultural dominance," where Russia is depicted as a "poly-ethnic civilization" held together by a Russian "cultural core." The President notes with satisfaction that many former citizens of the Soviet Union, "who found themselves abroad, are calling themselves Russian, regardless of their ethnicity." Russian people are evidently "nation-forming" as the "great mission of Russians is to unite and bind civilization" through language and culture. According to such ethno-racist thinking, Ukrainians, Belarusians, Georgians, and other nationalities simply do not match the historical importance of the Great Russian nation. For Putin, the Russian state has a key role to play in "forming a worldview that binds the nation." He has called for enhancing education, language use, and national history to buttress Russia's tradition of cultural dominance and lists numerous tools for promoting Russian culture, including television, cinema, the Internet, social media, and popular culture. All these outlets must evidently shape public opinion and set behavioral norms. An additional important "soft power" instrument for the Kremlin is the campaign to defend human and minority rights in neighboring states - a ploy designed to increase Moscow's political leverage. Russian leaders claim the inalienable right to defend their compatriots abroad regardless of their status and citizenship. This has involved promoting Russian as a second state language or a regional language in all former Soviet republics, including Ukraine and the Baltic countries. Issuing passports to citizens of neighboring states has been a favored way of developing pro-Russian sectors of the population, influencing local politics, and providing a potential pretext for intervention in case of internal conflict. Some observers have dubbed the policy as "re-occupation through passportization." Georgia is believed to have about 179,000 Russian passport holders, the Transnistria enclave in Moldova about 100,000, Azerbaijan 160,000, Armenia 114,000, and up to 100,000 reside in Ukraine's Crimea out of approximately half a million Russian citizens in Ukraine. In September 2008, the Federal Agency for CIS Affairs, attached to the Russian foreign ministry and answerable directly to the President, began its operations. It was designed to project Russia's soft security tools toward former satellites and to assist Russian citizens in neighboring countries, thereby indicating more systematic intervention by Moscow. Other organizations, such as the Institute of CIS Countries, have been created to channel funds to Moscow-friendly political parties and NGOs in the region. Russian media supportive of the Kremlin is also beamed throughout the CIS or has established joint ventures with local media. In Putin's estimation, Moscow must expand Russia's educational and cultural presence in the world, especially in those countries where a substantial part of the population understands Russian. Support for compatriots and Russian culture abroad involves expanding the rights of co-ethnics and co-linguists in all nearby states so they gain increasing political influence. Hence, we have witnessed persistent attacks on Latvian and Estonian authorities for supposedly abusing the Russian minority as both countries have linguistic stipulations for citizenship. Meanwhile, a high percentage of post-World War Two Russian colonists view their language as superior and have not made sufficient effort to learn Estonian or Latvian. CONFLICTING STRATEGIC OBJECTIVES In assessing the context of "soft power" projection, analysts often overlook some important differences between American and Russian spheres of influence. In order to grasp Moscow's objectives and understand how its "soft power" instruments fit into grand strategy it is useful to consider four significant contrasts with Washington's approach. First, US administrations accept the right of each state to choose its alliances, while Russian officials endeavor to impose security arrangements on neighbors. Countries enter the Western sphere and the NATO alliance voluntarily as this contributes to their security and is not seen as a threat to their sovereignty. States invariably join the Russian sphere as a result of inducement, threat, or outright pressure. Oftentimes, there are no viable alternatives to the Russian-centered alliance because of energy dependence, trade links, and other forms of entrapment. Governments seek to avoid potential destabilization from Moscow by partially acquiescing to Kremlin demands. Nonetheless, disputes continue to simmer as various capitals from Belarus to Uzbekistan resist surrendering the most important elements of their sovereignty to Russia. Second, NATO and the EU have not created spheres of influence orbiting around one power center but voluntary alliances operating on a consensual basis and in the case of the EU pooling elements of their sovereignty. By contrast, Russia has developed a post-Soviet version of the Brezhnev doctrine, whereby countries within Russian-sponsored institutions have serious limitations on their sovereignty, particularly in their foreign policy and security orientations. Third, while the US promotes cordial relations between its own allies and Russia, Moscow remains fixated on its own primacy or exclusivity. For instance, Washington supports closer bilateral relations between Poland or other Central-East European countries and Russia as it believes this generates regional stability and lessens the need for U.S. security guarantees. In stark contrast, the Kremlin does not support closer relations between Ukraine or the CIS states and the US, calculating that this deprives Moscow of its political leverage, undermines its privileged interests, and could be the harbinger of a political and military alliance. Fourth, the Kremlin actually promotes conflicts between its allies and the US to weaken America's influence or seeks to capitalize on disputes between Washington and third parties. For example, Moscow has endeavored to buttress the Hugo Chavez government in Venezuela into a more assertive regional player in Latin America that can create security headaches for the US. By contrast, Washington actively discourages disputes between Moscow and its former satellites. Moreover, it is not obsessed with alleged Russian encirclement when Moscow sends military vessels to Cuba or Venezuela. However, when a U.S ship sails into the Black Sea or

Washington sells military equipment to Georgia, the Kremlin claims that Washington is launching a new Cold War. For Russian officials, alliances and partnerships are in themselves zero sum calculations in a constant struggle for influence and advantage with the United States. "Soft power" is thereby understood by Moscow as an arm of Russian state influence and a valuable tactical tool employed to achieve specific geostrategic ambitions.

And, Russia and China can only deflect HR blame now because of a lack of U.S. credibility – the plan restores the credibility and makes pressure effective

Roth 9

(Kenneth, Kenneth Roth is executive director of Human Rights Watch, Graduate of Yale Law School and Brown University, "Taking Back the Initiative from the Human Rights Spoilers," pg online @ <http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers> //um-ef)

Shifts in global power have emboldened spoiler governments in international forums to challenge human rights as a "Western" or "imperialist" imposition. The force of China's authoritarian example and the oil-fueled muscle of Russia have made it easier to reject human rights principles. The moral standing of a country like South Africa by virtue of its own dark past means that its challenge to the international human rights agenda is influential. Nevertheless, governments that care about human rights worldwide retain enough clout to build a broad coalition to fight repression if they are willing to use it. Instead, these governments have largely abandoned the field. Succumbing to competing interests and credibility problems of their own making, they have let themselves be outmaneuvered and sidelined in UN venues such as the Security Council and the Human Rights Council, and in the policy debates that shape multilateral diplomacy toward Burma, Darfur, Sri Lanka, Zimbabwe, and other trouble spots. For the United States, that withdrawal is the logical consequence of the Bush administration's decision to combat terrorism without regard to the basic rights not to be subjected to torture, "disappearance," or detention without trial. Against that backdrop, Washington's periodic efforts to discuss rights have been undercut by justifiable accusations of hypocrisy. Reversing that ugly record must be a first priority for the new administration of Barack Obama if the US government is to assume a credible leadership role on human rights. Washington's frequent abdication has often forced the European Union to act on its own. Sometimes it has done so admirably, such as after the Russia-Georgia conflict, when its deployment of monitors eased tensions and helped protect civilians, or in eastern Chad, where it sent 3,300 troops as part of a UN civilian protection mission. But the EU did a poor job of projecting its influence more broadly, to places like Burma, Somalia, or the Democratic Republic of Congo. It often sought to avoid the political fallout of doing nothing by hiding behind a cumbersome EU decision-making process that favors inaction. Moreover, its frequent reluctance to stand up to the Bush administration in protest against abusive counterterrorism policies opened the EU to charges of double standards that poisoned the global debate on human rights and made it easier for spoilers to prevail. The US and the EU are not the only ones promoting human rights abroad. Increasingly, some governments in Latin America, Africa, and Asia can be looked to for support on international rights initiatives. Those that stand out include Argentina, Chile, Costa Rica, Mexico, and Uruguay in Latin America, and Botswana, Ghana, Liberia, and Zambia in Africa. In Asia, Japan and South Korea tend to be sympathetic to rights but are generally reluctant to take strong public positions. Yet forced to act without the firm and consistent backing of the major Western democracies, these important voices are rarely able to mount on their own a major international diplomatic effort to address serious human rights abuses. Even the best-intentioned middle-sized powers cannot forge a solution to the world's most repressive situations without the partnership of the larger Western powers that still dominate the United Nations, have large and active diplomatic corps, and can deploy substantial military and economic resources. So by default, those often setting the human rights agenda in international forums are opponents of human rights enforcement-governments of nations such as Algeria, China, Egypt, India, Pakistan, and Russia. They want to return to an era when the defense of human rights was left to the discretion of each government, and violations carried little international cost. To resist that aspiration will take a determination that too often has been lacking. First, because the most effective human rights advocacy is by example, governments hoping to defend human rights elsewhere must commit themselves to respect those rights in their own conduct. As described in more detail below, that means in the

counterterrorism realm, a definitive end to such abuses as the use of torture and other coercive interrogation techniques, the "disappearance" of suspects in secret detention facilities, and the long-term detention of suspects without trial—as well as a willingness to speak out immediately if any government, including a close ally, resumes these practices. **It also means addressing such persistent abuses as racism** in the criminal justice system, **mistreatment of migrants**, or use of the death penalty. Second, as in the case of any serious human rights violation, offenders must be held to account. For example, only by investigating, acknowledging, and repudiating the wrongdoing that has occurred, prosecuting serious crimes, and taking remedial steps to ensure that these abuses never recur, will Washington begin to build credibility as a government that practices what it preaches in the human rights realm. Third, **serious efforts must be undertaken to build a broad global coalition in support of human rights.** In the case of the United States, it should seek to rejoin multilateral institutions such as the UN Human Rights Council and ratify key treaties such as those on women's and children's rights, enforced disappearances, cluster munitions, and antipersonnel landmines. It should adopt a policy of embracing the rule of law by re-signing the International Criminal Court treaty, actively supporting the court, and initiating a process for ultimate ratification. And it should actively support—politically, financially, and militarily—multilateral efforts to protect civilians from mass atrocities. In the case of both the European Union and the United States, vigorous efforts should be made to reach out to governments of the global South, especially those that largely respect human rights at home but continue to resist the defense of human rights in their foreign policy. **That requires addressing issues of particular concern to Southern governments, such as economic and social rights, racism, and the rights of migrants. It also requires avoiding double standards** and remaining open to dialogue and appropriate political compromise. Governments of the global South, in turn, must reconsider their reflexive stand shoulder to shoulder with the oppressors of the world rather than their victims. This misguided solidarity is particularly disappointing in the case of governments such as India and South Africa, which today are democracies that on balance respect the rights of their own people but pursue a foreign policy suggesting that others do not deserve similar rights. Bloc solidarity should not become a substitute for embracing the more fundamental values of human rights. Finally, the new **Obama** administration **must abandon the Bush administration's policy of hyper-sovereignty. It is music to the ears of the governments of China, Russia, and India to hear Washington deflect human rights criticism on sovereignty grounds.** That approach effectively pushes back the clock to an era before the Universal Declaration of Human Rights and the many legal and institutional mechanisms it has spawned. **A radical reappraisal of US policy is urgently needed.** President Obama has promised such changes, and none too soon. The test will be whether he can resist pressures to sustain the Bush-led status quo.

*****And, the link is perception-based – even if the plan doesn't ACTUALLY threaten Russian power, they'll perceive U.S. actions as threatening and a power-play to undercut their influence**

Kuchins 2011

(Andrew Kuchins (Director of the Russia and Eurasia Program at the Center for Strategic and International Studies in Washington, D.C) 8-10-2011 "Reset expectations: Russian assessments of U.S. power", <http://valdaiclub.com/usa/29520.html>)

Russian perceptions of the United States and its role in the world provide a powerful lens not only for framing how Russia conceives its foreign and security policies—far more broadly than U.S. Russia bilateral relations—but also for understanding deeply rooted notions of contemporary Russian identity and even its domestic political system. For most of the second half of the twentieth century the United States and the Soviet Union were locked in a competitive struggle for global power and hegemony, and each country viewed its adversary as the principal "other" around which much of each country's identity and foreign policy revolved. The collapse of the Soviet Union was a searing event for citizens of Russia as well as the other newly sovereign states of the region, **yet for most policymakers and elites in Moscow old habits of measuring success or failure through a U.S.-centric prism have endured. Now, nearly 20 years past the Soviet collapse, perceptions of the United States probably remain more significant for Russia than for any other country in this study.** As in other countries in this study, the dominant paradigm for Russian government officials and political elite is realism with probably a higher relative weight for the value of economic and military indices of power and lower relative weight for factors of soft power. In the traditional Russian calculus (czarist, Soviet, and post-Soviet), **it is not the power of attraction that dominates; instead, it is the power of coercion, typically through intimidation or buying support—a very hard-edged realism. When Westerners emphasize values such as human rights and democracy, the default Russian reaction is deep skepticism that their interlocutors, especially the Americans, are being disingenuous. U.S. promotion of democracy, liberal capitalism, a rules-based system of global governance, and the like is interpreted as a collection of ideological fig leaves designed to conceal the naked U.S. ambition to expand its own power and influence abroad**

U.S. HR cred low due to a lack of legitimacy and credibility – policies increasing HR domestic re-build credibility and result in effective HR promotion abroad

ACS 08

(American Constitution Society for Law and Policy, October, “Human Rights at Home: A Domestic Blueprint for the New Administration, <http://www.acslaw.org/files/C%20Powell%20Blueprint.pdf>)

Reaffirming and implementing the U.S. commitment to human rights at home is critical for two reasons. First, **human rights principles are at the core of America’s founding values**, and Americans (as well as others within our borders or in U.S. custody), no less than others around the world, are entitled to the full benefit of these basic guarantees. That can hardly be open to debate. The **second** reason is perhaps less obvious, but equally compelling. **When the United States fails to practice at home what it preaches to others, it loses credibility and undermines its ability to play an effective leadership role in the world.** **Leading through the power of our example rather than through the example of our power**³ is particularly critical now, at a juncture when the United States needs to **cultivate international cooperation to address pressing issues** – such as the current economic downturn – that have global dimensions. Perhaps not surprisingly, then, an overwhelming majority of Americans strongly embrace the notion of human rights: that is, the idea that every person has basic rights regardless of whether or not the government recognizes those rights.⁴ This Blueprint therefore suggests ways in which the new Administration can take concrete steps to ensure that human rights principles are considered and implemented within the process of **U.S. domestic policymaking**. It does not address in any detail the substance of particular policies in areas such as equality, health care, or the prohibition on torture;⁵ rather, **it identifies and evaluates mechanisms by which human rights principles can be integrated into policymaking in all areas of U.S. domestic policy** where they are relevant. **BACKGROUND** The United States was founded on the human rights principle expressed in the American Declaration of Independence: that we all have certain basic, unalienable rights simply by virtue of our humanity. Declaring rights to be inherent, not based on the generosity of the state, was transformative. Two hundred years later, the United States can point to a tradition of promoting human rights in principle, if not always in practice. The United States was a leader in ending the atrocities of World War II and in developing international institutions and instruments aimed at securing peace in the world and human rights for all people. The Universal Declaration of Human Rights, which celebrates its sixtieth anniversary this year, was inspired in part by Franklin D. Roosevelt’s Four Freedoms speech and drafted in part by Eleanor Roosevelt, the first President of the U.N. Human Rights Commission. Just as the New Deal redefined the concept of “security” at home to include economic security for all Americans, so too these post-war international regimes redefined the notion of “security” internationally to include human security.⁶ Indeed, for Americans, recognition that the gross human rights violations of the Holocaust were intertwined with Nazi aggression underscored the inextricable link between our principles and our national interests. **A robust human rights policy supports the rule of law, democratic institutions, accountability mechanisms for serious abuses, a humane global economy, and U.S. global leadership in reducing violence, instability, and refugee flows.**⁷ Oftentimes, in fact, principled policy directly serves U.S. national interests because it allows us to demand reciprocal treatment of our citizens abroad, as in the case of humane treatment of detainees captured in war. Beyond the concern for reciprocity, the strong bipartisan commitment to human rights that has developed over the last several decades emerges from an understanding that ensuring the enjoyment of human rights at home and around the world serves not only America’s deeply held values but also its national interests. Even so, **there remains a gap between the human rights ideals that the United States professes and its actual domestic practice, resulting in both a gap in credibility and a weakening of U.S. moral authority to lead by example.** Human rights include the right to be free from torture or cruel, inhuman or degrading treatment, and yet the **United States has committed such acts in the name of counterterrorism efforts.** Human rights include the rights to emergency shelter, food, and water, as well as security of person, and yet the United States failed to adequately guarantee these rights in the aftermath of Hurricane Katrina. Human rights include the right to equality of opportunity, and yet inequalities persist in access to housing, education, jobs, and health care. **Human rights include the right to equality in the application of law enforcement measures, and yet** there are **gross racial disparities in the application of the death penalty, and racial and ethnic profiling has been used unfairly to target African Americans, Latinos, and those who appear Arab, Muslim, South Asian, or immigrant** (whether through traffic stops, airport screening, or immigration raids). Human rights include the right to equal pay and gender equality, and yet a pay gap persists between female and male workers. Certainly, **the journey to fully realizing human rights is a work-in-progress, but to**

make progress, we must work – through smart, principled policies that advance the ability of the United States to live up to its own highest ideals.

Increased soft power results in international state-driven HR promotion which is ineffective and spurs backlash over perceived regime change – only the status quo strategy of supporting NGO's can spur effective HR

Bouwman 15

(Bastiaan Bouwman is pursuing a doctorate in the international history of human rights, at the London School of Economics. He received his research MA in history from the University of Amsterdam. Previously, Bastiaan was a junior scholar at the Woodrow Wilson International Center for Scholars and worked on the Shelter City project of Justice and Peace Netherlands, pg online @ [//um-ef\)](http://www.humanityinaction.org/knowledgebase/579-uncomfortable-bedfellows-why-human-rights-and-democracy-promotion-are-better-off-separate)

Protecting Human Rights Defenders The specter that the convergence of human rights and democracy promotion raises is that Western states have established a universal blueprint for what societies should look like, and that they now aim to reform the world in their image – through soft power and international law as much as possible, but even through hard power if necessary. While this suspicion may be exaggerated, the stated universality of human rights and democracy leaves no doubt that their spread is, in principle, an objective of Western governments, even though it is bounded by other, competing interests. It is hard to imagine this objective ever being achieved, but as stated above, the notion that Western actors are pursuing it certainly vexes authoritarian regimes. It also disturbs many, especially in the non-West, who doubt the sincerity of the stated intentions for rights and democracy assistance, and who feel that interference in their national politics diminishes their ability to determine their own future. Some of those objections might of course be disingenuous – the product of government propaganda or self-serving logic. Yet it would be short-sighted to assume that all of them are, as there are good reasons for being skeptical of rights and democracy promotion. As indicated above, recent interventions in the name of human rights and democracy as well as human rights violations on the part of countries that are supposed champions of universal morality have dealt a real blow to Western legitimacy. And crucially, the more that human rights and democracy promotion have been amalgamated and expanded into a comprehensive approach to building better societies, the more this threatens to stifle, rather than encourage, political debate in countries in question. As the historian Samuel Moyn has put it, for the purpose of opposing a regime the 'fiction of moral consensus' may be useful, but 'construction requires political dissensus'. (52) The more extensive and concrete human rights and democracy promotion become, the more they risk preempting debate on the contentious political choices that need to be made, such as the makeup of political institutions or arrangements for social justice. An area that may have the potential to steer human rights and democracy promotion around these objections is the protection and assistance of human rights defenders and their organizations. Human rights defenders represent, in principle, endogenous change. Although support for them may well have broader goals in mind, as long as supporting actors guard against selectivity in terms of recipients and use a wide-ranging definition of what constitutes a human rights defender, they have a strong claim to impartiality. Human rights defenders began receiving serious attention as a category of their own about a decade and a half ago. In 1998, the General Assembly of the United Nations adopted its 'Declaration on Human Rights Defenders', a document that had been in production since 1984. In large part, its adoption was spurred by worries over the plight of human rights defenders in countries that had recently become democracies but now seemed to be receding into authoritarianism. By 1997, 'what enthusiasts at the start of the decade were calling "the worldwide democratic revolution"' had 'cooled considerably'. (53) Many new democracies became 'hybrid regimes' that had some features of democracies – such as elections – and some of authoritarian rule – such as concentration of power. In 2003, a UN expert noted that of the 81 countries that had democratized during the 1980s and 1990s, only 47 were now considered 'fully democratic', while problems persisted in the remaining 34. (54) Human rights defenders – a term generally taken to extend not only to human rights professionals but to anyone taking action in defense of any human right – as a category became subject to new measures designed to suppress their activities. Especially from the mid-2000s, countries like Russia, Ethiopia and Venezuela developed new legal and other measures to stifle civil society, in part because the 'color revolutions' and the Arab Spring demonstrated just how dangerous civil society could be, in particular with the onset of new communications technologies. (55) They specifically targeted international rights and democracy assistance by cutting domestic organizations off from foreign funding and forcing international organizations to register as 'foreign agents', among other measures. Since it was felt that existing mechanisms did not offer the means to counter such policies, the United Nations, states and non-governmental organizations began taking measures to protect human rights defenders. (56) In 2000, a UN Special Rapporteur was

appointed to deal with the issue. In 2006, the U.S. State Department established a Human Rights Defenders Fund. The 2007 Dutch human rights strategy prominently featured human rights defenders, as did the strategies that followed it. In 2008, the European Union adopted special Guidelines to instruct member states on how they could best protect and assist human rights defenders. As mentioned above, in 2013 President Obama headed an initiative at the United Nations to counter the closing of space for civil society organizations. Dutch policy has aimed to safeguard above all the physical safety of human rights defenders and to free them from intimidation. This has taken the form, for instance, of the Shelter City project, which allows the relocation of human rights defenders under threat to the Netherlands for a period of three months. (57) In order to preserve its political independence, the ministry limits its involvement to co-funding, opting to have the non-governmental organization Justice and Peace Netherlands execute the project. The selection of participants takes place on the recommendation of an advisory committee in which the ministry has one of the four seats, but Justice and Peace none. During its first year of operation, four human rights defenders participated in the program, and it was set to be ramped up in subsequent years. In 2012, a consultancy firm hired by the European Commission found that across the 27 member states of the European Union, there existed close to 200 temporary shelter places per year. (58) The U.S. State Department co-founded a similar initiative in 2011, called the Lifeline: Embattled Civil Society Organizations (CSOs) Assistance Fund, a multilateral mechanism supported by eleven (now seventeen) like-minded governments, including the Netherlands, and two major American foundations as funders, and a consortium of seven non-governmental organizations (NGOs) to execute the project. In addition to providing emergency support, including funds for relocation and security assistance, the fund supports short-term advocacy efforts to raise attention to violations of the freedom of association and assembly. The activities of the fund are carried out by the NGO consortium, a decision made by the donors to depoliticize the assistance provided through the fund, which reports on activities and outcomes to the donors each quarter. Carrying out the activities through the NGO consortium ensures the global scope of activities, while the inclusion of countries such as Chile and Mongolia shows the wide extent of diplomatic support for the work of Lifeline. (59) By its latest tally, the Lifeline fund had provided assistance to 446 civil society organizations in 85 countries. (60) Conclusion In the post-Cold War era,

human rights and democracy promotion have become increasingly interwoven. In terms of human rights promotion, the Netherlands, both in rhetoric and in practice, has clearly steered a more reticent course than the United States; perhaps not coincidentally, the country is home to one of the largest national sections of Amnesty International. Nevertheless, in Dutch foreign policy, too, human rights promotion has to some extent become interwoven with promoting democracy. The formulation of European foreign policy has exerted a strong pull in this direction and will continue to do so. The crackdown that human rights defenders have experienced since the late 1990s and especially since the mid-2000s was, in part, a response precisely to the amalgamation of human rights and democracy promotion into an increasingly far-reaching project on the part of Western states. As sovereignty has become more and more

conditional on compliance with the values and norms of human rights and democracy, states disputing those international standards have pushed back against international rights and democracy assistance as well as domestic individuals and organizations representing these

causes. While to a significant extent this was a matter of authoritarian leaders striving to maintain power, the widening of the agenda of human rights and democracy promotion and especially its deployment as a justification for military interventions also generated legitimate objections. The association of human rights with democracy promotion has politicized the former, and their association with war has done substantial damage to the legitimacy of both concepts. Measures to protect human rights defenders have largely been a response to the challenge of crackdown by authoritarian regimes. Yet it might be in precisely this area that the promotion of human rights might reclaim its relatively apolitical status. The minimalism of policies that protect human rights defenders – aiming simply to keep endogenous voices for change from being silenced – gives them greater legitimacy than more ambitious forms of human rights and democracy promotion. Insofar as these specific policies have become a priority, they signal a return to a less politicized way of promoting human rights, more in line with the original ethos of Amnesty International than with the zeal of the NED. This could provide a way in which to separate human rights and democracy promotion from each other once again, for the betterment of both. Policies aimed at protecting

human rights defenders must be reconciled with the legacy of Western states elevating civil and political rights over social, economic and cultural rights – to an important extent a legacy of the Cold War. The phrase ‘human rights defender’ in effect leads to a just such a focus on a set of civil and political rights, such as the right to freedom of opinion and expression, the right to freedom of association, and the right to protest. Since the end of the Cold War, however, Western states have subscribed to the indivisibility and interdependency of human rights. (61)

Amnesty has embraced the full spectrum of human rights. Nevertheless, a tendency to focus on civil and political rights has persisted. It is, then, all the more important to ensure that the individual human rights defenders that states focus their efforts on are engaged in furthering not only civil and political rights, but also social, economic and cultural rights. These rights may not resonate as strongly among the Western public, but are widely affirmed as equal in importance. Moreover, aiding human rights defenders in raising an issue like land rights will help to counter the notion that Western rights and democracy assistance goes hand in hand with the promotion of corporate interests that hurt local populations. For instance, by aiding activists who work against expropriation of local farmers, Western actors can prove that their concern extends across the full array of human rights. UN Special Rapporteur Margaret Sekaggya provided an important impetus in this direction in her 2012 report, which noted ‘Defenders working on land and environmental issues’ as one of the most at-risk groups of human rights defenders and called for their protection. (62) Furthermore, as the examples in the previous section show, the legitimacy of human rights as well as democracy promotion can be improved by reaching

out in new ways. Policies to protect human rights defenders are now increasingly the work of coalitions, not only of states but also of non-governmental organizations, municipalities, and even corporations. Heavier investment in international non-governmental organizations stands as a possible way for states to enact policies that enjoy greater legitimacy. In this way states can avoid direct ties with organizations in countries with authoritarian governments. The NED’s Gershman noted in 2008 that ‘[i]t is appropriate for the U.S. to seek the democratic transformation of states that foster extremism, but linking official U.S. policy and diplomacy so closely to this effort has a number of serious drawbacks.’ (63) For instance, because of their permanent engagement through bilateral relationships, states can never claim the impartiality of non-governmental organizations, nor can they single-mindedly pursue democratization or human rights. Cooperating with other actors will not placate those who class all rights and assistance activities as foreign interference, but it does help to show the breadth of support for these areas. The Dutch government’s innovation of trilateral cooperation is a particularly promising instrument in this regard, as it draws on the legitimacy and expertise of regional partners. Projects like Shelter City and Lifeline stand as important case-studies for the further development of a more network-based, multilateral and indirect approach – and similar projects are underway, not only in the West, but also locally and regionally, for instance the East and Horn of Africa Human Rights Defenders Project. A corollary of focusing in this area is to keep shifting the ultimate emphasis as much as possible to local partners. This applies to human rights promotion but also to processes of democratization that may of course be enabled by it. As a 2008 report by the Overseas Development Institute noted, ‘[t]he impetus for democratisation must come from within’. (64) This is so not only for the sake of efficacy, but also for the sake of legitimacy

(which are, of course, interrelated, since a project viewed as illegitimate will be more vulnerable to countervailing forces). Herein lies, perhaps, the greatest challenge for human rights promotion as a state-initiated project: to succeed in the long term, as a manifestation of a truly universal desire for dignity, it must seriously engage with local partners and allow them to not only use the resources that assistance affords to their needs, but also to contribute to setting the agenda. This means returning to the ethos of human rights as an apolitical project, aimed at countering repression and thereby empowering people to realize their ambitions as autonomously as possible.

And, Russia and China can only deflect HR blame now because of a lack of U.S. credibility – the plan restores the credibility and makes pressure effective

Roth 9

(Kenneth, Kenneth Roth is executive director of Human Rights Watch, Graduate of Yale Law School and Brown University, "Taking Back the Initiative from the Human Rights Spoilers," pg online @ <http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers> //um-ef)

Shifts in global power have emboldened spoiler governments in international forums to challenge human rights as a "Western" or "imperialist" imposition. The force of China's authoritarian example and the oil-fueled muscle of Russia have made it easier to reject human rights principles. The moral standing of a country like South Africa by virtue of its own dark past means that its challenge to the international human rights agenda is influential. Nevertheless, governments that care about human rights worldwide retain enough clout to build a broad coalition to fight repression if they are willing to use it. Instead, these governments have largely abandoned the field. Succumbing to competing interests and credibility problems of their own making, they have let themselves be outmaneuvered and sidelined in UN venues such as the Security Council and the Human Rights Council, and in the policy debates that shape multilateral diplomacy toward Burma, Darfur, Sri Lanka, Zimbabwe, and other trouble spots. For the United States, that withdrawal is the logical consequence of the Bush administration's decision to combat terrorism without regard to the basic rights not to be subjected to torture, "disappearance," or detention without trial. Against that backdrop, Washington's periodic efforts to discuss rights have been undercut by justifiable accusations of hypocrisy. Reversing that ugly record must be a first priority for the new administration of Barack Obama if the US government is to assume a credible leadership role on human rights. Washington's frequent abdication has often forced the European Union to act on its own. Sometimes it has done so admirably, such as after the Russia-Georgia conflict, when its deployment of monitors eased tensions and helped protect civilians, or in eastern Chad, where it sent 3,300 troops as part of a UN civilian protection mission. But the EU did a poor job of projecting its influence more broadly, to places like Burma, Somalia, or the Democratic Republic of Congo. It often sought to avoid the political fallout of doing nothing by hiding behind a cumbersome EU decision-making process that favors inaction. Moreover, its frequent reluctance to stand up to the Bush administration in protest against abusive counterterrorism policies opened the EU to charges of double standards that poisoned the global debate on human rights and made it easier for spoilers to prevail. The US and the EU are not the only ones promoting human rights abroad. Increasingly, some governments in Latin America, Africa, and Asia can be looked to for support on international rights initiatives. Those that stand out include Argentina, Chile, Costa Rica, Mexico, and Uruguay in Latin America, and Botswana, Ghana, Liberia, and Zambia in Africa. In Asia, Japan and South Korea tend to be sympathetic to rights but are generally reluctant to take strong public positions. Yet forced to act without the firm and consistent backing of the major Western democracies, these important voices are rarely able to mount on their own a major international diplomatic effort to address serious human rights abuses. Even the best-intentioned middle-sized powers cannot forge a solution to the world's most repressive situations without the partnership of the larger Western powers that still dominate the United Nations, have large and active diplomatic corps, and can deploy substantial military and economic resources. So by default, those often setting the human rights agenda in international forums are opponents of human rights enforcement-governments of nations such as Algeria, China, Egypt, India, Pakistan, and Russia. They want to return to an era when the defense of human rights was left to the discretion of each government, and violations carried little international cost. To resist that aspiration will take a determination that too often has been lacking. First, because the most effective human rights advocacy is by example, governments hoping to defend human rights elsewhere must commit themselves to respect those rights in their own conduct. As described in more detail below, that means, in the counterterrorism realm, a definitive end to such abuses as the use of torture and other coercive interrogation techniques, the "disappearance" of suspects in secret detention facilities, and the long-term detention of suspects without trial-as well as a willingness to speak out immediately if any government, including a close ally, resumes these practices. It also means addressing such persistent abuses as racism in the

criminal justice system, mistreatment of migrants, or use of the death penalty. Second, as in the case of any serious human rights violation, offenders must be held to account. For example, only by investigating, acknowledging, and repudiating the wrongdoing that has occurred, prosecuting serious crimes, and taking remedial steps to ensure that these abuses never recur, will Washington begin to build credibility as a government that practices what it preaches in the human rights realm. Third, serious efforts must be undertaken to build a broad global coalition in support of human rights. In the case of the United States, it should seek to rejoin multilateral institutions such as the UN Human Rights Council and ratify key treaties such as those on women's and children's rights, enforced disappearances, cluster munitions, and antipersonnel landmines. It should adopt a policy of embracing the rule of law by re-signing the International Criminal Court treaty, actively supporting the court, and initiating a process for ultimate ratification. And it should actively support—politically, financially, and militarily—multilateral efforts to protect civilians from mass atrocities. In the case of both the European Union and the United States, vigorous efforts should be made to reach out to governments of the global South, especially those that largely respect human rights at home but continue to resist the defense of human rights in their foreign policy. That requires addressing issues of particular concern to Southern governments, such as economic and social rights, racism, and the rights of migrants. It also requires avoiding double standards and remaining open to dialogue and appropriate political compromise. Governments of the global South, in turn, must reconsider their reflexive stand shoulder to shoulder with the oppressors of the world rather than their victims. This misguided solidarity is particularly disappointing in the case of governments such as India and South Africa, which today are democracies that on balance respect the rights of their own people but pursue a foreign policy suggesting that others do not deserve similar rights. Bloc solidarity should not become a substitute for embracing the more fundamental values of human rights. Finally, the new Obama administration must abandon the Bush administration's policy of hyper-sovereignty. It is music to the ears of the governments of China, Russia and India to hear Washington deflect human rights criticism on sovereignty grounds. That approach effectively pushes back the clock to an era before the Universal Declaration of Human Rights and the many legal and institutional mechanisms it has spawned. A radical reappraisal of US policy is urgently needed. President Obama has promised such changes, and none too soon. The test will be whether he can resist pressures to sustain the Bush-led status quo.

*****And, the link is perception-based – even if the plan doesn't ACTUALLY threaten Russian power, they'll perceive U.S. actions as threatening and a power-play to undercut their influence**

Kuchins 2011

(Andrew Kuchins (Director of the Russia and Eurasia Program at the Center for Strategic and International Studies in Washington, D.C.) 8-10-2011 "Reset expectations: Russian assessments of U.S. power", <http://valdaiclub.com/usa/29520.html>)

Russian perceptions of the United States and its role in the world provide a powerful lens not only for framing how Russia conceives its foreign and security policies—far more broadly than U.S. Russia bilateral relations—but also for understanding deeply rooted notions of contemporary Russian identity and even its domestic political system. For most of the second half of the twentieth century the United States and the Soviet Union were locked in a competitive struggle for global power and hegemony, and each country viewed its adversary as the principal "other" around which much of each country's identity and foreign policy revolved. The collapse of the Soviet Union was a searing event for citizens of Russia as well as the other newly sovereign states of the region, yet for most policymakers and elites in Moscow old habits of measuring success or failure through a U.S.-centric prism have endured. Now, nearly 20 years past the Soviet collapse, perceptions of the United States probably remain more significant for Russia than for any other country in this study. As in other countries in this study, the dominant paradigm for Russian government officials and political elite is realism with probably a higher relative weight for the value of economic and military indices of power and lower relative weight for factors of soft power. In the traditional Russian calculus (czarist, Soviet, and post-Soviet), it is not the power of attraction that dominates; instead, it is the power of coercion, typically through intimidation or buying support—a very hard-edged realism. When Westerners emphasize values such as human rights and democracy, the default Russian reaction is deep skepticism that their interlocutors, especially the Americans, are being disingenuous. U.S. promotion of democracy, liberal capitalism, a rules-based system of global governance, and the like is interpreted as a collection of ideological fig leaves designed to conceal the naked U.S. ambition to expand its own power and influence abroad

ACS 08

(American Constitution Society for Law and Policy, October, “Human Rights at Home: A Domestic Blueprint for the New Administration, <http://www.acslaw.org/files/C%20Powell%20Blueprint.pdf>)

Reaffirming and implementing the U.S. commitment to human rights at home is critical for two reasons. First, **human rights principles are at the core of America’s founding values**, and Americans (as well as others within our borders or in U.S. custody), no less than others around the world, are entitled to the full benefit of these basic guarantees. That can hardly be open to debate. The **second** reason is perhaps less obvious, but equally compelling. **When the United States fails to practice at home what it preaches to others, it loses credibility and undermines its ability to play an effective leadership role in the world.** Leading through the power of our example rather than through the example of our power³ is particularly critical now, at a juncture when the United States needs to **cultivate international cooperation to address pressing issues** – such as the current economic downturn – that have global dimensions. Perhaps not surprisingly, then, an overwhelming majority of Americans strongly embrace the notion of human rights: that is, the idea that every person has basic rights regardless of whether or not the government recognizes those rights.⁴ This Blueprint therefore suggests ways in which the new Administration can take concrete steps to ensure that human rights principles are considered and implemented within the process of **U.S. domestic policymaking**. It does not address in any detail the substance of particular policies in areas such as equality, health care, or the prohibition on torture;⁵ rather, **it identifies and evaluates mechanisms by which human rights principles can be integrated into policymaking in all areas of U.S. domestic policy** where they are relevant. BACKGROUND The United States was founded on the human rights principle expressed in the American Declaration of Independence: that we all have certain basic, unalienable rights simply by virtue of our humanity. Declaring rights to be inherent, not based on the generosity of the state, was transformative. Two hundred years later, the United States can point to a tradition of promoting human rights in principle, if not always in practice. The United States was a leader in ending the atrocities of World War II and in developing international institutions and instruments aimed at securing peace in the world and human rights for all people. The Universal Declaration of Human Rights, which celebrates its sixtieth anniversary this year, was inspired in part by Franklin D. Roosevelt’s Four Freedoms speech and drafted in part by Eleanor Roosevelt, the first President of the U.N. Human Rights Commission. Just as the New Deal redefined the concept of “security” at home to include economic security for all Americans, so too these post-war international regimes redefined the notion of “security” internationally to include human security.⁶ Indeed, for Americans, recognition that the gross human rights violations of the Holocaust were intertwined with Nazi aggression underscored the inextricable link between our principles and our national interests. **A robust human rights policy supports the rule of law, democratic institutions, accountability mechanisms for serious abuses, a humane global economy, and U.S. global leadership in reducing violence, instability, and refugee flows.**⁷ Oftentimes, in fact, principled policy directly serves U.S. national interests because it allows us to demand reciprocal treatment of our citizens abroad, as in the case of humane treatment of detainees captured in war. Beyond the concern for reciprocity, the strong bipartisan commitment to human rights that has developed over the last several decades emerges from an understanding that ensuring the enjoyment of human rights at home and around the world serves not only America’s deeply held values but also its national interests. Even so, **there remains a gap between the human rights ideals that the United States professes and its actual domestic practice, resulting in both a gap in credibility and a weakening of U.S. moral authority to lead by example.** Human rights include the right to be free from torture or cruel, inhuman or degrading treatment, and yet the **United States has committed such acts in the name of counterterrorism efforts.** Human rights include the rights to emergency shelter, food, and water, as well as security of person, and yet the United States failed to adequately guarantee these rights in the aftermath of Hurricane Katrina. Human rights include the right to equality of opportunity, and yet inequalities persist in access to housing, education, jobs, and health care. **Human rights include the right to equality in the application of law enforcement measures, and yet** there are **gross racial disparities in the application of the death penalty, and racial and ethnic profiling has been used unfairly to target African Americans, Latinos, and those who appear Arab, Muslim, South Asian, or immigrant** (whether through traffic stops, airport screening, or immigration raids). Human rights include the right to equal pay and gender equality, and yet a pay gap persists between female and male workers. Certainly, **the journey to fully realizing human rights is a work-in-progress, but to make progress, we must work – through smart, principled policies that advance the ability of the United States to live up to its own highest ideals.**

Increased soft power results in international state-driven HR promotion which is ineffective and spurs backlash over perceived regime change – only the status quo strategy of supporting NGO's can spur effective HR

Bouwman 15

(Bastiaan Bouwman is pursuing a doctorate in the international history of human rights, at the London School of Economics. He received his research MA in history from the University of Amsterdam. Previously, Bastiaan was a junior scholar at the Woodrow Wilson International Center for Scholars and worked on the Shelter City project of Justice and Peace Netherlands, pg online @ [//um-ef\)](http://www.humanityinaction.org/knowledgebase/579-uncomfortable-bedfellows-why-human-rights-and-democracy-promotion-are-better-off-separate)

Protecting Human Rights Defenders The specter that the convergence of human rights and democracy promotion raises is that Western states have established a universal blueprint for what societies should look like, and that they now aim to reform the world in their image - through soft power and international law as much as possible, but even through hard power if necessary. While this suspicion may be exaggerated, the stated universality of human rights and democracy leaves no doubt that their spread is, in principle, an objective of Western governments, even though it is bounded by other, competing interests. It is hard to imagine this objective ever being achieved, but as stated above, the notion that Western actors are pursuing it certainly vexes authoritarian regimes. It also disturbs many, especially in the non-West, who doubt the sincerity of the stated intentions for rights and democracy assistance, and who feel that interference in their national politics diminishes their ability to determine their own future. Some of those objections might of course be disingenuous – the product of government propaganda or self-serving logic. Yet it would be short-sighted to assume that all of them are, as there are good reasons for being skeptical of rights and democracy promotion. As indicated above, recent interventions in the name of human rights and democracy as well as human rights violations on the part of countries that are supposed champions of universal morality have dealt a real blow to Western legitimacy. And crucially, the more that human rights and democracy promotion have been amalgamated and expanded into a comprehensive approach to building better societies, the more this threatens to stifle, rather than encourage, political debate in countries in question. As the historian Samuel Moyn has put it, for the purpose of opposing a regime the 'fiction of moral consensus' may be useful, but 'construction requires political dissensus'. (52) The more extensive and concrete human rights and democracy promotion become, the more they risk preempting debate on the contentious political choices that need to be made, such as the makeup of political institutions or arrangements for social justice. An area that may have the potential to steer human rights and democracy promotion around these objections is the protection and assistance of human rights defenders and their organizations. Human rights defenders represent, in principle, endogenous change. Although support for them may well have broader goals in mind, as long as supporting actors guard against selectivity in terms of recipients and use a wide-ranging definition of what constitutes a human rights defender, they have a strong claim to impartiality. Human rights defenders began receiving serious attention as a category of their own about a decade and a half ago. In 1998, the General Assembly of the United Nations adopted its 'Declaration on Human Rights Defenders', a document that had been in production since 1984. In large part, its adoption was spurred by worries over the plight of human rights defenders in countries that had recently become democracies but now seemed to be receding into authoritarianism. By 1997, 'what enthusiasts at the start of the decade were calling "the worldwide democratic revolution" had 'cooled considerably'. (53) Many new democracies became 'hybrid regimes' that had some features of democracies – such as elections – and some of authoritarian rule – such as concentration of power. In 2003, a UN expert noted that of the 81 countries that had democratized during the 1980s and 1990s, only 47 were now considered 'fully democratic', while problems persisted in the remaining 34. (54) Human rights defenders – a term generally taken to extend not only to human rights professionals but to anyone taking action in defense of any human right – as a category became subject to new measures designed to suppress their activities. Especially from the mid-2000s, countries like Russia, Ethiopia and Venezuela developed new legal and other measures to stifle civil society, in part because the 'color revolutions' and the Arab Spring demonstrated just how dangerous civil society could be, in particular with the onset of new communications technologies. (55) They specifically targeted international rights and democracy assistance by cutting domestic organizations off from foreign funding and forcing international organizations to register as 'foreign agents', among other measures. Since it was felt that existing mechanisms did not offer the means to counter such policies, the United Nations, states and non-governmental organizations began taking measures to protect human rights defenders. (56) In 2000, a UN Special Rapporteur was appointed to deal with the issue. In 2006, the U.S. State Department established a Human Rights Defenders Fund. The 2007 Dutch human rights strategy prominently featured human rights defenders, as did the strategies that followed it. In 2008, the European Union adopted special Guidelines to instruct member states on how they could best protect and assist human rights defenders. As mentioned above, in 2013 President Obama headed an initiative at the United Nations to counter the closing of space for civil society organizations. Dutch policy has aimed to safeguard above all the physical safety of human rights defenders and to free them from intimidation. This has taken the form, for

instance, of the Shelter City project, which allows the relocation of human rights defenders under threat to the Netherlands for a period of three months. (57) In order to preserve its political independence, the ministry limits its involvement to co-funding, opting to have the non-governmental organization Justice and Peace Netherlands execute the project. The selection of participants takes place on the recommendation of an advisory committee in which the ministry has one of the four seats, but Justice and Peace none. During its first year of operation, four human rights defenders participated in the program, and it was set to be ramped up in subsequent years. In 2012, a consultancy firm hired by the European Commission found that across the 27 member states of the European Union, there existed close to 200 temporary shelter places per year. (58) The U.S. State Department co-founded a similar initiative in 2011, called the Lifeline: Embattled Civil Society Organizations (CSOs) Assistance Fund, a multilateral mechanism supported by eleven (now seventeen) like-minded governments, including the Netherlands, and two major American foundations as funders, and a consortium of seven non-governmental organizations (NGOs) to execute the project. In addition to providing emergency support, including funds for relocation and security assistance, the fund supports short-term advocacy efforts to raise attention to violations of the freedom of association and assembly. The activities of the fund are carried out by the NGO consortium, a decision made by the donors to depoliticize the assistance provided through the fund, which reports on activities and outcomes to the donors each quarter. Carrying out the activities through the NGO consortium ensures the global scope of activities, while the inclusion of countries such as Chile and Mongolia shows the wide extent of diplomatic support for the work of Lifeline. (59) By its latest tally, the Lifeline fund had provided assistance to 446 civil society organizations in 85 countries. (60) Conclusion In the post-Cold War era,

human rights and democracy promotion have become increasingly interwoven. In terms of human rights promotion, the Netherlands, both in rhetoric and in practice, has clearly steered a more reticent course than the United States; perhaps not coincidentally, the country is home to one of the largest national sections of Amnesty International. Nevertheless, in Dutch foreign policy, too, human rights promotion has to some extent become interwoven with promoting democracy. The formulation of European foreign policy has exerted a strong pull in this direction and will continue to do so. The crackdown that human rights defenders have experienced since the late 1990s and especially since the mid-2000s was, in part, a response precisely to the amalgamation of human rights and democracy promotion into an increasingly far-reaching project on the part of Western states. As sovereignty has become more and more

conditional on compliance with the values and norms of human rights and democracy, states disputing those international standards have pushed back against international rights and democracy assistance as well as domestic individuals and organizations representing these

causes. While to a significant extent this was a matter of authoritarian leaders striving to maintain power, the widening of the agenda of human rights and democracy promotion and especially its deployment as a justification for military interventions also generated legitimate objections. The association of human rights with democracy promotion has politicized the former, and their association with war has done substantial damage to the legitimacy of both concepts. Measures to protect human rights defenders have largely been a response to the challenge of crackdown by authoritarian regimes. Yet it might be in precisely this area that the promotion of human rights might reclaim its relatively apolitical status. The minimalism of policies that protect human rights defenders – aiming simply to keep endogenous voices for change from being silenced – gives them greater legitimacy than more ambitious forms of human rights and democracy promotion. Insofar as these specific policies have become a priority, they signal a return to a less politicized way of promoting human rights, more in line with the original ethos of Amnesty International than with the zeal of the NED. This could provide a way in which to separate human rights and democracy promotion from each other once again, for the betterment of both. Policies aimed at protecting

human rights defenders must be reconciled with the legacy of Western states elevating civil and political rights over social, economic and cultural rights – to an important extent a legacy of the Cold War. The phrase ‘human rights defender’ in effect leads to a just such a focus on a set of civil and political rights, such as the right to freedom of opinion and expression, the right to freedom of association, and the right to protest. Since the end of the Cold War, however, Western states have subscribed to the indivisibility and interdependency of human rights. (61) Amnesty has embraced the full spectrum of human rights. Nevertheless, a tendency to focus on civil and political rights has persisted. It is, then, all the more important to ensure that the individual human rights defenders that states focus their efforts on are engaged in furthering not only civil and political rights, but also social, economic and cultural rights. These rights may not resonate as strongly among the Western public, but are widely affirmed as equal in importance. Moreover, aiding human rights defenders in raising an issue like land rights will help to counter the notion that Western rights and democracy assistance goes hand in hand with the promotion of corporate interests that hurt local populations. For instance, by aiding activists who work against expropriation of local farmers, Western actors can prove that their concern extends across the full array of human rights. UN Special Rapporteur Margaret Sekaggya provided an important impetus in this direction in her 2012 report, which noted ‘Defenders working on land and environmental issues’ as one of the most at-risk groups of human rights defenders and called for their protection. (62) Furthermore, as the examples in the previous section show, the legitimacy of human rights as well as democracy promotion can be improved by reaching

out in new ways. Policies to protect human rights defenders are now increasingly the work of coalitions, not only of states but also of non-governmental organizations, municipalities, and even corporations. Heavier investment in international non-governmental organizations stands as a possible way for states to enact policies that enjoy greater legitimacy. In this way states can avoid direct ties with organizations in countries with authoritarian governments. The NED’s Gershman noted in 2008 that ‘[i]t is appropriate for the U.S. to seek the democratic transformation of states that foster extremism, but linking official U.S. policy and diplomacy so closely to this effort has a number of serious drawbacks.’ (63) For instance, because of their permanent engagement through bilateral relationships, states can never claim the impartiality of non-governmental organizations, nor can they single-mindedly pursue democratization or human rights. Cooperating with other actors will not placate those who class all rights and assistance activities as foreign interference, but it does help to show the breadth of support for these areas. The Dutch government’s innovation of trilateral cooperation is a particularly promising instrument in this regard, as it draws on the legitimacy and expertise of regional partners. Projects like Shelter City and Lifeline stand as important case-studies for the further development of a more network-based, multilateral and indirect approach – and similar projects are underway, not only in the West, but also locally and regionally, for instance the East and Horn of Africa Human Rights Defenders Project. A corollary of focusing in this area is to keep shifting the ultimate emphasis as much as possible to local partners. This applies to human rights promotion but also to processes of democratization that may of course be enabled by it. As a 2008 report by the Overseas Development Institute noted, ‘[t]he impetus for democratisation must come from within’. (64) This is so not only for the sake of efficacy, but also for the sake of legitimacy

(which are, of course, interrelated, since a project viewed as illegitimate will be more vulnerable to countervailing forces). Herein lies, perhaps, the greatest challenge for human rights promotion as a state-initiated project: to succeed in the long term, as a manifestation of a truly universal desire for dignity, it must seriously engage with local partners and allow them to not only use the resources that assistance affords to their needs, but also to contribute to setting the agenda. This means returning to the ethos of human rights as an apolitical project, aimed at countering repression and thereby empowering people to realize their ambitions as autonomously as possible.

stops, airport screening, or immigration raids). Human rights include the right to equal pay and gender equality, and yet a pay gap persists between female and male workers. Certainly, the journey to fully realizing human rights is a work-in-progress, but to make progress, we must work – through smart, principled policies that advance the ability of the United States to live up to its own highest ideals.

And, we'll win a new link here – increased credibility means NGO's are MORE EFFECTIVE at pushing HR policies – U.S. credibility ensures a more effective international push

Weisbrot '09 (Mark, Co-Director of the Center for Economic and Policy Research in Washington, D.C. He received his Ph.D. in economics from the University of Michigan, "Washington's Lost Credibility on Human Rights", Center for Economic and Policy Research, <http://www.cepr.net/publications/op-eds-columns/washingtons-lost-credibility-on-human-rights>, 3/12/2009)//HW

U.S.-based human rights organizations will undoubtedly see the erosion of Washington's credibility on these issues as a loss – and understandably so, since the United States is still a powerful country, and they hope to use this power to pressure other countries on human rights issues. But they too should be careful to avoid the kind of politicization that has earned notoriety for the State Department's annual report – which clearly discriminates between allies and "adversary" countries in its evaluations.

And, reversing U.S. hypocritical policies in the War on Terror is the essential place to start – re-builds U.S. credibility and brings allied cooperation together for an effective coalition on rights to pressure the holdouts like Russia and China

Roth 9

(Kenneth, Executive director of Human Rights Watch, Prior to joining Human Rights Watch in 1987, Roth served as a federal prosecutor in New York and for the Iran-Contra investigation in Washington, DC. A graduate of Yale Law School and Brown University, Roth has conducted numerous human rights investigations and missions around the world. He has written extensively on a wide range of human rights abuses, "Taking Back the Initiative from the Human Rights Spoilers," pg online @ <http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers> //um-ef)

The Disastrous Bush Years As noted, the rise of the spoilers would have had less impact without an abdication of leadership by governments that traditionally hold themselves forth as defenders of human rights. No government bears greater blame for this abdication than the United States under President

George W. Bush. As is widely known, the Bush administration chose to respond to the serious security challenge of

terrorism by ignoring the most basic requirements of international human rights law. Its decision, made not by low-level "bad apples" but at the highest levels of government, was to "disappear" suspects into secret detention facilities run by the Central Intelligence Agency (CIA) where their detention was unacknowledged, subject them to torture and other abusive interrogation including "waterboarding" (mock execution by drowning) and various "stress" techniques, and detain them for years on end without charge or trial at Guantanamo. The consequences have been disastrous. This

flouting of international human rights law generated resentment that was a boon to terrorist recruiters, and discouraged international cooperation with law-enforcement efforts, particularly in countries that are most likely to identify with the victims and to learn of suspicious activity. The

Bush administration's misconduct profoundly undermined US influence on human rights. Sometimes Washington could still productively promote human rights: when the issue was the right to free speech or association, which is still widely respected in the United States; when the US government enjoyed the added leverage of a major funding relationship with the government in question; or when the atrocities were so massive, such as widespread ethnic or political slaughter, that the United States could oppose them without facing accusations of hypocrisy. More typically, however, when the issue was human

rights abuses that the Bush administration practiced itself, the United States was forced to cede the field. Nowhere was this more visible than at the Human Rights Council. Washington rightly criticized the many shortcomings of this new institution, but as explained in more detail below, it is far from a lost cause. Rather than work to realize its considerable potential, the Bush administration abandoned it from the start. In part that may have been a concession to reality, since given the Bush administration's human rights record, the United States would have had a hard time getting elected. But a good part of the motivation seems to have been the Bush administration's arrogant approach to multilateral institutions.

Instead of undertaking the difficult but essential task of building a broad global coalition for human rights, Washington tended to throw rhetorical grenades from the sidelines when it did not get its way. With one of the human rights movement's most powerful traditional allies having given up without a fight, it is no surprise that those allies who

remain on the council face an uphill struggle. The Failure to Seize the Initiative As noted, the spoilers have taken center stage on global policy debates about human rights in part because the major rights-respecting democracies have chosen to hide in the wings. Of course, many of those democracies have never been consistent defenders of human rights, with their long

history of closing their eyes to, and sometimes sponsoring, abuses by allies and strategic partners. But the hopes that the new century would usher in foreign policies built on a consistent and principled defense of human rights have been dashed by compromises made in the fight against terrorism and by a disappointing lack of commitment. Recent years have seen a particularly feeble performance. Increasingly, these governments seem to consign the promotion of human rights to relations with pariahs and adversaries. In some cases of bilateral ineffectiveness,

the United States bore principal responsibility. For example: Washington provided massive assistance to the Pakistani military while doing little to rein in its Inter-Services Intelligence's use of torture and the "disappearance" of suspects. Indeed, the CIA worked closely with Pakistani intelligence forces, taking custody of suspected terrorists and interrogating them in secret prisons. The Pakistani judiciary's principled insistence on probing into these enforced disappearances, as well as its apparent unwillingness to bless General Musharraf's election as president while still a member of the army, is what led Musharraf to depose the chief justice, Iftikhar Chaudhry, and other high court judges. Washington did little to press for their restoration or to call on Musharraf to subject himself to the rule of law. Musharraf ultimately resigned under domestic pressure, but efforts to hold him accountable for his lawlessness were stymied by Washington's paramount concern that its close ally not be humiliated. Ethiopia has among the worst human rights records in Africa. Its troops have used scorched-earth counterinsurgency policies, including strangling people and burning villages, to displace rural villagers in the ethnic Somali Ogaden region. In Somalia, Ethiopian forces have indiscriminately shelled densely populated urban areas and tortured and executed alleged supporters of insurgent groups. Meanwhile, the Ethiopian government has used violence and arbitrary detention to suppress peaceful dissent at home. Yet as an important regional ally in the fight against terrorism, Ethiopia is the beneficiary of some US\$700 million annually from the US government-and of a notable public silence from Washington about these atrocities. Washington in 2005 briefly demonstrated its ability to gain human rights concessions from the Egyptian government, but it backed off its push for reform when parliamentary elections gave the Muslim Brotherhood big wins. With the restoration of unconditional support-Egypt remains the world's second largest recipient of US aid-the government has reverted to arresting and beating democracy activists, including thousands of members of the Muslim Brotherhood; prosecuting journalists, publishers, and writers who have called for free elections or even commented on President Hosni Mubarak's health; committing widespread torture; mistreating refugees by forcibly returning many to Eritrea and Sudan; and murdering since 2007 at least 32 migrants trying to cross into Israel. In other cases, the European Union or its member states were most at fault for a weak response to serious human rights abuses: The EU imposed sanctions-an arms embargo and visa restrictions for select senior officials-on Uzbekistan following the 2005 massacre of demonstrators in the town of Andijan. Since then, the EU's Uzbekistan policy has been a case study in capitulation. Initially EU sanctions were conditioned on Tashkent's agreement to an independent international investigation of the slaughter. The Uzbek government refused and, instead, arrested witnesses to the killings and forced them to exculpate the government. Nevertheless, the EU gradually weakened the sanctions, justifying its moves as "constructive gestures" to encourage the Uzbek government to undertake necessary reforms. To its credit, the EU tied the sanctions to the release of all imprisoned human rights defenders. But when Tashkent refused, the EU shrugged its shoulders and lifted the sanctions anyway. Among the examples of "progress" cited to justify this surrender was that Tashkent had released some political prisoners even as it imprisoned others, and had held a seminar on media freedom despite the lack of any actual media freedom in Uzbekistan. When the International Criminal Court's prosecutor sought an arrest warrant for Sudanese President Omar al-Bashir, Bashir tacitly threatened all manner of harm to civilians, humanitarian workers, and international peacekeepers unless the Security Council suspended the prosecution. Instead of condemning and rejecting this blackmail, Britain and France began negotiating terms (all the while denying that they were negotiating, as opposed to suggesting ways in which the issue could be resolved). The conditions they set were rigorous, and Bashir quickly showed he had no intention of meeting them, but the dangerous message implicitly delivered was that there might be a reward for following mass atrocities with a threat of more mass atrocities. As the forces of rebel leader Laurent Nkunda attacked and threatened civilians in the eastern region of the Democratic Republic of Congo, the British and French governments took the lead, dispatching their foreign ministers to the area, but their declarations of concern were not matched by substantially reinforced protection for the civilians of eastern Congo. Instead of urgently sending a modest European peacekeeping force, the EU dawdled during critical weeks. The Security Council authorized a slight expansion of the UN peacekeeping force in eastern Congo but without committing, as of late November 2008, to the improvements in the quality and capacity of the force needed to protect civilians. Notably, the EU expressed reluctance to deploy the two 1,500-troop "battle groups" that it had created in 2007 just for such situations, making one wonder when, if ever, these protective forces would be used. The EU lifted a travel ban on Belarus President Alexander Lukashenka despite a lack of discernible improvement in Minsk's dismal human rights record. The decision was motivated by the EU's worsening relations with Russia, and European governments' hope to bring Belarus closer to the West. Quite apart from responding to abuses by others, Britain threatened to itself become complicit in abuse by continuing to insist on the right to send terrorist suspects to governments that torture. To do so, it would rely on flimsy diplomatic assurances of humane treatment from governments that routinely flout their treaty obligations not to torture. Britain's efforts to develop a common EU position endorsing this practice have so far been unsuccessful, but its bad example has helped to inspire other governments -including Denmark, Italy, Kyrgyzstan, Russia, Spain, and Switzerland - thereby weakening the global torture ban. Britain also sought to hollow out an

exception to the prohibition of sending people to places where they risk ill-treatment short of torture by promoting a new rule that would allow such deportation if the suspect's continued presence in the sending country posed too much of a security threat. The European Court of Human Rights unanimously rejected that proposal. Especially in the Middle East, all Western governments seemed to share equally in the failure to promote human rights: Because of Saudi Arabia's oil production and its position as a counterterrorism ally, no Western government mounted any serious challenge to its virtual lack of political freedoms and civil society, or its severe restrictions on the rights of women and migrants. Indeed, the United States and Britain praised and promised to study and learn from a Saudi program that keeps thousands of terrorism suspects detained without charge or trial, offering "reeducation" instead. The West actively sought improved relations with Libya with little criticism of its deplorable human rights records. In return for Libya giving up plans for weapons of mass destruction and compensating the victims of the Lockerbie bombing, the West has rewarded it handsomely with the resumption of diplomatic visits and renewed economic activity. But Western governments have had little to say about the virtual absence of any civil and political freedom in the country. Israel repeatedly closed off Gaza, blocking the import of fuel, food, medicine, and essential supplies. It sought to justify this collective punishment against the civilian population as retaliation for indiscriminate rocket attacks by Gazan armed groups into civilian areas of Israel. Western governments offered occasional public condemnations, but did not condition their massive economic assistance to Israel on change. Nor did Israel suffer consequences for its illegal settlement expansion and construction of the wall/barrier within the West Bank. Elsewhere, Australia, Britain, Canada, France, Germany, and the Netherlands sought, at least at first, to undermine an absolute ban on cluster munitions by seeking exceptions for certain types that they tended to have stockpiled in their arsenals. An absolute ban was important because, as in the case of the landmines treaty, certain major powers such as the United States, Russia, and China could be expected to reject the treaty, but an absolute ban, by stigmatizing the weapon system, would make it politically difficult for them to use it anyway. A coalition led by Austria, Ireland, Mexico, Norway, and New Zealand overcame this resistance and achieved a total ban. Similarly, the 1990 Convention on the Rights of Migrant Workers and Members of their Families has not been ratified by any EU member state, or by Australia, Canada, Japan, or the United States. To date, only governments that send migrant workers have embraced the treaty, greatly undermining its capacity to protect a large and vulnerable population. Some of the major democracies did occasionally show positive leadership on human rights: British Prime Minister Gordon Brown refused to attend a summit between the European Union and the African Union because of the presence of Zimbabwean President Robert Mugabe. Douglas Alexander, the British international development secretary, suggested he would link aid to Ethiopia to an end to its abuses in the Ogaden region. This marked a possible shift from Britain's traditional silence on Ethiopian abuses while providing substantial financial support to the government. To protest Rwanda's support for the abusive forces of its ally, rebel leader Laurent Nkunda, in eastern Congo, the Netherlands redirected its development aid from Rwanda to eastern Congo. The United States, Australia, and the European Union imposed sanctions against Burma for its brutal crackdown against peaceful demonstrators despite countervailing pressure from China and the governments of the Association of Southeast Asian Nations (ASEAN). German Chancellor Angela Merkel boycotted the opening ceremonies of the Beijing Olympics to protest China's crackdown in Tibet. The Bush administration, despite its opposition to the International Criminal Court, took the lead in fending off efforts to suspend the ICC's efforts to prosecute Sudanese President Bashir. However, these positive examples were not repeated regularly enough to build momentum for the defense of human rights and thus to effectively deflect destructive pressure from the spoilers. The EU and the UN Human Rights Council The weakness of the EU's support for human rights was especially evident in multilateral settings such as the Human Rights Council. As noted, the Bush administration did not even try to make the council work, leaving the task to others. The EU has made some effort to assume the leadership mantle in Geneva, but talking to EU diplomats there is often a depressing lesson in defeatism. Much of the reason lies in the influence-sapping procedures that the EU follows for building a consensus around a common policy. The council is divided roughly evenly among governments that tend to support human rights initiatives, governments that tend to oppose them, and swing votes-governments that have tended to join the spoilers but could be moved in a more pro-human rights direction. By giving broad strategic direction, the EU might have empowered its diplomats to act creatively and boldly to forge a multi-regional, pro-human rights majority from among the swing votes. Instead, the EU let the process of building an internal consensus become an exercise in micromanagement. EU diplomats spend so much time negotiating a minutely detailed consensus among themselves, typically consisting of word-for-word approval of any proposed resolution, that by the time they reach agreement among all 27 member states, they are exhausted, with no energy or flexibility to fashion a consensus among other potential allies. To avoid restarting the painstaking process of building a new EU consensus, European diplomats must avoid genuine give-and-take and instead try to convince others to accept the agreed-upon EU position without amendment. Needless to say, that is not an effective negotiating posture. This approach tends to worsen the already--poisonous West-versus-rest atmosphere that frequently prevails at the UN. This polarization and "bloc mentality" makes it more difficult for moderate states to separate themselves from the spoilers such as Algeria, Egypt, and South Africa that tend to dominate African Union

deliberations, and thus harder to build a cross-regional, pro-human rights majority. Even when the EU has wanted to act, its reluctance to criticize Washington for abusive counterterrorism policies has left it open to charges of selectivity and double standards.

For example, by refusing to endorse a Cuba-backed effort at the Human Rights Council to criticize Guantanamo (even though the proposed resolution was deliberately written in the exact same language as the Council of Europe had previously used in its own resolution), the EU contributed to the protect-your-own mentality that now plagues the Human Rights Council. Similarly, by agreeing to end UN scrutiny of Iraq and Afghanistan after the US invasions, the EU made it easier for others to oppose country resolutions aimed at their own friends. Unable for these reasons to build a pro-human rights majority at the council, the EU tends to resign itself to watered-down consensus resolutions, such as on Sudan, or to outright defeat, such as on the decisions to end the work of an expert group on Darfur or to terminate scrutiny of Belarus and Cuba. Similarly, despite ongoing massive atrocities in the eastern Democratic Republic of Congo, the EU acquiesced in a "compromise" resolution sponsored by Egypt ending the mandate of the UN independent expert on Congo; the EU accepted the fig-leaf of scheduling another discussion of Congo a year later. Taking Back the Initiative That the initiative on human rights has been captured by governments that do not wish international protection well should generate not despair but resolve. The new Obama administration in Washington offers the hope of a US government that can assume a place of leadership in promoting human rights.

If the European Union can generate the political will and surmount its self-imposed procedural paralysis, it will be in a position to help build a genuine global coalition for human rights that can seize the initiative from the spoilers. Governments that purport to promote human rights should abide by certain basic rules to be effective. First, they should ensure their own scrupulous respect for human rights-because international law obliges them to do so, because it will set a positive example, and because compliance will help silence charges of hypocrisy. They should also abandon efforts to

undermine human rights standards, such as the prohibition of torture in the context of fighting terrorism, or refugee protection in the rush to develop a common asylum policy. When these governments face criticism for violating human rights, they should accept it as legitimate discourse rather than an affront to be reflexively rejected. In their foreign policy, these governments should promote human rights as even-handedly as possible. That means criticizing not only pariah states but also friends when they commit serious rights violations. They should also elevate the importance of human rights in their relations with other governments, assigning the issue to senior officials, insisting on human rights occupying a prominent place on the agenda during bilateral discussions, and establishing clear benchmarks for change with specific consequences for indifference or retrenchment. In multilateral settings, these governments should make it a major priority to build a pro-human rights majority by encouraging rights-respecting states from all regions to speak out on human rights. With respect to the Human Rights Council, for example, rights-respecting states should be encouraged to offer their candidacy, while the candidacies of the spoilers and their allies should be actively opposed. The defeat in recent years of the candidacies of Belarus and Sri Lanka illustrates what must be done more regularly. Efforts should also be made to ensure that governments obstructing the defense of human rights pay a political price at home. Democratic governments with vibrant civil societies such as India and South Africa are able to get away with negative positions on human rights because few people in those countries track their voting records in intergovernmental forums and their national media rarely report on their conduct there. So when they vote to protect Burma, Sudan, or Zimbabwe, they do not face the criticism that they surely would encounter were they to adopt similarly regressive domestic policies. Helping journalists and civil society representatives visit New York, Geneva, and regional capitals to monitor and lobby their governments would be a useful first step. It is also important to recognize that many governments from the South have legitimate grievances about the behavior of Western governments. These grievances do not justify their hostility to human rights, but they clearly affect their perspective. Expanding the number of Southern governments willing to promote human rights will require addressing their sense that Western concern for human rights varies with the level of strategic interest, that powerful countries are allowed to get away with bad behavior, and that richer parts of the world are insufficiently concerned with economic and social rights in the global South, such as the right to food in the context of rising prices or the right to basic health

care in the midst of a declining economy. A genuine commitment to recognizing these concerns would help to engage with states such as Ghana, Zambia, Mexico, Peru, Indonesia, and the Philippines that ought to be exerting greater human rights leadership in international and regional forums. Finally, there is a need to break the bloc mentality that leads so many governments to vote-almost by default-with their regional groups even when their own views are more progressive. Moderate states need encouragement to distance themselves from the spoilers that tend to dominate bloc voting. Thus in Africa, Ghana and Zambia should be encouraged to part company with Algeria and Egypt. In Asia, the Philippines and Thailand should be weaned from Burma and Vietnam. Success will require a strategy and vision, engagement and diplomacy-all designed to reach out to moderate states, take their concerns seriously, and bring them into the pro-human rights fold. A New Direction in Washington **The success of any effort**

to retake the initiative from the spoilers will depend to a large degree on Washington. The Obama administration **must undo the enormous damage caused by the Bush administration and begin to restore the US government's reputation and effectiveness as a human rights defender.**

Changing US policy on how to fight terrorism is an essential place to start

Among the steps that President Obama should take would be to: Close the CIA's secret detention centers permanently. Bush suggested he had emptied them only temporarily. Apply to the CIA the US military's new rules (revised in the wake of the Abu Ghraib scandal) prohibiting coercive interrogation. Congress had tried to legislate that step, but Bush vetoed the bill, and Congress lacked the votes to override the veto. Close the Guantanamo detention center without effectively moving it on-shore by permitting detention without trial in the United States. That means repatriating or prosecuting all detainees, and ensuring that prosecutions are conducted in regular courts, not the substandard military commissions, which allow criminal convictions based on coerced confessions, or any other "special" tribunal that compromises basic due process. It also means abandoning the radical theory that terrorist suspects arrested anywhere in the world, even far from any recognizable battlefield, can be detained as enemy combatants without regard to the protections of human rights law. Launch a nonpartisan, professionally staffed investigative commission, with subpoena power, to examine who authorized these serious abuses, how they should be held accountable-, and what steps should be taken to ensure that this ugly episode in US history never recurs. That process of exposure, acknowledgment, and repudiation is important so that the Bush administration's abuses do not stand as a precedent to be followed in future periods of security threat. The Obama administration should also signal that, from now on, the US government will submit to the requirements of international human rights law and reengage with international institutions for the enforcement of that law. President Obama should: Offer the United States as a candidate for the UN Human Rights Council with the purpose of making it an effective institution for promoting human rights. While a candidacy under Bush might well have failed, a candidacy under Obama is likely to prevail. Signal an intention to reengage constructively with the International Criminal Court by re-signing the ICC treaty, repealing the American Service-Members' Protection Act (which cuts aid to governments that will not forswear ever surrendering a US citizen for trial and authorizes invading The Hague to liberate any imprisoned American), and supporting the ICC politically and practically. The new administration should also begin the domestic political work needed for the United States to ratify the ICC treaty. Ratify other key human rights treaties, such as the new convention against enforced disappearances (as a sign of commitment never to resort to this despicable practice again), the long-ignored treaties on women's and children's rights (which the United States stands virtually alone in not having ratified), the treaty on economic, social, and cultural rights (to secure a safety net at home while helping to build a broader, cross-regional alliance for human rights abroad), the First Additional Protocol to the Geneva Conventions (setting forth standards for the conduct of warfare that the US already largely accepts as a matter of customary law), and the more recent, life-saving treaties banning cluster munitions and antipersonnel landmines (weapons that, because they have become so stigmatized, the US military would have a hard time using anyway). Finally, President Obama should reassess US bilateral relations with certain governments whose significance as strategic or counterterrorism allies led the Bush administration to overlook their abuses. The United States should use its substantial economic leverage to push for an end to abuses by close allies, such as Ethiopian atrocities in the Ogaden and Somalia, the Pakistani military's use of torture and "disappearances," Egypt's stifling of political opposition, Israel's use of collective punishment to respond to Palestinian rocket attacks on civilians, and Colombia's obstruction of investigations into links between senior government officials and murderous paramilitary forces. Conclusion

Like other global endeavors, **the effective promotion of human rights cannot ignore shifts in global power.**

The traditional role of the West in promoting human rights is not enough. New coalitions must be built by reaching out to other democracies that largely respect human rights at home and could be convinced to join efforts to promote human rights around the world. But such coalitions cannot be built without significant shifts in the policy and approach of the world's leading democracies. Today, the effective defense of human rights requires new commitments-**to studiously respect human rights in one's own conduct,**

to insist on accountability for serious abuses regardless of the perpetrator, to promote human rights consistently without favoritism for allies or strategic partners, and to reach out to potential new allies with an openness to addressing their human rights concerns. None of this is impossible. Those who believe that global shifts in power will sound the death knell of human rights enforcement are confusing the

leading democracies' current poor performance with immutable reality. But the **successful defense of human rights will require serious self-examination on the part of these democracies and a willingness to change course.** The

arrival of the Obama administration in Washington with its seeming determination to end the disastrous abuses of the Bush years **provides an ideal opportunity. The task facing the human rights community is to convince the supporters of human rights-both traditional allies and potentially new ones-to seize this opportunity.** That would truly be something to celebrate in this sixtieth anniversary year of the Universal Declaration of Human Rights.

And, re-building credibility by changing War on Terror policies that kill HR protections is critical to effective HR promotion

The first is **credibility**. A government cannot effectively promote human rights abroad if it is not observing them at home. If a government considers that habeas corpus and guarantees against torture are at variance with its national security, then it will not be able to urge other governments to respect these rights. Nor will a human rights policy be credible if it is used as a pretext for achieving other foreign policy goals, for example as a rationale for an invasion of another country, or for regime change, or to achieve domestic political purposes. Credibility also means a policy based on sound information that neither downplays nor exaggerates the situation for political reasons. Second, the promotion of human rights must be defined as a national interest reflecting American values and bearing on national security. Rather than defining the policy in terms of morality or religion, it should be underscored that governments with open societies and that respect human rights are better allies and less likely to be threats to international peace and security and that our interests are not well served over the long term by allying ourselves with oppressive regimes. Moreover, respect for human rights should be presented as in the interest of foreign governments as well. I always liked the following quotation: "Never appeal to a man's better nature. He may not have one. Invoking his self interest gives you more leverage." Once the policy is defined as a national interest, there should be a willingness to pay something for it. **If trade and exports or the war on terror always trump human rights considerations, the policy will not be effective.**

U.S. HR cred low due to a lack of legitimacy and credibility – policies increasing HR domestic re-build credibility and result in effective HR promotion abroad

ACS 08

(American Constitution Society for Law and Policy, October, “Human Rights at Home: A Domestic Blueprint for the New Administration, <http://www.acslaw.org/files/C%20Powell%20Blueprint.pdf>)

Reaffirming and implementing the U.S. commitment to human rights at home is critical for two reasons. First, human rights principles are at the core of America’s founding values, and Americans (as well as others within our borders or in U.S. custody), no less than others around the world, are entitled to the full benefit of these basic guarantees. That can hardly be open to debate. The second reason is perhaps less obvious, but equally compelling. **When the U_{nited} S_{tates} fails to practice at home what it preaches to others, it loses credibility and undermines its ability to play an effective leadership role in the world.** Leading through the power of our example rather than through the example of our power³ is particularly critical now, at a juncture when the United States needs to cultivate international cooperation to address pressing issues – such as the current economic downturn – that have global dimensions. Perhaps not surprisingly, then, an overwhelming majority of Americans strongly embrace the notion of human rights: that is, the idea that every person has basic rights regardless of whether or not the government recognizes those rights.⁴ This Blueprint therefore suggests ways in which the new Administration can take concrete steps to ensure that human rights principles are considered and implemented within the process of **U.S. domestic policymaking**. It does not address in any detail the substance of particular policies in areas such as equality, health care, or the prohibition on torture;⁵ rather, it identifies and evaluates mechanisms by which human rights principles can be integrated into policymaking in all areas of U.S. domestic policy where they are relevant. **BACKGROUND** The United States was founded on the human rights principle expressed in the American Declaration of Independence: that we all have certain basic, unalienable rights simply by virtue of our humanity. Declaring rights to be inherent, not based on the generosity of the state, was transformative. Two hundred years later, the United States can point to a tradition of promoting human rights in principle, if not always in practice. The United States was a leader in ending the atrocities of World War II and in developing international institutions and instruments aimed at securing peace in the world and human rights for all people. The Universal Declaration of Human Rights, which celebrates its sixtieth anniversary this year, was inspired in part by Franklin D. Roosevelt’s Four Freedoms speech and drafted in part by Eleanor Roosevelt, the first President of the U.N. Human Rights Commission. Just as the New Deal redefined the concept of “security” at home to include economic security for all Americans, so too these post-war international regimes redefined the notion of “security” internationally to include human security.⁶ Indeed, for Americans, recognition that the gross human rights violations of the Holocaust were intertwined with Nazi aggression underscored the inextricable link between our principles and our national interests. **A robust human rights policy supports the rule of law, democratic institutions, accountability mechanisms for serious abuses, a humane global economy, and U.S. global leadership in reducing violence, instability, and refugee flows.**⁷ Oftentimes, in fact, principled policy directly serves U.S. national interests because it allows us to demand reciprocal treatment of our citizens abroad, as in the case of humane treatment of detainees captured in war. Beyond the concern for reciprocity, the strong bipartisan commitment to human rights that has developed over the last several decades emerges from an understanding that ensuring the enjoyment of human rights at home and around the world serves not only America’s deeply held values but also its national interests. Even so, there remains a gap between the human rights ideals that the United States professes and its actual domestic practice, resulting in both a gap in credibility and a weakening of U.S. moral authority to lead by example. Human rights include the right to be free from torture or cruel, inhuman or degrading treatment, and yet the United States has committed such acts in the name of counterterrorism efforts. Human rights include the rights to emergency shelter, food, and water, as well as security of person, and yet the United States failed to adequately guarantee these rights in the aftermath of Hurricane Katrina. Human rights include the right to equality of opportunity, and yet inequalities persist in access to housing, education, jobs, and health care. Human rights include the right to equality in the application of law enforcement measures, and yet there are gross racial disparities in the application of the death penalty, and racial and ethnic profiling has been used unfairly to target African Americans, Latinos, and those who appear Arab, Muslim, South Asian, or immigrant (whether through traffic stops, airport screening, or immigration raids). Human rights include the right to equal pay and gender equality, and yet a pay gap persists

between female and male workers. Certainly, the journey to fully realizing human rights is a work-in-progress, but to make progress, we must work – through smart, principled policies that advance the ability of the United States to live up to its own highest ideals.

Increased soft power results in international state-driven HR promotion which is ineffective and spurs backlash over perceived regime change – only the status quo strategy of supporting NGO's can spur effective HR

Bouwman 15

Previously, Bastiaan was a junior scholar at the Woodrow Wilson International Center for Scholars and worked on the Shelter City project of Justice and Peace Netherlands, pg online @ [//um-ef\)](http://www.humanityinaction.org/knowledgebase/579-uncomfortable-bedfellows-why-human-rights-and-democracy-promotion-are-better-off-separate)

Protecting Human Rights Defenders The specter that the convergence of human rights and democracy promotion raises is that Western states have established a universal blueprint for what societies should look like, and that they now aim to reform the world in their image – through soft power and international law **as much as possible**, but even through hard power if necessary. While this suspicion may be exaggerated, the stated universality of human rights and democracy leaves no doubt that their spread is, in principle, an objective of Western governments, even though it is bounded by other, competing interests. It is hard to imagine this objective ever being achieved, but as stated above, the notion that Western actors are pursuing it certainly vexes authoritarian regimes. It also disturbs many, especially in the non-West, who doubt the sincerity of the stated intentions for rights and democracy assistance, and who feel that interference in their national politics diminishes their ability to determine their own future. Some of those objections might of course be disingenuous – the product of government propaganda or self-serving logic. Yet it would be short-sighted to assume that all of them are, as there are good reasons for being skeptical of rights and democracy promotion. As indicated above, recent interventions in the name of human rights and democracy as well as human rights violations on the part of countries that are supposed champions of universal morality have dealt a real blow to Western legitimacy. And crucially, the more that human rights and democracy promotion have been amalgamated and expanded into a comprehensive approach to building better societies, the more this threatens to stifle, rather than encourage, political debate in countries in question. As the historian Samuel Moyn has put it, for the purpose of opposing a regime the 'fiction of moral consensus' may be useful, but 'construction requires political dissensus'. (52) The more extensive and concrete human rights and democracy promotion become, the more they risk preempting debate on the contentious political choices that need to be made, such as the makeup of political institutions or arrangements for social justice. An area that may have the potential to steer human rights and democracy promotion around these objections is the protection and assistance of human rights defenders and their organizations. Human rights defenders represent, in principle, endogenous change. Although support for them may well have broader goals in mind, as long as supporting actors guard against selectivity in terms of recipients and use a wide-ranging definition of what constitutes a human rights defender, they have a strong claim to impartiality. Human rights defenders began receiving serious attention as a category of their own about a decade and a half ago. In 1998, the General Assembly of the United Nations adopted its 'Declaration on Human Rights Defenders', a document that had been in production since 1984. In large part, its adoption was spurred by worries over the plight of human rights defenders in countries that had recently become democracies but now seemed to be receding into authoritarianism. By 1997, 'what enthusiasts at the start of the decade were calling "the worldwide democratic revolution"' had 'cooled considerably'. (53) Many new democracies became 'hybrid regimes' that had some features of democracies – such as elections – and some of authoritarian rule – such as concentration of power. In 2003, a UN expert noted that of the 81 countries that had democratized during the 1980s and 1990s, only 47 were now considered 'fully democratic', while problems persisted in the remaining 34. (54) Human rights defenders – a term generally taken to extend not only to human rights professionals but to anyone taking action in defense of any human right – as a category became subject to new measures designed to suppress their activities. Especially from the mid-2000s, countries like Russia, Ethiopia and Venezuela developed new legal and other measures to stifle civil society, in part because the 'color revolutions' and the Arab Spring demonstrated just how dangerous civil society could be, in particular with the onset of new communications technologies. (55) They specifically targeted international rights and democracy assistance by cutting domestic organizations off from foreign funding and forcing international organizations to register as 'foreign agents', among other measures. Since it was felt that existing mechanisms did not offer the means to counter such policies, the United Nations, states and non-governmental organizations began taking measures to protect human rights defenders. (56) In 2000, a UN Special Rapporteur was appointed to deal with the issue. In 2006, the U.S. State Department established a Human Rights Defenders Fund. The 2007 Dutch human rights strategy prominently featured human rights defenders, as did the strategies that followed it. In 2008, the European Union adopted special Guidelines to instruct member states on how they could best protect and assist human rights defenders. As mentioned above, in 2013 President Obama headed an initiative at the United Nations to counter the closing of space for civil society organizations. Dutch policy has aimed to safeguard above all the physical safety of human rights defenders and to free them from intimidation. This has taken the form, for instance, of the Shelter City project, which allows the relocation of human rights defenders under threat to the Netherlands for a period of three months. (57) In order to

preserve its political independence, the ministry limits its involvement to co-funding, opting to have the non-governmental organization Justice and Peace Netherlands execute the project. The selection of participants takes place on the recommendation of an advisory committee in which the ministry has one of the four seats, but Justice and Peace none. During its first year of operation, four human rights defenders participated in the program, and it was set to be ramped up in subsequent years. In 2012, a consultancy firm hired by the European Commission found that across the 27 member states of the European Union, there existed close to 200 temporary shelter places per year. (58) The U.S. State Department co-founded a similar initiative in 2011, called the Lifeline: Embattled Civil Society Organizations (CSOs) Assistance Fund, a multilateral mechanism supported by eleven (now seventeen) like-minded governments, including the Netherlands, and two major American foundations as funders, and a consortium of seven non-governmental organizations (NGOs) to execute the project. In addition to providing emergency support, including funds for relocation and security assistance, the fund supports short-term advocacy efforts to raise attention to violations of the freedom of association and assembly. The activities of the fund are carried out by the NGO consortium, a decision made by the donors to depoliticize the assistance provided through the fund, which reports on activities and outcomes to the donors each quarter. Carrying out the activities through the NGO consortium ensures the global scope of activities, while the inclusion of countries such as Chile and Mongolia shows the wide extent of diplomatic support for the work of Lifeline. (59) By its latest tally, the Lifeline fund had provided assistance to 446 civil society organizations in 85 countries. (60) Conclusion In the post-Cold War era,

human rights and democracy promotion have become increasingly interwoven. In terms of human rights promotion, the Netherlands, both in rhetoric and in practice, has clearly steered a more reticent course than the United States; perhaps not coincidentally, the country is home to one of the largest national sections of Amnesty International. Nevertheless, in Dutch foreign policy, too, human rights promotion has to some extent become interwoven with promoting democracy. The formulation of European foreign policy has exerted a strong pull in this direction and will continue to do so. The crackdown that human rights defenders have experienced since the late 1990s and especially since the mid-2000s was, in part, a response precisely to the amalgamation of human rights and democracy

promotion into an increasingly far-reaching project on the part of Western states. As sovereignty has become more and more conditional on compliance with the values and norms of human rights and democracy, states disputing those international standards have pushed back against international rights and democracy assistance as well as domestic individuals and organizations representing these

causes. While to a significant extent this was a matter of authoritarian leaders striving to maintain power, the widening of the agenda of human rights and democracy promotion and especially its deployment as a justification for military interventions also generated legitimate objections. The association of human rights with democracy promotion has politicized the former, and their association with war has done substantial damage to the legitimacy of both concepts. Measures to protect human rights defenders have largely been a response to the challenge of crackdown by authoritarian regimes. Yet it might be in precisely this area that the promotion of human rights might reclaim its relatively apolitical status. The minimalism of policies that protect human rights defenders – aiming simply to keep endogenous voices for change from being silenced – gives them greater legitimacy than more ambitious forms of human rights and democracy promotion. Insofar as these specific policies have become a priority, they signal a return to a less politicized way of promoting human rights, more in line with the original ethos of Amnesty International than with the zeal of the NED. This could provide a way

in which to separate human rights and democracy promotion from each other once again, for the betterment of both. Policies aimed at protecting human rights defenders must be reconciled with the legacy of Western states elevating civil and political rights over social, economic and cultural rights – to an important extent a legacy of the Cold War. The phrase ‘human rights defender’ in effect leads to a just such a focus on a set of civil and political rights, such as the right to freedom of opinion and expression, the right to freedom of association, and the right to protest. Since the end of the Cold War, however, Western states have subscribed to the indivisibility and interdependency of human rights. (61) Amnesty has embraced the full spectrum of human rights. Nevertheless, a tendency to focus on civil and political rights has persisted. It is, then, all the more important to ensure that the individual human rights defenders that states focus their efforts on are engaged in furthering not only civil and political rights, but also social, economic and cultural rights. These rights may not resonate as strongly among the Western public, but are widely affirmed as equal in importance. Moreover, aiding human rights defenders in raising an issue like land rights will help to counter the notion that Western rights and democracy assistance goes hand in hand with the promotion of corporate interests that hurt local populations. For instance, by aiding activists who work against expropriation of local farmers, Western actors can prove that their concern extends across the full array of human rights. UN Special Rapporteur Margaret Sekaggya provided an important impetus in this direction in her 2012 report, which noted ‘Defenders working on land and environmental issues’ as one of the most at-risk groups of human rights defenders and called for their protection. (62) Furthermore, as the examples in the previous section

show, the legitimacy of human rights as well as democracy promotion can be improved by reaching out in new ways. Policies to protect human rights defenders are now increasingly the work of coalitions, not only of states but also of non-governmental organizations, municipalities, and even corporations. Heavier investment in international non-governmental organizations stands as a possible way for states to enact policies that enjoy greater legitimacy. In this way states can avoid direct ties with organizations in countries with authoritarian governments. The NED’s Gershman noted in 2008 that ‘[i]t is appropriate for the U.S. to seek the democratic transformation of states that foster extremism, but linking official U.S. policy and diplomacy so closely to this effort has a number of serious drawbacks.’ (63) For instance, because of their permanent engagement through bilateral relationships, states can never claim the impartiality of non-governmental organizations, nor can they single-mindedly pursue democratization or human rights. Cooperating with other actors will not placate those who class all rights and assistance activities as foreign interference, but it does help to show the breadth of support for these areas. The Dutch government’s innovation of trilateral cooperation is a particularly promising instrument in this regard, as it draws on the legitimacy and expertise of regional partners. Projects like Shelter City and Lifeline stand as important case-studies for the further development of a more network-based, multilateral and indirect approach – and similar projects are underway, not only in the West, but also locally and regionally, for instance the East and Horn of Africa Human Rights Defenders Project. A corollary of focusing in this area is to keep shifting the ultimate emphasis as much as possible to local partners. This applies to human rights promotion but also to processes of democratization that may of course be enabled by it. As a 2008 report by the Overseas Development Institute noted, ‘[t]he impetus for democratisation must come from within’. (64) This is so not only for the sake of efficacy, but also for the sake of legitimacy

(which are, of course, interrelated, since a project viewed as illegitimate will be more vulnerable to countervailing forces). Herein lies, perhaps, the greatest challenge for human rights promotion as a state-initiated project: to succeed in the long term, as a manifestation of a truly universal desire for dignity, it must seriously engage with local partners and allow them to not only use the resources that assistance affords to their needs, but also to contribute to setting the agenda. This means returning to the ethos of human rights as an apolitical project, aimed at countering repression and thereby empowering people to realize their ambitions as autonomously as possible.

Herein lies, perhaps, the greatest challenge for human rights promotion as a state-initiated project: to succeed in the long term, as a manifestation of a truly universal desire for dignity, it must seriously engage with local partners and allow them to not only use the resources that assistance affords to their needs, but also to contribute to setting the agenda. This means returning to the ethos of human rights as an apolitical project, aimed at countering repression and thereby empowering people to realize their ambitions as autonomously as possible.

U.S. HR cred low due to a lack of legitimacy and credibility – policies increasing HR domestic re-build credibility and result in effective HR promotion abroad

(American Constitution Society for Law and Policy, October, “Human Rights at Home: A Domestic Blueprint for the New Administration, <http://www.acslaw.org/files/C%20Powell%20Blueprint.pdf>)

Reaffirming and implementing the U.S. commitment to human rights at home is critical for two reasons. First, **human rights principles are at the core of America’s founding values**, and Americans (as well as others within our borders or in U.S. custody), no less than others around the world, are entitled to the full benefit of these basic guarantees. That can hardly be open to debate. The **second** reason is perhaps less obvious, but equally compelling. **When the United States fails to practice at home what it preaches to others, it loses credibility and undermines its ability to play an effective leadership role in the world.** **Leading through the power of our example rather than through the example of our power**³ is particularly critical now, at a juncture when the United States needs to **cultivate international cooperation to address pressing issues** – such as the current economic downturn – that have global dimensions. Perhaps not surprisingly, then, an overwhelming majority of Americans strongly embrace the notion of human rights: that is, the idea that every person has basic rights regardless of whether or not the government recognizes those rights.⁴ This Blueprint therefore suggests ways in which the new Administration can take concrete steps to ensure that human rights principles are considered and implemented within the process of **U.S. domestic policymaking**. It does not address in any detail the substance of particular policies in areas such as equality, health care, or the prohibition on torture;⁵ rather, **it identifies and evaluates mechanisms by which human rights principles can be integrated into policymaking in all areas of U.S. domestic policy** where they are relevant. **BACKGROUND** The United States was founded on the human rights principle expressed in the American Declaration of Independence: that we all have certain basic, unalienable rights simply by virtue of our humanity. Declaring rights to be inherent, not based on the generosity of the state, was transformative. Two hundred years later, the United States can point to a tradition of promoting human rights in principle, if not always in practice. The United States was a leader in ending the atrocities of World War II and in developing international institutions and instruments aimed at securing peace in the world and human rights for all people. The Universal Declaration of Human Rights, which celebrates its sixtieth anniversary this year, was inspired in part by Franklin D. Roosevelt’s Four Freedoms speech and drafted in part by Eleanor Roosevelt, the first President of the U.N. Human Rights Commission. Just as the New Deal redefined the concept of “security” at home to include economic security for all Americans, so too these post-war international regimes redefined the notion of “security” internationally to include human security.⁶ Indeed, for Americans, recognition that the gross human rights violations of the Holocaust were intertwined with Nazi aggression underscored the inextricable link between our principles and our national interests. **A robust human rights policy supports the rule of law, democratic institutions, accountability mechanisms for serious abuses, a humane global economy, and U.S. global leadership in reducing violence, instability, and refugee flows.**⁷ Oftentimes, in fact, principled policy directly serves U.S. national interests because it allows us to demand reciprocal treatment of our citizens abroad, as in the case of humane treatment of detainees captured in war. Beyond the concern for reciprocity, the strong bipartisan commitment to human rights that has developed over the last several decades emerges from an understanding that ensuring the enjoyment of human rights at home and around the world serves not only America’s deeply held values but also its national interests. Even so, **there remains a gap between the human rights ideals that the United States professes and its actual domestic practice, resulting in both a gap in credibility and a weakening of U.S. moral authority to lead by example.** Human rights include the right to be free from torture or cruel, inhuman or degrading treatment, and yet the **United States has committed such acts in the name of counterterrorism efforts.** Human rights include the rights to emergency shelter, food, and water, as well as security of person, and yet the United States failed to adequately guarantee these rights in the aftermath of Hurricane Katrina. Human rights include the right to equality of opportunity, and yet inequalities persist in access to housing, education, jobs, and health care. **Human rights include the right to equality in the application of law enforcement measures, and yet** there are **gross racial disparities in the application of the death penalty, and racial and ethnic profiling has been used unfairly to target African Americans, Latinos, and those who appear Arab, Muslim, South Asian, or immigrant** (whether **through traffic stops, airport screening, or immigration raids**). Human rights include the right to equal pay and gender equality, and yet a pay gap persists between female and male workers. Certainly, **the journey to fully realizing human rights is a work-in-progress, but to make progress, we must work – through smart, principled policies that advance the ability of the United States to live up to its own highest ideals.**

And, we'll win a new link here – increased credibility means NGO's are MORE EFFECTIVE at pushing HR policies – U.S. credibility ensures a more effective international push

Weisbrot '09 (Mark, Co-Director of the Center for Economic and Policy Research in Washington, D.C. He received his Ph.D. in economics from the University of Michigan, "Washington's Lost Credibility on Human Rights", Center for Economic and Policy Research, <http://www.cepr.net/publications/op-eds-columns/washingtons-lost-credibility-on-human-rights>, 3/12/2009)//HW

U.S.-based human rights organizations will undoubtedly see the erosion of Washington's credibility on these issues as a loss – and understandably so, since the United States is still a powerful country, and they hope to use this power to pressure other countries on human rights issues. But they too should be careful to avoid the kind of politicization that has earned notoriety for the State Department's annual report – which clearly discriminates between allies and "adversary" countries in its evaluations.

And, reversing U.S. hypocritical policies in the War on Terror is the essential place to start – re-builds U.S. credibility and brings allied cooperation together for an effective coalition on rights to pressure the holdouts like Russia and China

Roth 9

(Kenneth, Executive director of Human Rights Watch, Prior to joining Human Rights Watch in 1987, Roth served as a federal prosecutor in New York and for the Iran-Contra investigation in Washington, DC. A graduate of Yale Law School and Brown University, Roth has conducted numerous human rights investigations and missions around the world. He has written extensively on a wide range of human rights abuses, "Taking Back the Initiative from the Human Rights Spoilers," pg online @ <http://www.hrw.org/world-report-2009/taking-back-initiative-human-rights-spoilers> //um-ef)

The Disastrous Bush Years As noted, the rise of the spoilers would have had less impact without an abdication of leadership by governments that traditionally hold themselves forth as defenders of human rights. No government bears greater blame for this abdication than the United States under President

George W. Bush. As is widely known, the Bush administration **chose to respond to the serious security challenge of terrorism by ignoring the most basic requirements of international human rights law**. Its decision, made not by low-level "bad apples" but at the highest levels of government, was to "disappear" suspects into secret detention facilities run by the Central Intelligence Agency (CIA) where their detention was unacknowledged, subject them to torture and other abusive interrogation including "waterboarding" (mock execution by drowning) and various "stress" techniques, and detain them for years on end without charge or trial at Guantanamo. The consequences have been disastrous. This flouting of international human rights law generated resentment that was a boon to terrorist recruiters, and discouraged international cooperation with law-enforcement efforts, particularly

in countries that are most likely to identify with the victims and to learn of suspicious activity. The Bush administration's misconduct profoundly undermined US influence on human rights. Sometimes Washington could still productively promote human rights: when the issue was the right to free speech or association, which is still widely respected in the United States; when the US government enjoyed the added leverage of a major funding relationship with the government in question; or when the atrocities were so massive, such as widespread ethnic or political slaughter, that the United States could oppose them without facing accusations of hypocrisy. More typically, however, when the issue was human rights abuses that the Bush administration practiced itself, the United States was forced to cede the field. Nowhere was this more visible than at the Human Rights Council. Washington rightly criticized the many shortcomings of this new institution, but as explained in more detail below, it is far from a lost cause. Rather than work to realize its considerable potential, the Bush administration abandoned it from the start. In part that may have been a concession to reality, since given the Bush administration's human rights record, the United States would have had a hard time getting elected. But a good part of the motivation seems to have been the Bush administration's arrogant approach to multilateral institutions.

Instead of undertaking the difficult but essential task of building a broad global coalition for human rights, Washington tended to throw rhetorical grenades from the sidelines when it did not get its way. With one of the human rights movement's most powerful traditional allies having given up without a fight, it is no surprise that those allies who remain on the council face an uphill struggle. The Failure to Seize the Initiative As noted, the spoilers have taken center stage on global policy debates about human rights in part because the major rights-respecting democracies have chosen to hide in the wings. Of course, many of those democracies have never been consistent defenders of human rights, with their long history of closing their eyes to, and sometimes sponsoring, abuses by allies and strategic partners. But the hopes that the new century would usher in foreign policies built on a consistent and principled defense of human rights have been dashed by compromises made in the fight against terrorism and by a disappointing lack of commitment. Recent years have seen a particularly feeble performance. Increasingly, these governments seem to consign the promotion of human rights to relations with pariahs and adversaries. In some cases of bilateral ineffectiveness, the United States bore principal responsibility. For example: Washington provided massive assistance to the Pakistani military while doing little to rein in its Inter-Services Intelligence's use of torture and the "disappearance" of suspects. Indeed, the CIA worked closely with Pakistani intelligence forces, taking custody of suspected terrorists and interrogating them in secret prisons. The Pakistani judiciary's principled insistence on probing into these enforced disappearances, as well as its apparent unwillingness to bless General Musharraf's election as president while still a member of the army, is what led Musharraf to depose the chief justice, Iftikhar Chaudhry, and other high court judges. Washington did little to press for their restoration or to call on Musharraf to subject himself to the rule of law. Musharraf ultimately resigned under domestic pressure, but efforts to hold him accountable for his lawlessness were stymied by Washington's paramount concern that its close ally not be humiliated. Ethiopia has among the worst human rights records in Africa. Its troops have used scorched-earth counterinsurgency policies, including strangling people and burning villages, to displace rural villagers in the ethnic Somali Ogaden region. In Somalia, Ethiopian forces have indiscriminately shelled densely populated urban areas and tortured and executed alleged supporters of insurgent groups. Meanwhile, the Ethiopian government has used violence and arbitrary detention to suppress peaceful dissent at home. Yet as an important regional ally in the fight against terrorism, Ethiopia is the beneficiary of some US\$700 million annually from the US government-and of a notable public silence from Washington about these atrocities. Washington in 2005 briefly demonstrated its ability to gain human rights concessions from the Egyptian government, but it backed off its push for reform when parliamentary elections gave the Muslim Brotherhood big wins. With the restoration of unconditional support-Egypt remains the world's second largest recipient of US aid-the government has reverted to arresting and beating democracy activists, including thousands of members of the Muslim Brotherhood; prosecuting journalists, publishers, and writers who have called for free elections or even commented on President Hosni Mubarak's health; committing widespread torture; mistreating refugees by forcibly returning many to Eritrea and Sudan; and murdering since 2007 at least 32 migrants trying to cross into Israel. In other cases, the European Union or its member states were most at fault for a weak response to serious human rights abuses: The EU imposed sanctions-an arms embargo and visa restrictions for select senior officials-on Uzbekistan following the 2005 massacre of demonstrators in the town of Andijan. Since then, the EU's Uzbekistan policy has been a case study in capitulation. Initially EU sanctions were conditioned on Tashkent's agreement to an independent international investigation of the slaughter. The Uzbek government refused and, instead, arrested witnesses to the killings and forced them to exculpate the government. Nevertheless, the EU gradually weakened the sanctions, justifying its moves as "constructive gestures" to encourage the Uzbek government to undertake necessary reforms. To its credit, the EU tied the sanctions to the release of all imprisoned human rights defenders. But when Tashkent refused, the EU shrugged its shoulders and lifted the sanctions anyway. Among the examples of "progress" cited to justify this surrender was that Tashkent had released some political prisoners even as it imprisoned others, and had held a seminar on media freedom despite the lack of any actual media freedom in Uzbekistan. When the International Criminal Court's prosecutor sought an arrest warrant for Sudanese President Omar al-Bashir, Bashir tacitly threatened all manner of harm to civilians, humanitarian workers, and international peacekeepers unless the Security Council suspended the prosecution. Instead of condemning and rejecting this blackmail, Britain and France began negotiating terms (all the while denying that they were negotiating, as opposed to suggesting ways in which the issue could be resolved). The conditions they set were rigorous, and Bashir quickly showed he had no intention of meeting them, but the dangerous message implicitly delivered was that there might be a reward for following mass atrocities with a threat of more mass atrocities. As the forces of rebel leader Laurent Nkunda attacked and threatened civilians in the eastern region of the Democratic Republic of Congo, the British and French governments took the lead, dispatching their foreign ministers to the area, but their declarations of concern were not matched by substantially reinforced protection for the civilians of eastern Congo. Instead of urgently sending a modest European peacekeeping force, the EU dawdled during critical weeks. The Security Council authorized a slight expansion of the UN peacekeeping force in eastern Congo but without committing, as of late November 2008, to the improvements in the quality and capacity of the force needed to protect civilians. Notably, the EU expressed reluctance to deploy the two 1,500-troop "battle groups" that it had created in 2007 just for such situations, making one wonder when, if ever, these protective forces would be used. The EU lifted a travel ban on Belarus President Alexander Lukashenko despite a lack of discernible improvement in Minsk's dismal human rights record. The decision was motivated by the EU's worsening relations with Russia, and European governments' hope to bring Belarus closer to the West. Quite apart from responding to abuses by others, Britain threatened to itself become complicit in abuse by continuing to insist on the right to send terrorist suspects to governments that torture. To do so, it would rely on flimsy diplomatic assurances of humane treatment from governments that routinely flout their treaty obligations not to torture. Britain's efforts to develop a common EU position endorsing this practice have so far been unsuccessful, but its bad example has helped to inspire other governments-including Denmark, Italy, Kyrgyzstan, Russia, Spain, and Switzerland - thereby weakening the global torture ban. Britain also sought to hollow out an exception to the prohibition of sending people to places where they risk ill-treatment short of torture by promoting a new rule that would allow such deportation if the suspect's continued presence in the sending country posed too much of a security threat. The European Court of Human Rights unanimously rejected that proposal. Especially in the Middle East, all Western governments seemed to share equally in the failure to promote human rights: Because of Saudi Arabia's oil production and its position as a counterterrorism ally, no Western government mounted any serious challenge to its virtual lack of political freedoms and civil society, or its severe restrictions on the rights of women and migrants. Indeed, the United States and Britain praised and promised to study and learn from a Saudi program that keeps thousands of terrorism suspects detained without charge or trial, offering "reeducation" instead. The West actively sought improved relations with Libya with little criticism of its deplorable human rights records. In return for Libya giving up plans for weapons of mass destruction and compensating the victims of the Lockerbie bombing, the West has rewarded it handsomely with the resumption of diplomatic visits and renewed economic activity. But Western governments have had little to say about the virtual absence of any civil and political freedom in the country. Israel repeatedly closed off Gaza, blocking the import of fuel, food, medicine, and essential supplies. It sought to justify this collective punishment against the civilian

population as retaliation for indiscriminate rocket attacks by Gazan armed groups into civilian areas of Israel. Western governments offered occasional public condemnations, but did not condition their massive economic assistance to Israel on change. Nor did Israel suffer consequences for its illegal settlement expansion and construction of the wall/barrier within the West Bank. Elsewhere, Australia, Britain, Canada, France, Germany, and the Netherlands sought, at least at first, to undermine an absolute ban on cluster munitions by seeking exceptions for certain types that they tended to have stockpiled in their arsenals. An absolute ban was important because, as in the case of the landmines treaty, certain major powers such as the United States, Russia, and China could be expected to reject the treaty, but an absolute ban, by stigmatizing the weapon system, would make it politically difficult for them to use it anyway. A coalition led by Austria, Ireland, Mexico, Norway, and New Zealand overcame this resistance and achieved a total ban. Similarly, the 1990 Convention on the Rights of Migrant Workers and Members of their Families has not been ratified by any EU member state, or by Australia, Canada, Japan, or the United States. To date, only governments that send migrant workers have embraced the treaty, greatly undermining its capacity to protect a large and vulnerable population. Some of the major democracies did occasionally show positive leadership on human rights: British Prime Minister Gordon Brown refused to attend a summit between the European Union and the African Union because of the presence of Zimbabwean President Robert Mugabe. Douglas Alexander, the British international development secretary, suggested he would link aid to Ethiopia to an end to its abuses in the Ogaden region. This marked a possible shift from Britain's traditional silence on Ethiopian abuses while providing substantial financial support to the government. To protest Rwanda's support for the abusive forces of its ally, rebel leader Laurent Nkunda, in eastern Congo, the Netherlands redirected its development aid from Rwanda to eastern Congo. The United States, Australia, and the European Union imposed sanctions against Burma for its brutal crackdown against peaceful demonstrators despite countervailing pressure from China and the governments of the Association of Southeast Asian Nations (ASEAN). German Chancellor Angela Merkel boycotted the opening ceremonies of the Beijing Olympics to protest China's crackdown in Tibet. The Bush administration, despite its opposition to the International Criminal Court, took the lead in fending off efforts to suspend the ICC's efforts to prosecute Sudanese President Bashir. However, these positive examples were not repeated regularly enough to build momentum for the defense of human rights and thus to effectively deflect destructive pressure from the spoilers. The EU and the UN Human Rights Council The weakness of the EU's support for human rights was especially evident in multilateral settings such as the Human Rights Council. As noted, the Bush administration did not even try to make the council work, leaving the task to others. The EU has made some effort to assume the leadership mantle in Geneva, but talking to EU diplomats there is often a depressing lesson in defeatism. Much of the reason lies in the influence-sapping procedures that the EU follows for building a consensus around a common policy. The council is divided roughly evenly among governments that tend to support human rights initiatives, governments that tend to oppose them, and swing votes—governments that have tended to join the spoilers but could be moved in a more pro-human rights direction. By giving broad strategic direction, the EU might have empowered its diplomats to act creatively and boldly to forge a multi-regional, pro-human rights majority from among the swing votes. Instead, the EU let the process of building an internal consensus become an exercise in micromanagement. EU diplomats spend so much time negotiating a minutely detailed consensus among themselves, typically consisting of word-for-word approval of any proposed resolution, that by the time they reach agreement among all 27 member states, they are exhausted, with no energy or flexibility to fashion a consensus among other potential allies. To avoid restarting the painstaking process of building a new EU consensus, European diplomats must avoid genuine give-and-take and instead try to convince others to accept the agreed-upon EU position without amendment. Needless to say, that is not an effective negotiating posture. This approach tends to worsen the already--poisonous West-versus-rest atmosphere that frequently prevails at the UN. This polarization and "bloc mentality" makes it more difficult for moderate states to separate themselves from the spoilers such as Algeria, Egypt, and South Africa that tend to dominate African Union deliberations, and thus harder to build a cross-regional, pro-human rights majority. Even when the EU has wanted to act, its

reluctance to criticize Washington for abusive counterterrorism policies has left it open to charges of selectivity and double standards. For example, by refusing to endorse a Cuba-backed effort at the Human Rights Council to

criticize Guantanamo (even though the proposed resolution was deliberately written in the exact same language as the Council of Europe had previously used in its own resolution), the EU contributed to the protect-your-own mentality that now plagues the Human Rights Council. Similarly, by agreeing to end UN scrutiny of Iraq and Afghanistan after the US invasions, the EU made it easier for others to oppose country resolutions aimed at their own friends. Unable for these reasons to build a pro-human rights majority at the council, the EU tends to resign itself to watered-down consensus resolutions, such as on Sudan, or to outright defeat, such as on the decisions to end the work of an expert group on Darfur or to terminate scrutiny of Belarus and Cuba. Similarly, despite ongoing massive atrocities in the eastern Democratic Republic of Congo, the EU acquiesced in a "compromise" resolution sponsored by Egypt ending the mandate of the UN independent expert on Congo; the EU accepted the fig-leaf of scheduling another discussion of Congo a year later. Taking Back the Initiative That the initiative on human rights has been captured by governments that do not wish international protection well should generate not despair but resolve. The new Obama administration in Washington offers the hope of a US government that can

assume a place of leadership in promoting human rights. If the European Union can generate the political will and surmount its self-imposed procedural paralysis, it will be in a position to help build a genuine global coalition for human rights that can seize the initiative from the spoilers. Governments that purport to promote human rights should abide by certain basic rules to be effective. First, they should ensure their own scrupulous respect for human rights—because international law obliges them to do so, because it will set a positive example, and because compliance will help silence charges of hypocrisy. They should also abandon efforts to

undermine human rights standards, such as the prohibition of torture in the context of fighting terrorism, or refugee protection in the rush to develop a common asylum policy. When these governments face criticism for violating human rights, they should accept it as legitimate discourse rather than an affront to be reflexively rejected. In their foreign policy, these governments should promote human rights as even-handedly as possible. That means criticizing not only pariah states but also friends when they commit serious rights violations. They should also elevate the importance of human rights in their relations with other governments, assigning the issue to senior officials, insisting on human rights occupying a prominent place on the agenda during bilateral discussions, and establishing clear benchmarks for change with specific consequences for indifference or retrenchment. In multilateral settings, these governments should make it a major priority to build a pro-human rights majority by encouraging rights-respecting states from all regions to speak out on human rights. With respect to the Human Rights Council, for example, rights-respecting states should be encouraged to offer their candidacy, while the candidacies of the spoilers and their allies should be actively opposed. The defeat in recent years of the candidacies of Belarus and Sri Lanka illustrates what must be done more regularly. Efforts should also be made to ensure that governments obstructing the defense of human rights pay a political price at home. Democratic governments with vibrant civil societies such as India and South Africa are able to get away with negative positions on human rights because few people in those countries track their voting records in intergovernmental forums and their national media rarely report on their conduct there. So when they vote to protect Burma, Sudan, or Zimbabwe, they do not face the criticism that they surely would encounter were they to adopt similarly regressive domestic policies. Helping journalists and civil society representatives visit New York, Geneva, and regional capitals to monitor and lobby their governments would be a useful first step. It is also important to recognize that many governments from the South have legitimate grievances about the behavior of Western governments. These grievances do not justify their hostility to human rights, but they clearly affect their perspective. Expanding the number of Southern governments willing to promote human rights will require addressing their sense that Western concern for human rights varies with the level of strategic interest, that powerful countries are allowed to get away with bad behavior, and that richer parts of the world are insufficiently concerned with economic and social rights in the global South, such as the right to food in the context of rising prices or the right to basic health care in the midst of a declining economy. A genuine commitment to recognizing these concerns would help to engage with states such as Ghana, Zambia, Mexico, Peru, Indonesia, and the Philippines that ought to be exerting greater human rights leadership in international and regional forums. Finally, there is a need to break the bloc mentality that leads so many governments to vote-almost by default—with their regional groups even when their own views are more progressive. Moderate states need encouragement to distance themselves from the spoilers that tend to dominate bloc voting. Thus in Africa, Ghana and Zambia should be encouraged to part company with Algeria and Egypt. In Asia, the Philippines and Thailand should be weaned from Burma and Vietnam. Success will require a strategy and vision, engagement and diplomacy—all designed to reach out to moderate states, take their concerns seriously, and bring them into the pro-human rights fold. A New Direction in Washington The success of any effort

to retake the initiative from the spoilers will depend to a large degree on Washington. The

Obama administration must undo the enormous damage caused by the Bush administration and begin to restore the US government's reputation and effectiveness as a human rights defender.

Changing US policy on how to fight terrorism is an essential place to start

Among the steps that President Obama should take would be to: Close the CIA's secret detention centers permanently. Bush suggested he had emptied them only temporarily. Apply to the CIA the US military's new rules (revised in the wake of the Abu Ghraib scandal) prohibiting coercive interrogation. Congress had tried to legislate that step, but Bush vetoed the bill, and Congress lacked the votes to override the veto. Close the Guantanamo detention center without effectively moving it on-shore by permitting detention without trial in the United States. That means repatriating or prosecuting all detainees, and ensuring that prosecutions are conducted in regular courts, not the substandard military commissions, which allow criminal convictions based on coerced confessions, or any other "special" tribunal that compromises basic due process. It also means abandoning the radical theory that terrorist suspects arrested anywhere in the world, even far from any recognizable battlefield, can be detained as enemy combatants without regard to the protections of human rights law. Launch a nonpartisan, professionally staffed investigative commission, with subpoena power, to examine who authorized these serious abuses, how they should be held accountable, and what steps should be taken to ensure that this ugly episode in US history never recurs. That process of exposure, acknowledgment, and repudiation is important so that the Bush administration's abuses do not stand as a precedent to be followed in future periods of security threat. The Obama administration should also signal that, from now on, the US government will submit to the requirements of international human rights law and reengage with international institutions for the enforcement of that law. President Obama should: Offer the United States as a candidate for the UN Human Rights Council with the purpose of making it an effective institution for promoting human rights. While a candidacy under Bush might well have failed, a candidacy under Obama is likely to prevail. Signal an intention to reengage constructively with the International Criminal Court by re-signing the ICC treaty, repealing the American Service-Members' Protection Act (which cuts aid to governments that will not forswear ever surrendering a US citizen for trial and authorizes invading The Hague to liberate any imprisoned American), and supporting the ICC politically and practically. The new administration should also begin the domestic political work needed for the United States to ratify the ICC treaty. Ratify other key human rights treaties, such as the new convention against enforced disappearances (as a sign of commitment never to resort to this despicable practice again), the long-ignored treaties on women's and children's rights (which the United States stands virtually alone in not having ratified), the treaty on economic, social, and cultural rights (to secure a safety net at home while helping to build a broader, cross-regional alliance for human rights abroad), the First Additional Protocol to the Geneva Conventions (setting forth standards for the conduct of warfare that the US already largely accepts as a matter of customary law), and the more recent, life-saving treaties banning cluster munitions and antipersonnel landmines (weapons that, because they have become so stigmatized, the US military would have a hard time using anyway). Finally, President Obama should reassess US bilateral relations with certain governments whose significance as strategic or counterterrorism allies led the Bush administration to overlook their abuses. The United States should use its substantial economic leverage to push for an end to abuses by close allies, such as Ethiopian atrocities in the Ogaden and Somalia, the Pakistani military's use of torture and "disappearances," Egypt's stifling of political opposition, Israel's use of collective punishment to respond to Palestinian rocket attacks on civilians, and Colombia's obstruction of investigations into links between senior government officials and murderous paramilitary forces. Conclusion

Like other global endeavors, **the effective promotion of human rights cannot ignore shifts in global power.**

The traditional role of the West in promoting human rights is not enough. New coalitions must be built by reaching out to other democracies that largely respect human rights at home and could be convinced to join efforts to promote human rights around the world. But such coalitions cannot be built without significant shifts in the policy and approach of the world's leading democracies. Today, the effective defense of human rights requires new commitments-

to studiously respect human rights in one's own conduct, to insist on accountability for serious abuses regardless of the perpetrator, to promote human rights consistently without favoritism for allies or strategic partners, and to reach out to potential new allies with an openness to addressing their human rights concerns. None of this is impossible. Those who believe that global shifts in power will sound the death knell of human rights enforcement are confusing the leading democracies' current poor performance with immutable reality. But the **successful defense of human rights will require serious self-examination on the part of these democracies and a willingness to change course.**

The arrival of the **Obama administration** in Washington with its seeming determination to end the disastrous abuses of the Bush years **provides an ideal opportunity. The task facing the human rights community is to convince the supporters of human rights-both traditional allies and potentially new ones-to seize this opportunity.** That would truly be something to celebrate in this sixtieth anniversary year of the Universal Declaration of Human Rights.

And, re-building credibility by changing War on Terror policies that kill HR protections is critical to effective HR promotion

http://globetrotter.berkeley.edu/NewEra/pdfs/BarmaRatner_China2006.pdf

The first is **credibility**. **A government cannot effectively promote human rights abroad if it is not observing them at home. If a government considers that habeas corpus and guarantees against torture are at variance with its national security, then it will not be able to urge other governments to respect these rights.** Nor will a human rights policy be credible if it is used as a pretext for achieving other foreign policy goals, for example as a rationale for an invasion of another country, or for regime change, or to achieve domestic political purposes. **Credibility also means a policy based on sound information that neither downplays nor exaggerates the situation for political reasons.** Second, the promotion of human rights must be defined as a national interest reflecting American values and bearing on national security. Rather than defining the policy in terms of morality or religion, it should be underscored that governments with open societies and that respect human rights are better allies and less likely to be threats to international peace and security and that our interests are not well served over the long term by allying ourselves with oppressive regimes. Moreover, respect for human rights should be presented as in the interest of foreign governments as well. I always liked the following quotation: "Never appeal to a man's better nature. He may not have one. Invoking his self interest gives you more leverage." Once the policy is defined as a national interest, there should be a willingness to pay something for it. **If trade and exports or the war on terror always trump human rights considerations, the policy will not be effective.**

2NC Uniqueness Wall

[each 1nc has a little different version of the same argument – U.S. human rights credibility/pressure is down now/ineffective due to a lack of U.S. credibility on human rights at home]

And, U.S. HR credibility is down now – surveillance policy and U.S. double standards gut HR promotion – reversal is essential

Carasik '14 (Lauren, clinical professor of law and the director of the international human rights clinic at the Western New England University School of Law, “Human rights for thee but not for me”, Al Jazeera, <http://america.aljazeera.com/opinions/2014/3/the-us-lacks-moralauthorityonhumanrights.html>, 3/12/2014)//HW

Last month U.S. Secretary of State John **Kerry unveiled the State Department's comprehensive annual assessment of human rights** around the globe. **It painted a grim picture of pervasive violations. Notably absent from the report, however, was any discussion of Washington's own record on human rights. The report elicited sharp rebukes from some of the countries singled out for criticism. Many of them questioned the United States' legitimacy as self-appointed global champion of human rights. China issued its own report**, 154 pages long, **excoriating the U.S. record on human rights** and presenting a list of Washington's violations. Egypt's Foreign Ministry called the report “unbalanced and nonobjective” and censured the U.S. for appointing itself the world's watchdog. Ecuador, Russia and Iran also criticized the report. By signaling that the world cares about human rights violations, the report provides a useful tool for advocates. **While the omission of any internal critique is unsurprising, that stance ultimately undermines the State Department's goals of promoting human rights abroad. Abuses unfolding around the world demand and deserve condemnation. But it is difficult for the U.S. to don the unimpeachable mantle, behave hypocritically and still maintain credibility.** North-south schism It is tempting to dismiss the scolding as retaliatory howls by authoritarian states, but their critiques have long been echoed by others. Pointing to simmering divisions over human rights standards, China argued that developing countries face a different set of challenges from their more developed counterparts. This ideological debate has permeated rights discourse and often underscores a north-south schism. The divide has its roots in the history of human rights. In 1945, still reeling from the atrocities of World War II, world powers gathered in Paris to forge a multilateral agreement that would form “the foundation of freedom, justice and peace in the world.” Those principles were enshrined in the nonbinding Universal Declaration of Human Rights (UDHR). The U.N. then adopted two covenants that would have the force of law: one focused on civil and political rights and the other on economic, social and cultural rights. Together with the UDHR, they form the International Bill of Human Rights. The covenants were meant to be universal, interdependent and indivisible and equally treated, but they do not exist in a political vacuum. Although the U.S. was instrumental in creating this international framework, it has resisted conforming to many of the norms for which there is an emerging international consensus. The U.S. holds sacred its commitment to civil and political rights, such as those protected by its robust and revered Bill of Rights and proclaims itself a beacon of freedom and justice in the world. Critics argue that the rhetoric exceeds the reality on the ground. Economic and social rights are far more contested, in part because they require affirmative duties that affect resource allocation: States must take progressive action toward providing housing, food, education, health care and a host of other rights. The U.S. has been singularly unwilling to ratify key international human rights instruments, reinforcing its status as an outlier in the field. The U.S. purports to be evenhanded. But geopolitical interests influence the tenor and content of its assessments, leading some critics to accuse the U.S. of sacrificing human rights at the altar of political expediency. For example, the U.S. has been accused of blunting its appraisal of allies such as Saudi Arabia, Bahrain, Mexico, Uzbekistan, Honduras and Israel. Economic interests also factor in. Critics decry the sale of arms to countries that by Washington's own assessment are complicit in human rights abuses. While politically and economically self-interested maneuvering is inevitable, not all countries issue an ostensibly definitive and unvarnished report on the state of global human rights. In December during Human Rights Week, U.S. President Barack Obama issued a proclamation reaffirming the United States' “unwavering support for the principles enshrined in the Universal Declaration of Human Rights.” Yet **global headlines are dominated by high-profile U.S. human rights transgressions — indefinite detention at Guantánamo Bay, torture, extraordinary rendition, extrajudicial assassination by drones that claims the lives of innocents in addition to its targets, the aggressive pursuit of whistle-blowers and data collection that violates privacy both at home and abroad.** Advocates criticize a litany of other human rights abuses, such as mass incarceration (the U.S. has 5 percent of the world's population but 25 percent of its inmates, with disproportionate representation among minority groups), the death penalty (including post-execution revelations that raise serious doubt about already questionable convictions), **racial profiling, the disenfranchisement of felons**, sentences of life without parole for juvenile offenders, gun violence, solitary confinement, the shackling of pregnant inmates and many others. The New York-based Human Rights Watch says **these violations disproportionately affect minority communities. “Victims are often** the most vulnerable members of society: **racial and ethnic minorities, immigrants, children, the elderly,**

the poor and prisoners,” it said in its annual report on the U.S. last year. Evading treaties Aside from specific human rights violations, the U.S. has been singularly unwilling to ratify key international human rights instruments, which reinforces its status as an outlier in the field. These include its refusal to ratify the Convention to Eliminate All Forms of Discrimination Against Women (only seven other countries are not parties to it), the International Covenant on Economic, Social and Cultural Rights, the Convention on Rights of the Child (ratified by all states except the U.S., Somalia and South Sudan) and the Convention on the Rights of Persons with Disabilities. The U.S. has also failed to ratify the American Convention on Human Rights, a regional framework on human rights in the Americas. It has ratified only two of the International Labor Organization’s eight fundamental conventions. Washington’s refusal to ratify the Rome Statute of the International Criminal Court (ICC) has provoked particular consternation. The international community has a profound interest in deterring the most violent abuses by ending impunity for war crimes, crimes against humanity and genocide. The ICC was created to promote accountability for these crimes, which are, for a complex and interrelated constellation of reasons, notoriously difficult to prosecute in domestic courts. But the U.S. will not submit to its jurisdiction, citing a number of concerns, including that the court would be subject to political manipulation and lack accountability to the U.N. and that submitting to it would violate state sovereignty. Some critics claim that it is the U.S. that fears being held to account in the international arena for the global expansion of its military and its possible commission of war crimes. To be fair, the ICC has its critics as well, who contest both its legitimacy and its efficacy. Subjects of complaint include its perceived preoccupation with African criminals, its slow pace of prosecutions and questions about how and when the international community should protect citizens of a sovereign state against atrocities. But the U.S. refusal to sign the Rome Statute, which established the ICC, undermines the principle that each and every country must be accountable to certain universal standards if they are to be rendered meaningful. American exceptionalism **U.S. intransigence is often cloaked behind lofty conception of American exceptionalism – the idea that the U.S. embodies the standards of liberty and democracy to which other countries should aspire.** Claiming to stand at the apex of democracy and human rights, **the U.S. exempts itself from surrendering its sovereignty to any global rights framework** Resistance to the adoption of international norms is not monolithic within the country, however. In a sign of retreat from these principles at a local level, some states and municipalities are embracing international human rights standards. The “Bringing Human Rights Home” report by the Human Rights Institute at Columbia School of Law evinces the willingness of some local governments to incorporate universal human rights standards, including economic and social rights that the U.S. has so far declined to validate. In 2012 former U.S. President Jimmy Carter urged the U.S. to reclaim its moral high ground, lamenting that **“America’s violation of international human rights abets our enemies and alienates our friends.”** Upholding universal, inalienable and enforceable human rights standards in a pluralistic and increasingly entangled world is no easy task. But **the domestic and international human rights movements are driven by the urgent goal of protecting the dignity of all human beings — including those at the margins who are powerless, poor, invisible and persecuted. The U.S. would have more credibility in promoting those principles if it reflected on its own transgressions. Naming and shaming by international actors is an essential tool for advancing human rights. But it assumes both the moral authority to sit in judgment and the humility to be self-critical.**

Obama is unable to turn words into action now due to a lack Human Rights Leadership – effective strategy change would result in Putin backlash – he’d perceive the strategy as an attempt at regime change

McFaul 15

(Michael, interview, pg online @ [//um-ef\)](https://news.vice.com/article/there-has-to-be-more-pressure-michael-mcfaul-americas-last-ambassador-to-russia-discusses-putin-and-ukraine)

A lot of **the criticism of President Obama at home is that he’s weak or reactive – that he “leads from behind.”** A more sophisticated version of those arguments is that he has “overlearned” the lessons of the **Bush Administration.** Are there lessons from Obama’s shortcomings that the next president, Democrat or Republican, should keep in mind? I think **there most certainly was in the beginning of the Obama Administration an overreaction and rejection to what the Bush Administration called the Freedom Agenda.** If they were all for it, there were **some in the Administration that thought we had to be against it.** I do think **over time that the President has articulated a much more sophisticated position,** his own voice in this debate. I think about two of his UNGA [United Nations General Assembly] speeches where he did that. I think about his May 2011 speech on the Arab Spring. Or even his South Africa speech last year where if you go and you look at these, **they have some pretty clear analytic statements about why the United States should support democracy and human rights abroad.** You can see there the democratic peace argument. You can see there the economic progress argument that says that democracy and development go together, they’re not in competition with one another.... I think **the problem for the Administration has been to articulate in difficult places strategies for doing something about those analytic statements.** And that’s where I think in terms of self-criticism, including my own work in the government. I wish we had done better and wish I had done better to have the kinds of implementation strategies to achieve the objectives that the president

has outlined. To turn back to Ukraine, I'm actually quite impressed by what the Administration has been able to do under very constraining circumstances with allies that are reluctant to engage in this. Crimea, of course, that came out of the blue. But I think the response in terms of the insurgency in eastern Ukraine has been rather impressive. I can think of areas where that could have gone in a much more negative way. So that's a particular area where I think the president did show leadership, he pivoted strongly to put this coalition together. And when people say the president is weak, I would remind people — how many people were sanctioned when Russia invaded Georgia? The answer to that is zero. So it's got to be compared to that when you talk about the weak response of the Administration. The American ambassador is an easy target. Do you think Putin successfully implemented a strategy against you? Were you, as an expert on democracy, an especially easy target? The answer to your first question is yes. Day two on the job as ambassador, a big feature of me was run on national TV in Russia basically saying that I was sent to Russia to foment revolution. That was part of the campaign strategy and I was a part of it. The answer to your second piece about my biography is also yes. In that hit piece and in many others they would take out of context my writings, some of which I did fifteen years ago, and portray them as US foreign policy. Sometimes they just added things and made up things. Let's be clear, there's no commitment to the truth when it comes to these folks. But they would definitely use my biography that way, and that was frustrating for me. They didn't write about my writings — I have lots of writings, for instance, about why we should engage with Russia and reset relations. I wrote those articles years ago, too, but they didn't focus on that. Nor, of course, did they focus on the work that I did at the White House in terms of signing the START treaty, opening the Northern Distribution Network, Russia's WTO accession. I was involved in all of those things, I wasn't just involved in democracy and human rights. Having said all that, I think there were some people even in the West that thought, "Why is McFaul there? There he is again speaking about the nasty things that Putin is doing in terms of democracy and human rights, and talking about how greater autocracy leads to more belligerent foreign policy." I think there were lots of people that thought that it was all about me personally. I think what the subsequent history shows is that it was not about me personally. This was a bigger, broader trend. This was not about me, this was about Putin. I think the evidence is now overwhelming that it was about him. And maybe people should have paid a little more attention two and a half years ago to the things I was saying to better understand why we're in the mess that we're in

now. How strong is Putin? Is he really as powerful and controlling of the situation in Russia as it appears from the outside? Well, I think he's quite powerful when it

comes to foreign policy matters. I should underscore that no amount of quiet diplomacy, no amount of constructive engagement at lower levels or with Putin, in my view, would have changed the dynamic in US-Russia relations that we see today. I think that that's sometimes hard for people to admit. But I've thought about this pretty hard and I don't think that if only we had some

secret channel to Putin through some government official or private citizen, we could have solved the problem. Because he just has a different theory about international relations than we do. He sees

us as a sinister force. He sees us as wanting to foment regime change around the world, and no amount of engagement is going to change his mind. I saw the president engage with him. I saw other senior American government officials engage.

And he's pretty firm in his views. That's the first thing. The second thing is there is not, in my view, a coalition around him that does the kind of red-teaming, plan B, or pushing back on his theory of international relations. He's been in the job for fourteen years, so he thinks he knows everything. And if fourteen, ten years ago, there were people around him that I think he did listen to, particularly on economic policy, today I think his circle has become smaller and more insulated and more filled with yes men....

Cihangir-Tetik 14

(Damla Cihangir-Tetik is a Ph.D Candidate in Political Science, Sabanci University/Istanbul as well as Project Coordinator for Transparency International Turkey, pg online @ <http://idsmagazine.org/human-rights-and-democracy-promotion-as-foreign-policy-tools-of-transatlantic-partners-by-damla-cihangir-tetik/> //um-ef)

Regarding human rights protection and democracy promotion, the “discrepancy of the West” argument reached its peak with the “war on terrorism” policy of the US after the 9/11 terrorist attacks. **Western democracy promotion and human rights norms deteriorated with the US-led operation in Afghanistan in order to fight against global terrorism** and with the invasion of Iraq by the US and Britain. Additionally, **the treatment of prisoners by the US officials** in Guantanamo Bay, Bagram in Afghanistan and Abu Ghraib was **perceived as aggressive, paternalistic, neo-imperialist** and a combination of all those by the rest of the international community (Burnell 2010, 2). Importantly, the EU and especially **the US are faced with an important credibility problem at the moment concerning their efforts towards international human rights protection** and democracy promotion in the rest of the world. **“Credibility refers to the fact that democratization is hardly ever the only foreign policy goal of those governments who provide democracy assistance”** (Burnell 2010). As Bermeo explains, even though the US has spent hundreds of millions of dollars on democracy and good governance in Egypt, its military aid, which is much more higher than the ones for democratization, increases the scepticism towards the priority of the US in Egypt (Bermeo 2009). **Democracy promotion can therefore only succeed if** it is embedded within the overall set of foreign policies of the promoting country and if **the promoting country itself adheres to the rules, norms and values it claims to want to become more widespread** (Burnell 2010). Similarly, **concerning international human rights protection, the US fails to accede to the ICC with others** – including China, India, Indonesia, Saudi Arabia – **and this discourages these states and also the others from engaging in activities that promote human rights** (Muftuler-Bac and Peterson 2014). As a result, **at the moment it is not expected from the US to be a global leader of human rights protection** and democracy promotion **internationally**. However, one has to keep in mind that the US under President Wilson’s administration was leading both bilateral and multilateral means of democracy promotion at the beginning of the 20th century. The US has established USAID in 1961 and the National Endowment for Democracy as its main democracy promotion instruments. In the mission statement of the State Department, democracy promotion is underlined as a political purpose for the US; “...advance freedom for benefit of the American people and the international community by helping to build and sustain a more democratic, secure and prosperous world composed of well-governed states that respond to the needs of their people, reduce widespread poverty, and act responsibly within the international system” (US Department of State 2007). As Babayan mentions, **different US administrations have different modes of democracy promotion and human rights protection**. While in the 1990s President Clinton made democracy promotion one of the three main pillars of his foreign policy, President George W. Bush adopted a different democracy promotion rhetoric, which is combined with military means and which President **Obama** later distanced himself from (Babayan 2013, Babayan and Huber 2012, 3). **Even though he continues to apply human rights and democracy promotion policies, he is much more cautious than his predecessors** because of increasing multipolarity in global security environment and **increasing domestic pressures**. According to discussed outcomes of diverse Western-led human rights protection and democracy promotion policies there is no certain, clear answer to the question of “do human rights protection and democracy promotion policies of the West work?” The

answer is both "yes" and "no". As Gravingholt et. al. mention, the foremost reason for this blurriness is the unknown precise rules of democratization (Gravingholt et. al. 2009). It is the same for human rights protection, an area where international legal norms and rules are not specified, internationalized and applicable until now, even though some improved steps regarding the creation of enforceable rules of International Criminal Court (ICC) and International Criminal Tribunals for the former Yugoslavia and Rwanda. Even the US and the EU have different approaches regarding human rights protection and democracy promotion and several disagreements on some issues, ranging from counterterrorism policies to private data collection and their shared security measures. As mentioned above, even though there is a continuation of the "discrepancy of the West" and/or the "credibility problem of the West", the transatlantic partners still lead human rights protection and democracy promotion internationally. Therefore, they have been pushing other states, IOs and non-state actors for the creation of international norms in the multilateral framework. However, this leadership perception is now insufficient to abolish the question: Has the West dropped human rights protection and democracy as a norm in response to the emergence of alternative political regimes to the Western democracy especially by the rise of China and Russia as global powers?

Obama Strategy

No Push

Obama's current strategy AVOIDS contentious HR promotion in favor of building institutions and allied cooperation

Beauchamp 15

(Zach, "Obama's long-view foreign policy: why he thinks the US can bend the arc of history," pg online @ <http://www.vox.com/2015/2/10/8013793/obama-interview-history//um-ef>)

That's fine for the long view, but Obama also has to manage foreign policy now, day-to-day. And, on that view, it can look like he's significantly less active on global human rights. **Obama hasn't seriously challenged Chinese authoritarianism** or Saudi theocracy. Iran and Russia pose major threats to stability in Europe and the Middle East. And North Korea is still North Korea. In the Vox interview, Obama's direct response to this line of criticism is pretty weak: the Internet will fix it. "I am a firm believer that particularly in this modern internet age, the capacity of the old-style authoritarian government to sustain itself and to thrive just is going to continue to weaken," he said. Still, his longer-view, implicit argument is a great deal stronger: the best way to deal with authoritarianism in the long run is to build up the global institutions that have accelerated positive trends worldwide — and to prevent other countries from weakening those institutions and trends. China is a good example of this. As a rising power that has been at times hostile to Western power, it was widely expected to challenge the US-dominated global order — potentially catastrophically — and in some cases it has. But, since 2008, the country has generally worked within and even endorsed that international system. This was mostly out of self-interest, but the Obama administration has worked to make sure that China's self-interest and that of the international system lined up. The result has been China buying into those positive trends of the status quo, rather than overturning them. For example, China helped the United States and global economic institutions rescue the global economy after 2008 by refraining from turning to trade protectionism. According to Tufts Fletcher School Professor Dan Drezner, that's evidence that "China is not proposing a serious challenge to what the liberal international order looks like." China benefits from a fairly open international trading regime and would suffer if security competition with the United States ramped up. Roping China into these systems demonstrates Obama's strategy in action. Throughout the interview, he mentions the need to get China on board with helping maintain global institutions: "you've got to step up and help us underwrite these global rules that in fact help to facilitate your rise," he says, addressing China's leaders. Obama has attempted to integrate other bad actors into the global system to make them less likely to cause trouble. The opening to Cuba is the clearest example, but so too are his overtures to Iran on nukes and the original (if ill-fated) Russia reset. "We can't guarantee that [Iran makes] a rational decision [on nukes] any more than we can guarantee Russia and Mr. Putin make rational decisions about something like Ukraine," he said. "But we've also got to see whether things like diplomacy, things like economic sanctions, things like international pressure and international norms, will in fact make a difference." And while these bad actors are co-opted or contained, by sanctions or international isolation, the rest of the world will continue to improve, bringing more states into the global system and depriving its enemies of potential allies. That'll make it harder for these states to sustain aggressive foreign policies — and even brutal repression at home — in the face of long-run international pressure. The Obama Doctrine This long-run vision is, in many ways, quite compelling. But it doesn't do a whole lot for protestors in Hong Kong, Saudi women demanding the right to drive, or Ukrainians gunned down by Russian troops in Donbas. **What about abuses that are happening now? That's where Obama's recognition of America's policy limits kick in**. Yglesias calls this Obama's Undoctrine: avoid costly and counterproductive mistakes, particularly military ones. **In the area of human rights, that means avoiding ostentatious pressure that might backfire**. For instance, Obama avoided openly embracing Iran's green protest movement in 2009, and he's kept support for the Syrian rebels to a relative minimum. That's because, in a lot of these cases, Obama thinks high-profile American statements or actions can backfire. Instead, Obama argues, we have to take human rights wins where we can get them. Not every issue is amenable to American pressure or direct action. "Our successes will happen in fits and starts, and sometimes there's going to be a breakthrough and sometimes you'll just modestly make things a little better," he says. **This may not always be a satisfying approach to spreading human rights** — long-views rarely are — but it has the virtue of being a smart one.

<http://www.washingtonpost.com/wp-dyn/content/article/2010/05/30/AR2010053003299.html>

Obama doesn't care about human rights-low budgets, doesn't release human rights report

Abrams 15 Elliot, senior fellow for Middle Eastern Studies, Council on Foreign Relations. "Why is Obama's Human Rights Report 115 Days Late?" *CCouncil on Foreign Relations*. 06/16/15.

Accessed 6/29/15. <http://blogs.cfr.org/abrams/2015/06/16/why-is-obamas-human-rights-report-115-days-late/>

The argument that this is so important to Mr. Obama and Mr. Kerry that Kerry and only Kerry must preside strikes me as nonsense. Neither man has paid much attention to human rights while in office, human rights budgets are declining, and human rights advocates write constantly about the diminishing U.S. interest in the subject. In fact the reports speak for themselves and any high State Department official could preside over a little ceremony releasing them. If the topic were so important to Secretary Kerry he would not be delaying the release by just short of four months. He could ask National Security Adviser Susan Rice over to dress up the press conference, or Joe Biden. Or let the Deputy Secretary of State do it, noting that the bicycle accident removed Kerry from the scene.

Obama deliberately not promoting Human Rights-Africa Summit

Washington Post 14 Editorial Board, "Where is human rights in the Africa summit?" *Washington Post*. 08/02/14.

www.washingtonpost.com/opinions/where-is-human-rights-in-the-africa-summit/2014/08/02/858d7eae-18ee-11e4-9e3b-7f2f110c6265_story.html

Africa is indeed home to the seven of the 10 fastest growing economies of the past decade. But it's also home to at least 16 countries with a broken or deteriorating human rights record. Three of those countries — Eritrea, Sudan and Zimbabwe — were not invited to the summit because they were not in good standing with the United States. But in a push for inclusiveness, the Obama administration invited at least 13 other strongmen. President Teodoro Obiang Nguema of Equatorial Guinea, the longest-serving non-monarch in the world, will likely be in attendance. He's allegedly jailed and tortured political opponents, including an Italian businessman named Roberto Berardi who was to testify in the United States about corruption by Mr. Obiang's son. Mr. Berardi has been "severely beaten and flogged by guards, [and] held for lengthy periods in solitary confinement," Human Rights Watch reported. Another likely attendee, Ugandan President Yoweri Museveni, had his anti-gay law struck down on Friday but still enforces his public order law, which is used to shutter media organizations and detain politicians. Mr. Museveni's police reportedly killed at least 49 people with impunity in two separate protest crackdowns in recent years. The inclusion of these leaders would have been understandable — and perhaps productive — if human rights were centrally placed on the agenda. No African leader would refuse an invitation to the White House even with a summit prominently featuring human rights. Yet the topic is wholly sidelined through all three days of conferences. There's no doubt a purposeful, diplomatic choice was made to deny human rights its own session, while topics like wildlife trafficking receive their OWN. The idea, as national security adviser Susan E. Rice says, is that "in each of the sessions, there will be some very straight talk and give-and-take." The White House argues that human rights will weave itself into discussions, especially in the Civil Society Forum and the leaders' session on governance. But like all uncomfortable topics, human rights will likely be pushed to the back-burner while more agreeable issues like "civic innovation" and managing "transnational threats" take precedence.

not emphasizing hr now

No Push: China

Obama is not focused on human rights in China – rather political motives, the global economy, climate change, and the security crisis

Hickey 4/7, (Jennifer Hickey, Strategic Communications Specialist and Writer, "Joe Biden to Chinese: US Emphasis on Human Rights Just Politics," <http://www.newsmax.com/Newsfront/Joe-Biden-China-human-rights-Xi-Jinping/2015/04/07/id/637000/>, 04/07/15, //VZ)

During conversations with Chinese President Xi Jinping in 2011 and 2012, Vice President Joe Biden said that American presidents speak about human rights because of "political imperative," according to an article in the latest New Yorker. "No president of the United States could represent the United States were he not committed to human rights," he told Xi when asked why the U.S. puts so much "emphasis" on human rights. "President Barack Obama would not be able to stay in power if he did not speak of it. So look at it as a political imperative. It doesn't make us better or worse. It's who we are. You make your decisions. We'll make ours." "It was not exactly a gaffe. It wasn't a misstatement of a phrase or two," says Wall Street Journal editorial page writer David Feith, who is stationed in Hong Kong. "The answer that Vice President Biden gave to the Chinese leader was quite unusual. This is simply for consumption back home in the U.S. It is not a matter of strategic importance or of America's moral values," but one of political posturing. As noted in the latest report issued by the State Department's Bureau of Democracy, Human Rights and Labor on human rights practices, after completing the leadership transition to Xi, Chinese government officials often engaged in human rights abuses. "Repression and coercion, particularly against organizations and individuals involved in civil and political rights advocacy and public interest issues, ethnic minorities, and law firms that took on sensitive cases, were routine. Increasingly, officials employed harassment, intimidation, and prosecution of family members and associates to retaliate against rights advocates and defenders," the report said, adding that "security forces reportedly committed arbitrary or unlawful killings." Biden's comments echo similar sentiments expressed by then-Secretary of State Hillary Clinton during a visit to South Korea in 2009. "Successive administrations and Chinese governments have been poised back and forth on these issues, and we have to continue to press them. But our pressing on those issues can't interfere with the global economic crisis, the global climate change crisis, and the security crisis," she told reporters when describing the administration's priorities, according to CNN.

No Push: Iran

Obama neglects Iran's human rights' violations – Obama's focus is on the nuclear deal

Kredo 3/17, (Adam Kredo, Adam Kredo is senior writer for the Washington Free Beacon. Formerly an award-winning political reporter for the Washington Jewish Week, where he frequently broke national news, quotes numerous Iranian dissidents, "Iranian Dissidents Criticize Obama's Nuclear Diplomacy," <http://freebeacon.com/issues/iranian-dissidents-criticize-obamas-nuclear-diplomacy/>, 3/17/15, //VZ)

JERUSALEM—A group of Iranian dissidents and political prisoners have lashed out at the Obama administration, lambasting its ongoing diplomacy with Iran, according to two open letters sent to the White House in recent days. As Tehran and the United States move closer to a final deal aimed at stalling Iran's nuclear breakout time at around one year, opponents are stepping forward to register their skepticism and anger over the agreement, which they say does little to address the Islamic Republic's poor human rights record. In each letter, the dissidents—most of whom are currently political prisoners in Iran—criticize the White House for ignoring the issues of human rights and democracy in Iran as they push to finalize a deal with a regime that the dissidents says is murderous and untrustworthy. Iranian reformers and those seeking a change in the country's leadership say they do not view the agreement as representing the plurality of Iranians. "Any deal in which the real representatives of Iranian people are not present and human rights are ignored, is basically a deal between President Obama and Khamenei's agents, and Iranian people will not consider it to be legal," 21 Iranian political prisoners wrote in an open letter to Obama that was translated from Persian for the Washington Free Beacon. **As the Obama administration negotiates with Iran, the Islamic Republic continues to execute scores of political prisoners and dissidents each day**, the letter states. An American pastor, Saeed Abedini, also continues to be imprisoned in Iran. "In this chaos, Iranian people, human rights, and basic civil rights are absent without any representation," they write. **"During President Obama's negotiations for a profitable deal with the non-democratic Regime of Iran, the number of people executed increases everyday; freedoms of speech, religion, women, and journalists are restricted more and more, and civil, labor, and political associations are suppressed heavily."** On Sunday, another Iranian dissident currently in jail for leading protests against the regime sent his own letter to Obama. Heshmat Tabarzadi says that the Obama administration has been ignoring human rights issues in order to placate the Islamic Republic in talks. "When the people of Iran asked you to support them against the tyranny of the Shia clerics over five years ago you, the president of the most powerful country on earth, were secretly writing letters to the dictator of Iran," he writes in the letter, which was smuggled out of Iran by human rights activists and provided to the Foundation for Democracy in Iran, an advocacy group. Obama's outreach has only empowered Ali Khamenei, Iran's supreme leader, writes Tabarzadi, who says he shares a prison cell with Saeed Abedini. "In June 2009, as Khamenei ruthlessly ordered his paramilitary forces to kill people on the streets and on university campuses, imprisoning and torturing journalists, intellectuals, the young and the old mercilessly, your friendly communications with the tyrant of Iran continued in the name of the people of the United States, ignoring the human rights of the people of Iran," the letter states. "You helped Khamenei to continue his Islamic tyranny in the name of Allah and Islam." "The Islamic clerics have taken our nation hostage to their fanatical Islamic tyranny," he adds. "In 2009 when the people of Iran loudly and clearly asked for your support for their freedom and sovereignty, you ignored us and empowered the tyrants to

imprison, torture, and kill us.” Nations such as the United States should be supporting “the People of Iran, not the tyrants,” according to Tabarzadi. Obama has intimidated Americans into going along with his diplomacy by forwarding “misinformation” about the talks, Tabarzadi writes.

No Push: Saudi Arabia

Obama not pushing for human rights in Saudi Arabia – Middle East Stability and relations

McKelvey 1/27, (Tara McKelvey, BBC News, quotes US President Obama, "US-Saudi ties: Obama pursues stability, not human rights," <http://www.bbc.com/news/world-us-canada-30961918>, 01/27/15, //VZ)

Today as in years past, Americans value their ties with Saudi leaders, working closely with them on counterterrorism and intelligence issues. Not everything is perfect, though. The Saudis wish US officials would push harder for Syria President Bashar al-Assad's ouster, for instance. But overall, the US and Saudi Arabia have a shared history - and common goals. For these reasons Mr Obama and his advisors appear to have downplayed the issue of human rights during their visit, though the subject has been in the news. A Saudi blogger, Raif Badawi, was sentenced to weekly floggings recently, charged with "insulting Islam through electronic channels". The scheduled floggings have twice been postponed. In addition Saudi Arabia is a world leader in beheadings, according to Foreign Policy. Still these issues were not high on Mr Obama's agenda during this trip. By his own account he felt reluctant to press matters at this time. Talking about human rights makes some allies "uncomfortable," he explained on CNN. "It makes them frustrated." On his trip to Riyadh Mr Obama was accompanied by Secretary of State John Kerry and CIA Director John Brennan. Condoleezza Rice, who has served as secretary of state, and Brent Scowcroft, a former national security adviser, were also there. "The US has important relationships with lots of countries with which it has differences. China is one, Saudi Arabia is another," says Jon Alterman, the director of the Center for Strategic and International Studies' Middle East program. "I don't see that changing in the near future," he says. The Saudis play a key role in maintaining security in the region. Other countries have been rocked by chaos over the past several years, yet the political situation in Riyadh has remained largely unchanged. "Saudi Arabia is a status quo power," says Bruce Rutherford, an associate professor of political science at Colgate University. "The Saudis provide a rock of stability". The new king has been careful to explain what people could expect in the future. "We will continue adhering to the correct policies which Saudi Arabia has followed since its establishment," King Salman said in a speech broadcast on state television. In recent days US officials have seen people they've gotten to know, such as Prince Mohammed bin Nayef, the interior minister, move up. He is now deputy crown prince and has been formerly placed in the line of succession. This helps to ensure continuity within Saudi Arabia - and also with US-Saudi relations. Prince Mohammed bin Nayef, a graduate of Lewis & Clark College in the US state of Oregon, has "close ties" to White House officials, according to the New York Times. Yet continuity makes it harder for US officials to push for a new approach to human rights. Prince Mohammed bin Nayef, for example, takes a hard line against human-rights campaigners.

No Push: Bahrain

Bahrain is just one example of Obama's vanishing human rights campaign – Obama's words and actions on Human Rights are distinct

Abrams 2/27, (Elliott Abrams, Elliott Abrams is a senior fellow for Middle Eastern Studies at the Council on Foreign Relations in Washington, DC. He served as deputy assistant to the president and deputy national security advisor in the administration of President George W. Bush, where he supervised U.S. policy in the Middle East for the White House. Mr. Abrams was educated at Harvard College, the London School of Economics, and Harvard Law School. After serving on the staffs of Sens. Henry M. Jackson and Daniel P. Moynihan, he was an assistant secretary of state in the Reagan administration and received the secretary of state's Distinguished Service Award from Secretary George P. Shultz. In 2012, the Washington Institute for Near East Policy gave him its Scholar-Statesman Award. Mr. Abrams was president of the Ethics and Public Policy Center in Washington, DC, from 1996 until joining the White House staff. He was a member of the United States Commission on International Religious Freedom from 1999 to 2001 and chairman of the commission in the latter year, and in 2012 was reappointed to membership for another term. Mr. Abrams is also a member of the U.S. Holocaust Memorial Council, which directs the activities of the U.S. Holocaust Memorial Museum. He teaches U.S. foreign policy at Georgetown University's School of Foreign Service. Mr. Abrams joined the Bush administration in June 2001 as special assistant to the president and *senior director of the National Security Council for democracy, human rights, and international organizations*. From December 2002 to February 2005, he served as special assistant to the president and senior director of the National Security Council for Near East and North African affairs. He served as *deputy assistant to the president and deputy national security advisor for global democracy strategy from February 2005 to January 2009, and in that capacity supervised both the Near East and North African Affairs and the democracy, human rights, and international organizations directorates of the NSC*. He is the author of four books, *Undue Process* (1993), *Security and Sacrifice* (1995), *Faith or Fear: How Jews Can Survive in a Christian America* (1997), and *Tested by Zion: the Bush Administration and the Israeli-Palestinian Conflict* (2013); and the editor of three more, *Close Calls: Intervention, Terrorism, Missile Defense and "Just War" Today*; *Honor Among Nations: Intangible Interests and Foreign Policy*; and *The Influence of Faith: Religion and American Foreign Policy*. "How Obama Caved on Bahrain," <http://foreignpolicy.com/2015/02/27/how-obama-caved-on-bahrain-manama-human-rights/>, 2/27/15, //VZ)

Once upon a time, President Barack Obama's administration not only followed the crisis in **Bahrain closely, but spoke loudly about it**. American policy was clearly to press for a compromise between the Sunni royal family and the majority Shiite population. After all, the U.S. Fifth Fleet is based in Bahrain, allowing the United States to project its naval power across the Gulf, and roughly 8,500 Americans live there. Violence and instability in Manama are obviously something the United States wishes to avoid. **Way back in 2011, when the Arab Spring began and protests spread across the country, demanding more democracy and better representation for Shiites**, Obama himself pressed for change in Bahrain. In February 2011, as protesters massed in the tens of thousands at Manama's Pearl Roundabout, **the president issued a statement welcoming reform plans** — which, alas, were **never really carried through** — **announced by King Hamad bin Isa Al Khalifa**. Obama reaffirmed that it was the U.S. position

that Bahrain's stability would be ensured through "respecting the universal rights of the people of Bahrain and reforms that meet the aspirations of all Bahrainis." The king, however, answered Obama's call for reform with more repression. On March 14, he invited in troops from Saudi Arabia and the United Arab Emirates to help put down the protests. Thousands of security forces stormed the Pearl Roundabout demonstrations on March 16, clearing the protest camp and arresting its leaders. Two days later, the Pearl Monument at the center of the roundabout, which had become an icon of the protests, was demolished, and closed the area off to the public. In the aftermath of the crackdown, Obama's tone on Bahrain noticeably toughened. The message was clear: Stability must depend on respecting the rights of the people, not on foreign troops. When the president gave a major speech on the Middle East in May 2011, he was even more critical of Bahrain and its policy of repression: "We have insisted both publicly and privately that mass arrests and brute force are at odds with the universal rights of Bahrain's citizens, and ... such steps will not make legitimate calls for reform go away." Later in that speech, he said that Shiites "must never have their mosques destroyed in Bahrain," raising one of the most explosive aspects of how the Sunni government has attempted to suppress protests by the Shiite majority. In Obama's September 2011 address to the U.N. General Assembly, the tiny country got a whole paragraph. The president said that the United States "will continue to call on the government and the main opposition bloc — the Wifaq — to pursue a meaningful dialogue that brings peaceful change that is responsive to the people." He also said that reforms had been made, but that "more is required" — three words that amounted to a clear message that the monarchy was falling short. The White House was not about to let the king off the hook — and the president himself was raising the issue, not some spokesperson. **What has happened since then? Not much. There has been little or no progress in Bahrain — domestic tensions have instead risen higher.** Everything President Obama demanded has been refused. In June 2011, an independent commission was established to examine the events during the early months of the uprising, and in November it reported its findings to the king. Its recommendations, however, were roundly ignored: In 2012, the commission's chairman, law professor Cherif Bassiouni, delivered what George Washington University's Marc Lynch termed a "scathing critique of its failure to undertake any deeper political or social reforms." Bassiouni has given the government credit for taking a number of his recommendations — even as he laid out Manama's failings to resolve the underlying grievances of the protests. "There are very, very fundamental social and economic issues involved in the Shiite population that need to be addressed, and have not been addressed," he said in a 2014 interview. **"When you have people who do not have the hope of seeing themselves as equal citizens, as having equal opportunities in a particular country, living in mostly economic underprivileged areas in high-density population areas, they explode."** Others are even more critical. In May 2014, Human Rights Watch issued a report finding that, despite the king's promised reforms, **"members of security forces are rarely prosecuted for unlawful killings, including in detention, and the few convictions have carried extremely light sentences."** **The Bahraini government has also adopted new methods to silence opposition voices. In January 2015, it stripped 72 citizens of their nationality, rendering many of them stateless.** As Amnesty International pointed out, **the authorities included human rights and political activists on the same list as Bahrainis who allegedly went to fight with the Islamic State (IS). So the government of Bahrain is trying to equate peaceful protest with jihadi terrorism.** While the government is painting all protesters as "terrorists" who support the Islamic State, its own policy appears to be one of promoting sectarian divisions. As the human rights activist Ala'a Shehabi wrote in Foreign Policy last year, the monarchy has been "nurturing and nourishing extremist groups and their sectarian ideology to counter the so-called 'Shiite threat' posed by the pro-democracy uprising." For the government, Sunni solidarity appears to trump the need to act against Sunni extremism. "Bahrain's public stance on the war against IS contrasts sharply with its lack of action at home," Shehabi continued. **"So far there doesn't appear to have been any documented trial of any person on charges of IS-related terrorist activity despite government vows to pursue and monitor their activities."** All of this is not to offer roses to the conduct of the Bahraini opposition, which some observers see as having missed several opportunities to gain ground. It has said no when it should have said yes to occasional government offers, some close students of Bahraini politics have argued, and has a habit of seeing compromise as betrayal. Not every movement has a Nelson Mandela at its head: Many opposition leaders around the world could probably make a good case that the leadership of al-Wefaq, the main Shiite opposition group in Bahrain, has made tactical errors. Yet it is hard to agree to compromise when you or your family are in jail, being beaten, or being called a terrorist. In the case of al-Wefaq, its leader, Sheikh Ali Salman, has been thrown in jail yet again and charged with plotting a coup and inciting violence against the security forces. **As the Bahrain situation has worsened in the years since 2011, what has been the Obama administration's reaction? After the tough language and the demands made by the president in 2011, what has come next? The answer is: near silence — accompanied by steps that make it clear to the royal family that**

there will be no real American pressure for reform. After the firm language in his 2011 U.N. General Assembly speech, Obama's only mention of the worsening situation in his U.N. address two years later was a one-line reference to the need for efforts "to resolve sectarian tensions that continue to surface in places like Iraq, Bahrain, and Syria." No doubt the Bahraini monarchy was unhappy to see Bahrain compared to Iraq and Syria, but there was no blame — and no call for action. In 2012, the president didn't mention Bahrain in his U.N. speech, and that year the White House issued just one statement about Bahrain — from the press secretary rather than from the president. It blamed both the government and the opposition for the continuing violence, urged the government "to redouble its ongoing efforts to implement the recommendations of the Bahrain Independent Commission of Inquiry," and called for "genuine dialogue" and "meaningful reforms." We do not need to wonder whether the government of Bahrain viewed those comments in 2011 and 2012 as real pressure. In May 2011, it orchestrated a campaign against the human rights officer at the U.S. Embassy in Manama, Ludovic Hood, and the State Department pulled him out for his own safety. "It is unacceptable that elements within Bahrain would target an individual for carrying out his professional duties," said the State Department — but Bahrain paid no price. Throughout his term as ambassador to Bahrain, from 2011 until early this year, Tom Krajeski was subject to the same sort of abuse in the press. Krajeski was no hot-head, and said repeatedly that he placed the blame on the lack of political reconciliation in Bahrain on both sides. But the veteran diplomat's mere recognition of serious human rights and political problems in Bahrain was too much for the government, which made sure he was vilified in the press. In May 2013, the Bahraini cabinet approved a parliamentary proposal to "put an end to the interference of U.S. Ambassador Thomas Krajeski in Bahrain's internal affairs." Then in July 2014, Bahrain's government actually expelled U.S. Assistant Secretary of State for Human Rights Tom Malinowski for meeting with members of the country's political opposition — an extraordinary and unprecedented act for a U.S. ally to take. What price did Bahrain pay for this? Zero. It gets worse. An American citizen named Tagi Abdalla al-Maidan has been in jail in Bahrain since 2012. He's accused of violent acts, and the government claims he confessed; he denies the accusations and says the confession was obtained by torture. He was held in prison for almost an entire year before a court hearing, and then handed a 10-year prison sentence. Last year, the U.N. Working Group on Arbitrary Detention declared that the court had violated a whole series of substantive and procedural rights that rendered his imprisonment a violation of international and Bahraini law. What has the U.S. government reaction been to the imprisonment of one of its citizens in a faulty legal process? As CNN pointed out in November, the United States "has said little" about Maidan's case. State Department spokesman Jeff Rathke said that the United States was following the case closely, and that "this is a matter of ongoing concern." Were I in a foreign prison, those words — "this is a matter of ongoing concern" — would not seem to me a tough and energetic demand for my freedom. It's hard to believe the United States could not spring Maidan if it pushed hard enough. The United States maintains considerable leverage in Manama. Even a small drawdown of U.S. military personnel would reverberate loudly there, as would moving — or even announcing a study of moving — any piece of the U.S. military presence out of Bahrain. Perhaps more important, there's a great struggle over whose "narrative" will prevail in Bahrain: the government's, arguing that its crackdown is designed to oppose terrorism and maintain stability; or that of the opposition, arguing that the country is becoming increasingly repressive toward peaceful protests and human rights. If the United States were to side publicly, and loudly, with the opposition, the outcome of the argument would be affected. More public pressure might well force the royals to think harder about compromises, and strengthen the hand of those who are privately arguing for reform. Instead, the United States has not only remained largely silent on human rights abuses, but has acted in ways that can only convince the Bahraini government to ignore any quiet protests that are actually made. In 2012, when Congress objected to arms sales to Bahrain because of the repression there, the Obama administration used a loophole to continue the sales. As Foreign Policy reported, the State Department is required to formally notify Congress of any arms sales over \$1 million. According to a congressional source, rather than going through the notification process, the administration divided up an arms sales package into multiple sales, each of which was less than \$1 million — thereby dodging congressional oversight. That was 2012. In 2013, the Navy announced that it was adding five more coastal patrol ships to American forces in Bahrain. Last year, the Obama administration went forward with a more than half-billion-dollar expansion of the U.S. presence in Bahrain, which will cement the U.S. presence in the country for decades to come. Now, what signal does that send the royals? "With each passing day, the Bahrain government's self-fulfilling prophecy of a sectarian war is

becoming more and more the reality,” Reza Aslan wrote in 2013. “If that happens — if the Bahrain uprising descends into the kind of regional holy war between Sunni and [Shiite] — the United States will not be able to avoid the consequences.”

That message holds true for the U.S. Navy’s Fifth Fleet, which makes one wonder why it is smart to assume that the facilities the United States has in Bahrain will in fact be available — or safe to use — in the coming decades. Meanwhile, the announcement of the expansion can only be read one way by the Bahraini authorities: The American protests about human rights conditions are not serious. It didn’t have to be this way — nobody forced the United States to turn a blind eye to Bahrain’s explosive domestic situation. Consider an alternative path: Suppose a top-level messenger, such as the chief of naval operations or chairman of the Joint Chiefs of Staff, had been sent to Bahrain to say, “Look, I personally would like this base expansion. But there’s no way it’s going to happen until the repression stops. In fact, we are going to announce that naval facilities elsewhere in the Gulf will be examined for future expansion to replace Bahrain, because Bahrain is viewed as increasingly unstable. Guys, you’ve got three months to start showing us something.” Such a message — and if necessary, a public statement a few months later — would have had a huge impact. It would have shown the Bahraini government and its supporters the risks they face; it would have made the business community nervous, and perhaps more supportive of reform; and above all, it might have given additional ammunition to those in the royal family who favor reconciliation over repression.

Instead, the Obama administration is sending the clear message that its loud protests are over, the president won’t speak about Bahrain, and the monarchy can relax. In fact, no one should relax about Bahrain. It is on a path toward increasing instability, featuring growing Sunni extremism, growing Shiite outrage, and ever-widening sectarian divisions. The Fifth Fleet is a hostage, and the Obama administration is spending hundreds of millions of dollars there as if America’s welcome will be permanent. That’s a suspect assumption: As the majority of Bahrainis conclude that the United States is indifferent to the crackdown and siding with the most regressive elements of the royal family, support for the Fifth Fleet’s presence will start to disappear. As will Bahrain’s very sovereignty, as it is caught up in the regional rivalry between Iran and Saudi Arabia. Once upon a time, Bahrain was an outpost of civility and moderation in the Middle East. Now, it is coming to share the pathologies of its neighbors. That’s tragic, and it is in part the result of weak American policy. By placing security matters — Bahrain’s minuscule participation in the anti-Islamic State coalition and its hosting of the Fifth Fleet — above all other considerations, the Obama administration is putting that very security relationship at risk. Once upon a time, Bahrain was also an example of a sensible Obama human rights policy. Today, one can sadly say that it’s a good example of how that human rights policy has vanished into thin air.

HR Cred Low

U.S. Cred Low: China Report

Multiple issues undermine US HR cred

New York Times 6/26 (Michael Forsythe, “China Issues Report on U.S. Human Rights Record, in Annual Tit for Tat,” New York Times, June 26, 2015, <http://sinosphere.blogs.nytimes.com/2015/06/26/china-issues-report-on-u-s-human-rights-record-in-annual-tit-for-tat/>)//AG

Police brutality, racial discrimination, torture of terrorism suspects, horrifically overcrowded prisons, rising income inequality and endemic poverty. These are just some of the human rights abuses in the United States highlighted by China on Friday in response to the State Department’s annual human rights report. Beijing’s retort is an annual ritual that some might find almost too easy to dismiss. Those who try to equate what happens in the democratic United States with the repression of human rights and civil liberties in authoritarian China will be challenged by the State Department’s 148-page report on China, released on Thursday. But that doesn’t mean that China’s report, issued by the State Council, the country’s cabinet, doesn’t make for sobering reading. Citing American news reports, scholarly articles and government documents while adopting a format and tone similar to the State Department report, the Chinese report covers topics such as the death of Michael Brown in Ferguson, Mo., and the case of Tamir E. Rice, a 12-year-old in Cleveland who was shot by a police officer after he brandished what turned out to be a toy gun. “Racial bias in law enforcement and judicial system is very distinct,” said the Chinese report, titled “Human Rights Record of the United States in 2014.” “Compared with other ethnic groups, African-Americans are more likely to become victims of police shooting.” China’s government considers economic rights to be human rights, and the report takes aim at the rising income inequality in the United States; high poverty rates, especially for minorities; homelessness; and the increasing costs of higher education. The Chinese report liberally cites a December 2014 report from the Senate Intelligence Committee on the use of torture, listing techniques including “sleep deprivation, waterboarding, long-term solitary confinement, slamming prisoners’ heads against the wall, lashing, death threats and even the appalling ‘rectal rehydration.’ ” Still, the report’s statements that Americans “have increasingly lost confidence in electoral politics” and “a few interest groups with power were able to influence the government’s decision making” are bold criticisms coming from a country in which the Communist Party has a monopoly on political power. On Thursday, Human Rights Watch released a report detailing how some lawyers who represent clients in politically sensitive cases in China are physically assaulted. That a New York-based group, and not one based in Beijing, documented these abuses speaks to the awkwardness of the Chinese government taking on the role of human rights critic. China’s report drew on extensive reporting by the American news media and by government agencies, including revelations concerning the excessive use of force by the police, torture and the government’s bulk collection of data about United States citizens, issues that have been the subject of national debates and that have, in some cases, led to policy changes.

US HR cred low and empirically fails with China

Reuters 6/26 (Sui-Lee Wee, “China Attacks U.S. Human Rights Record in Annual Report,” Reuters, June 26, 2015,

<http://www.reuters.com/article/2015/06/26/us-china-usa-rights-idUSKBN0P60A820150626//AG>

China accused the United States on Friday of being "haunted by spreading guns" and racial discrimination, in its annual tit-for-tat rebuttal to U.S. criticism of China's human rights record. In a lengthy report carried by the official Xinhua news agency, the information office of the State Council, or cabinet, said the United States "violated human rights in other countries in a more brazen manner, and was given more 'red cards' in the international human rights field". Human rights have long been a source of tension between the world's two largest economies, especially since 1989, when the United States imposed sanctions on China after a bloody crackdown on pro-democracy demonstrators around Beijing's Tiananmen Square. On Thursday, the U.S. State Department released its annual report on human rights conditions in the world. In the China section of the report, it said repression and coercion were routine against activists, ethnic minorities and law firms that took on sensitive cases. Senior leaders in China periodically promise citizens democracy and human rights, but the last two years under President Xi Jinping's administration have been marked by a sweeping crackdown on dissidents and activists. China has long rejected criticism of its rights' record and has pointed to its success at lifting millions out of poverty. The State Council report was "an equal and mutually beneficial way of reciprocating" the United States, Chinese Foreign Ministry spokesman Lu Kang said at a daily briefing. The State Department report came in the same week that the United States and China held three days of high-level talks in Washington. The Chinese report, which was mostly compiled from U.S. media articles, said "racial discrimination has been a chronic problem in the United States human rights record", adding that the United States suppressed the voting rights of minorities. "In 2014, multiple cases of arbitrary police killing of African-Americans have sparked huge waves of protests, casting doubts on the racial 'equality' in the United States and giving rise to racial hatred factors," the report said. The report also criticized the United States for conducting surveillance on world leaders and civilians and for allowing a few interest groups to influence the government's decision-making.

US HR cred low- surveillance and racial discrimination undermine

Pakistan Today 6/26 (Agencies, "China Slams US Human Rights Record in Annual Report," Pakistan Today, June 26, 2015, <http://www.pakistantoday.com.pk/2015/06/26/foreign/china-slams-us-human-rights-record-in-annual-report//AG>)

China on Friday slammed the United States for a "terrible human rights record", denouncing it for police brutality and global surveillance a day after Washington criticised Beijing's own performance. In a report sourced mainly from US media, China said the US was "haunted by spreading guns, frequent occurrence of violent crimes, the excessive use of force by police". It said that US intelligence had used "indiscriminate" torture against terrorist suspects, while "violating human rights in other countries" with drone strikes and surveillance. The document is released each year by China the day after the US State Department issues its annual global human rights report. Beijing does not release rights reports on other countries. Unlike China the US is a multiparty democracy but the report declared: "Money is a deciding factor in the US politics, and the US citizens' political rights were not properly protected." China's ruling Communist Party has repeatedly imprisoned those who openly challenge its right to rule or have protested publicly. Its state-run media said in December that torture by Chinese police to extract confessions is "not rare", in an unusual admission. Friday's document, released by China's State Council, or cabinet, largely cited US domestic media websites, including the New York Times, which is blocked by Beijing as part of its Internet censorship regime. China said the US justice system suffered from "serious racial bias", highlighting police killings of several unarmed black men, which sparked protests over the

past year. The US has “grim problems of racial discrimination, and institutional discrimination against ethnic minorities continued”, it added. Washington’s own report on Thursday said that in China “repression and coercion were routine, particularly against organisations and individuals involved in civil and political rights advocacy”. It also noted Beijing’s continued repression of ethnic Uighurs and Tibetans. Human rights are a long-standing source of tensions between China and the US, which imposed sanctions on Beijing after the 1989 Tiananmen Square crackdown on pro-democracy protesters that left hundreds, by some estimates more than 1,000, dead. China often says that its rapid economic development in recent decades has led to a greater respect for human rights, and that other countries are not entitled to criticise its record.

U.S. Cred Low: CIA Torture

CIA torture scandal undermines US HR cred

Lord 14 (Kristin Lord, President and CEO of IREX, "Soft Power Outrage," December 23, 2014, <http://foreignpolicy.com/2014/12/23/soft-power-outrage/>)/AG

The release of a long-awaited report by the U.S. Senate Select Committee on Intelligence on the CIA's secret detention and interrogation program dealt yet another blow to the United States' moral authority and its credibility as a defender of human rights around the globe. It also begs the question: How much damage must the United States suffer before it learns to take soft power more seriously and, finally, learn to use it more proactively? To understand the immediate damage done to U.S. influence, look no further than the commentary surrounding the report's release. According to the Washington Post, the state-run Chinese news service Xinhua editorialized that "America is neither a suitable role model nor a qualified judge on human rights issues in other countries," while a pro-government television commentator in Egypt observed, "The United States cannot demand human rights reports from other countries since this [document] proves they know nothing about human rights." The Islamic State and other extremists joined the propaganda gold rush. One tweet, quoted in a report from the SITE Intelligence Group, pointed to the audacity of the United States lecturing Muslims about brutality, adding, "Getting beheaded is 100 times more humane, more dignified than what these filthy scumbags do to Muslims." Such reactions are galling and they do real harm to U.S. credibility. But the fault lies not with those who released the report, as some critics argue, but with those who permitted and perpetrated acts of torture, those who lied about it to America's elected representatives, and those who willfully kept the president and senior members of the Bush administration in the dark. Their actions undermined not only American values, but also American influence and national security interests. In the words of a former prisoner of war, Sen. John McCain (R-Ariz.), the actions laid out in the Senate report "stained our national honor" and "did much harm and little practical good."

US HR cred low- CIA torture

HRW 6/25 (Coalition statement to the Human Rights Council by the ACLU, CELS, Conectas Direitos Humanos, and WOLA, "Letter from more than 100 groups to UN demanding accountability for US torture and other abuses," Human Rights Watch, June 25, 2015, <http://www.hrw.org/news/2015/06/25/letter-more-100-groups-un-demanding-accountability-us-torture-and-other-abuses>)/AG

Last December, the U.S. Senate Select Committee on Intelligence released the summary, findings and conclusions of its four-year investigation into the Detention and Interrogation Program operated by the Central Intelligence Agency (CIA). Since then, the international human rights community has reiterated the call for full transparency about and accountability for this unlawful program, in which systematic human rights violations, including the crimes under international law of torture and enforced disappearance were committed. Last March, more than 20 human rights groups called on the Council to take action and demand that the United States fulfill its international human rights obligations on truth, accountability and remedy, including by appointing a special prosecutor to conduct a comprehensive and credible criminal investigation of alleged serious crimes described in the report and to establish a special fund to compensate victims. Last month, during the United States' UPR session, a significant number of Member-States joined civil society's call and raised the issue of accountability and reparations for the use of torture and other human rights violations in the context of U.S. counter-terrorism policies and practices. They also emphasized the need to end indefinite detention and

close the Guantánamo detention facility, one of the remaining examples of the unlawful actions taken in the name of national security since the attacks of 11 September 2001. Delivering justice for the victims and ending indefinite detention in Guantánamo are both issues that still require more decisive and urgent action from the Obama administration. On 26 June, the world will mark the International Day in Support of Victims of Torture. The U.S. government was a strong supporter of the adoption of the UN Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (UNCAT), which is commemorated every year on this day. The United States is also a generous contributor to the U.N. Voluntary Fund for Victims of Torture. But the U.S.'s failure to hold accountable those responsible for the CIA program of torture and enforced disappearance, to ensure the victims' rights to truth and reparations, and to take other actions to ensure non-repetition of these heinous crimes leaves the U.S. in violation of its own obligations under UNCAT and other international instruments and is a serious blow to the international human rights system, in general, and to the global effort to eradicate torture and enforced disappearance, in particular. During its next session, the Council will adopt the Working Group report on the U.S. UPR. We call on the Council to send a strong message against impunity for torture and enforced disappearances and demand that the United States take measures to meet the full spectrum of its obligations under international law to ensure accountability, transparency, reparations and non-repetition, including declassification of the full Senate report on the CIA detention program, independent comprehensive criminal investigation, and the issuing of apologies and compensation to victims of enforced disappearance, torture or other cruel, inhuman or degrading treatment. Continued impunity is a dark chapter in the history of the United States that threatens to undermine the universally-recognized prohibition against torture and other abusive treatment, and sends the dangerous message to U.S. and foreign officials that there will be no consequences for future abuses. Other governments implicated in the CIA torture program must also be held accountable and are obligated to conduct independent investigations, hold perpetrators accountable, and provide effective remedies to victims of torture, enforced disappearance and other human rights violations. We know from the experiences of civil society groups and survivors of torture around the world that the struggle for accountability for human rights violations and the search for truth can be a long and difficult journey. Yet the United States has much to gain from rejecting impunity, returning to the rule of law, and providing adequate redress to the dozens and dozens of people it so brutally abused.

U.S. hypocrisy has obliterated its credibility – China confirms

Blanchard '14 (Ben, correspondent at Reuters, primary areas of coverage are China's relations with Southeast Asia and Taiwan, the development of China's military, and ethnic minority issues in China, "China: Police brutality, racism, torture undermine US credibility on human rights", RawStory/Reuters, <http://www.rawstory.com/2014/12/china-police-brutality-racism-torture-underline-us-credibility-on-human-rights/>, 12/11/2014)//HW

China's foreign ministry said on Thursday that the United States has no right to confront other countries on their human rights records when it faces problems with racism and mistreatment of prisoners at home.[¶] Both U.S. Secretary of State John **Kerry** and U.S. ambassador to China Max Baucus **issued statements on Wednesday to mark International Human Rights Day in which they mentioned cases such as the imprisoned Chinese Nobel laureate Liu Xiaobo.**[¶] **Chinese Foreign Ministry spokesman Hong Lei said it was hypocritical of the United States to do this considering its own poor record, in apparent reference to recent protests over the killings of unarmed black men and a U.S. Senate report on the torture of detainees after the Sept. 11 attacks.**[¶] **"The United States has no right to pose as arbiters and at every turn point their fingers at other countries' human rights as racism and mistreatment of prisoners and other serious problems in the United States are facts now known to all,"** Hong told a daily news briefing.[¶] China and the United States often spar about each other's human rights records, and on Wednesday, **Beijing urged Washington to "correct its ways" following the torture report.**

U.S. Cred Low: NSA

US HR cred low- NSA spying angers allies and others on issues of international law

Petersen 13, (Rufus Petersen, "US under heavy criticism at home and abroad over NSA Cyber Spying Another total failure of Obama's to do the right thing."

<http://www.veteransnewsnow.com/2013/09/28/us-under-heavy-criticism-at-home-and-abroad-over-nsa-cyber-spying/>, 9/28/13, //VZ)

Many years ago there was joke that Disney had bought Michael Jackson when he was still just a kid and turned him into a robot. What else would explain his transformation from an innocent little black kid into a gradually whitened and plastic surgeried scarecrow dancing machine? Who bought Obama and turned him into a Zibot? That too was a pretty gradual and complete transformation. PRESS TV reports a group of U-S senators have prepared a bill in a bid to put an end to the National Security Agency's cyber spying on Americans. The lawmakers say the N-S-A's collecting of phone records and data on Internet usage has cost the United States economically and angered its allies. They argue that their bill is an appropriate response to disclosures this past summer about the controversial surveillance programs. Newly-released documents show the N-S-A spied on civil rights icon Martin Luther King, heavyweight boxer Muhammad Ali, and even a number of senators. The U-S administration is under heavy criticism— both at home and abroad— over its vast espionage program that includes many of Washington's close allies. The White House, however, continues to argue that the N-S-A programs are crucial in combating terrorism. I must admit, I know little about the bill, but new revelations about the extent of NSA spying seem to emerge every day in the MSM- "encryption" as it's been known is no longer safe from NSA probing. As a non-techie, I don't pretend to understand the full extent of these disclosures, but the idea of built-in backdoors is now being discussed openly. It's like having a new lock installed in your front door while a copy of your key has been kept, and possibly distributed, by someone else. One copy of that key can easily be many copies, so the potential is there for foreign governments (or any criminal or group of them) to gain access to your private information. This goes for Big Business as well, making the implications of the scale of theft staggering- and not just for businesses but whole economies. Commentator James Morris has a good grasp of what's going on regarding the nexus of where the technology meets the political issues which surround it. What he neglects to say but even I as a layman know is that we are late getting here: US senators prepare bill to end NSA cyber spying on Americans. Brazil's President Dilma Rousseff's obviously an impressive emerging figure in the world of Latin American politics, and now she's on the world stage with a message which must be heard. She's actually acting like the leader of her own country, and that's refreshing for more than just Brazilians to see. Dilma Rousseff's launched a blistering attack on US espionage at the UN general assembly, accusing the NSA of violating international law. Her scathing speech to UN general assembly is the most serious diplomatic fallout over revelations of US spying.

US espionage has caused backlash from former allies like Brazil and others – privacy concerns and violations of international law

Borger 13, (Julian Borger, The Guardian, quotes Dilma Rousseff, Brazil's President, "Brazilian president: US surveillance a 'breach of international law,'"

<http://www.theguardian.com/world/2013/sep/24/brazil-president-un-speech-nsa-surveillance>, 9/24/13, //VZ)

Brazil's president, Dilma Rousseff, has launched a blistering attack on US espionage at the UN general assembly, accusing the NSA of violating international law by its indiscriminate collection of personal information of Brazilian citizens and economic espionage targeted on the country's

strategic industries. Rousseff's angry speech was a direct challenge to President Barack Obama, who was waiting in the wings to deliver his own address to the UN general assembly, and represented the most serious diplomatic fallout to date from the revelations by former NSA contractor Edward Snowden. Rousseff had already put off a planned visit to Washington in protest at US spying, after NSA documents leaked by Snowden revealed that the US electronic eavesdropping agency had monitored the Brazilian president's phone calls, as well as Brazilian embassies and spied on the state oil corporation, Petrobras. "Personal data of citizens was intercepted indiscriminately. Corporate information – often of high economic and even strategic value – was at the centre of espionage activity. "Also, Brazilian diplomatic missions, among them the permanent mission to the UN and the office of the president of the republic itself, had their communications intercepted," Rousseff said, in a global rallying cry against what she portrayed as the overweening power of the US security apparatus. "Tampering in such a manner in the affairs of other countries is a breach of international law and is an affront of the principles that must guide the relations among them, especially among friendly nations. A sovereign nation can never establish itself to the detriment of another sovereign nation. The right to safety of citizens of one country can never be guaranteed by violating fundamental human rights of citizens of another country." Washington's efforts to smooth over Brazilian outrage over NSA espionage have so far been rebuffed by Rousseff, who has proposed that Brazil build its own internet infrastructure. "Friendly governments and societies that seek to build a true strategic partnership, as in our case, cannot allow recurring illegal actions to take place as if they were normal. They are unacceptable," she said. "The arguments that the illegal interception of information and data aims at protecting nations against terrorism cannot be sustained. Brazil, Mr President, knows how to protect itself. We reject, fight and do not harbour terrorist groups," Rousseff said. "As many other Latin Americans, I fought against authoritarianism and censorship and I cannot but defend, in an uncompromising fashion, the right to privacy of individuals and the sovereignty of my country," the Brazilian president said. She was imprisoned and tortured for her role in a guerilla movement opposed to Brazil's military dictatorship in the 1970s. "In the absence of the right to privacy, there can be no true freedom of expression and opinion, and therefore no effective democracy. In the absence of the respect for sovereignty, there is no basis for the relationship among nations." Rousseff called on the UN oversee a new global legal system to govern the internet. She said such multilateral mechanisms should guarantee the "freedom of expression, privacy of the individual and respect for human rights" and the "neutrality of the network, guided only by technical and ethical criteria, rendering it inadmissible to restrict it for political, commercial, religious or any other purposes. "The time is ripe to create the conditions to prevent cyberspace from being used as a weapon of war, through espionage, sabotage and attacks against systems and infrastructure of other countries," the Brazilian president said. As host to the UN headquarters, the US has been attacked from the general assembly many times in the past, but what made Rousseff's denunciation all the more painful diplomatically was the fact that it was delivered on behalf of large, increasingly powerful and historically friendly state.

PRISM destroyed soft power / credibility

Migranyan 13 (Andranik is the director of the Institute for Democracy and Cooperation in New York. He is also a professor at the Institute of International Relations in Moscow, a former member of the Public Chamber and a former member of the Russian Presidential Council. "Scandals Harm U.S. Soft Power," 2013, <http://nationalinterest.org/commentary/scandals-harm-us-soft-power-8695>)

For the past few months, the United States has been rocked by a series of scandals. It all started with the events in Benghazi, when Al Qaeda-affiliated terrorists attacked the General Consulate there and murdered four diplomats, including the U.S. ambassador to Libya. Then there was the scandal exposed when it was revealed that the Justice Department was monitoring the calls of the Associated Press. The Internal Revenue Service seems to have targeted certain political groups. Finally, there was the vast National Security Agency apparatus for monitoring online activity revealed by Edward Snowden. Together, these events provoke a number of questions about the path taken by contemporary Western societies, and especially the one taken by America. Large and powerful institutions, especially those in the security

sphere, **have become unaccountable to the public**, even to representatives of the people themselves. Have George Orwell's cautionary tales of total government control over society been realized?¶ At the end of the 1960s and the beginning of the 1970s, my fellow students and I read Orwell's 1984 and other dystopian stories and believed them to portray fascist Germany or the Soviet Union—two totalitarian regimes—but today it has become increasingly apparent that Orwell, Huxley and other dystopian authors had seen in their own countries (Britain and the United States) certain trends, especially as technological capabilities grew, that would ultimately allow governments to exert total control over their societies. The potential for this type of all-knowing regime is what Edward Snowden revealed, confirming the worst fears that the dystopias are already being realized.¶ **On a practical geopolitical level, the spying scandals have seriously tarnished the reputation of the United States. They have circumscribed its ability to exert soft power;** the same influence that made the U.S. model very attractive to the rest of the world. This former lustre is now diminished. **The blatant everyday intrusions** into the private lives of Americans, **and violations of individual rights and liberties by runaway, unaccountable U.S. government agencies, have deprived the United States of its authority to dictate** how others must live and **what others must do**. Washington can no longer lecture others **when its very foundational institutions and values are being discredited**—or at a minimum, when all is not well “in the state of Denmark.”¶ Perhaps precisely because not all is well, many American politicians seem unable to adequately address the current situation. Instead of asking what isn't working in the government and how to ensure accountability and transparency in their institutions, they try, in their annoyance, to blame the messenger—as they are doing in Snowden's case. Some Senators hurried to blame Russia and Ecuador for anti-American behavior, and threatened to punish them should they offer asylum to Snowden.¶ These threats could only cause confusion in sober minds, as every sovereign country retains the right to issue or deny asylum to whomever it pleases. In addition, the United States itself has a tradition of always offering political asylum to deserters of the secret services of other countries, especially in the case of the former Soviet Union and other ex-socialist countries. In those situations, the United States never gave any consideration to how those other countries might react—it considered the deserters sources of valuable information. As long as deserters have not had a criminal and murderous past, they can receive political asylum in any country that considers itself sovereign and can stand up to any pressure and blackmail.¶ Meanwhile, **the hysteria of some politicians**, if the State Department or other institutions of the executive branch join it, **can only accelerate the process of Snowden's asylum. For any country he might ask will only be more willing to demonstrate its own sovereignty and dignity by standing up to a bully that tries to dictate conditions to it.** In our particular case, **political pressure on Russia** and President Putin **could turn out to be utterly counterproductive**. I believe that Washington has enough levelheaded people to understand that fact, and correctly advise the White House. The administration will need sound advice, as **many people in Congress fail to understand the consequences of their calls for punishment of sovereign countries or foreign political leaders that don't dance to Washington's tune.** Judging by the latest exchange between Moscow and Washington, it appears that the executive branches of both countries will find adequate solutions to the Snowden situation without attacks on each other's dignity and self-esteem. Russia and the United States are both Security Council members, and much hinges on their decisions, including a slew of common problems that make cooperation necessary.¶ Yet **the recent series of scandals has caused irreparable damage to the image and soft power of the United States.** I do not know how soon this damage can be repaired. But gone are the days when Orwell was seen as a relic of the Cold War, as the all-powerful Leviathan of the security services has run away from all accountability to state and society. **Today the world is looking at America—and its model for governance—with a more critical eye.**

China rejects US human rights legitimacy over PRISM

Durden 14 Cites Chinese report, “China Strikes Back At US "Human Rights Violations": Slams PRISM Spying, Droning, Gun Violence, Homelessness And Unemployment.” 02/28/2014.
<http://www.zerohedge.com/news/2014-02-28/china-strikes-back-us-human-rights-violations-slams-prism-spying-droning-gun-violenc>

Today, **China decided to strike back at the US with its own report on US "human rights."** In a nutshell, **China launches a full frontal attack on the hypocrisy of the US, saying that "posing as "the world judge of human rights," the U.S. government "made arbitrary attacks and irresponsible remarks" on the human rights situation in almost 200 countries and regions again in its just-released reports, the report says.** "However, the U.S. carefully concealed and avoided mentioning its own human rights problems," it adds. **The report calls the U.S. tapping program, code-named PRISM, which exercises long-term and vast surveillance both at home and abroad,**

"a blatant violation of international law" and it "seriously infringes on human rights." Hard to argue with that. Full report from Xinhua: [China on Friday responded to the United States criticism and irresponsible remarks of its human rights situation by publishing its own report on the U.S. human rights issues.](#) The Human Rights Record of the United States in 2013 was released by the Information Office of China's State Council, or the Cabinet, in response to the Country Reports on Human Rights Practices for 2013 issued by the U.S. State Department on Thursday. [China said in the report that there were still serious human rights problems in the U.S in 2013, with the situation in many fields even deteriorating. Posing as "the world judge of human rights," the U.S. government "made arbitrary attacks and irresponsible remarks" on the human rights situation in almost 200 countries and regions again in its just-released reports, the report says. "However, the U.S. carefully concealed and avoided mentioning its own human rights problems," it adds.](#)

U.S. Cred Low: Tsarnaev

US HR cred in question- Tsarnaev death penalty

The Globe and Mail 6/26 (Stephanie Nebehay, "UN human rights experts urge U.S. moratorium on death penalty," The Globe and Mail, Reuters, June 26, 2015, <http://www.theglobeandmail.com/news/world/un-human-rights-experts-urge-us-moratorium-on-death-penalty/article25144173/>)/AG

United Nations human rights experts appealed to the United States on Friday to impose a moratorium on the death penalty for federal crimes, including the sentence imposed on the Boston Marathon bomber, with a view to abolishing the practice. Dzhokhar Tsarnaev, 21, was moved on Thursday to a U.S. penitentiary in Florence, Colorado, home to the so-called "Supermax" unit that houses high-risk prisoners. The ethnic Chechen was transferred a day after a federal judge in Boston, Massachusetts, sentenced him to death by lethal injection for killing four people and injuring 264 in the April 2013 bombing and its aftermath with his late older brother. "This decision contradicts the trends towards abolishing the death penalty in the country in law and practice," U.N. special rapporteur on executions Christof Heyns and U.N. torture investigator Juan Mendez said in a joint statement. Tsarnaev's acts fall within the definition of "most serious crimes" to which the United Nations says the death penalty - if imposed at all - should be restricted. More than three-quarters of countries worldwide have abolished the death penalty in law or in practice, the experts said. There is "no proof" that the death penalty has a deterrent effect and many executions have resulted in "degrading spectacles," they added. "Especially if imposed for crimes motivated by ideological or religious considerations, this form of punishment plays into the hands of those who treat life as dispensable and encourage rather than discourage them," their statement said. Massachusetts abolished capital punishment for state crimes in 1984, it noted. "The decision of a federal jury to impose the death penalty for a crime committed in Massachusetts, where the death penalty has been abolished for decades, illustrates how out of place this form of punishment is," the U.N. experts said. Under international law a nation is accountable for all of its jurisdictions, according to Heyns and Mendez. "And there are concrete steps that the Federal Government could take, including a moratorium on the death penalty for federal crimes." Mendez accused the United States in March of stalling on his requests to visit its prisons, where 80,000 people are in solitary confinement, and to interview inmates on his terms. He has sought for more than two years to enter U.S. prisons, including maximum-security facilities, specifically ADX in Colorado where inmates include Oklahoma City bomber accomplice Terry Nichols, underwear bomber Umar Farouk Abdulmutallab and Unabomber Ted Kaczynski. U.S. human rights ambassador Keith Harper told a news briefing on June 11 that talks were "ongoing" with Mendez regarding a "robust and effective" visit. Harper, asked whether he expected the visit to take place this year, said: "We hope it will, yes."

U.S. Cred Low: Ferguson

Ferguson has destroyed U.S. credibility – international backlash

MacLeod and Leger '14 (Calum, Asia Correspondent for the newspaper USA Today, Donna, reporter covering breaking news, national and international crime and disasters at USA Today, "Countries scolded on human rights lash U.S. on Ferguson", USA Today, <http://www.usatoday.com/story/news/world/2014/08/24/ferguson-china-russia-world-media/14524517/>, 8/24/2014)//HW

BEIJING — Countries long the targets of U.S. scoldings for human rights abuses revel in the opportunity to call out Americans for the angry protests that have convulsed Ferguson, Mo., after the police shooting of an unarmed black teenager.¶State-run media in China air extensive and often-critical coverage of the events in Ferguson. Editorials have pointed out the hypocrisy of the United States criticizing China for its treatment of Tibetans and ethnic minorities while apparently committing abuses at home.¶"It's ironic that the U.S., with its brutal manner of assimilating minorities, never ceases to accuse China and countries like it of violating the rights of minorities," The Global Times wrote last week. The popular tabloid, published by the People's Daily, the main mouthpiece of China's ruling Communist Party, often takes a stridently nationalistic tone.¶Another state-run news agency, Xinhua, noted that police in the USA used rubber bullets and tear gas against protesters — tools Xinhua says are used only "under extreme caution in other countries, where police usually use riot shields and batons instead to reduce damage."¶Other countries usually at the pointed end of U.S. criticism, including Russia, Egypt and Iran, also condemned the police response in Ferguson.¶Russia's Foreign Ministry said in a statement last week that the United States needs to clean its own house if it wants to call itself a "bastion of human rights" that "declares its own 'exceptionalism.'"

U.S. Cred Low: WOT

****US HR cred low-double standards in War on Terror and promotion of security policies**

Babayan and Huber 12 Nelli, Senior Researcher and Lecturer, Center for Transnational, Foreign and Security Policy at Freie Universität Berlin; and Daniela, Researcher, Istituto Affari Internazionali. "Motioned, Debated, Agreed? Human Rights and Democracy Promotion in International Affairs." *Transworld*. Dec 2012. [Accessed 6/26/15 www.transworld-fp7.eu/wp-content/uploads/2013/01/TW_WP_06.pdf](http://www.transworld-fp7.eu/wp-content/uploads/2013/01/TW_WP_06.pdf)

The credibility of leading players in the fields of democracy and human rights promotion is one of the most debated issues regarding democracy and human rights promotion. The US and Europe have been called the "axis of double standards" by Al Jazeera. The issue has two dimensions. On the one hand, democracy and human promoters are often accused of own democratic deficits or violations of human rights standards. This became an issue especially in the peaking period of the "war on terror" in which not only the pictures of Abu Ghraib showed Western double standards regarding human rights, but in which democracy also started to deteriorate in Western democracies themselves due to new security legislation (Bigo 2010). On the other hand, the issue of double standards also refers to the observation that democracies tend to prioritize stability over democracy in their foreign policies. Both, the US and Europe, exhibit discrepancies in condemning human rights violations or promoting democracy depending whether they have strategic or energy interests in the given countries. Coupling close ties with autocratic regimes that help in the "war on terror" with a proactive democracy promotion policy, the George W. Bush Administration was accused of applying double standards (Carothers 2009b). Similarly, the EU has often expressed very strong criticism of the Lukashenka regime in Belarus, while frequently failing to condone similar developments in Azerbaijan or Kazakhstan, which are major partners in the EU's attempts to diversify its energy resources. The EU's sometimes "deliberately vague understandings" of democracy prompt claims that instead of being committed to democracy promotion, it "intends to adjust its promotion agenda to fit its own commercial or security interests" (Wetzell and Orbie 2012). Similar double standards can be found in US and EU policies in the Middle East and North Africa, where the authoritarian regimes had been successful in using the Western terrorism script to securitize Islamic opposition movements (Lia 1999; Joffé 2008). These movements perceive especially the EU as "fundamentally anti-Islamic" (Kausch and Youngs 2009: 969)

U.S. Cred Low: Hypocrisy

America is seen as hypocritical-pushing human rights in other nations while violating the same things

Jianting 14 Ding, translated by Yuzhi Yang & edited by Stephen Procter. "Let's See America's Real Face as a Human Rights Defender." 12/12/14.

<http://watchingamerica.com/WA/2014/12/19/lets-see-americas-real-face-as-a-human-rights-defender/>

No country's human rights record is flawless. However, the United States is used to standing on the moral high ground and habitually criticizing and commenting on the human rights issues of other countries and regions, while obscuring and not discussing its own human rights situation. Even as the prisoner abuse scandal worsened, the U.S. government still shamelessly tried to dictate for other countries. U.S. Secretary of State John Kerry and U.S. Ambassador to China Max Baucus released a statement on World Human Rights Day, expressing their concern for human rights in China. We know that a country's own people have the most right to speak about the situation, so how could we allow a country with a tattered record to be the arbitrator, and let it act like a saint, criticizing others? Ever since the People's Republic of China was founded, especially in the 30-plus years after its opening up and reforming, human rights in China have made great strides — a fact that anyone without any political prejudice can admit. The U.S. disregard for the truth and smearing of China could only expose its own hypocrisy and double-standard on human rights. The United States is a typical detractor on China's human rights, and it never sees, nor admits, its own shortcomings. The U.S. government has always used a double-standard, whether for human rights, counterterrorism, trade or other areas; it has always given itself the most leeway and harshly treated others. It can be said that the human rights defender mask the United States wears has long been shed, but the U.S. is still relaxed and willful. It will let domestic and international society keep on criticizing its record, while still sticking to the status quo, without any self-criticism and reflection, and continues to smear other countries from time to time. I wonder how the United States got its nerve and confidence, and what it's using to improve its international image and soft power? A country that cannot really understand the real meaning of human rights, nor see the improvement of other countries in the area, other than adding noncredible, negative feedback to other countries, can only bring disorder, conflict and instability to international society.

U.S. Cred Low: Misc

US Human rights record doesn't look great – surveillance techniques and empirics prove

HRW 14, (Human Rights Watch is an international non-governmental organization that conducts research and advocacy on human right and has won the Peabody award for Prestigious Journalism, "WORLD REPORT 2014," [//VZ](http://www.hrw.org/world-report/2014/country-chapters/united-states))

The United States has a vibrant civil society and media that enjoy strong constitutional protections. Yet its rights record is marred by abuses related to criminal justice, immigration, national security, and drug policy. Within these areas, victims are often the most vulnerable members of society: racial and ethnic minorities, immigrants, children, the elderly, the poor, and prisoners. Revelations in 2013 of extensive government surveillance and aggressive prosecutions of whistleblowers raised concerns about infringement of privacy rights and freedom of expression, generating a firestorm of international protest against US practices. Federal policymakers proposed reforms to harmful longstanding immigration and sentencing laws and policies. The outcome of these initiatives was uncertain at time of writing. A renewed commitment by President Barack Obama to close the Guantanamo Bay detention facility remained unfulfilled. Lack of transparency made it impossible to assess the implementation of promised reforms to the practice of "targeted killings" abroad, including through use of unmanned aerial drones; new information on individual strikes found instances of violations of international humanitarian and human rights law.

HR Cred low-international panels find issues

Associated Press 14 "UN raps US civil rights record on secret programs." 03/27/14.
www.washingtonexaminer.com/article/feed/2125909

GENEVA (AP) — A U.N. panel has found serious shortcomings in the United States' civil rights record, with experts citing Thursday a lack of adequate oversight and transparency in national security programs dealing with everything from electronic surveillance to targeted drone killings and secret detentions. The report by the U.N. Human Rights Committee, a panel of 18 independent experts from different countries, found general improvement in some areas — such as the handling of rights of indigenous peoples and the Guantanamo Bay prisoners — since the last such review in 2006. And while the panel's experts made clear they generally view the U.S. as a promoter of human rights, they also found major concerns while examining compliance with the International Covenant on Civil and Political Rights. "It's one of the top concerns, the lack of transparency, secrecy," committee member Walter Kaelin, a prominent Swiss legal expert, told The Associated Press about the National Security Agency electronic surveillance, use of drone strikes against al-Qaida and the Taliban and CIA secret rendition programs closed in 2012. "We all know that the rights of individuals are very well protected in the United States, and we are not second-guessing that. But there are for certain serious issues, yes." Some of the areas dealt with by the panel include the prolonged solitary confinement of prisoners, sentencing of life without parole for juvenile offenders, racial disparities in the use of the death penalty and laws hindering felons from voting. Other areas include solitary confinement, racial profiling, gun violence, excessive use of force by law enforcement officials and domestic violence. Kaelin said there were concerns about the federal government's inability to ensure compliance on state and local levels, and its long-held views the treaty only applies to its actions on U.S. soil but can't be used as the basis for any U.S. court action.

US HR Cred low-policies don't meet international standards

Dakwar, 14 Jamil, Director, ACLU Human Rights Program. "U.S. Human Rights Record Undergoes International Scrutiny." 3/9/14. <https://www.aclu.org/blog/us-human-rights-record-undergoes-international-scrutiny>

The ACLU submitted a shadow report to the committee highlighting examples of accountability gaps between U.S. human rights obligations and current law, policy, and practice. Although the U.S. human rights record has shown marked improvement since its last review by the committee in 2006, most notably in the areas of LGBT rights and enforcement of civil rights by the Department of Justice, U.S. laws and policies remain out of step with international human rights law in many areas. In addition, the ACLU provided an update to the issues covered in our September submission to the committee, which addresses serious rights violations that have emerged in recent months. The report covers: Anti-Immigrant Measures at the State and Federal Levels U.S.-Mexico Border killings and Militarization of the Border, Solitary Confinement The Death Penalty Accountability for Torture and Abuse During the Bush Administration Targeted Killings NSA Surveillance Programs More than ever, the U.S. is facing an uphill battle to prove its bona fides on human rights issues. The United States is not only seen as a hypocrite, resisting demands to practice at home what it preaches abroad, it is now increasingly seen as a violator of human rights that is setting a dangerous precedent for other governments to justify and legitimize their own rights' violations.

US Human Rights record under scrutiny-international committees

Zamani 14 Nahal, Advocacy Program Manager, Center for Constitutional Rights. "From Stop-and-Frisk to Guantánamo: US Human Rights Record Under Scrutiny at UN." Huffington Post. April 2014. ccrjustice.org/home/press-center/ccr-news/stop-and-frisk-guant-namo-us-human-rights-record-under-scrutiny-un

The two-day grilling strongly condemned the rights abuses that CCR had highlighted, and many others that the U.S. government has either failed to address or openly sanctioned, as in the case of detentions and force-feedings at Guantánamo, immigration detention quotas, and drone strikes. In particular, the committee highlighted the cases of our Guantánamo clients Tarik Ba Odah and Djamel Ameziane. Mr. Ba Odah has been on an uninterrupted hunger strike for 7 years and is force-fed daily by guard staff. He is one of the 56 Yemenis who have been cleared for release for years but remain detained because of their citizenship. Mr. Ameziane was forcibly repatriated to Algeria last December after nearly 12 years of detention without charge. On the stop-and-frisk front, the committee framed the issue as a violation of Article 12 of the ICCPR on the right to freedom of movement and pushed the U.S. government to clarify its position on the practice, noting that a U.S. federal judge has already ruled the program was implemented in a racially discriminatory manner. It was particularly rewarding to see the committee's understanding of this situation match the experiences of affected communities in New York City who feel under siege by the police in their own neighborhoods and reflect former NYPD Commissioner Ray Kelly's statement that he "targeted and focused on [Blacks and Latinos] because he wanted to instill fear in them that every time that they left their homes they could be targeted by police." The committee's acknowledgment shows that the voices of those affected by stop-and-frisk have been heard far and wide. When the U.S. delegation had its turn to respond, its responses were heavy on lip-service to the committee's thorough questioning but light on substance. The delegation insisted that the U.S. government is "continually striving to improve" on many of the issues highlighted and largely stuck to its rhetoric on the importance of the ICCPR, while continuing to hold that the treaty does not apply to U.S. actions overseas. The U.S. mentioned the "exceptional healthcare" Guantánamo detainees receive but refused to address the committee's questions about the force-feedings at the prison, only stating that it is U.S. policy to "support the preservation of life in a humane manner." Similarly, the delegation told the committee that President Obama had lifted his self-imposed ban on repatriations to Yemen last year but did not explain why zero Yemenis have been transferred since. On drone strikes, ignoring the well-documented impact of these practices on civilians, the delegation simply expected the committee to take its word that the attacks are conducted in compliance with the fundamental principles of humanitarian law and that President Obama uses them only when there are no other reasonable alternatives. On stop-and-frisk, they took no position on the NYPD's implementation of the program but stated that the DOJ supports the appointment of a court-monitor as part of the remedies

ordered in Floyd v. City of New York. On specific requests, like declassifying the U.S. Senate's torture report, the delegation simply stayed quiet. The U.S. government's responses show the Obama administration is likely to finish its second term without ever truly "walking its talk" as a human rights leader. But the tough questioning was an indication of how far activists across the U.S. have come in bringing these human rights abuses to the international stage. Public scrutiny from international bodies like the Human Rights Committee helps advocates like us fight for accountability in all possible venues, increase public awareness of these issues, and create new opportunities for real change. Stay tuned for when the committee issues its concluding observations in the coming week.

US human rights credibility down-countries criticizing US & focus shifting from foreign to domestic focus

Weisbrot 9 Mark, co-director, Centre for Economic and Policy Research. "Washington's Lost Credibility on Human Rights." The Guardian. 3/11/09. Accessed 6/26/15
<http://www.cepr.net/publications/op-eds-columns/washingtons-lost-credibility-on-human-rights>

The U.S. State Department's annual human rights report got an unusual amount of criticism this year. This time the center-left coalition government of Chile was notable in joining other countries such as Bolivia, Venezuela, and China – who have had more rocky relations with Washington – in questioning the "moral authority" of the U.S. government's judging other countries' human rights practices. It's a reasonable question, and the fact that more democratic governments are asking it may signal a tipping point. Clearly a state that is responsible for such high-profile torture and abuses as took place at Abu Ghraib and Guantanamo, the regular killing of civilians in Afghanistan and Iraq, and has reserved for itself the right to kidnap people and send them to prisons in other countries to be tortured ("extraordinary rendition") has a credibility problem on human rights issues. Although President Obama has pledged to close down the prison at Guantanamo and outlaw torture by U.S. officials, he has so far decided not to abolish the practice of "extraordinary rendition," and is escalating the war in Afghanistan. But this tipping point may go beyond any differences – and they are quite significant – between the current administration and its predecessor. In the past, Washington was able to position itself as an important judge of human rights practices despite being complicit or directly participating in some of the worst, large-scale human rights atrocities of the post-World War II era – in Vietnam, Indonesia, Central America, and other places. This makes no sense from a strictly logical point of view, but it could persist primarily because the U_{nited} S_{tates} was judged not on how it treated persons outside its borders but within them. Internally, the U_{nited} S_{tates} has had a relatively well-developed system of the rule of law, trial by jury, an independent judiciary, and other constitutional guarantees (although these did not extend to African-Americans in most of the Southern United States prior to the 1960s civil rights reforms). Washington was able to contrast these conditions with those of its main adversary during the Cold War – the Soviet Union. The powerful influence of the U_{nited} S_{tates} over the international media helped ensure that this was the primary framework under which human rights were presented to most of the world. The Bush Administration's "shredding of the Constitution" at home and overt support for human rights abuses abroad has fostered not only a change in image but perhaps the standards by which "the judge" will henceforth be judged. One example may help illustrate the point: China has for several years responded to the State Department's human rights report by publishing its own report on the U_{nited} S_{tates}. It includes a catalogue of social ills in the United States, including crime, prison and police abuse, racial and gender discrimination, poverty and inequality. But the last section is entitled "On the violation of human rights in other nations." The argument is that the abuse of people in other countries – including the more than one million people who have been killed as a result of the United States' illegal invasion and occupation of Iraq – must now be taken into account when

evaluating the human rights record of the United States. With this criterion included, a country such as China – which does not have a free press, democratic elections, or other guarantees that western democracies treasure – can claim that it is as qualified to judge the United States on human rights as vice versa.

Low democracy promotion support-successful autocratic states & failed Iraq war

Babayan and Huber 12 Nelli, Senior Researcher and Lecturer, Center for Transnational, Foreign and Security Policy at Freie Universität Berlin; and Daniela, Researcher, Istituto Affari Internazionali. "Motioned, Debated, Agreed? Human Rights and Democracy Promotion in International Affairs." *Transworld*. Dec 2012. Accessed 6/26/15

www.transworld-fp7.eu/wp-content/uploads/2013/01/TW_WP_06.pdf

Human rights, as has been pointed out above, are less contested than “democracy” and relatively well settled in international law. Nonetheless, also the concept of the universality of human rights has been challenged by the Asian value debate. Democracy promotion as a world value (McFaul 2005) has been challenged by several trends. Many states liberalized economically without democratizing (Gat 2007; Bremmer 2009), while many new democracies performed badly. Even though democracies are in general better performers than autocracies, they are nonetheless outrun economically and in terms of welfare by a few successful autocracies such as Singapore or Malaysia (Saxer 2009: 3), making these states another model to follow. Furthermore, democracy promotion is also countered by possible autocracy promotion (Burnell 2010; Burnell and Schlumberger 2010), given China’s development without democratization and Russia’s fall back into semi-authoritarianism. China and Russia exhibit degrees of normative foreign policy behaviour, even if norms and normative behaviour are interpreted differently than in the US and Europe (Tocci and Manners 2008). China, for example, perceives the Arab Spring as a chance to spread its developmental approach to the Arab world (Liu 2013). Finally, also the Iraq war harmed democracy promotion as a world value. Whitehead claims that it was a “pivotal case,” which undermined the international consensus on democracy promotion and also damaged the legitimacy of democracy promotion by countries and international institutions which had not participated in it. Democracy promotion, above all in the Arab world, became associated with occupation, war and torture, followed by disillusionment with democracy promotion and the Western liberal agenda (Gray 2007; Kagan 2008)

Countries Block HR Now

Uniq: LL

A laundry list of countries reject US HR criticism- Ferguson

MacLeod and Leger 6/25, (Calum MacLeod and Donna Leinwand Leger, USA Today,

“Countries scolded on human rights lash U.S. on Ferguson,”

<http://www.usatoday.com/story/news/world/2014/08/24/ferguson-china-russia-world-media/14524517/>, 6/25/15, //VZ)

BEIJING — **Countries long the targets of U.S. scoldings for human rights abuses revel in the opportunity to call out Americans for the angry protests that have convulsed Ferguson, Mo.,** after the police shooting of an unarmed black teenager. **State-run media in China air extensive and often-critical coverage of the events in Ferguson. Editorials have pointed out the hypocrisy of the United States criticizing China for its treatment of Tibetans and ethnic minorities while apparently committing abuses at home.** "It's ironic that the U.S., with its brutal manner of assimilating minorities, never ceases to accuse China and countries like it of violating the rights of minorities," The Global Times wrote last week. The popular tabloid, published by the People's Daily, the main mouthpiece of China's ruling Communist Party, often takes a stridently nationalistic tone. Another state-run news agency, Xinhua, noted that police in the USA used rubber bullets and tear gas against protesters — tools Xinhua says are used only "under extreme caution in other countries, where police usually use riot shields and batons instead to reduce damage." **Other countries usually at the pointed end of U.S. criticism, including Russia, Egypt and Iran, also condemned the police response in Ferguson. Russia's Foreign Ministry said in a statement last week that the United States needs to clean its own house if it wants to call itself a "bastion of human rights" that "declares its own 'exceptionalism.'** " "I would like to advise the American leaders to pay more attention to restoring order in their country before imposing its dubious experience on other states," the Foreign Ministry said. **Ayatollah Ali Khamenei, Iran's supreme leader and religious authority, has tweeted regularly in English with the hashtag #Ferguson to chide the United States over human rights abuses.** "Today the world is a world of tyranny and lies," he wrote. "The flag of #humanrights is borne by enemies of human rights w/US leading them! #Ferguson." **A spokesman for Egypt's Foreign Ministry urged the United States last week to exercise "restraint" and to respect the rights of people who wanted to peaceably assemble in Ferguson.** The United States has repeatedly criticized Egypt for cracking down on political protests. **The protests in Ferguson have gotten widespread coverage in Chinese media. One commentary in Xinhua appeared under the headline "The shadow below the Statue of Liberty" and urged the United States to turn its critical eye on itself.** "Facing this notorious record, when **America directs her torch to check on the morality and human rights situation in other countries, it's time for her to shine it on herself,**" Xinhua wrote. The news agency reported that a human rights society in **China urged the United States to "correct its double standards on human rights" and "reflect on its finger pointing over other countries' human rights records."**

China resisting US democracy promotion -cracking down on dissent and financial transactions

Chen and Kinzelbach 15 Dingding, Assistant professor of Government and Public Administration, University of Macau and Katrin, Associate director, Public Policy Institute. "Democracy Promotion and China: Blocker or Bystander?" *Democratization*. 03/05/15. Accessed 6/24/15. <http://dx.doi.org/10.1080/13510347.2014.999322>

In the period covered by this special issue (2011–2014), pro-democracy activism in China has been small in scale overall and only loosely organized. At the same time, the resilience of authoritarian rule in China has been tested by economic development trends, changes in Chinese political culture, competition among Chinese leaders, and the effects of globalization.⁴ Andrew Nathan observed in 2013 that consensus was "stronger than at any time since the 1989 Tiananmen crisis that the resilience of the authoritarian regime in the People's Republic of China (PRC) is approaching its limits".⁵ Minxin Pei postulated in the same year that "a transition to democracy in China in the next 10 to 15 years is a high probability event".⁶ It is striking that Document No. 9, the CCP's April 2013 communiqué on the state of the ideological sphere, essentially provides the same analysis, but with a view to stalling democratization pressures. It warns that democracy promotion is an "attempt to undermine the current leadership and the socialism with Chinese characteristics system of governance".⁷ In addition to ideological challenges, the CCP also grapples with an increase in larger-scale protests around bread and butter issues, such as grievances about working conditions and salary levels, but also land grabbing and environmental degradation. Demonstrations, some of which turn violent, are said to continue to grow in frequency, and while there is a lack of clarity on the exact figures, public security spending has been rising as a result.⁸ A sophisticated system of so-called social stability management (weiwen) was set up to deal with these pressures and to undermine organizations that could compete with the authority of the party-state.⁹ According to Xie Yue, a political science professor at Tongji University in Shanghai, weiwen seeks to reduce social and political instability by enhancing coercive capacity rather than by moving forward to the rule of law and democracy.¹⁰ In the CCP's orthodoxy, domestic challengers of one-party rule are not only "anti-Chinese", they also play into the hands of China's international rivals that seek to undermine China's rise, notably the US. That is, the CCP employs a nation-alist counter-discourse and it suggests that external actors (or rather: global rivals) try to politically destabilize the People's Republic for strategic reasons. According to Document No. 9, "Western anti-China forces" and "all kinds of so-called citizens movements" echo each other and rely on each other's support "to squeeze the Party out of leadership".¹¹ Finally, it concludes: "In the face of these threats, we must not let down our guard or decrease our vigilance."¹² Document No. 9 most likely spurred a number of recent arrests, notably of individuals belonging to the "New Citizen Movement". For example, Xu Zhiyong, who gave the movement its name,¹³ received a four-year prison term in early 2014. Three years earlier, in March 2010, China's State Administration of Foreign Exchange had already issued stricter rules on the receipt of foreign donations by Chinese organizations, thereby increasing the party-state's control over the flow of foreign resources to Chinese non-governmental organizations (NGOs). Chinese organizations can now only receive foreign funds if they have a special foreign exchange account and after getting their grant agreements notarized. Due to this procedure, it has become very difficult if not impossible for the US and the EU to make financial transfers to organizations that engage in democracy promotion in China. Therefore, foreign support for domestic civil society actors is, more often than not, designed so as to dispel possible concerns, thereby restricting the flow of foreign resources to activities that are

palatable to the Chinese authorities. The US and the EU continue to support Chinese human rights activists through financial grants, quiet diplomacy, and public statements, but both actors have scaled down their ambitions in recent years. This is not only because financial regulations have changed. China's rapidly increasing international weight, which was further accelerated by the subprime mortgage crisis in the US and the sovereign debt crisis in Europe, changed the dynamics of international politics, and significantly decreased the party-state's vulnerability to international pressure. Accordingly, high-ranking leaders in Beijing now dismiss Western criticism of China's governance model rather confidently. For example, according to confidential accounts of EU officials, Wu Hailong (since 2014 China's Representative at the UN in Geneva) noted repeatedly in closed-door meetings that China was no longer willing to be lectured on human rights and democracy because "times have changed".

China resisting US pressure to comply with human rights in talks

Bodeen 11 Christopher, Associated Press Correspondent. "China media says human rights pressure from U.S. will fail." *Northwest Asian Weekly*. 05/13/15.

<http://www.nwasianweekly.com/2011/05/china-media-says-human-rights-pressure-from-u-s-will-fail/>

BEIJING (AP) — China will never allow the United States to dictate political reforms and any American pressure over human rights will torpedo talks on such issues, a Communist Party-run newspaper said last Thursday. The defiant editorial in the Global Times appeared on the second day of an annual China–U.S. human rights dialogue that comes amid a major Chinese crackdown on government critics. Talks have yielded little progress in recent years and are expected to be even more testy than usual this year. Many human rights advocates are questioning the value of such diplomatic exchanges. The Global Times said China would not accept requests from the United States and claimed that most Chinese "were disgusted" by outside pressure on human rights. "As China is a sovereign nation, there is zero possibility of it allowing the United States to dictate its political development," the editorial said. "If the United States adopts exerting pressure as the starting point of its 'dialogue' with China, that will ensure that there is no progress," it said. The two sides traded frosty language ahead of the closed-door talks, with the United States saying it would focus on the ongoing campaign against dissent, as well as on the rule of law, religious freedom, and labor and minority rights. China's Foreign Ministry warned it would reject what it regards as U.S. meddling. "We also are opposed to the United States using human rights as a pretext for interfering in China's internal affairs," spokesman Hong Lei said, at a regularly scheduled briefing Thursday. Often an occasion for testy exchanges in years past, the dialogue is being buffeted by the broadest clampdown in years by China's Communist government. Hundreds of people, including well-known lawyers and activists, have been questioned, detained, confined to their homes, or have simply disappeared, apparently to squelch any chances of the kind of popular uprisings roiling the Middle East and North Africa.

China fiercely opposes human rights policies

Feldman '13 (Noah, professor of constitutional and international law at Harvard University, BA from Harvard, law degree from Yale, Rhodes Scholar at Oxford, "How Guantanamo affects China: Our human rights hypocrisies", Salon, http://www.salon.com/2013/05/19/how_guantanamo_affects_china_our_human_rights_hypocrisies/, 5/19/2013)//HW

Could all that change? Could China gradually become a human-rights-respecting country, even without becoming a democracy? In the short run, the answer is no. From the Chinese

standpoint, the international human rights agenda poses serious dangers, and China can be expected to oppose it. Today, looking at the collapse of the Soviet Union as a negative model, the party believes that lifting its control over speech and protest and many other aspects of Chinese society would likely bring an end to its rule. The party's overarching interest — remaining in power —precludes rapid advances in human rights.¶This perspective will also in the near term be expressed in China's international attitude toward other rights violators, who are potential allies. With its increased power, China has increased capacity to block human-rights-related initiatives. Thus, for example, one can safely predict that China would not allow any more ad hoc international tribunals to punish genocidal leaders. The ICC will, for the time being, proceed very slowly and cautiously, concerned not only about the nonassent of the United States but about **opposition** from China as well.

U.S. human rights intervention has empirically angered China

Kumar '15 (Kalyan, staff writer for the International Business Times, "China Irked By US Criticism Of Detention Of Human Rights Activist Pu Zhiqiang", International Business Times, <http://www.ibtimes.com/china-irked-us-criticism-detention-human-rights-activist-pu-zhiqiang-1914604>, 5/08/2015)//HW

China has apparently taken exception to criticism from the U.S. over the nearly yearlong detention of a Chinese civil rights lawyer. Reacting to comments by the U. S State Department, a Chinese Foreign Ministry spokeswoman said **Washington should address its own human rights problems** without portraying itself as the "world's policeman or judge."¶On Wednesday, the State Department called on China to immediately release Pu Zhiqiang. The human rights activist, detained since May 2014, faces a plethora of charges. The State Department asked Beijing "to release and remove all restrictions on Pu Zhiqiang, and respect his rights in accordance with China's international human rights commitments."¶Pu, who is awaiting trial, was arrested in Beijing on his way back from a private gathering that honored victims of the 1989 Tiananmen Square massacre.¶The State Department said it objected to the fact that Pu has been denied prompt access to "counsel and other procedural safeguards," and subjected to "harsh conditions and denied access to proper medical treatment." In response, Hua Chunying, a Foreign Ministry spokeswoman, said in Beijing that "some people in the United States have hearts that are **too big** and hands that are **too long.**" Hua then advised Washington to address its own domestic problems -- an obvious reference to recent unrest in Baltimore.

Uniq: Russia

Russia rejects US rights fingerpointing – racism and hypocrisy

Gorst 6/24, (Isabel Gorst, The Irish Times, quotes Pravda.ru, Andrei Klishas, Russian senator who heads the constitutional legislation committee in the Federation Council, and Dmitry Trenin, the director of the Moscow Carnegie Center “Russian propagandists seize on Ferguson race riots,” <http://www.irishtimes.com/news/world/europe/russian-propagandists-seize-on-ferguson-race-riots-1.1906546>, 6/24/15, //VZ)

As the United States embarked on what is likely to be a long period of soul-searching over the race riots in Ferguson, Missouri, Russia has weighed in with some unsympathetic advice: **put your own house in order before lecturing us on human rights**. Sparked by the killing of an unarmed African-American teenager by a white policeman, the **violent unrest in Ferguson has exposed deep rifts in society and shattered any illusions of racial harmony in Barack Obama’s America**. And Russia is relishing the upheaval in the country that presents itself as an exemplary democracy. Russian state television news, after months of devoting prime time reporting to the battlefields of southeastern Ukraine, switched focus to Ferguson as the race riots escalated. Instead of images of Ukrainian troops attacking beleaguered pro-Moscow separatists in Donetsk, Russian audiences were treated to apocalyptic scenes of riot police, tear gas, vandalising and looting on the streets of the Missouri town. For the most part Russian media has dwelt on the heavy-handed reaction of US police to the riots and the authorities’ failure to quell the unrest. Ku Klux Klan In a catchy headline this week Pravda.ru, a Russian news website, described Ferguson police as “the Ku Klux Klan dressed up as law enforcers”. Even though US media and social networks are controlled by the state, the report claimed, “it’s impossible to hide that the country is mortally ill with racism”. Images of the violence gripping Ferguson may help distract, and even console, Russians about problems nearer to home – the economic slowdown, western sanctions and the fate of their fellow Slavs in conflict-torn Ukraine. In a broader sense, Russian gloating over the troubles in the US represents an extension of the Kremlin’s increasingly direct geopolitical confrontation with the West. “While trying to control the situation in Iraq, Syria, Lebanon and Ukraine, the US authorities turn out to be incapable of resolving a domestic conflict,” said Andrei Klishas, a Russian senator who heads the constitutional legislation committee in the Federation Council, the parliament’s upper house. Klishas, who was singled out by the US and the European Union for individual sanctions after calling for a Russian military deployment in Ukraine this year, has a personal axe to grind with the West. Events in Ferguson serve to illustrate that mighty, judgmental America is not all it’s cracked up to be. However, the US and EU economic sanctions against Russia are having a wider psychological impact, creating an “atmosphere in Russia of a country constantly under US pressure,” according to Dmitry Trenin, the director of the Moscow Carnegie Center. “This will stimulate Russian patriotism and nationalism focused on the US as an external adversary,” he said. Hypocrisy For Russia, the police violence in Ferguson has provided an opportunity to expose what it sees as hypocrisy in American policy-making and tell its adversaries in Washington to back off. Over the 14 years that Vladimir Putin has been Russia’s paramount leader, the US has routinely condemned the Kremlin for its increasingly heavy-handed stifling of dissent. Washington was particularly disapproving when Russian police cracked down on an anti-government protest in Moscow in 2012 after scuffles broke out in the crowd, followed by multiple arrests. At least a dozen of those detained have since been handed hefty prison sentences for participating in mass riots and assaulting law enforcers. To the fury of the Kremlin, the US once again took the side of the opposition at protests in Kiev’s Maidan this year that led to the overthrow of Viktor Yanukovich, the Ukrainian president, and swept a new, pro-western government to power. According to the Russian official narrative, the US has lent support to a bunch of usurpers in Ukraine who, while masquerading as democrats, have neglected the rights of minorities and wrought violent havoc in their country. Systemic problems As the unrest in Ferguson

entered a 10th day this week, Russia's foreign ministry issued a lengthy statement detailing "deep systemic problems" in America regarding the observance of human rights and democratic standards. "While demanding that other countries guarantee freedom of speech and don't suppress anti-government protests, the USA does not stand on ceremony with those in its own country who actively express discontent about the immoral discrimination of 'second-class' citizens," it said.

Uniq: Middle East

US Surveillance undermines US credibility in the Middle East - cred key to expand US influence

Al-Gharbi 3/10, (Musa al-Gharbi is a social epistemologist affiliated with the Southwest Initiative for the Study of Middle East Conflicts (SISMEC), “Why America Lacks Credibility in the Middle East,” <http://fpif.org/america-lacks-credibility-middle-east/>, 3/10/15, //VZ)

To hear politicians and beltway pundits tell it, credibility in international relations boils down to this: Do others believe that the United States is willing and able to follow through on its word? Actually, this is a sloppy and often pernicious way to think, leading policymakers to senselessly commit themselves to failing policies (like enforcing a “red line,” for instance) for the sake of “maintaining credibility” — and actually undermining it in the process. Credibility is not about resolve. Strategic credibility is actually about assuring partners that things will work out well for them if they throw their lot in with you. This perception plays a pivotal role in determining whether others will support or resist U.S. interests abroad. The primary way agents establish themselves as credible is by making good decisions, which means forming and executing policies that generate positive outcomes for the relevant stakeholders. The stronger an agent’s track record, the more likely others will be willing to get behind them — that is, the more credibility they will have. Incidentally, this is the secret to ISIS’ success: Regardless of how distasteful many find their methods and ideology, they have established themselves as one of the most effective forces at seizing territory from the governments of Iraq and Syria, making tangible progress in restoring a caliphate, and resisting the prevailing international order. America, on the other hand, has a serious credibility problem in the Middle East. The results of U.S. interventions in the region have been consistently catastrophic: Whether in Afghanistan, Pakistan, Iraq, Yemen, Libya, or Syria, direct U.S. involvement is usually followed by an erosion of state governance, the empowerment of exploitative sub-state and non-state actors, and a dramatic rise in violence, civil tension, and unrest. American indirect involvement, meanwhile, tends to empower corrupt, oppressive, and undemocratic forces — such as in Pakistan, Egypt, Palestine, Saudi Arabia, and Bahrain. In terms of achieving positive outcomes, America simply has absolutely no credibility in the Middle East. However, character is also important: **Moral credibility means a nation’s intentions and motivations are more likely to be trusted.** Strategic and moral credibility are interrelated: Consistently generating good outcomes goes a long way toward bolstering one’s reputation. Even if the methods for achieving an objective seem questionable, they tend to be justified retrospectively if things turn out all right. In the interim, people are much more willing to extend the benefit of doubt to those with a strong track record of success. Conversely, moral credibility can help make up for occasional bad outcomes — an agent is afforded slack when things go awry if it’s perceived as being genuinely well-intentioned. However, when there are glaring inconsistencies between a government’s declared aspirations (say, promotion of democracy and human rights) and their means of realization (imposing Western socio-economic models at the expense of indigenous self-determination) — especially when paired with a general failure to realize stated objectives (producing chaos rather than order, be it liberal or otherwise) — these generate suspicion about its real intentions and motives. Hypocrisy Undermines “Resolve” Part of what contributes to America’s cycle of diplomatic and military failures in the Middle East is an underlying distrust of the United States among most Arabs, which inspires widespread ambivalence or resistance to U.S. efforts in the region. The source of this deficit has nothing to do with U.S. follow-through or resolve, as foreign policy hawks love to allege. One can be consistent with regards to backing up threats, etc. while still being a hypocrite in the moral sphere. Indeed, this is precisely the problem America faces. After decades of supporting the region’s dictators with arms and money, Washington has now formed a coalition with both the surviving local autocrats and the Middle East’s former imperial powers to “bring democracy” to Syria and (once more) to Iraq. Is it any surprise the “Arab street” is mistrustful? It further fuels skepticism when America attempts to fight ISIS — a group largely empowered by previous U.S. support for other non-state actors in

Iraq, Libya, and Syria — by training and arming new, ineffective, and unpopular proxy militias. Moreover, these new groups are often aligned with, and trained in, Saudi Arabia — the power most responsible for proliferating the ideology embraced by the so-called “Islamic State.” It seems disingenuous when the U.S. condemns Russia for funding non-state actors in Ukraine, or Pakistan for doing so in Afghanistan, or Iran in Lebanon — even as America expands its own support of insurgents in Syria. The Arab public is outraged when U.S. policymakers decry human rights violations elsewhere while continuing to support Israel and shield it from international accountability for its occupation of the West Bank or its wars on Gaza. And it doesn’t help at all when the Obama administration, among other failings, declines to prosecute clear and grievous infractions like **torture by its own intelligence agencies, while calling for regime change in other countries for the same sorts of infractions.** When American representatives lecture others about upholding the very international rules and norms **the U.S. government systematically and unapologetically violates through its drone strikes and mass surveillance, enhanced interrogation, and extraordinary rendition programs, others will not take American rhetoric or ideals seriously.** These glaring contradictions imbue the entire ethical project with a cynical hue — undermining not just American credibility, but the general value of moral discourse on the world stage more generally. This breakdown, in turn, disrupts consensus building and cooperation, threatening the long-term viability of the rules-based international order Americans sacrificed so much in years past to establish and preserve.

And, increases in allied credibility and cooperation are critical to effective HR promotion – plan’s boost in cooperation is critical

Power 15

(Statement by Ambassador Samantha Power, U.S. Permanent Representative to the United Nations, on the President’s 2015 National Security Strategy, February 6, 2015, pg online @ [//um-ef\)](http://iipdigital.usembassy.gov/st/english/texttrans/2015/02/20150206313448.html#ixzz3eBGOeAx8)

The President’s 2015 National Security Strategy lays out the framework for how the United States will pursue our nation’s interests, and advance universal values through strong and sustainable American leadership. At the United Nations, we pursue these goals every day. By building coalitions to fight international terrorism, prevent and respond to infectious diseases like Ebola, pressure rogue regimes and human rights violators like North Korea, modernize UN peacekeeping, and fight Anti-Semitism and other forms of hate, American leadership at the United Nations is vital to addressing some of the world’s most pressing needs. Recognizing that many challenges facing the world require long-term solutions — from the underlying sources of violent extremism to threats to our security like poverty, inequality and climate change — our strategy maintains a long-term perspective and emphasizes that we must seek a wide array of partners to solve issues of global concern. **Our strategy recognizes that the root of American power stems from how we live our values at home and abroad.** That’s why we’ve prohibited torture, why we are working to close the detention center at Guantanamo Bay, and why we place support for universal values at the center of all we do. We recognize that threats to our collective security — from the war in Syria to Russian aggression in Ukraine — often arise when authoritarian regimes oppose democratic voices. So we will continue to fight against corruption and threats to free expression and a free press, and we will continue to fight for open governments, open societies, and the universal rights of women and LGBT persons. As the strategy notes, “Today, the United States is stronger and better positioned to seize the opportunities of a still new century and safeguard our interests against the risks of an insecure world.” America is leading from a position of strength and in a spirit of partnership. We will not shy away from confronting threats to international peace and security, and to human dignity. That mission, and the vision laid out by the President today, motivate all that we do.

Demonstrating constitutional values increases human rights legitimacy

Shattuck 8 John, foreign policy lecturer, Tufts University. "Restoring US Credibility on Human Rights." *Human Rights Magazine*. Fall 2008.

https://www.americanbar.org/publications/human_rights_magazine_home/human_rights_vol35_2008/human_rights_fall2008/hr_fall08_shattuck.html

Second, you should bring U.S. values and practices back into alignment. The United States in recent years has lost credibility by charging others with the types of human rights violations that it has committed itself. In recent annual country reports on human rights practices, the State Department has criticized other countries for engaging in torture, detention without trial, warrantless electronic surveillance, and other abuses, even though the U.S. record in these areas also has been abysmal.

Links: Hypocrisy

US Hypocrisy is noticed by other nations-delegitimizes US democracy promotion

Morgus 15 Robert, Program Associate, Cyber Security Initiative and International Security Program, New America Foundation. "Credibility Matters: Revisiting Hard Power, Soft Power and Smart Power." Public Diplomacy Magazine. Summer 2015. publicdiplomacymagazine.com/wp-content/uploads/2015/02/Magazine-LGBT-Winter-2014-Smart-Power.pdf

American values are the root of US soft power. But the United States cannot credibly continue to trumpet freedom, liberty, and justice for all without acknowledging and somehow rectifying the actions of the past fifteen years as they begin to come to light. Without privacy, there is no freedom. Without a state that grants, guards, and guarantees freedom, there is no liberty. Without acknowledgement of and restitution for crimes committed, whether legal or moral, there is no justice. As American policymakers and leaders turn a blind eye to the wrongdoings that they and their predecessors have committed or allowed, the rest of the world has noticed. As Martha Finnemore and Henry Farrell pointed out in Foreign Affairs in 2014, "the United States is far from the only hypocrite in international politics. But the United States' hypocrisy matters more than that of other countries... because most of the world today lives within an order that the United States built, one that is both underwritten by US power and legitimated by liberal ideas." ¹³ US ability to exercise soft power is experiencing a slow atrophy—limiting the ways in which it can exercise smart power. Perhaps the Senate's report is a step in the right direction. Though the contents of the report are troubling, the report itself is an acknowledgement of mistakes. How the current American powers that be react to the report will prove crucial.

Links: Immigration

Reducing Border surveillance is a critical human rights issue that will boost U.S. credibility

Piper Garcia and Flora 10

(Jennifer, Jordan, and Gabriela “Human rights and immigration reform” Flora are with the Colorado office of the American Friends Service Committee, a Quaker peace and justice organization. 03/28/To access A New Path Toward Humane Immigration Policy go to <http://www.afsc.org/newpath>. http://www.denverpost.com/headlines/ci_14764341)

Reforming our obsolete immigration system is a human rights issue that can no longer wait. Our nation needs a clear and workable path toward legal residency for the millions of undocumented workers and families living in this country. Some proposals, such as the immigration-reform blueprint that Senators Chuck Schumer and Lindsey Graham are spearheading, will only create the needed path after creating a more militarized southern border. **Border communities along the U.S.-Mexico border have for generations demanded accountability and respect for their quality of life, not more of the same failed policies. Adding more patrols, or high-tech surveillance systems, to "secure the borders" does not make us more secure.** The tragic deaths of at least 6,000 migrants attempting to cross the U.S. - Mexico border since the mid 1990s are a stark reminder that border control policies have only perpetuated suffering. Migrants are 17 times more likely to die today while crossing the border than they were in 1998. But, we hear from lawmakers that trumpeting border security is necessary to make immigration reform possible. Then where is the clear proof that the multimillion-dollar wall along the U.S. - Mexico border has curbed migration? Economists say the recession of the past two years has had more of an impact. Stepping up ineffective border patrols, filling more detention jails like the one in Aurora, and more wholesale deportations would only aggravate the climate of fear and uncertainty under which millions of families live. In fact, the Obama administration deported more undocumented migrants in its first year in office than in George W. Bush's last year in the White House, based on the Department of Homeland Security's own reports. That is why eighty people from Colorado are traveling via bus, van and plane to Washington D.C. and why tens of thousands of immigrant rights supporters are preparing to converge on the streets of Denver, Washington D.C. and across the country, this weekend to call for just and humane immigration reform, not policies that would expand the current ineffective, overzealous enforcement system. They and millions of others are calling for an end to policies that split families apart and the beginnings of policies that provide safe and swift paths to legalization. We believe the seven core principles the American Friends Service Committee have proposed in A New Path Toward Humane Immigration Policy will help achieve that goal quickly, fairly and humanely. These principles are: create justice with humane economic policies, protect the labor rights of all workers, develop a clear path to permanent residence, respect the civil and human rights of immigrants, demilitarize the U.S.-Mexico border, make family reunification a top priority, and ensure that immigrants and refugees have access to services. As a nation, we should reject appeals to tie the future of millions of families to a broken, unjust system of enforcement. Instead we should respect the human rights and dignity of immigrants through humane and fair immigration policies.

Links: Soft Power/Influence

And, increasing U.S. soft power and influence will increase HR promotion and credibility – past precedent proves

Rubin 1/28

(Jennifer, “A weak America means human rights disasters,” pg online @ <http://www.washingtonpost.com/blogs/right-turn/wp/2015/01/28/a-weak-america-means-human-rights-disasters/> //um-ef)

Former deputy national security adviser Elliott Abrams, citing the Freedom House report showing a massive erosion in human rights worldwide, argues that “the regression in freedom and the decline in perceived American power overlap. Moreover, the decline in freedom and the decline in perceived U.S. government interest in advancing freedom also overlap. Hard to believe all this is coincidence.” He concludes, “It is impossible to prove a negative—to demonstrate that had the **Obama** administration not shrunk democracy assistance, not adopted what it may view as a ‘realpolitik’ attitude of indifference to human rights advances, not backed so many dictators—freedom in the world would not have declined every single year that Mr. Obama has been president. But it is possible to wonder, and it is possible to wish that someone, somewhere in the White House were also wondering.” There are several instances that support this view, namely that **U.S. weakness abets human rights violations and that ignoring human rights violations weakens U.S. influence**. The first is Syria, where the administration refused to take definitive early action to oust Bashar al-Assad and later erased its red line. The results are grotesque and massive human rights atrocities, including the killing of an estimated 200,000 people, the use of WMDs on civilians and the forced flight of millions of civilians. Before jihadists poured into the country, could we have removed Assad? Could airstrikes at key targets to enforce the red line have tipped the scales against Assad? Almost certainly. Second, had the president not adopted reset, not entered into a flawed arms deal with the Russians, not let Russia into the World Trade Organization without a peep, not handed off the Syrian issue to Russia, not dragged its feet on sanctions against Russia for invasion of Ukraine and not refused to arm the Ukrainians, do we really think Russia’s leader would be acting more aggressively than at any time since the end of the Cold War or engaging in massive internal repression? As Abrams notes, nothing is certain, but it is hard to see how our behavior did not encourage Vladimir Putin both at home and internationally. Third, the administration in June 2009 could have extended support for the Green Movement and begun to exert greater political and economic pressure against the Iranian regime. While it might not have been sufficient to topple the mullahs, it would not have conveyed that we were desperate to engage the regime on nukes and therefore would overlook domestic repression. The Iranians quickly learned not to take us seriously at the bargaining table. Now we have the worst of all worlds — worsening human rights atrocities in Iran, Iranian aggression throughout the Middle East and Iranian defiance in nuclear talks. There has never been an administration that has so divorced human rights from geopolitical strategy as this one has. It creates an Atrocities Prevention Board and sends out officials to give speeches filled with empty platitudes. But our actions in the real world — be it in foot-dragging on Magnitsky legislation, doing little to prevent the rise and spread of the barbarous Islamic State, soft peddling criticism of whatever regime is in power in Egypt or giving the Castro brothers normalization without extracting any concrete agreement on human rights — leave innocents to fend for themselves and embolden tyrants. No one in the administration has the slightest clue that the ultimate atrocities prevention mechanism is the influence of the United States, backed up by and, if needed, enforced through the use of hard power. No wonder the world is less free, more chaotic and respects the U.S. less.

Links: War on Terror

The U.S. has empirically lost international credibility over surveillance

Dyer and Waters '13 (Geoff, Beijing bureau chief of the Financial Times, Richard, West Coast editor of the Financial Times, "US admits surveillance on foreign governments 'reached too far'", Financial Times Politics and Policy, <http://www.ft.com/cms/s/0/e028f49c-4257-11e3-9d3c-00144feabdc0.html#axzz3eBswpPMm>, 11/1/2013)//HW

Although the dispute about US dominance over the internet is a long-running one, the Snowden revelations have given substantial ammunition to Washington's critics. "US credibility as a neutral steward of the internet **has been severely damaged by the NSA revelations,**" said Milton Mueller, professor at the Syracuse University school of information studies. **If the US does not move** to appease its critics, he said, **the risk of fragmentation will increase** as countries insist on more data being held locally or erect gateways to control the flow of information to the web. **They have to do something** in response to the revelations," Mr. Mueller said.

International perception of the War on Terror decimates credibility – the plan shifts away from this

Lynch '10 (Marc, Director, Institute for Middle East Studies and Professor of Political Science, The George Washington University, "Rhetoric and Reality: Countering Terrorism in the Age of Obama", Center for a New American Security, http://www.cnas.org/files/documents/publications/CNAS_Rhetoric%20and%20Reality_Lynch.pdf, 6/5/2010)//HW

But if this is no longer a "global war on terror," then what exactly is it? While the administration's policy has taken on clearer contours over the last year and a half, it is still easier to say what the policy is not rather than what it is. The components of the strategy emerge clearly from official statements, documents and from the patterns of behavior, but President Obama has not yet clearly and effectively articulated this strategy. Tellingly, the 2010 Quadrennial Defense Review removed references to the "Global War on Terror" but did not replace it with a new intellectual framework.¹⁰ **The National Security Strategy explicitly says that the U.S. is not fighting a war against terror, but still repeatedly emphasizes an ongoing war against al Qaeda and its affiliates. The administration must fill this void, because the "Global War on Terror" has proven to be a remarkably resilient framework.** Both the **Bush administration and the Obama administration have tried to move away from this terminology, but it has persisted – as an organizing concept, as a justification for budgets and organizational structures, as a set of legal authorities and as a justification for a range of otherwise disparate practices, from enhanced interrogation techniques and domestic surveillance to military campaigns and democracy promotion.** **If the administration's strategy cannot be better articulated and a new approach institutionalized** through a durable and robust set of institutional commitments and legal authorities, then **there is a real risk that it will collapse in the face of challenges or setbacks. The promise of fundamental change combined with significant continuity, even escalation, of controversial counterterrorism practices risks provoking a backlash by those at home and abroad who took the President's rhetoric of**

change seriously. The President came to office amidst stirring promises to close the Guantanamo Bay prison and end many of the controversial practices associated with his predecessor's unpopular "Global War on Terror." The National Security Strategy forcefully argues for stricter adherence to the rule of law in order to restore American leadership and establish durable legal foundations for the struggle against al Qaeda and its affiliates. **That many controversial practices continue has undermined Obama's credibility. Even if useful in the short-term, continuing the "Global War on Terror" in practice threatens to undermine the President's ambitious longer term efforts to transform America's relations with the Muslim communities of the world.**

The War on Terror undermines U.S. human rights credibility

Hooper et al. '15 (Melissa Hooper, Ignacio Mujica, Megan Corrarino, attorneys with Human Rights First, where they focus on the advancement of international human rights law in the United States, "U.S. Must Affirm Leadership Role on Human Rights", New York Law Journal, [//HW](http://www.newyorklawjournal.com/id=1202719078471/US-Must-Affirm-Leadership-Role-on-Human-Rights?slreturn=20150524151844, 2/27/2015)

A recent military commission decision, for example, vacated David Hicks' conviction for "material support for terrorism" that was secured with evidence obtained by torture and outside of the military commission's jurisdiction, which is limited to war crimes.¶ And a federal district judge in Washington, D.C., recently ordered the Obama administration to stop using the immigration detention of women and children to deter others seeking refuge in the United States. These cases reaffirm the principle that human rights can and should be enforceable, and that the first place to begin enforcing them is in our own courts.¶ To reestablish its credibility on the international stage following things like the torture report and more than a decade of due process violations in Guantánamo, the United States must begin more seriously enforcing its own international legal obligations, which are constitutionally-binding law, in its own courts.¶ The United States once positioned itself as a human rights leader, and that moral authority gave it considerable soft power around the world. U.S. leadership was instrumental in creating the Universal Declaration of Human Rights, the United Nations, and the International Covenant on Civil and Political Rights. The significant due process components of the U.S. justice system have been used as the basis for rule-of-law reforms in numerous other countries. The United States still has among the broadest frameworks for protection for free speech and freedom of religion in the world. But **any claim that the United States might have to leadership in human rights is undermined by the fact that, over the past decade and a half, it has failed to satisfy its own international legal obligations. The most famous and egregious examples are those that have come from the so-called "War on Terror," reliance on torture as outlined in the Senate Select Committee on Intelligence Report, and arbitrary detention of prisoners at Guantánamo, often based on secret evidence without access to due process.**

Counterterrorism procedures destroy U.S. human rights credibility

Keyel '13 (Jake, works with immigrants, refugees, and asylees to help them re-enter their professional fields in the United States, "U.S. Credibility Begins at Home", Citizens for Global Solutions, [//HW](http://globalsolutions.org/blog/2013/09/U.S.-Credibility-Begins-Home#.VYsV2BNVikp, 9/12/2013)

What is unclear, however, is whether the United States can credibly claim to represent and speak for those who demand the protection of civilians and an end to human rights abuses. Unfortunately, the United States' record in this regard shows a serious deficit in this type of credibility. Guantanamo Bay remains open, drone wars are on-going in Pakistan and Yemen, and the war in Iraq, a war called illegal by Kofi Annon, has only just ended. The United States is also the world's largest weapons exporter. If the United States wants to be a world leader against human rights abuses and violence it needs to lead by example and not by force.

Internals: Domestic k to Cred

Inconsistency between domestic policy and international human rights demands undermines moral power

Mehta and Winship 10 (Jal Mehta, Associate Professor in Education at the Harvard Graduate School of Education, and Christopher Winship, the Diker-Tishman Professor of Sociology in the Faculty of Arts and Sciences in the Harvard Kennedy School, "Moral Power," Handbook of the Sociology of Morality, 2010, http://scholar.harvard.edu/files/cwinship/files/moral_power--final_1.pdf)//AG

Moral power is like the other forms of capital: it is a resource which allows actors to do things that they wouldn't be able to do without it. Just like actors can differ in their level of financial capital, or human capital, or even social capital, they can differ in their level of moral power, which affects what they can do and what options they have at their disposal. Unlike financial or political capital, one does not deplete moral power by "spending it"; effective moral leadership enhances one's moral power for the future. Moral power is important for everyone from parents to leaders of organizations to heads of state. Parents of adolescents today need to rely almost entirely on their persuasive powers, and the ability to make well - intentioned and morally capable judgments are key to getting their children to accede to their wishes. Organizational leaders often have some form of coercive or top - down power, but in more collaborative or less hierarchical organizations, moral power can be a means to overcome collective action dilemmas and motivate one's charges to action. Inconsistencies between what one is asking from others and what one is willing to do oneself erode moral power, as when clergy drive Cadillacs or university presidents' pay themselves extravagantly while raising tuition or freezing faculty salaries. Similarly, when world leaders gather and make requests to one another to amend treaties or contribute troops or humanitarian aid, how they are viewed morally by their contemporaries is often a critical factor in the success of these efforts. Like other sources of power, the importance of moral power is in its ability to convince other actors to do something or to allow something to be done. But moral power does more than this. As David Beetham has argued in his book *The Legitimation of Power*, legitimation of authority is created by the expressed consensual behavior of individuals who obey that authority whether they in fact believe in the legitimacy of that authority or whether in any principled sense that authority is legitimate. For example, although George W. Bush's election in 2000 was initially contested, the fact the media covered his inauguration as they had past inaugurations, in part legitimated his election. In a similar way, when individuals act in consent with the moral power of an actor, they cause both that actor and the actions he advocates to be seen as moral. To return to Martin Luther King, King not only convinced the majority of Americans that blacks deserved equal rights, but also that this was morally correct and thus established himself as a moral leader. As Tom Tyler has argued in *Why People Obey the Law* (Tyler 2006) persuading people to do or not do something because it is right is a far more effective form of influence than outright coercion which is often costly to carry out. Thus democracy has proved a more viable form of government in many situations than authoritarian totalitarianism as its stability is

to a large degree a function of people's belief in its legitimacy. Moral power is a centrally important factor in social life which has not been given its proper due. We suggest in this chapter that outcomes are not just determined by standard structural factors (the economic and social resources of various actors and the relationships between them), but by the relative ability of different actors to persuade and influence others by asserting the correctness of particular moral positions. Differences in the moral power of various actors in their relationships with others are an important and at times key determinant of various outcomes. We have found moral power to be a useful concept in our own work in explaining everything from school policy to presidential politics to the relationship between cops and ministers. Our hope is that other researchers will find the concept of moral power similarly useful in explaining a variety of outcomes.

Addressing human rights violations at home would restore U.S. credibility abroad

Carasik '14 (Lauren, clinical professor of law and the director of the international human rights clinic at the Western New England University School of Law, "Human rights for thee but not for me", Al Jazeera, <http://america.aljazeera.com/opinions/2014/3/the-us-lacks-moralauthorityonhumanrights.html>, 3/12/2014)//HW

U.S. intransigence is often cloaked behind lofty conception of American exceptionalism — the idea that the U.S. embodies the standards of liberty and democracy to which other countries should aspire. Claiming to stand at the apex of democracy and human rights, the U.S. exempts itself from surrendering its sovereignty to any global rights framework. Resistance to the adoption of international norms is not monolithic within the country, however. In a sign of retreat from these principles at a local level, some states and municipalities are embracing international human rights standards. The "Bringing Human Rights Home" report by the Human Rights Institute at Columbia School of Law evinces the willingness of some local governments to incorporate universal human rights standards, including economic and social rights that the U.S. has so far declined to validate.¹ In 2012 former U.S. President Jimmy Carter urged the U.S. to reclaim its moral high ground, lamenting that "America's violation of international human rights abets our enemies and alienates our friends." Upholding universal, inalienable and enforceable human rights standards in a pluralistic and increasingly entangled world is no easy task. But the domestic and international human rights movements are driven by the urgent goal of protecting the dignity of all human beings — including those at the margins who are powerless, poor, invisible and persecuted. The U.S. would have more credibility in promoting those principles if it reflected on its own transgressions. Naming and shaming by international actors is an essential tool for advancing human rights. But it assumes both the moral authority to sit in judgment and the humility to be self-critical.

Moral inconsistency undermines international influence

Mehta and Winship 10 (Jal Mehta, Associate Professor in Education at the Harvard Graduate School of Education, and Christopher Winship, the Diker-Tishman Professor of Sociology in the Faculty of Arts and Sciences in the Harvard Kennedy School, "Moral Power," Handbook of the Sociology of Morality, 2010, http://scholar.harvard.edu/files/cwinship/files/moral_power--final_1.pdf)//AG

Despite their many differences, when Barack Obama speaks about the Muslim world, his words are remarkably similar to those of his predecessor, George W. Bush. Compare the September 2006 speech President Bush gave to the U.N. with the June 2009 Cairo speech of President Obama. Both presidents talked about the importance of human rights, self-determination, and democracy in Muslim nations; both said that America will respect the history and traditions of the Muslim world; both argued that America is not at war with Islam; both called on Muslim moderates to join America in denouncing the perpetrators of the September 11th attacks. The reaction to the two men from the Muslim community, however, could not be more different: shoe throwing hatred for President Bush, and, at least as of June 2009, healthy respect for President Obama. The difference in the way that the two presidents have been received by the Muslim world, we argue, lies not in what these men have said, but in how they are perceived. As a product of their past actions, their biographies, and the narratives that they have crafted for themselves they have entirely different moral status and standing, or what we call moral power, in their relationship to the Muslim world. As a result, their words are interpreted quite differently. This difference in moral power is critical for understanding not only how they are perceived, but is one of the resources they have available to persuade and affect the actions of others. To claim the importance of moral power is not to discount more traditional forms of power such as economic or military power. Rather it is to say that there are frequently situations where other forms of power are not dispositive, and moral power is one critical resource in these situations. In these cases, there is often an important but uncommitted middle; moral power is critical to persuading that middle that a particular interpretation of a situation is the correct one, which in turn affects which positions that middle will adopt. Put another way, moral power is important when there is moral ambiguity and the ability to persuade those on the fence as to what is moral is critical. This is frequently the case in politics, but can also be true in other spheres of life. In situations such as these, moral claims about what is right or just and/or what is best for the common good are often made to influence people to support one position or another. A classic example to which we will return is the Civil Rights movement and the passage of federal civil rights legislation during the 1960's. It is difficult to argue that the power of blacks and black leaders as understood in its traditional sense was the key factor in pushing through this legislation. Rather, it was, at least in part, the moral arguments made by Martin Luther King and others that were critical. Furthermore, it was not just the arguments that King and other clergy made, but their moral status and standing as ministers that was influential. Morality and power are often taken to be opposites, with morality grounded in altruism and a commitment to the common good, and power located in self-interest. Our contention is that moral power, seemingly an oxymoron, is actually a widely present and important factor in social and political life. Our aim is to introduce and situate the concept, offer a theory of how moral power is generated and what role it plays, and give examples that illustrate its importance. Moral power is the degree to which an actor, by virtue of his or her perceived moral stature, is able to persuade others to adopt a particular belief or take a particular course of action. While there has been some writing about the importance of moral claims and narratives (Jasper 1997, Polletta 2006, Ganz 2007), it is our argument that it is not only the perceived morality of the claims, as argued by Boltanski and Thevenot (2005), but also the moral power of the specific actor making the claim that is important in determining the outcome. Thus, the quite different reception of Bush's and Obama's comments in the Muslim world. The importance of moral power as a form of influence is exemplified in the widespread debate about the extent to which the United States' behavior in foreign affairs is consistent with the moral claims that it espouses. One common view is that although the U.S. preaches the virtues of democracy, its practices violate that claim in important ways (e.g., by engaging in torture or supporting authoritarian or dictatorial leaders). The issue here is not whether the U.S. has the economic or political muscle

to convince other countries to take particular actions, but rather whether it has the ability to persuade other countries that particular actions are morally justified given the perceived moral inconsistencies of its own behavior. Below we develop the outlines of a theory of moral power. Specifically, we argue that moral power is a function of whether one is perceived as morally well - intentioned, morally capable, and whether one has moral standing to speak to an issue. With respect to intentions, the issue is whether an actor is perceived to be promoting a particular position out of concern with what is morally right or good, as opposed to being driven by self - interest or other motivations, and, relatedly, whether that actor is perceived to be trustworthy. In terms of capability, the question is whether an individual is seen to be both generally wise and knowledgeable in forming moral judgments and appropriately informed about the specific issue at hand. Moral standing refers to the degree to which the actor is understood to be a member of the relevant moral community.

Internals: Credibility k to Push

The administration strategy is low-key diplomacy, but a boost in HR credibility will result in expanded HR promotion

Washington Post 9

("Human Rights Activists Troubled by Administration's Approach", May 5, 2009, <http://www.washingtonpost.com/wp-dyn/content/article/2009/05/04/AR2009050403450.html//um-ef>)

The Obama administration has backed away from overt expressions of support for human rights and democracy in favor of a more subtle approach, worrying advocates who say that the issues are being given short shrift as President Obama seeks to rebuild relations with allies and reach out to adversaries. Although Obama moved quickly to announce the closure of the detention center at Guantanamo Bay, Cuba, drawing praise from human rights activists, many say other actions by the administration have been troubling. Administration officials have suggested that sanctions against human rights pariahs Burma and Sudan could be eased, that concerns over China's treatment of Tibetans and dissidents should take a back seat to issues such as climate change, and that the United States might once again grant Egypt's autocratic government veto power over the disbursement of U.S. funds to nongovernmental groups. "They need to be careful here that they don't set a pattern they will regret later on," said Jennifer Windsor, a former Clinton administration official who is executive director of Freedom House, a group that supports democracy activists. "There are some good people in the administration, but the instinct of abandoning everything President Bush has stood for has done a disservice." Administration officials acknowledge they have approached the issue of human rights differently but deny that there has been a reduction in commitment. Instead, they say, they are first seeking to restore U.S. credibility on the issue by acknowledging U.S. failings and then pushing for progress on human rights and democracy.

Robust policies and increased US credibility will allow it to promote its interests internationally

FH 12, (Freedom House, endorsed by the American Civil Liberties Union, Amnesty International USA, Better World Campaign, Center for Justice and Accountability, Center for Victims of Torture, Ambassador Mark P. Lagon, International Relations Chair, Georgetown University MSFS Program, Physicians for Human Rights, Eric Sapp Executive Director of American Values Network, Ted Piccone of the Brookings Institution, United to End Genocide, Jennifer Windsor the Associate Dean for Programs at Georgetown and the University School of Foreign Service, "Ten Critical Human Rights Challenges for the Next American President," <https://freedomhouse.org/sites/default/files/Ten%20Critical%20Human%20Rights%20Challenges%20For%20The%20Next%20American%20President.pdf>, Page I, 8/2/12, //VZ)

The next administration should articulate clear priorities and implement credible policies on human rights, address human

rights in its relations with all foreign governments that commit significant violations, and select senior officials who have the expertise and authority to carry out effective human rights policy, while ensuring that America's own policies and practices are consistent with the universal values it promotes around the world. The National Security

Advisor should have sufficient authority to ensure consistent implementation of human rights policy across U.S.

government departments and agencies, and a key criterion in the selection of the Secretary of State should be the candidate's commitment to human rights. While there are many human rights challenges that will confront the next administration, some are so severe, consequential, or open to U.S. influence that they merit the next administration's attention. In this paper,

we highlight ten issues for the next administration to address. **If the U.S. response to these issues is inadequate, they may harm U.S. interests and credibility abroad. If, however, the next administration crafts and executes robust policies to overcome these human rights challenges, it can make a distinct contribution in promoting U.S. values and interests internationally. We recommend that the next presidential administration give priority in pursuing the following policies:** 1. Prioritize U.S. leadership on international norms and universality of human rights 2. Act to prevent genocide and mass atrocities and ensure accountability 3. **Pursue policies that protect people from the threat of terrorism while respecting human rights both at home and abroad** 4. Oppose the coordinated global assault on civil society, including the murder, criminalization, and vilification of human rights defenders 5. Proactively address the democracy and human rights opportunities and challenges presented by the Arab Uprisings 6. Ensure that corporations avoid contributing to human rights violations in their operations and through their supply chains 7. Bolster accountability and access to justice for survivors of sexual and gender-based violence 8. Review the United States' relationships and alliances with governments that violate human rights 9. Support international justice and accountability for human rights violators present in the United States 10. Support policies both at home and abroad and norms that respect the rights of and equal treatment for refugees/migrants/immigrants. The presidential campaigns have to date addressed some human rights issues and benefitted from the insights of individual human rights experts, but leading human rights organizations have yet to weigh in to the debate surrounding the presidential campaigns in a substantial way. This policy paper is a collective effort by leading U.S.-based human rights organizations and experts to contribute to the debate and to the human rights policies of the next administration as it prepares to take office. This paper is a product of Freedom House, the Connect US Fund, and the Human Rights Working Group, a Washington, D.C.-based forum for human rights organizations and expert individuals to share practices, discuss policy challenges, and coordinate advocacy strategies. The policy paper takes into account the priorities of 22 human rights organizations that contributed in some way to its content. However, not every group has a position on all of the issues in this paper, and individual organizations and experts have additional views that are not included in this paper but are nonetheless important positions on critical issues. The analyses and recommendations presented here reflect the views of human rights organizations and experts on particular issues within their organizational mandates and expertise. Participants in the Human Rights Working Group voted on the top ten issues to highlight in this paper. They were guided by three factors: (1) the severity of the human rights violations, (2) the extent of the harm or threat caused by these violations, and (3) the ability of the United States to influence the situation. The absence of an issue in this paper does not suggest a lack of importance. In fact, **many issues, including LGBT rights, Internet freedom, and general women's rights,** are not covered in this paper because they **are current priorities of the United States, which has led efforts to address them worldwide. We anticipate and strongly recommend that work in these areas continue to be a priority** for the next administration. Each of the top ten issues in this paper is covered in one page. Background to frame each issue is followed by a summary of the U.S. record to date on the issue and then by key recommendations. The top ten issues presented in this paper merit discussion during the presidential debates this fall. We look forward to a sustained conversation on these issues with both candidates and ultimately with the next president. 1 **Prioritize U.S. leadership on international norms and universality of human rights. International organizations are most effective in protecting and promoting human rights when the United States plays a leadership role and lives up to its own human rights commitments.**

Despite their imperfections, the United Nations, Organization of American States, Organization for Security and Cooperation in Europe, World Bank, and other multilateral institutions provide a greater level of legitimacy and influence than U.S. bilateral efforts alone. U.S. support, both practical and financial, for multilateral institutions is critical for the United States to shape international human rights norms as well as improve the overall functioning of the institutions themselves. Moreover, by withdrawing from these institutions or restricting funding, the United States forfeits its leadership in these bodies and undermines its ability to advance its own interests. An illustration of how the United States can positively shape the policies of such bodies is demonstrated clearly by its membership in the UN Human Rights Council (HRC). Prior to U.S. membership in the Council in September 2009, very little progress was made on calling attention to the human rights situations in all but the most egregious cases, most often countries such as North Korea and Somalia that have few allies. However, U.S. leadership has been one of the key factors in many of the achievements of the HRC, including launching international investigations into abuses in Libya, Syria, Côte d'Ivoire, Iran, Belarus, Honduras, Guinea, and Eritrea, as well as in pushing engagement of the HRC on dealing with wartime abuses in Sri Lanka. Moreover, the United States was instrumental in the creation of a special rapporteur on freedom of association and peaceful assembly; in the support of the South African initiative for the adoption of the first resolution on the protection of LGBT rights; and in the defeat of the annual —Defamation of Religions— resolution, an attempt by Islamic states to create an international norm criminalizing blasphemy. **The credibility of U.S. engagement on human rights internationally is also directly related to the United States' own human rights record. The United States will be in the strongest position to promote human rights abroad if it improves the domestic implementation of its human rights obligations.**

Perceived moral legitimacy is key to international influence

Mehta and Winship 10 (Jal Mehta, Associate Professor in Education at the Harvard Graduate School of Education, and Christopher Winship, the Diker-Tishman Professor of Sociology in the Faculty of Arts and Sciences in the Harvard Kennedy School, "Moral Power," Handbook of the Sociology of Morality, 2010, http://scholar.harvard.edu/files/cwinship/files/moral_power--final_1.pdf)//AG

A third essential component of moral power is moral standing. Moral standing is whether or not an actor is perceived to be part of the moral interpretive community that is relevant to the question at hand. Moral philosophers are an example of a group that is morally capable and well-intentioned but has little moral standing with respect to many questions of social and political life. **Moral standing can come within a rational - legal structure if the structure is perceived as legitimate (i.e. judges). Alternatively, it can emerge through a kind of open jurisdictional claims - making (as advocates often do in politics).** This means that moral standing can sometimes derive

at least in part from one's role, while at other times it may be more informally negotiated. Much of politics is about who has moral standing with respect to an issue: issues that sit at the intersection of race and other social problems are potent examples of the fights over who has moral standing in the dispute between different claims. Another example is euthanasia: the debate over who should decide (medical professionals? family members? ethicists? society writ large?) is in part a question of who has appropriate moral standing in the matter. Extremely powerful and skilled moral actors are often able to claim membership in multiple moral communities. To return to the Martin Luther King example, the civil right leader was part of at least three such communities: the black community, the Christian community, and the American community, and his standing within each of them effectively allowed him to broaden the reach of his moral power and mobilize multiple moral communities. It should be clear from the preceding discussion that we view moral power as something which is both highly relational and socially constructed. There is no "view from nowhere" when it comes to moral power — there are only actions which are seen as moral or not by a relevant community, which in turn then allows the actor to utilize (or not) moral power with reference to that community. As such, there is a strong "performative" (to use Jeffrey Alexander's term dimension to moral power. Whether an individual has moral power is function of whether their performance in relation to others is successful, which requires that it be perceived as "authentic" (Alexander 2004). Here we argue that perceived intentions, capability, and moral standing are the essential ingredients for initially achieving moral power. Over time, moral power can become a kind of social fact — once an actor's moral power is widely seen as legitimate, it then becomes a resource which that actor can use as new situations arise. At the core of our argument is the claim that moral power is a result of a cultural/symbolic process, that is socially constructed, where the enactment and perception of moral standing, intentions, and capability coheres into a "successful performance." Our theory of how moral power works is similar to Jeffrey Alexander's view of how social "performances" work more generally, and so we draw upon some of his thinking here. For Alexander, the understanding of a situation is the result of the cultural performances of the individuals involved and how the "audience" experiences and understands that performance. A key issue for Alexander is the necessary conditions for a performance to be persuasive and thus successful. He argues that the critical component of success is that the performance be seen as authentic. To quote Alexander: "a strategy's success depends on belief in the validity of the cultural contents of the strategist's symbolic communication and on accepting the authenticity and even the sincerity of another's strategic intentions" (2004: 528). Note that while the language of "strategy" and "performance" seem to imply that moral power is something which is contrived, we do not mean to suggest that that is necessarily so. It may be that the most convincing and sustainable way to establish moral power is simply to consistently act in a way that is broadly seen as morally right (e.g. Gandhi). But given that moral power is ultimately relational, and that it is the perception of the surrounding community that matters, it is also the case that some actors will seek to achieve moral power by intentionally creating a narrative of their moral worthiness and concealing their immoral actions. Our argument is that moral standing, intentionality and capability are the needed ingredients for an actor to be seen as morally "authentic" and thus achieve and maintain moral power. A failure in any one of these components is likely to lead to a performance being seen as invalid, and thus result in the loss of moral power. As such, moral power is fragile. If it is discovered that an actor's intentions are

based in self - interest, the actor's arguments lose their persuasive power. Similarly, if the actor is thought to be morally incapable, no one is likely to give credence to the arguments the actor makes. If she is perceived to be outside the relevant moral community, her opinions are easily ignored.

Internals: U.S. Leadership Key

**U.S. leadership on human rights essential to strengthen democracy abroad—
The Aff ensures we follow through on our commitments**

Griffey 2011 By Brian Griffey 03/18/11 “U.S. leadership on human rights essential to strengthen democracy abroad” (Brian Griffey is a human rights consultant who has worked for the United Nations, Human Rights Watch, Amnesty International USA and as an investigative journalist.) //thehill.com/blogs/congress-blog/foreign-policy/150667-us-leadership-on-human-rights-essential-to-strengthen-democracy-abroad#ixzz2YhFC9FXE

“Human rights is the soul of our foreign policy, because human rights is the soul of our sense of nationhood.” Since helping to establish the United Nations, **U.S. participation in international human rights treaties and mechanisms has been fraught with debate over the merits of involvement and perceived threats to U.S. policymaking prerogative**, topics still contentious on Capitol Hill. Nonetheless, **U.S. leadership on human rights offers clear opportunities to advance not only international peace and security** – a fundamental purpose of the U.N. – **but also conjoined US political and economic interests at home and abroad.** The U.S. is presently demonstrating exactly how crucial such involvement is as an elected member of the Human Rights Council, participating in vital negotiations on how best to mitigate widespread abuses responding to ongoing unrest in the Middle East and North Africa, including by strategic US allies in global security and trade. As Secretary Clinton expressed en route to Geneva to participate in recent talks on human rights violations in Libya, joining the Council has “proven to be a good decision, because we’ve been able to influence a number of actions that we otherwise would have been on the outside looking in.” In its first submission to the body, the U.S. likewise recognized that participation in the Council’s peer-review system allows the U.S. not only to lead by example and “encourage others to strengthen their commitments to human rights,” but also to address domestic human rights shortcomings. **By leading international discourse on human rights, the U.S. will be in a better position both to advance observation of human rights abroad, and to take on new treaty commitments that demonstrate adherence of our own system to the vaulting principles we identify with our democracy. While the U.S. is party to more than 12,000 treaties, it has dodged most human rights treaties drafted since World War II through the U.N., and has ratified only a dozen.** Upon transmission of four core human rights treaties to the Senate in 1978, President Carter observed: **“Our failure to become a party increasingly reflects upon our attainments, and prejudices U_{nited} S_{tates} participation in the development of the international law of human rights.”** The Senate ratified two of those treaties 15 years later. The others continue to languish in the Senate Foreign Relations Committee, still awaiting ratification after 32 years. It likewise took the Senate almost 40 years to approve a treaty punishing genocide, after signing it in 1948 following the Holocaust. Other human rights treaties U.S. presidents have signed – but the Senate has yet to agree to – include U.N. conventions protecting the rights of women, children, and persons with disabilities. The U.S. is the only nation in the world that hasn’t ratified the Convention on the Rights of the Child, with the exception of war-torn Somalia, which lacks a functioning government and control over much of its territory. **As we watch the contours and nature of power being reshaped in the Middle East and North Africa, the U.S. must have a singular message on human rights – both at home and abroad: Human rights go hand-in-hand with a healthy democracy, and demand a concerted and collective effort to be upheld, especially in times of crisis. Greater U.S. participation in U.N. human rights treaties would ensure that the country has not only a seat at the table, but also an authoritative voice on matters vital to advancing democracy abroad, and our national security.** A welcome consequence would be a more prominent place for the human rights lens in our vision of U.S.

democracy – and perhaps a stronger resolve to ameliorate the plights of those least well off in our own society.

The U.S. is a key player in human rights issues

Freedom House '12 (Freedom House, a U.S.-based non-governmental organization that conducts research and advocacy on democracy, political freedom, and human rights, “Ten Critical Human Rights Challenges for the Next American President”, The Connect U.S. Fund, <https://freedomhouse.org/sites/default/files/Ten%20Critical%20Human%20Rights%20Challenges%20For%20The%20Next%20American%20President.pdf>, 8/13/2012)//HW

U.S. leadership is critical to effectively address international human rights issues. International responses to gross violations and systematic abuses of human rights around the world tend to have the greatest impact when the United States plays a prominent role or is otherwise actively engaged in promoting a rights-based response. Multilateral **human rights institutions** similarly **make the greatest progress** in drawing attention to abuses and maintaining human rights standards **when the United States exercises leadership.** Human rights affect almost every aspect of U.S. engagement abroad. Governments that abuse human rights make unstable and unreliable partners across the range of U.S. interests, from business to arms control to counter-terrorism. **By strengthening the protection of human rights, the United States not only promotes its own values but also advances its strategic interests.**

Impacts

Internals: Pressure Kills China Relations

China strongly opposes U.S. interference in its internal affairs

TBP '14 (The BRICS Post, an international news and views website with writers, analysts, and experts in over a dozen countries, [“Don’t interfere in our internal affairs: China tells US”](http://thebricspost.com/dont-interfere-in-chinas-internal-affairs-china-tells-us/#.VY2nBRNViko, 10/2/2014)//HW), thebricspost.com, [//HW">http://thebricspost.com/dont-interfere-in-chinas-internal-affairs-china-tells-us/#.VY2nBRNViko, 10/2/2014\)//HW](http://thebricspost.com/dont-interfere-in-chinas-internal-affairs-china-tells-us/#.VY2nBRNViko, 10/2/2014)

China has said **no country** must interfere in its internal affairs even as the Occupy protestors in Hong Kong refuse to disperse, threatening to occupy government buildings if the current chief executive does not resign.¶ “Secretary Kerry mentioned Hong Kong. The Chinese Government has very firmly and clearly stated its position. Hong Kong affairs are China’s internal affairs. All countries should respect China’s sovereignty. And this is also a basic principle governing international relations,” Chinese Foreign Minister Wang Yi said in Washington on Wednesday.¶ Wang was meeting US Secretary of State John Kerry to discuss regional and international issues of mutual interest.¶ “I believe for any country, for any society, no one will allow those illegal acts that violate public order. That’s the situation in the United States, and that’s the same situation in Hong Kong.” Wang said in an apparent reference to US police clashing with demonstrators at protest rallies in Ferguson, Missouri, where black teenager Michael Brown was shot to death by a white police officer in August.¶ “We believe that the Hong Kong Special Administrative Region’s government has the capability to properly handle the current situation in accordance with the law,” Wang added.

Internals: Pressure kills China Rels

US criticism of China on HR tanks relations

Zeng et al 15 (Jinghan Zeng, Vice-Chancellor's 2020 Lecturer in the Department of Politics and Public Policy at De Montfort University and an Associate Fellow in the Centre for the Study of Globalisation and Regionalisation at the University of Warwick, Yuefan Xiao, Postdoctoral Research Fellow at the Amsterdam School for Cultural Analysis, University of Amsterdam, Professor of Politics and International Studies at the University of Warwick and Senior Scientist on the EU funded GR:EEN Project (Global Reordering: Evolution through European Networks) that focuses on the EU's role in a multipolar world, Associate Fellow of the Chatham House Asia Programme and co-editor of The Pacific Review, "Securing China's Core Interests: The State of the Debate in China," International Affairs, March 27 2015, <http://onlinelibrary.wiley.com/doi/10.1111/1468-2346.12233/full>)/AG

By far the biggest problem for China in respect of protecting its core interests is the United States. Taiwan is not only important in itself for China; it is also considered to be the biggest problem in Sino-US relations. Moreover, the US is blamed for trying to sabotage this most important core interest. For example, one article argues that, 'regarding the issue of the most central and important interest [Taiwan], the US has always been interfering, challenging, and damaging China's core interests'.⁷⁹ In total, 14.81 per cent of papers refer to US policy towards China on a range of other issues (especially Xinjiang, Tibet and human rights policies) as threatening China's core interests. It is argued that the US has never 'cared' about China's core interests. For example, one article argues: 'The US has never had any scruples respecting China's core interests ... the more important the issues are concerned with China's national core interests, the more likely that the US will "challenge" them.'⁸⁰ In two articles, Chu Shulong, a professor at Tsinghua University, goes a step further and argues that the core interests of the US and China cannot be resolved because they are 'oppositional'.⁸¹ It is argued that the core interests of the US and China are 'opposite and confrontational ... this fundamentally determines that Sino-US relations cannot be friendly—it may even be an opposing and confrontational relationship'.⁸² This view echoes the prediction of Great Power conflict theory that the core interests of the rising power and the existing hegemon will eventually clash—though without directly engaging with the extant (western) literature on the theme. There is, then, a tendency to treat tensions in US–Chinese relations as an unfortunate but natural fact of life in a changing world order. As one article puts it: 'It is not easy to ask the US to give up its hegemonic attitude and actions; and it is impossible to ask China to continue to tolerate the US actions that damaged China's core interests. So a struggle is inevitable.'⁸³

Chinese see US HR policies as intending to interfere on internal affairs and limit its rise

Nathan and Scobell 12 Andrew, prof of political science, Columbia University and Andrew, Senior Political Scientist, RAND Corporation. "How China Sees America: The Sum of Beijing's Fears." Foreign Affairs. September/October 2012. <https://www.foreignaffairs.com/articles/china/2012-08-16/how-china-sees-america>

Chinese analysts also believe that the United States possesses potent ideological weapons and the willingness to use them. After World War II, the United States took advantage of its position as the dominant power to enshrine American principles in the Universal Declaration of Human Rights and other international human rights instruments and to install what China sees as Western-style democracies in Japan and, eventually, south Korea, Taiwan, and other countries. Chinese officials contend that the United States uses the ideas of democracy and human rights to delegitimize and destabilize regimes that espouse

alternative values, such as socialism and Asian-style developmental authoritarianism. In the words of Li Qun, a member of the Shandong Provincial Party Committee and a rising star in the Communist Party, the Americans' "real purpose is not to protect so-called human rights but to use this pretext to influence and limit China's healthy economic growth and to prevent China's wealth and power from threatening [their] world hegemony."

US attempts to democratize China backfire-integrating it into the international system is best

Wyne 13 Ali, contributing analyst at Wikistrat and a global fellow at the Project for the Study of the 21st Century. "Some Thoughts on the Ethics of China's Rise." 08/14/13. Accessed 6/26/14.
http://www.carnegiecouncil.org/publications/ethics_online/0084

The more contentious topic, of course, is the role that human rights should play in U.S.-China relations. While the United States should neither hesitate to articulate its differences with China on issues of human rights, nor refrain from encouraging those trends within China that are promoting greater citizen empowerment, it should not urge China to democratize or condition its interactions with China on the leadership's acceptance of core American values. A country that is not yet 250 years old should appreciate the possibility that a country several millennia old may have its own strain of exceptionalism. Furthermore, attempts to democratize China could backfire. One of the foremost China watchers, former prime minister of Singapore Lee Kuan Yew, declares that it will not "become a liberal democracy; if it did, it would collapse." While the Chinese Communist Party (CCP) is willing to experiment with democratic reforms in "villages and small towns," he explains, it fears that large-scale democratization "would lead to a loss of control by the center over the provinces, like [during] the warlord years of the 1920s and '30s.³ Whatever challenges an increasingly capable and assertive China might pose, a weak China in the throes of chaos would be even more problematic, especially now that its growth is vital to the health of the global economy. It is China's ongoing integration into the international system and attendant exposure to information technology that hold the greatest promise for improvements to its human rights climate. Since the late 1970s, the CCP has implicitly conditioned its delivery of rapid growth to the Chinese people on their acquiescence to its rule. The problem is that citizens' priorities become more sophisticated as their day-to-day situations grow less exigent. Those in dire poverty are quite likely to censor themselves in exchange for food, shelter, and other necessities. As they enter the middle class, however, and become less preoccupied with the demands of survival, they naturally think more about critiquing government policy. Within this transition lies a fundamental challenge for the CCP: the very bargain that it implemented to forestall challenges to its rule is enabling greater numbers of Chinese to pose such challenges. There were only 20 million Internet users in China in 2000; today, there are more than 560 million.⁴

HR pressure on China fails: doesn't take external cues

Drury and Li 6 A. Cooper Drury, prof of political science, University of Missouri. Yitan Li, phd candidate, politics and IR, University of Southern California. "US Economic Sanction Threats Against China: Failing to Leverage Better Human Rights." Foreign Policy Analysis. 6 fac-staff.seattleu.edu/liy/web/druryandli2006fpa.pdf

The question of effectiveness of these sanction threats depends largely on how we conceptualize China's behavior. If change in China's behavior is measured by the level of repression, then there is no link between U.S. threats and Beijing's behavior. Instead, repression is seemingly driven by the domestic situation in

China. Beijing decides to repress in order to maintain its control of the population. It does not take cues from America whether they are verbal or active threats. It is worth noting that positive or cooperative moves by Washington also have no impact. Beijing simply does not respond to external factors when deciding to repress.

China threatened by Western Human Rights pressure-leads to crackdowns

Buckley 13 Chris, New York Times China Correspondent. "China Takes Aim at Western Ideas." New York Times. 08/19/13. www.nytimes.com/2013/08/20/world/asia/chinas-new-leadership-takes-hard-line-in-secret-memo.html? r=0

Even as Mr. Xi has sought to prepare some reforms to expose China's economy to stronger market forces, he has undertaken a "mass line" campaign to enforce party authority that goes beyond the party's periodic calls for discipline. The internal warnings to cadres show that Mr. Xi's confident public face has been accompanied by fears that the party is vulnerable to an economic slowdown, public anger about corruption and challenges from liberals impatient for political change. "Western forces hostile to China and dissidents within the country are still constantly infiltrating the ideological sphere," says Document No. 9, the number given to it by the central party office that issued it in April. It has not been openly published, but a version was shown to The New York Times and was verified by four sources close to senior officials, including an editor with a party newspaper. Opponents of one-party rule, it says, "have stirred up trouble about disclosing officials' assets, using the Internet to fight corruption, media controls and other sensitive topics, to provoke discontent with the party and government." The warnings were not idle. Since the circular was issued, party-run publications and Web sites have vehemently denounced constitutionalism and civil society, notions that were not considered off limits in recent years. Officials have intensified efforts to block access to critical views on the Internet. Two prominent rights advocates have been detained in the past few weeks, in what their supporters have called a blow to the "rights defense movement," which was already beleaguered under Mr. Xi's predecessor, Hu Jintao. Mr. Xi's hard line has disappointed Chinese liberals, some of whom once hailed his rise to power as an opportunity to push for political change after a long period of stagnation. Instead, Mr. Xi has signaled a shift to a more conservative, traditional leftist stance with his "rectification" campaign to ensure discipline and conspicuous attempts to defend the legacy of Mao Zedong. That has included a visit to a historic site where Mao undertook one of his own attempts to remake the ruling party in the 1950s. Mr. Xi's edicts have been disseminated in a series of compulsory study sessions across the country, like one in the southern province of Hunan that was recounted on a local government Web site. "Promotion of Western constitutional democracy is an attempt to negate the party's leadership," Cheng Xinping, a deputy head of propaganda for Hengyang, a city in Hunan, told a gathering of mining industry officials. Human rights advocates, he continued, want "ultimately to form a force for political confrontation." The campaign carries some risks for Mr. Xi, who has indicated that the slowing economy needs new, more market-driven momentum that can come only from a relaxation of state influence. In China's tight but often contentious political circles, proponents of deeper Western-style economic changes are often allied with those pushing for rule of law and a more open political system, while traditionalists favor greater state control of both economic and political life. Mr. Xi's cherry picking of approaches from each of the rival camps, analysts say, could end up mirroring his own agenda in intraparty squabbling. Condemnations of constitutional government have prompted dismayed opposition from liberal intellectuals and even some moderate-minded former officials. The campaign has also exhilarated leftist defenders of party orthodoxy, many of whom pointedly oppose the sort of market reforms that Mr. Xi and Prime Minister Li Keqiang have said are needed. The consequent rifts are unusually open, and they could widen and bog down Mr. Xi, said Xiao Gongqin, a professor of history at Shanghai Normal University who is also a prominent proponent of gradual, party-guided reform. "Now the leftists feel very excited and elated, while the liberals feel very discouraged and discontented," said Professor Xiao, who said he was generally sympathetic to Mr. Xi's aims. "The ramifications are very serious, because this seriously hurts the broad middle class and moderate reformers — entrepreneurs and intellectuals. It's possible that this situation will get out of control, and that won't help the political stability that the central leadership stresses." The pressures that prompted the party's ideological counteroffensive spilled onto the streets of Guangzhou, a city in southern China, early this year. Staff members at the Southern Weekend newspaper there protested after a propaganda official rewrote an editorial celebrating constitutionalism — the idea that state and party power should be subject to a supreme law that prevents abuses and protects citizens' rights. The confrontation at the newspaper and campaign demanding that officials disclose their wealth alarmed leaders and helped galvanize them into

issuing Document No. 9, said Professor Xiao, the historian. Indeed, senior central propaganda officials met to discuss the newspaper protest, among other issues, and called it a plot to subvert the party, according to a speech on a party Web site of Lianyungang, a port city in eastern China. “Western anti-China forces led by the United States have joined in one after the other, and colluded with dissidents within the country to make slanderous attacks on us in the name of so-called press freedom and constitutional democracy,” said Zhang Guangdong, a propaganda official in Lianyungang, citing the conclusions from the meeting of central propaganda officials. “They are trying to break through our political system, and this was a classic example,” he said of the newspaper protest.

Internals: Pressure kills Russia Rels

Russia's warned the U.S. to stay out of its affairs

Firstpost '14 (Firstpost, Indian based international news source, "Don't interfere in Russia's internal affairs: Putin to new US envoy", firstpost.com, <http://www.firstpost.com/world/dont-interfere-in-russias-internal-affairs-putin-to-new-us-envoy-1811277.html>, 11/19/2014)//HW

Moscow, Russia: President Vladimir **Putin urged Washington's new envoy on Wednesday not to interfere in Russia's affairs** as he accepted credentials from US ambassador John Tefft amid raging tensions.¶ "**We are ready for practical cooperation with American partners along various directions guided by the principles of respect for each other's interests, equal rights and non-interference into domestic affairs,**" Putin said.¶ He spoke at the Kremlin where Tefft, Washington's new ambassador to Russia, presented his letter of credence along with envoys from several other countries including North Korea.¶ Tefft -- known for backing the pro-Western aspirations of former Soviet states -- succeeded Michael McFaul, who abruptly quit his post in February after just two years on the job. Tefft served as US ambassador to Ukraine from 2009 to 2013 and was Washington's representative in Georgia during its five-day war with Russia in 2008.¶ His predecessor McFaul, a Stanford university professor, frequently sparked Russia's fury with critical comments on Twitter and meetings with Russian opposition activists.¶ **Cold War-era rivals Russia and the United States are locked in a tug-of-war over the fate of ex-Soviet republic Ukraine, with Washington imposing sanctions and** US President Barack **Obama branding Moscow's actions over Ukraine a "threat to the world"**.¶ Meeting with his supporters on Tuesday, **Putin claimed the United States wanted to subjugate Russia but would never succeed.**¶ "**They want to subdue us, want to solve their problems at our expense,**" the Russian president said.¶ "**No one in history ever managed to do this to Russia, and no one ever will.**"

Putin has used U.S. human rights pressure to promote anti-Americanism

Gerber and Zavisca '15 (Theodore, professor of sociology and director of the Center for Russia, East Europe, and Central Asia at the University of Wisconsin-Madison, Jane, associate professor of sociology at the University of Arizona, "WHAT 18 FOCUS GROUPS IN THE FORMER USSR TAUGHT US ABOUT AMERICA'S IMAGE PROBLEMS", The Wilson Quarterly, <http://wilsonquarterly.com/stories/what-18-focus-groups-in-former-ussr-taught-us-about-americas-pr-problems/>, 5/27/2015)//HW

As Thomas Carothers observed in a 2006 Foreign Affairs article, Putin has been leading a "backlash" campaign against American democracy assistance since 2005, when Russian officials began labeling domestic human rights NGOs with foreign funding as a traitorous "fifth column," a now-standard moniker in official speeches and pro-Kremlin Russian media. In a February 2007 speech in Munich, Putin sounded the themes of unipolarity, U.S. hypocrisy in preaching democracy and human rights, and its interference in Russia's sovereign affairs. After spontaneous protests arose in Russia following allegations of widespread fraud in the country's

December 2011 parliamentary elections, Putin blamed the revolts on U.S. Secretary of State Hillary Clinton, charging that she sent “a signal” to certain “actors” in Russia — a threatening specter of American menace, which became a prominent theme throughout Putin’s 2012 presidential campaign. In his March 18, 2014, address on the “reunification” of Russia and Crimea, Putin again labeled those who oppose his policies as a “fifth column, [a] disparate bunch of national traitors” supported by foreign interests.

Calling out Russian human rights abuses risks relations collapse

Burkhalter ’13 (Holly, International Justice Mission VP for government relations, “The U.S. should use its ability to pressure Russia to end orphan trafficking”, The Washington Post, http://www.washingtonpost.com/opinions/the-us-should-use-its-ability-to-pressure-russia-to-end-orphan-trafficking/2013/05/24/d93596e0-c2ff-11e2-914f-a7aba60512a7_story.html, 5/24/2013)//HW

Meanwhile, Russian authorities are methodically dismantling the country’s once-robust civil society. Human rights groups are required to register as foreign agents if they receive foreign assistance, and their leaders are increasingly harassed, hounded and jailed. **The U.S. government has financially supported Russian anti-trafficking organizations in the past but can no longer do so because of restrictions enacted in November.** **Russia has been on a ranking watch list for nine years** and, under the law, must be moved either up to Tier II or down to Tier III. **Diplomats** recognizing that the United States needs Russian cooperation on a host of national security matters **aren’t eager to irritate Putin. Obama administration officials are reportedly debating whether to graduate Russia to Tier II or to rank the country where Russia watchers understand it belongs — and risk roiling a complicated bilateral relationship.**

U.S. interference into Russian human rights affairs has empirically angered them

Matlock ’14 (Jack, ambassador to the U.S.S.R. from 1987 to 1991, “Who is the bully? The U.S. has treated Russia like a loser since the end of the Cold War.”, The Washington Post, http://www.washingtonpost.com/opinions/who-is-the-bully-the-united-states-has-treated-russia-like-a-loser-since-the-cold-war/2014/03/14/b0868882-aa06-11e3-8599-ce7295b6851c_story.html, 3/24/2014)//HW

President Obama famously attempted a “reset” of relations with Russia, with some success: The New START treaty was an important achievement, and there was increased quiet cooperation on a number of regional issues. But then Congress’s penchant for minding other people’s business when it cannot cope with its own began to take its toll. The Magnitsky Act, which singled out Russia for human rights violations as if there were none of comparable gravity elsewhere, infuriated Russia’s rulers and confirmed with the broader public the image of the United States as an implacable enemy.

Internals: Pressure = Russia Overreact

Russia responds negatively to US HR Pressure-Putin attempting to restore Russia's status

Larson and Shevchenko 14 Deborah Welch, prof of political science, UCLA; and Alexei, associate professor of pol science, CSU Fullerton. "Russia says no: Power, status and Emotions in Foreign Policy." Communist and Post-Communist Studies. 10/16/14.
doi:10.1016/j.postcomstud.2014.09.003

Even the triumph of Russia's 2012 admission into the WTO, after two decades of negotiations, was marred by Russian status grievances. Russian political circles were predictably enraged by the decision of the U.S. Congress to replace the obsolete Cold War-era Jackson e Vanik amendment (which conditioned trade relations with the USSR on freedom of Jewish emigration) with the December 2012 Sergey Magnitsky Rule of Law Accountability Act (which denied visas to Russian officials implicated in " gross human rights violations " and froze their U.S. assets), viewing it as intolerable interference in their domestic affairs (Herszenhorn, 2012). 1 According to Alexei Pushkov, chair of the Russian Duma's international affairs committee, the Magnitsky Act reflected American " pure double standards. " Russia was castigated for its human rights practices while authoritarian partners of the U.S., including China, continued to get a pass from Washington (Weir, 2013). Russia responded tit for tat, first with a bill targeting political nongovernmental organizations receiving financial support from the United States and prohibiting U.S. adoptions of Russian orphans. The latter provision was ostensibly designed to protect Russian children from abuse by American parents, but attracted much opposition within Russia, including from some members of Putin's cabinet (Economist, 2013). A day after the United States released the name of Russian officials subject to sanctions Russia provided its own list of eighteen current and former U.S. officials who would be barred from entering Russia. A spokesperson for the Russian Foreign Ministry, Alexander Lukashevich, commented that the United States must realize that it cannot conduct its relationship with Moscow " in the spirit of mentoring and undisguised diktat " (Barry, 2013). Putin's resentment over the West's use of Russia's March 2011 abstention, rather than a veto, of a UN SC resolution 1973, allowing the NATO air campaign against Gaddafi 's troops in Libya, to promote " regime change " in that country contributed to Russia's falling out with the West over the civil war in Syria, which broke out in 2012 (Economist, 2012). Tellingly, Putin initially signaled his willingness to cooperate with the U.S. in stopping the war and leading the post-con flict peace process, but insisted that this should be a cooperation of equals, a condition which Washington, despite the reset rhetoric, refused to accept (Trenin, 2013b). By saying " no " to Western intervention in Syria and by supporting Syrian President Bashar al-Assad in is military campaign against rebels Putin aimed at restoring Russia's status as an " indispensable power " in global politics and earning the respect of China and other rising powers (Baev, 2013).

Internals: China Pressure

China suspicious of US democracy promotion-believe it is part of US strategy to maintain global hegemony

Lieberthal and Jisi 12 Kenneth G., senior fellow in foreign policy & global economy, Brookings Institute and Wang, Dean of School of International Studies, Peking University. "Addressing US-China Strategic Distruct." March 2012. Accessed 6/26/15. http://www.brookings.edu/~media/research/files/papers/2012/3/30%20us%20china%20lieberthal/0330_china_lieberthal.pdf

In combination, these views make many Chinese political elites suspect that it is the United States that is "on the wrong side of history." Because they believe that the ultimate goal of the U.S. in view of these factors is to maintain its global hegemony, they conclude that America will seek to constrain or even upset China's rise. America's democracy promotion agenda is understood in China as designed to sabotage the Communist Party's leadership. The leadership therefore actively promotes efforts to guard against the influence of American ideology and U.S. thinking about democracy, human rights, and related issues. This perceived American effort to divide and weaken China has been met by building increasingly powerful and sophisticated political and technological devices to safeguard domestic stability.

China believes US democracy promotion is a conspiracy to undermine Chinese sovereignty

He 12 Baogang, prof of Public Policy and Global Affairs, Nanyang Technological University. "Working with China to Promote Democracy." The Washington Quarterly. 12/17/12. <http://dx.doi.org/10.1080/0163660X.2013.751649>

While China has proven resistant to democratic pressures, many Chinese believe that the United States is using democracy to destabilize China from rising. In a survey in the Global Times, 59 percent of the respondents believed that the United States is seeking to contain China, and 79 percent held negative views toward the United States in 2005 — / 06. 25 To combat this external pressure, China responds to U.S. democracy promotion in several ways: it calls democracy promotion a conspiracy theory and infiltration campaign; it reinforces official ideology, even to the point of confrontational statements by high - / powered officials; it impedes NGOs in the country; and it " securitizes " democracy promotion. Ultimately, China views U.S. democracy promotion as a strategic threat ————— / some Chinese scholars even present it as a U.S. conspiracy to split China. In this view, the United States has a hidden plan for peaceful evolution in China, aiming to isolate it from Europe and elsewhere internationally, in part by consolidating U.S. moral leadership. It is widely acknowledged in China that the democracy project has cut to the core of China ' s territorial integrity, with Bill Clinton supporting Tibet, George W. Bush supporting Taiwan, and the National Endowment for Democracy (NED) supporting Xinjiang ' s separatism. Similar projects undermined the power of the former Soviet Union in the past, and today are perceived as playing a parallel role in containing the rise of China. 26 Beijing claims to be able to see through the so - / called human rights issue to its real objective: to frame and constrain China ' s sovereignty, and to negotiate a better deal for the United States at the WTO or in bilateral business relations during China ' s economic transition by highlighting China ' s advantage in having a low human rights standard. 2

General Impact Stuff

Impacts: Turns Case

The disad turns case- human rights promotion leads to crackdown and tanks US human rights credibility

Burnell and Youngs 9 (Peter Burnell, Professor of Politics and International Studies, Richard Youngs, Senior Associate Carnegie Endowment for International Peace and Professor of International Relations, "New Challenges to Democratization," Routledge, December 4, 2009)//AG

The color revolutions were enough on their own to spark concern in many quarters about Western democracy promotion. Yet several elements of the larger international context in which they occurred multiplied this effect. Most importantly, the color revolutions happened to take place in the period immediately following the US-led intervention in Iraq. In March 2003, the United States led an intervention that ousted President Saddam Hussein from power in Iraq. Seven months after the United States and its allies defeated Saddam, the "Rose Revolution" brought a pro-US leader in power in Georgia. A year later, the Orange Revolution did the same in Ukraine. Although this series of events was a coincidence, it did not look like one to many people. Instead it appeared to many that the color revolutions were an integral element of a new Bush global regime change policy—Washington would oust some governments by force, some through economic sanctions and diplomatic pressure, and some through quiet, well-crafted aid to political opposition groups, replacing them with compliant, pro-Western governments. More generally, Bush's extremely assertive and also relentless presentation of the Iraq intervention as the leading edge of his "global freedom agenda" undermined the legitimacy of US democracy promotion and of democracy promotion generally. In the minds of many people around the world, democracy promotion became a code word for military intervention and US hegemony. This greatly fueled the backlash, alarming people about what democracy promotion really is and allowing nondemocratic power-holders all over to justify restrictions on external democracy assistance as national self-defense. This foreign policy dimension of the backlash has been most vividly exemplified by the case of Russia. During his presidency, and in the first year of his prime ministership, Vladimir Putin became increasingly suspicious of US policy towards Russia, in tandem with Russia's growing recovery of national self-confidence (fueled by the energy bonanza that greatly boosted the Russian economy). By 2007, Putin and the Russian security establishment generally were talking darkly about the growing threat of encirclement of Russia by pro-Western governments that sought to join the North Atlantic Treaty Organization (NATO) and do America's bidding. The fact that Western, especially US, democracy assistance was linked with the rise of pro-Western governments in Central Europe and the Baltic States throughout the 1990s and Georgia and Ukraine in this decade tempted Russians to view Western democracy promotion as a direct foreign policy challenge to Russia, and to react vociferously against it on those terms.

The disad turns case- HR promotion leads to worse HR records

Burnell and Youngs 9 (Peter Burnell, Professor of Politics and International Studies, Richard Youngs, Senior Associate Carnegie Endowment for International Peace and Professor of International Relations, "New Challenges to Democratization," Routledge, December 4, 2009)//AG

As we explore whether aid interactions undercut the likelihood of democratic regime change, we should also explore how aid interactions affect the particular components of democracy assistance programmes. Finkel et al. have illustrated that the components of democracy assistance programmes do not 'work' in tandem. On the contrary, despite finding that democracy assistance 'works' in the aggregate, Finkel et al. have shown that 'USAID human rights assistance has a significant negative impact on the human rights' records of recipient states. '[R]eceiving rule of law funding directed at the improvement of human rights' and, specifically, at preventing states from 'abusing the personal integrity of their populations' actually correlates with an increase in human rights abuse (Finkel et al. 2008: 5 and 55; italics added). Why would increased funding for the protection of human rights correlate with increases in human rights abuse? It is possible that the US directs a dis-proportional amount of human rights aid to countries with especially 'suspect' human rights records (and that the trend is one of reverse causation) but Finkel et al. (ibid.: 85) show that this hypothesis does not hold up to statistical tests. Moreover, even if this particular form of aid did go disproportionately to states with the worst human rights records, reverse causality would not explain the dynamic, temporal dimension of the association, that is, why human rights violations actually increase. A focus on the interaction of aid initiatives suggests a more compelling explanation for this troubling association. The following, highly problematic, mix of incentives may be at play: aid for the development of civil society, political parties, and anti-corruption programmes encourages all sorts of political actors to engage in opposition activities and challenge ruling elites. Aid for human rights programmes and judicial development programmes encourages these same actors to use the judicial apparatus of the state as a vehicle for change, but this causes fissures in the state elite. These fissures threaten the anti-democratic forces in government who then use the coercive apparatus of the state to crack down on democratizing forces and protect their own power base. Anti-democratic actors have the capacity to initiate a crack-down precisely because military aid has bolstered the strength of the coercive apparatus and lowered the costs of repression and abuse. In the meantime, aid for free media and transparency has increased the likelihood that the abuses will be reported and recorded. One set of incentives leads people to exercise or demand their rights while another set of incentives lowers the costs of abusing the rights of these same actors. And so the incidence of recorded abuse rises. Recent events in Egypt under President Mubarak and in Pakistan under General Musharraf illustrate the scenario I have just described. How often this cycle of events has been played out elsewhere requires more research but it is a predictable outcome of the US attempt to meet the challenge of promoting national security while aiding democracy abroad.

Impacts: General HR Cred Bad

Countries use human rights law to justify atrocities

Posner 14 (Eric Posner, professor at the University of Chicago Law School, "The Case Against Human Rights," The Guardian, December 4, 2014, [//AG](http://www.theguardian.com/news/2014/dec/04/-sp-case-against-human-rights)

But while **governments** all **use the idiom of human rights**, they use it **to make radically** different **arguments** about how countries should behave. China cites "the right to development" to **explain** why the Chinese government gives **priority to economic growth over political liberalisation**. Many countries cite the "right to security," a catch-all idea **that protection from crime justifies harsh enforcement methods**. Vladimir Putin cited the rights of ethnic minorities in **Ukraine** in order **to justify his military intervention there**, just as **the United States cited Saddam Hussein's suppression of human rights** in order **to build support for the Iraq war**. Certain **Islamic countries cite the right to religious freedom** in order **to explain why women must be subordinated**, arguing that women must play the role set out for them in Islamic law. The right of "self-determination" can be invoked to convert foreign pressure against a human-rights violating country into a violation of that country's right to determine its destiny. **The language of rights**, **untethered to specific legal interpretations**, **is too spongy to prevent governments from committing abuses and can easily be used to clothe illiberal agendas in words soothing to the western ear**. And while NGOs do press countries to improve their behaviour, they cite the human rights they care about and do not try to take an impartial approach to enforcing human rights in general. **Sophisticated organisations such as Human Rights Watch understand that poor countries cannot comply with all the human rights listed in the treaties**, so they pick and choose, in effect **telling governments around the world that they should reorder their priorities so as to coincide with what Human Rights Watch thinks is important, often fixing on practices that outrage uninformed westerners who donate the money that NGOs need to survive**. But is there any reason to believe that Human Rights Watch, or its donors, knows better than the people living in Suriname, Laos or Madagascar how their governments should set priorities and implement policy?

Top-down attempts to force developing countries to adopt Western human rights ideology lead to their domination

Posner 14 (Eric Posner, professor at the University of Chicago Law School, "The Case Against Human Rights," The Guardian, December 4, 2014, [//AG](http://www.theguardian.com/news/2014/dec/04/-sp-case-against-human-rights)

International human rights law reflects the same top-down mode of implementation, pursued in the same crude manner. But human rights law has its distinctive features as well. **Because it is law**, it requires the consent of states, **creating an illusion of symmetry and even-handedness** that is **missing from foreign aid**. Hence the insistence, wholly absent from discussions about foreign aid, that western countries are subject to international human rights law as other countries are. **However, in practice, international human rights law does not require western countries to change their behaviour**, while (in principle) **it requires massive changes in the behaviour of most non-western countries**. Both foreign aid and **human rights enforcement**

can be corrupted or undermined because western countries have strategic interests that are not always aligned with the missions of those institutions. But the major problem, in both cases, is that the systems reflect a vision of good governance rooted in the common historical experiences of western countries and that prevails (albeit only approximately) in countries that enjoy wealth, security and order. There is no reason that this vision – the vision of institutionally enforced human rights – is appropriate for poor countries, with different traditions, and facing a range of challenges that belong, in the view of western countries, to the distant past. Development economics has gone some distance to curing itself of this error. The best development scholars today, such as Esther Duflo, have been experimenting furiously with different ways of improving lives of people living in foreign countries. Rigorous statistical methods are increasingly used, and in recent years economists have implemented a range of randomised controlled trials. Much greater attention is paid to the minutiae of social context, as it has become clear that a vaccination programme that works well in one location may fail in another, for reasons relating to social order that outsiders do not understand. Expectations have been lowered; the goal is no longer to convert poor societies into rich societies, or even to create market institutions and eliminate corruption; it is to help a school encourage children to read in one village, or to simplify lending markets in another. It is time to start over with an approach to promoting wellbeing in foreign countries that is empirical rather than ideological. Human rights advocates can learn a lot from the experiences of development economists – not only about the flaws of top-down, coercive styles of forcing people living in other countries to be free, but about how one can actually help those people if one really wants to. Wealthy countries can and should provide foreign aid to developing countries, but with the understanding that helping other countries is not the same as forcing them to adopt western institutions, modes of governance, dispute-resolution systems and rights. Helping other countries means giving them cash, technical assistance and credit where there is reason to believe that these forms of aid will raise the living standards of the poorest people. Resources currently used in fruitless efforts to compel foreign countries to comply with the byzantine, amorphous treaty regime would be better used in this way. With the benefit of hindsight, we can see that the human rights treaties were not so much an act of idealism as an act of hubris, with more than a passing resemblance to the civilising efforts undertaken by western governments and missionary groups in the 19th century, which did little good for native populations while entangling European powers in the affairs of countries they did not understand. A humbler approach is long overdue.

Impacts: General Instability

US democracy promotion causes revolts and instability- empirics

Burnell and Youngs 9 (Peter Burnell, Professor of Politics and International Studies, Richard Youngs, Senior Associate Carnegie Endowment for International Peace and Professor of International Relations, "New Challenges to Democratization," Routledge, December 4, 2009)//AG

Although the backlash against democracy promotion is the result of multiple factors, the "color revolutions" in Georgia, Ukraine, and Kyrgyzstan were clearly a major trigger. Even though these events were few in number, limited to one region, and produced only mixed pro-democratic efforts after their initial bloom faded, they resounded remarkably widely around the world.

Autocrats in many regions reacted, declaring that they would not permit such events to occur and warning both their own countries and outside actors against pushing in such a direction. **The color revolutions produced serious concerns and defensive reactions even in countries that do not match the political profile of the**

countries where color revolutions did occur. The color revolutions (and the similar case of the electoral revolution that ousted Serbian President Slobodan Milošević in 2000) took place in contexts that shared some important characteristics: (1) an incumbent government that was somewhat anti-democratic but not fully authoritarian, one that violated political rights but which did tolerate some active, significant opposition parties and some independent civil society, including, very importantly, at least one independent radio station or television station; (2) a leader who had been losing popularity and was perceived to be in political decline; and (3) a recent record of national elections which, even though manipulated by the incumbent government, did give opposition parties a chance to organize and compete (McFaul 2006). Yet the main countries pushing back against Western democracy assistance in recent years, such as Russia and China, have few or any of these features. They are more authoritarian societies, with relatively secure leaders, very weak or nonexistent opposition parties, fragmented, highly constrained civil societies, and either perfunctory or nonexistent national elections. Why did the color revolutions cast such a wide spell, even in countries which do not fit the profile

of a country ripe for such a cataclysm? **In some places of course the power-holders accusing foreign actors of trying to stir up a color revolution in their country are not genuinely worried.** They are simply using the color revolution "threat" as an excuse to stir up anti-foreign popular sentiment, to crack down on domestic political activists, or to block Western democracy promoters they find irritating even if not threatening. Nevertheless, in many cases of pushback, the color revolution concern is real. The relevant power-holders probably do not feel that a civic uprising is imminent or even possible any time soon but they view it as a troubling prospect that they want to nip in the bud. Two interrelated elements of the color revolution phenomenon, or at least perceptions of the phenomenon, are central to this fear. One of these elements is the specter of mass protests. **The mass protests that occurred in the color**

revolutions were only one part of a larger chain of political events that led to the fall of the regime. Also critical were the active campaigns and electoral successes of unified opposition coalitions and the work of NGOs to scrutinize the elections through domestic monitoring campaigns and parallel vote counts. Yet due to their visibility and drama, the mass protests appeared to many observers as the essence of the color revolutions. **The specter of mass protests is inherently unsettling to authoritarian leaders. They erupt unpredictably and are extremely difficult for power-holders to deal with.** Even authoritarians who believe themselves to be well liked by their citizens seem to harbor fears that just a few small streams of citizen discontent may suddenly coalesce into a surging river of protests. **Some of the governments engaged in pushback, such as those in Russia, China, and Iran, either came to power through or have in their**

national history revolutionary movements that started with the concerted actions of small groups of activists, culminating in mass protests and other mass actions. Power-holders in these countries tend to connect the color revolution idea to such experiences. One Iranian-American who was questioned by the Iranian security services about his civil society work, reports that the Iranians said that they know all about color revolutions because their own revolution, the Islamic revolution, was all about civic resistance and mass mobilization. The other element of the color revolutions that has contributed to such a wide, sharp defensive reaction is the belief prevalent in many quarters that outsiders, especially US groups, fundamentally drove these events. Studies that have assessed the actual weight of the role of outside actors in the color revolutions reach the consistent conclusion that the outsiders' role is not determinative. It can be a valuable helping hand to domestic forces pushing for change, but it neither creates those forces when they do not already exist, drastically increases their strength, nor directs their actions. Nevertheless, the tendency of many observers, especially power-holders in authoritarian or semi-authoritarian countries, to assume a much greater level of influence of outside actors and subscribe to the "made in the US" view of these events is not surprising.

The idea of foreign-sponsored political influence and manipulation by determined,

sophisticated, well-financed organizations funded by governments or private foundations in powerful, wealthy foreign countries is a fertile one. Nondemocratic power-holders themselves rely on behind-the-scenes efforts to try to manipulate political events in their own countries or neighboring ones. They naturally therefore tend to respect the power of what they see as parallel efforts by interventionist foreigners. More-over, the idea of color revolutions as products of outside intervention fits into a familiar historical narrative in many countries where past US or other Western political interventions resulted in ousted leaders, such as the 1953 coup in Iran that ousted Prime Minister Mohammed Mossadegh.

Russia-China Impacts

2NC Impact: R/C Alliance

Increased HR promotion causes backlash from Russia and China – they’ll create an alliance to oppose the U.S. and counterbalance against U.S. strategy

Migranyan 14

(Andranik Migranyan is the director of the Institute for Democracy and Cooperation in New York, which works closely with the Russian Presidential administration, “Washington's Creation: A Russia-China Alliance?,” pg online @ <http://nationalinterest.org/feature/washingtons-creation-russia-china-alliance-10843> //um-ef)

Despite internal concerns in both Russia and China that prevent both countries from announcing loudly and decidedly their support for each other—as was in the case of China’s restraint in recognizing the independence of Abkhazia and South Ossetia or the reincorporation of Crimea, and as in the reciprocal case when Russia has not voiced outright support for China in Chinese territorial disputes with neighbors—the two countries act as allies on a host of issues in world politics. These issues include

stabilizing Syria, the Iranian nuclear program, U.S. regime change around the world, and **the hard attempts of the United States to**

interfere in Chinese and Russian internal affairs masked as support for human rights. Russian-Chinese relations are entering a qualitatively new stage. They are more than merely partnership relations, but are not quite those of allies. However, it is entirely possible that increasing U.S. sanctions on Russia and attempts to contain China will push the two countries into a full-blown alliance. The present situation in trilateral U.S.-Chinese-Russian relations is at odds with the strategy articulated by Henry Kissinger during the Nixon Administration, which held that American relations with either Russia or China had to be substantially better than the bilateral relations between Russia and China themselves. Today the opposite is occurring. U.S. relations with either of the other two countries are considerably worse than bilateral Russia-China relations. Therefore, the potential for America pitting one against the other is decidedly smaller than the potential of the two countries uniting their efforts and resources to oppose American pressure in the spheres each country considers most sensitive. In both the U.S. and in Russian liberal circles, it is not uncommon to hear the tired assertions that further rapprochement between Russia and China will render Russia a junior partner in the Russo-Chinese relationship and that Russia should keep this in mind when choosing between China and the West. I believe such pronouncements stem more from their authors’ ideological convictions than from real political facts. They are meant to scare Moscow and to cow it into avoiding the strategic alliance with a growing China that is asserting its interests against the status quo in the face of American containment, particularly in the Asia-Pacific region, where it faces conflicts with virtually all of its neighbors—Japan, the Philippines, South Korea, Vietnam, India—and needs an alliance with Russia, with whom it lacks any potential conflicts in the foreseeable future. In talking about the threat of Moscow becoming Beijing’s junior partner, and in pressuring Moscow to choose the West over China, our Western partners have never articulated their vision of Russia in the world, the character of Russian relations with the West and especially with the United States. We are, of course, grateful to our Western partners for their espoused worry that Russia may “inadvertently” become a junior partner to China. But they have never articulated the place of Russia in the Western world, particularly in the Western economic and security frameworks. Since the 1990s, Western, and especially American, policy towards Russia followed a clear line according to which Moscow was to be treated as a whipping boy. Since the collapse of the USSR, the United States has not once, in words or deeds, demonstrated its

readiness for an equal partnership with Russia. And by the way, **in the context of the Ukrainian crisis, the West, and U.S.**

politicians and military officials, hurried to place Russia not in the role of a partner, but that of

an adversary, which, in their understanding, is practically indistinguishable from that of an enemy. Recently, various analysts have been busy using statistics to prove yet another unsubstantiated claim frequently invoked to discourage Russo-Chinese relations, namely, the alleged prospect of large Chinese populations pouring into Siberia and the Far East, thereby presenting a threat to Russia’s territorial integrity. As we can see from migratory tendencies in the northern border regions of China, the vast majority of migrants flock not to Russia’s Siberia and the Far East, but rather to the central regions of China and the new large cities, where lifestyle conditions are more comfortable. And, thanks to China’s demographic policies during last decades, the population in the border regions close to Russia is projected to decline rather than grow. In the foreseeable future, **Russia has plenty of space for maneuver in its relations with China. Russia’s next steps with**

regard to Beijing will largely depend on Washington’s readiness to impose tougher sanctions

because of Ukraine. **Russo-Chinese relations have great potential for development. We cannot exclude the possibility that Russia and China will enter into a military-political alliance that can shift the global balance of power.** The military, technological, and resource potential of Russia propped up by the economic and colossal labor resources of China

would allow the two countries to make decisions on many global issues in a way that would

rattle the current balance of power in international relations. Apparently, there is some sort of instinctive understanding of this in Washington, which is why the U.S. is not pushing Japan to adopt strict sanctions against Russia. Should Japan impose such sanctions, Prime Minister Shinzo Abe would have to forget his ambition to solve the question of the "Northern territories" in his relations with Russia, as he might force Russia's hand in supporting China's claim over the contentious Senkaku islands. A potential alliance of Russia and China can present many new and unexpected developments for both Washington and Brussels in economic and military-political relations. Today, there are many politicians and analysts in Washington who, on the one hand, desperately thirst to punish Russia and China, and on the other, consciously or not, avoid calculating the consequences of their actions and remain blind to the real preconditions for a closer partnership between Russia and China on all leading global problems. A continued refusal to contemplate such a partnership could have profound consequences for the U.S. foreign policy.

A China-Russia alliance would cause nuclear war

Shukla 5/13

(Vikas, reporter, quotes Paul Craig Roberts, head of the Institute of Political Economy, "Russia, China Challenge U.S. Hegemony; Nuclear War 'Likely Future', <http://www.valuewalk.com/2015/05/russia-china-challenge-u-s-nuclear-war-likely-future/>, 5/13/15//VZ)

Russia and China are conducting naval exercises in the Mediterranean Sea. The naval exercises commenced just a couple of days after Chinese President Xi Jinping attended the grand Victory Day celebrations in Moscow. They include live-fire exercises in the backyard of Western Europe. Russia and China have started flexing their muscles together to challenge the U.S. hegemony as they look to change the current world order. U.S. determined to block Russia and China Dr Paul Craig Roberts, the former U.S. Assistant Secretary of the Treasury for Economic Policy, said in a blog post that the United States was determined to block the rise of Russia and China. But neither of them will join the "world's acceptance of Washington's hegemony." Roberts notes that the US' attempt to contain Russia is the key reason for the crisis "Washington has created in Ukraine." Paul Craig Roberts, head of the Institute of Political Economy, said that Washington's aggression and propoganda have convinced Moscow and Beijing that Washington intends war. It has prompted Russia and China to form a strategic alliance to counterbalance the U.S. might. Dr Roberts believes that Russia and China will not accept the "vassalage status" that Germany, France, the UK, Canada, Japan, Australia and many other countries have accepted. 'Nuclear war is our likely future' Washington's arrogance of its self-image as an "exceptional, indispensable" country with hegemonic rights over other nations has laid the groundwork for a war. Unless the U.S. dollar and power collapses, "nuclear war is our likely future," said Dr Roberts. Besides military exercises, Russia and China have been stitching economic alliances to move closer to each other.

Impacts: Alliance = Russian Aggression

Sino-Russian Relations Trigger Renewed Russian Aggression

Constantine Menges, Senior Fellow at the Hudson Institute, 2005

[“China: The Gathering Threat”, p. 426]

Of equal concern is the possible reemergence of an authoritarian dictatorship in Russia under President Putin or a successor, whether ultranationalist or Communist. Our in-depth analysis of President Putin has included insights into his personal development, his work in the Soviet foreign intelligence service (KGB), and his actions since assuming the presidency of Russia on January 1, 2000. Putin is an intelligent, disciplined, and systematic leader, determined to assure that Russia is, in his words, a “strong state,” under a “dictatorship of law” and that Russia has a major role in the world. Putin declares his support for political democracy and movement toward a market-oriented economy, but the evidence to date suggests that Russia is gradually moving toward a more autocratic path. As Russia moved toward dictatorship, Putin would attempt to maintain a Potemkin democracy for the purpose of deceiving the major democracies, so that they would continue providing needed economic support for Russia. The ever-closer relationship between Russia and China strengthens the authoritarian tendencies within Russia, thereby increasing the risk that it will become more aggressive internationally. As the Chinese government develops relations with the Putin government, the Chinese Communist Party has revived direct relations with the Communist Party in Russia and also ties between the Chinese and Russian parliaments. These multiple relationships, all coordinated from the Chinese side through its Communist Party, provide many opportunities to cultivate allies in Russia and to fan suspicion of the U.S. and of democracy. This is especially true of China’s ever-expanding and mutually profitable relationships with the Russian military and its military production and research entities.

This causes global conflict which escalates internationally

Ariel Cohen, Senior Policy Analyst at the Heritage Foundation, 1996

[“The New ‘Great Game’: Oil Politics in the Caucasus and Central Asia”, January 25, <http://www.heritage.org/Research/RussiaandEurasia/BG1065.cfm>]

Much is at stake in Eurasia for the U.S. and its allies. Attempts to restore its empire will doom Russia's transition to a democracy and free-market economy. The ongoing war in Chechnya alone has cost Russia \$6 billion to date (equal to Russia’s IMF and World Bank loans for 1995). Moreover, it has extracted a tremendous price from Russian society. The wars which would be required to restore the Russian empire would prove much more costly not just for Russia and the region, but for peace, world stability, and security. As the former Soviet arsenals are spread throughout the NIS, these conflicts may escalate to include the use of weapons of mass destruction. Scenarios including unauthorized missile launches are especially threatening. Moreover, if successful, a reconstituted Russian empire would become a major destabilizing influence both in Eurasia and throughout the world. It would endanger not only Russia's neighbors, but also the U.S. and its allies in Europe and the Middle East. And, of course, a neo-imperialist Russia could imperil the oil reserves of the Persian Gulf.¹⁵ Domination of the Caucasus would bring Russia closer to the Balkans, the Mediterranean Sea, and the Middle East. Russian imperialists, such as radical nationalist Vladimir Zhirinovskiy, have resurrected the old dream of obtaining a warm port on the Indian Ocean. If Russia succeeds in establishing its domination in the south, the threat to Ukraine, Turkey, Iran, and Afghanistan will increase. The independence of pro-Western Georgia and Azerbaijan already has been undermined by pressures from the Russian armed forces and covert actions by the intelligence and security services, in addition to which Russian hegemony would make Western political and economic efforts to stave off Islamic militancy more difficult. Eurasian oil resources are pivotal to economic development in the early 21st century. The supply of Middle Eastern oil would become precarious if Saudi Arabia became unstable, or if Iran or Iraq provoked another military conflict in the area. Eurasian oil is also key to the economic development of the southern NIS. Only with oil revenues can these countries sever their dependence on Moscow and develop modern market economies and free societies. Moreover, if these vast oil reserves were tapped and developed, tens of thousands of U.S. and Western jobs would be created. The U.S. should ensure free access to these reserves for the benefit of both Western and local economies.

Impacts: Alliance = NW

Russia/China Alliance causes extinction

Roberts 7 - Senior Research Fellow at the Hoover Institution, Stanford University and Chair in Political Economy at the Center for Strategic and International Studies (Paul Craig, "US Hegemony Spawns Russian-Chinese Military Alliance", <http://www.lewrockwell.com/roberts/roberts218.html>)

This week the Russian and Chinese militaries are conducting a joint military exercise involving large numbers of troops and combat vehicles. The former Soviet Republics of Tajikistan, Kyrgyzstan, and Kazakhstan are participating. Other countries appear ready to join the military alliance. This new potent military alliance is a real world response to neoconservative delusions about US hegemony. Neocons believe that the US is supreme in the world and can dictate its course. The neoconservative idiots have actually written papers, read by Russians and Chinese, about why the US must use its military superiority to assert hegemony over Russia and China. Cynics believe that the neocons are just shills, like Bush and Cheney, for the military-security complex and are paid to restart the cold war for the sake of the profits of the armaments industry. But the fact is that the neocons actually believe their delusions about American hegemony. Russia and China have now witnessed enough of the Bush administration's unprovoked aggression in the world to take neocon intentions seriously. As the US has proven that it cannot occupy the Iraqi city of Baghdad despite 5 years of efforts, it most certainly cannot occupy Russia or China. That means the conflict toward which the neocons are driving will be a nuclear conflict. In an attempt to gain the advantage in a nuclear conflict, the neocons are positioning US anti-ballistic missiles on Soviet borders in Poland and the Czech Republic. This is an idiotic provocation as the Russians can eliminate anti-ballistic missiles with cruise missiles. Neocons are people who desire war, but know nothing about it. Thus, the US failures in Iraq and Afghanistan. Reagan and Gorbachev ended the cold war. However, US administrations after Reagan's have broken the agreements and understandings. The US gratuitously brought NATO and anti-ballistic missiles to Russia's borders. The Bush regime has initiated a propaganda war against the Russian government of V. Putin. These are gratuitous acts of aggression. Both the Russian and Chinese governments are trying to devote resources to their economic development, not to their militaries. Yet, both are being forced by America's aggressive posture to revamp their militaries. Americans need to understand what the neocon Bush regime cannot: a nuclear exchange between the US, Russia, and China would establish the hegemony of the cockroach.

Internals: Alliance Possible

A China-Russia alliance is possible

Browne 5/4, (Clayton Browne, writer and editor for Valuewalk, quotes Pepe Escobar, a roving correspondent for Asia Times/Hong Kong, an analyst for RT and TomDispatch, and a frequent contributor to websites and radio shows ranging from the US to East Asia; a foreign correspondent since 1985, and has lived in London, Paris, Milan, Los Angeles, Washington, Bangkok and Hong Kong, "US Forcing Russia, China And Iran Into Eurasian Military Alliance," <http://www.valuewalk.com/2015/05/us-forcing-russia-china-iran-military-alliance/>, 5/4/15, //VZ)

It is important to keep in mind that Russia is not acting in a vacuum. Russian President Vladimir Putin's belligerence over the last few years is not entirely about whipping up a nationalist fervor to improve his political fortunes. As Pepe Escobar points out in a recent Op-Ed on Zero Hedge, it's also about U.S. foreign policy in effect forcing Russia, China and Iran into a military alliance against the West. Russia selling Iran S-300 anti-aircraft missiles is a game changer Russia's decision to sell the S-300 anti-aircraft missile system to Iran is clearly a game-changer, and reflects changing geopolitics and the new world order. Jane's Defense Weekly has been saying for years that Israel would have great difficulty penetrating Iranian airspace, and that will certainly be true soon. Keep in mind that following the S-300s, Iran will almost certainly be offered the yet more sophisticated S-400s, which China is already slated to receive. Escobar explains the implications of Russia's decision: "The unspoken secret behind these game-changing proceedings actually terrifies Washington warmongers; it spells out a further frontline of Eurasian integration, in the form of an evolving Eurasian missile shield deployed against Pentagon/NATO ballistic plans." Eurasian military alliance A possible glimpse of the future was offered at the Moscow Conference on International Security in April of this year. Iranian Defense Minister, Brigadier-General Hussein Dehghan, unabashedly stating that Iran wanted BRICS members China, India and Russia to jointly oppose NATO's eastward expansion, and calling NATO's missile shield as an existential threat to their collective security. At the same conference, Russian Defense Minister Sergey Shoigu and Chinese Defense Minister Chang Wanquan noted that their military ties are an "overriding priority", and Iran and Moscow also emphasized that they're working together in their push towards a new global order. NATO versus Russia/China/Iran The battle lines are becoming more clearly drawn between NATO and Russia/China/Iran, so it's not surprising the three nations are cooperating more than ever before. Of note, Iran is an observer at the Collective Security Treaty Organization, and is virtually certain to join the SCO (Shanghai Cooperation Organization) within the next year or two. Given Russia is providing S-300 systems to Iran and S-400 systems to China, and developing the S-500 systems, which can supposedly intercept supersonic targets, it's clear the current NATO /U.S. military domination is at least threatened. On a related note, despite its small fleet in the area, China symbolically announced joint naval exercises with Russia in the Mediterranean last week. More over, as Escobar points out, this "budding military Eurasia integration is a key subplot of the New Great Game that runs parallel to the Chinese-led New Silk Road project." He argues that this Eurasian military alliance was almost inevitable given Beijing is confronted by U.S. and allies encroachment via the Asia-Pacific; Russia by encroachment via Eastern Europe; and Iran by encroachment via Southwest Asia. This means the multi-vector Russia-China-Iran strategic alliance is a reality for the foreseeable future. And despite whatever may occur with the nuclear negotiations with Iran this summer, 'Iran is bound to remain — alongside Russia — a key US geostrategic target."

Impacts: Alliance kills U.S. Leadership

A Russia-China alliance would be disastrous for the U.S. (RE-TAG)

Adomanis '14 (Mark, specializes in Russian economics and demographics, "A Russia-China Alliance Is Emerging, And It Will Be A Disaster For The West", Forbes, <http://www.forbes.com/sites/markadomanis/2014/05/20/a-russia-china-alliance-is-emerging-and-it-will-be-a-disaster-for-the-west/>, 5/20/2014)//HW

It's rare for the Times to be so critical of Obama, but this is an appropriate criticism. **A Russia-China alliance would, of course, be an absolute disaster for the United States, pretty much the only grouping of countries that would be genuinely interested in and capable of challenging its position of global leadership. Preventing the emergence of a Russia-China alliance ought to be at the very top of the list of US foreign policy priorities,** but, as the Times noted, no one seems to be paying any attention. In Washington circles, **Russia and China are considered two totally different and mutually exclusive issues studied by different groups** of people with different affiliations. **A Russia-China alliance is far from inevitable.** Frankly, given the troubled history of the two countries, **I don't think it would take a herculean diplomatic effort to head off the creation of such a partnership. The current policy of not doing anything, however, is clearly not an adequate response to such a serious potential threat. The US foreign policy community needs to wake up** or, a decade from **now**, we'll be hearing anguished debates about "who lost Eurasia."

Russia Impacts

2NC Impact Overview

Disad Outweighs –

A. Lack of Rationality – Loss of Russian prestige causes Putin to grab for power – incites nationalism that results in foreign policy irrationality and accidental nuclear war with the United States

B. Magnitude – Russian war is the only scenario for extinction

Bostrom 2

(Nick Bostrom, Ph.D. and Professor of Philosophy at Oxford University, March 2002, Journal of Evolution and Technology, Existential Risks: Analyzing Human Extinction Scenarios and Related Hazards)

A much greater existential risk emerged with the build-up of nuclear arsenals in the US and the USSR. An all-out nuclear war was a possibility with both a substantial probability and with consequences that might have been persistent enough to qualify as global and terminal. There was a real worry among those best acquainted with the information available at the time that a nuclear Armageddon would occur and that it might annihilate our species or permanently destroy human civilization.^[4] Russia and the US retain large nuclear arsenals that could be used in a future confrontation, either accidentally or deliberately. There is also a risk that other states may one day build up large nuclear arsenals. Note however that a smaller nuclear exchange, between India and Pakistan for instance, is not an existential risk, since it would not destroy or thwart humankind's potential permanently. Such a war might however be a local terminal risk for the cities most likely to be targeted. Unfortunately, we shall see that nuclear Armageddon and comet or asteroid strikes are mere preludes to the existential risks that we will encounter in the 21st century

C. Miscalculation comes first – times of tension make the risk of nuclear use higher – Russian strategy dictates first use of nuclear weapons in case of conflict with the U.S.

Parry 3/2/15

(Robert, Investigative reporter broke many of the Iran-Contra stories for The Associated Press and Newsweek in the 1980s, "Playing Chicken with Nuclear War," pg online @ <https://consortiumnews.com/2015/03/02/playing-chicken-with-nuclear-war/> //um-ef)

Exclusive: U.S.-Russian tensions keep escalating – now surrounding the murder of Russian opposition figure Boris Nemtsov – **yet almost no one on the American side seems to worry about the possibility that** the tough-guy rhetoric and proxy war in Ukraine **might risk a nuclear conflagration**, writes Robert Parry. The United States and Russia still maintain vast nuclear arsenals of mutual assured destruction, putting the future of humanity in jeopardy every instant. But an unnerving nonchalance has settled over the American side which has become so casual about the risk of cataclysmic war that the West's propaganda and passions now ignore Russian fears and sensitivities. A swaggering goofiness has come to dominate how the United States reacts to Russia, with American politicians and journalists dashing off tweets and op-eds, rushing to judgment about the perfidy of Moscow's leaders, blaming them for almost anything and everything. These days, playing with nuclear fire is seen as a sign of seriousness and courage. Anyone who urges caution and suggests there might be two sides to the U.S.-Russia story is dismissed

as a wimp or a stooge. A what-me-worry “group think” has taken hold across the U.S. ideological spectrum. Fretting about nuclear annihilation is so 1960s. So, immediately after last Friday night’s murder of Russian opposition figure Boris Nemtsov, the West’s media began insinuating that Russian President Vladimir Putin was somehow responsible even though there was no evidence or logic connecting him to the shooting, just 100 meters from the Kremlin, probably the last place Russian authorities would pick for a hit. But that didn’t stop the mainstream U.S. news media from casting blame on Putin. For instance, the New York Times published an op-ed by anti-Putin author Martha Gessen saying: “The scariest thing about the murder of Boris Nemtsov is that he himself did not scare anyone,” suggesting that his very irrelevance was part of a sinister political message. Though no one outside the actual killers seems to know yet why Nemtsov was gunned down, Gessen took the case several steps further explaining how – while Putin probably didn’t finger Nemtsov for death – the Russian president was somehow still responsible. She wrote: “In all likelihood no one in the Kremlin actually ordered the killing – and this is part of the reason Mr. Nemtsov’s murder marks the beginning of yet another new and frightening period in Russian history. The Kremlin has recently created a loose army of avengers who believe they are acting in the country’s best interests, without receiving any explicit instructions. Despite his lack of political clout, Mr. Nemtsov was a logical first target for this menacing force.” So, rather than wait for actual evidence to emerge, the Times published Gessen’s conclusions and then let her spin off some even more speculative interpretations. Yet, basing speculation upon speculation is almost always a bad idea, assuming you care about fairness and accuracy. Remember how after the Oklahoma City bombing in 1995, some terrorism “experts” not only jumped to the false conclusion that the attack was a case of Islamic terrorism but that Oklahoma was chosen to send a message to Americans that no part of the country was safe. But the terrorist turned out to be a white right-wing extremist lashing out at the federal government. While surely hard-line Russian nationalists, who resented Nemtsov’s support for the U.S.-backed Ukrainian regime in Kiev, should be included on a list of early suspects, there are a number of other possibilities that investigators must also consider, including business enemies, jealous rivals and even adversaries within Russia’s splintered opposition – though that last one has become a target of particular ridicule in the West. Yet, during my years at the Associated Press, one of my articles was about a CIA “psychological operations” manual which an agency contractor prepared for the Nicaraguan Contra rebels noting the value of assassinating someone on your own side to create a “martyr” for the cause. I’m in no way suggesting that such a motive was in play regarding Nemtsov’s slaying but it’s not as if this idea is entirely preposterous either. My point is that even in this age of Twitter when everyone wants to broadcast his or her personal speculation about whodunit to every mystery, it would be wise for news organizations to resist the temptation. Surely, if parallel circumstances occurred inside the United States, such guess work would be rightly dismissed as “conspiracy theory.” Nuclear Mischief Plus, this latest rush to judgment isn’t about some relatively innocuous topic – like, say, how some footballs ended up under-inflated in an NFL game – this situation involves how the United States will deal with **Russia, which possesses some 8,000 nuclear warheads** – roughly the same size as the U.S. arsenal – while **the two countries have around 1,800 missiles on high-alert, i.e., ready to launch at nearly a moment’s notice**. Over the weekend, I participated in a conference on nuclear dangers sponsored by the Helen Caldicott Foundation in New York City. On my Saturday afternoon panel was **Seth Baum of the Global Catastrophic Risk Institute who offered a sobering look at how the percentage chances of a nuclear war – though perhaps low at any given moment – add up over time to quite likely if not inevitable**. He made the additional observation that those **doomsday odds rise at times of high tensions between the United States and Russia**. As Baum noted, **at such crisis moments, the people responsible for the U.S. and Russian nuclear weapons are more likely to read a possible computer glitch or some other false alarm as a genuine launch and are thus more likely to push their own nuclear button**. In other words, it makes good sense to avoid a replay of the Cuban Missile Crisis in reverse by edging U.S. nuclear weapons up against Russia’s borders, especially when U.S. politicians and commentators are engaging in Cold War-style Russia-bashing. Baiting the Russian bear may seem like great fun to the tough-talking politicians in Washington or the editors of the New York Times and Washington Post but this hostile rhetoric could be taken more seriously in Moscow. When I spoke to the nuclear conference, I noted how the U.S. media/political system had helped create just that sort of crisis in Ukraine, with every “important” person jumping in on the side of the Kiev coup-makers in February 2014 when they overthrew elected President Viktor Yanukovich. Since then, nearly every detail of that conflict has been seen through the prism of “our side good/their side bad.” Facts that put “our side” in a negative light, such as the key role played by neo-Nazis and the Kiev regime’s brutal “anti-terrorism operation,” are downplayed or ignored. Conversely, anything that makes the Ukrainians who are resisting Kiev’s authority look bad gets hyped and even invented, such as one New York Times’ lead story citing photos that supposedly proved Russian military involvement but quickly turned out to be fraudulent. [See Consortiumnews.com’s “NYT Retracts Russian Photo Scoop.”] At pivotal moments in the crisis, such as the Feb. 20, 2014 sniper fire that killed both police and protesters and the July 17, 2014 shoot-down of Malaysia Airlines Flight 17 killing 298 passengers and crew, the U.S. political/media establishment has immediately pinned the blame on Yanukovich, the ethnic Russian rebels who are resisting his ouster, or Putin. Then, when evidence emerged going in the opposite direction – toward “our side” – a studied silence followed, allowing the earlier propaganda to stay in place as part of the preferred storyline. [See, for instance, Consortiumnews.com’s “President Gollum’s ‘Precious’ Secrets.”] A Pedestrian Dispute One of the points of my talk was that the Ukrainian crisis emerged from a fairly pedestrian dispute, i.e., plans for expanding economic ties with the European Union while not destroying the historic business relationship with Russia. In November 2013, Yanukovich backed away from signing an EU association agreement when experts in Kiev announced that it would blow a \$160 billion hole in Ukraine’s economy. He asked for more time. But Yanukovich’s decision disappointed many western Ukrainians who favored the EU agreement. Tens of thousands poured into Kiev’s Maidan square to protest. The demonstrations then were seized upon by far-right Ukrainian political forces who have long detested the country’s ethnic Russians in the east and began dispatching organized “sotins” of 100 fighters each to begin firebombing police and seizing government buildings. As the violence grew worse, U.S. neoconservatives also saw an opportunity, including Sen. John McCain, R-Arizona, who told the protesters the United States was on their side, and Assistant Secretary of State for European Affairs Victoria Nuland, who passed out cookies to the protesters and plotted with U.S. Ambassador Geoffrey Pyatt on who would become the new leaders of Ukraine. [See Consortiumnews.com’s “NYT Still Pretends No Coup in Ukraine.”] Thus, a very manageable political problem in Ukraine was allowed to expand into a proxy war between nuclear-armed United States and Russia. Added to it were intense passions and extensive propaganda. In the West, the Ukraine crisis was presented as a morality play of people who “share our values” pitted against conniving Russians and their Hitler-like president Putin. In Official Washington, anyone who dared suggest compromise was dismissed as a modern-day Neville Chamberlain practicing “appeasement.” Everyone “serious” was set on stopping Putin now by shipping sophisticated weapons to the Ukrainian government so it could do battle against “Russian aggression.” The war fever was such that no one raised an eyebrow when Ukraine’s Deputy Foreign Minister Vadym Prystaiko told Canada’s CBC Radio last month that the West should no longer fear fighting nuclear-armed Russia and that Ukraine wanted arms for a “full-scale war” against Moscow. “Everybody is afraid of fighting with a nuclear state. We are not anymore, in Ukraine,” Prystaiko said. “However dangerous it sounds, we have to stop [Putin] somehow. For the sake of the Russian nation as well, not just for the Ukrainians and Europe. ... What we expect from the world is that the world will stiffen up in the spine a little.” [See Consortiumnews.com’s “Ready for Nuclear War over Ukraine?”] Instead of condemning Prystaiko’s recklessness, more U.S. officials began lining up in support of sending lethal military hardware to Ukraine so it could fight Russia, including Director of National Intelligence James Clapper who said he favored the idea though it might provoke a “negative reaction” from Moscow. Russian Regime Change Even President Barack Obama and other U.S. leaders who have yet to publicly endorse arming the Kiev coup-makers enjoy boasting about how much pain they are inflicting on the Russian economy and its government. In effect, there is a U.S. strategy of making the Russian economy “scream,” a first step toward a larger neocon goal to achieve “regime change” in Moscow. Another point I made in my talk on Saturday was how the neocons are good at drafting “regime change” plans that sound great when discussed at a think tank or outlined on an op-ed page but often fail to survive in the real world, such as their 2003 plan for a smooth transition in Iraq to replace Saddam Hussein with someone of their choosing – except that it didn’t work out that way. Perhaps the greatest danger from the new neocon dream for “regime change” in Moscow is that whoever follows Putin might not be the pliable yes man that the neocons envision, but a fierce Russian nationalist who would suddenly have control of their nuclear launch codes and might decide that it’s time for the United States to make concessions or face annihilation. On March 3, the Washington Post’s neocon editorialists emphasized the need for ousting Putin as they praised Nemtsov and other anti-Putin activists who have urged an escalation of Western pressure on Russia. The Post wrote: “They say he [Putin] can be stopped only by steps that decisively raise the cost of his military aggression and cripple the financial system that sustains his regime.” The Post then added its own suggestion that Putin was behind Nemtsov’s murder and its own hope that Putin might be soon be removed, saying: “It’s not known who murdered Mr. Nemtsov, and it probably won’t be as long as Mr. Putin remains in power.” Yet, what I find truly remarkable about the Ukraine crisis is that it was always relatively simple to resolve: Before the coup, Yanukovich agreed to reduced powers and early elections so he could be voted out of office. Then, either he or some new leadership could have crafted an economic arrangement that expanded ties to the EU while not severing them with Russia. Even after the coup, the new regime could have negotiated a federalized system that granted more independence to the disenfranchised ethnic Russians of eastern Ukraine, rather than launch a brutal “anti-terrorist

operation" against those resisting the new authorities. But Official Washington's "group think" has been single-minded: only bellicose anti-Russian sentiments are permitted and no suggestions of accommodation are allowed.

Relations independently prevent extinction and a collapse of U.S. foreign policy

Allison and Blackwill 11

(Graham and Robert, * director of the Belfer Center for Science and International Affairs at Harvard's Kennedy School AND ** Henry A. Kissinger senior fellow for U.S. foreign policy at the Council on Foreign Relations 10/30/11 "10 reasons why Russia still matters," Politico, <http://www.politico.com/news/stories/1011/67178.html>)

That central point is that Russia matters a great deal to a U.S. government seeking to defend and advance its national interests. Prime Minister Vladimir Putin's decision to return next year as president makes it all the more critical for Washington to manage its relationship with Russia through coherent, realistic policies. No one denies that Russia is a dangerous, difficult, often disappointing state to do business with. We should not overlook its many human rights and legal failures. Nonetheless, Russia is a player whose choices affect our vital interests in nuclear security and energy. It is key to supplying 100,000 U.S. troops fighting in Afghanistan and preventing Iran from acquiring nuclear weapons. Ten realities require U.S. policymakers to advance our nation's interests by engaging and working with Moscow. First, Russia remains the only nation that can erase the U.S. from the map in 30 minutes. As every president since John F. Kennedy has recognized, Russia's cooperation is critical to averting nuclear war. Second, Russia is our most consequential partner in preventing nuclear terrorism. Through a combination of more than \$11 billion in U.S. aid, provided through the Nunn-Lugar Cooperative Threat Reduction program, and impressive Russian professionalism, two decades after the collapse of the "evil empire," not one nuclear weapon has been found loose. Third, Russia plays an essential role in preventing the proliferation of nuclear weapons and missile-delivery systems. As Washington seeks to stop Iran's drive toward nuclear weapons, Russian choices to sell or withhold sensitive technologies are the difference between failure and the possibility of success. Fourth, Russian support in sharing intelligence and cooperating in operations remains essential to the U.S. war to destroy Al Qaeda and combat other transnational terrorist groups. Fifth, Russia provides a vital supply line to 100,000 U.S. troops fighting in Afghanistan. As U.S. relations with Pakistan have deteriorated, the Russian lifeline has grown ever more important and now accounts for half all daily deliveries. Sixth, Russia is the world's largest oil producer and second largest gas producer. Over the past decade, Russia has added more oil and gas exports to world energy markets than any other nation. Most major energy transport routes from Eurasia start in Russia or cross its nine time zones. As citizens of a country that imports two of every three of the 20 million barrels of oil that fuel U.S. cars daily, Americans feel Russia's impact at our gas pumps. Seventh, Moscow is an important player in today's international system. It is no accident that Russia is one of the five veto-wielding permanent members of the U.N. Security Council, as well as a member of the G-8 and G-20. A Moscow more closely aligned with U.S. goals would be significant in the balance of power to shape an environment in which China can emerge as a global power without overturning the existing order. Eighth, Russia is the largest country on Earth by land area, abutting China on the East, Poland in the West and the United States across the Arctic. This territory provides transit corridors for supplies to global markets whose stability is vital to the U.S. economy. Ninth, Russia's brainpower is reflected in the fact that it has won more Nobel Prizes for science than all of Asia, places first in most math competitions and dominates the world chess masters list. The only way U.S. astronauts can now travel to and from the International Space Station is to hitch a ride on Russian rockets. The co-founder of the most advanced digital company in the world, Google, is Russian-born Sergei Brin. Tenth, Russia's potential as a spoiler is difficult to exaggerate. Consider what a Russian president intent on frustrating U.S. international objectives could do — from stopping the supply flow to Afghanistan to selling S-300 air defense missiles to Tehran to joining China in preventing U.N. Security Council resolutions. so next time you hear a policymaker dismissing Russia with rhetoric about "who cares?" ask them to identify nations that matter more to U.S. success, or failure, in advancing our national interests

The impact is extinction – this is the fastest and most likely scenario, miscalc is likely

Hallam 9

(John, Editor of Nuclear Flashpoints, John Burroughs and Marcy Fowler, Lawyers Committee on Nuclear Policy, NPT Preparatory Committee, Steps Toward a Safer World, <http://www.pndnsw.org.au/articles/features/86-steps-towards-a-safer-world.html>)

Why did an article in the September 2008 edition of the Bulletin of the Atomic Scientists, entitled 'avoiding human extinction' give a list of measures needed to avoid that, with lowering the operating status of nuclear weapon systems (along with their elimination) topping the rather consequential 'to - do' list, even before climate - change measures and incoming large asteroids? Why over the years has this issue been thought so important at such a high level? The US and Russia undeniably keep a large number (estimated by Blair at 2,654 by Kristensen more recently 2,300) of nuclear warheads (both land - based ICBMs and SLBMs) in a status in which they can be launched at roughly 2 minutes or less notice. This fact is never seriously disputed. The core of the issue is that standard operating procedures envisage extremely short decision making timeframes, and these are imposed by the simple fact of having some missiles on quick - launch status. Careful and measured decision-making in such a situation is simply not possible. Yet the consequences of such decisions are truly apocalyptic. Recent research by US scientists (Toon and Robock 2008/9) on the effects of the use of US and Russian arsenals indicates that even at levels down to 1000 warheads, the use by malice, madness, miscalculation or malfunction of the 'on alert' portions of US and Russian strategic nuclear forces would be essentially terminal for civilization. Maintaining arsenals in an unstable configuration was insanely risky during the Cold War, when there were even larger numbers of warheads on alert and when there were just too many occasions on which it would be fair to say that the world came just too close to ending. There is even less reason, now that the cold - war confrontation has supposedly ended, to maintain nuclear forces in these dangerous configurations. Yet in spite of denials and obfuscations from those who wish to maintain existing postures they are indeed so maintained. President Obama, in his election manifesto, promised to negotiate with Russia to lower the operational status of nuclear weapon systems. It is vital that this promise is not forgotten. The talks between the US and Russia on the successor to the START Treaty are an ideal opportunity to take action to implement Obama's promises to negotiate with Russia to achieve lower operational status of nuclear weapon systems.

And, resurgent Russian Nationalism and aggressive foreign policy causes Russian internal collapse – goes nuclear

Dr. Blank '00

(Stephen, "Threats to Russian Security: The View from Moscow," pg online @ <http://www.strategicstudiesinstitute.army.mil/pubs/summary.cfm?q=135//um-ef>)

The greater danger here is not necessarily that a nuclear provocation will occur, it is rather that the military institutions and government have yet to devise a strategy and policy based on reality. Instead they continue to chase after fantasies of recovering a lost status and of being a military-political global superpower. The deeply embedded notions of international security as a zero-sum game of the militarization of politics and the pervasiveness of threats from all sides, are axioms that are deployed, first of all, for domestic advantage and to obstruct reform. When juxtaposed to the absence of coherent controls and institutions to formulate and direct defense policy, these axioms are an invitation to disaster. These documents and the security consensus that lies behind them represent only the latest manifestation of Russia's continuing failure to become a true democracy at peace with itself and the world. As long as this unrealism and pre-modern structure of politics govern the discourse and practice of Russian security policy, continuous internal unrest is the best scenario we can predict for Russia. But experience shows that this unrest does not remain bottled up in Russia. The war in Chechnya is now accompanied by threats against Tbilisi and Baku as well as attempts at military-political union in the CIS. Thus Russia's refusal or inability to adapt to reality presages a continuing struggle in the CIS and other unsettled areas like the Balkans. Every preceding time when state power in Russia fragmented, the whole region within which it acted was engulfed in instability, if not conflict, and foreign armies were either tempted to invade or dragged into the quagmire. Thus these documents are ultimately a confession of political, economic, social and moral bankruptcy and an admission of despair. If Russia perceives everything around it as a threat whose origins lay beyond its borders, then the temptation to avert domestic reform will continue to strengthen and breed still more internal unrest and instability. Nor will any outside attempts to help be appreciated or accepted. Absent a reliable defense policy and defense forces and following an elite that seems determined on racing to the brink of a precipice Russia's elites remain fixated on military threats that exist mainly in their fantasies. Thus they show themselves utterly unable to come to grips with the new but very real threats to Russia's security and stability. 119 If this situation continues, then the Russian people, if not their neighbors and partners, will be thrown over the edge as Russia falls into an economic, ecological, demographic, and possibly even nuclear abyss.

2NC Relations Impact

And, the plan IMMEDIATELY freaks out Russia and tanks U.S.-Russian Relations – the impact is perception-based

Merry 9

(E. Wayne, a former State Department and Pentagon official, is a senior associate at the American Foreign Policy Council in Washington, 5/22/09 New York Times, “A ‘Reset’ Is Not Enough” http://www.nytimes.com/2009/05/23/opinion/23iht-edmerry.html?_r=0 7/6/13)

The Obama administration has offered to “reset” relations with Russia. But what is really needed is a change of operating system. A reset seeks to restore a previous relationship, which for former officials of the Clinton administration now back in office means the Yeltsin years. This will fail because Moscow views that period as emblematic of Russian weakness and exploitation by the West, and especially by the United States. Relations with Moscow deteriorated under both Bill Clinton and George W. Bush. **The U.S. neo-liberal project of the '90s not only failed but deeply alienated Russians. The bilateral nadir was the Kosovo war, a worse episode than last year's Georgia conflict. A new opportunity after 9/11 was frankly squandered. Washington regarded Russia as a loser and treated it as such. It forgot that Russia would not be weak forever, and would remember. Two structural problems limit the relationship and its improvement. First, it is very narrow, with few automatic stabilizers.** Unlike Russian-European or U.S.-Chinese relations, **the scant economic and human ties between the U.S. and Russia provide inadequate ballast when problems arise. Relations are highly vulnerable to outside events and defined more by disputes than cooperation.** When malice is added to the mix, the result is dangerous. Second, **for Moscow the relationship is largely zero sum,** in that **Russian diplomacy succeeds where America's fails, as in Iran and Venezuela. This is the consequence both of the huge asymmetry in real power and influence of the two countries and an asymmetry of geography in that almost anything the United States does in Eurasia affects Russia's interests, often adversely.** Thus **Moscow worries that a successful Obama presidency will come at their expense with other countries.** Russian commentators especially fear this may be the case with Iran, seeing the potential for a shift comparable to Mao's China or Sadat's Egypt. The current Russian leadership bears a disproportionate share of the blame for our poisonous relations. **But Washington needs to adopt new rules of engagement to not repeat mistakes of the previous 16 years: One, minimize deliberate challenges to Russian interests** and know that none will come free. If we push NATO, they will push back. When we sponsored an independent Kosovo, Moscow declared it would do the same in Abkhazia and South Ossetia. Reciprocity is real.

The impact is extinction and a collapse of U.S. foreign policy

Allison and Blackwill 11

(Graham and Robert, * director of the Belfer Center for Science and International Affairs at Harvard's Kennedy School AND ** Henry A. Kissinger senior fellow for U.S. foreign policy at the Council on Foreign Relations 10/30/11 “10 reasons why Russia still matters,” Politico, <http://www.politico.com/news/stories/1011/67178.html>)

That central point is that **Russia matters a great deal to a U.S. government seeking to defend and advance its national interests.** Prime Minister Vladimir Putin's decision to return next year as president makes it all the more critical for Washington to manage its relationship with Russia through coherent, realistic policies. No one denies that **Russia is a dangerous, difficult** often disappointing **state to do business with.** We should not overlook its many human rights and legal failures. **Nonetheless, Russia is a player**

whose choices affect our vital interests in nuclear security and energy. It is key to supplying 100,000 U.S. troops fighting in Afghanistan and

preventing Iran from acquiring nuclear weapons. Ten realities require U.S. policymakers to advance our nation's interests by engaging and working with Moscow. First, **Russia remains the only nation that**

can erase the U.S. from the map in 30 minutes. As every president since John F. Kennedy has recognized, **Russia's cooperation is**

critical to averting nuclear war. Second, **Russia is our most consequential partner in preventing**

nuclear terrorism. Through a combination of more than \$11 billion in U.S. aid, provided through the Nunn-Lugar Cooperative Threat Reduction program, and impressive Russian professionalism, two decades after the collapse of the

"evil empire," not one nuclear weapon has been found loose. Third, **Russia plays an essential role in preventing the proliferation of nuclear**

weapons and missile-delivery systems. As Washington seeks to stop Iran's drive toward nuclear

weapons, Russian choices to sell or withhold sensitive technologies are the difference between

failure and the possibility of success. Fourth, **Russian support in sharing intelligence and cooperating**

in operations remains essential to the U.S. war to destroy Al Qaeda and combat other transnational terrorist groups. Fifth, Russia provides a vital

supply line to 100,000 U.S. troops fighting in Afghanistan. As U.S. relations with Pakistan have deteriorated, the Russian lifeline has grown ever more important and now accounts for half all daily deliveries. Sixth, Russia is the world's largest oil producer and second largest gas producer. Over the past decade, Russia has added more oil and gas exports to world energy markets than any other nation. Most major energy transport routes from Eurasia start in Russia or cross its nine time zones. As citizens of a country that imports two of every three of the 20 million barrels of oil that fuel U.S. cars daily, Americans feel Russia's impact at our gas pumps. Seventh, Moscow is an important player in today's international system. It is no accident that Russia is one of the five veto-wielding permanent members of the U.N. Security Council, as well as a member of the G-8 and G-20. A Moscow more closely aligned with U.S. goals would be significant in the balance of power to shape an environment in which China can emerge as a global power without

overturning the existing order. Eighth, **Russia is the largest country** on Earth by land area, abutting China on the East, Poland in the West and the United States across the Arctic. **This territory**

provides transit corridors for supplies to global markets whose stability is vital to the U.S.

economy. Ninth, Russia's brainpower is reflected in the fact that it has won more Nobel Prizes for science than all of Asia, places first in most math competitions and dominates the world chess masters list. The only way U.S. astronauts can now

travel to and from the International Space Station is to hitch a ride on Russian rockets. The co-founder of the most advanced digital company in the world, Google, is Russian-born Sergei Brin. Tenth, **Russia's potential as a**

spoiler is difficult to exaggerate. **Consider what a Russian president intent on frustrating U.S.**

international objectives could do — from stopping the supply flow to Afghanistan to selling S-

300 air defense missiles to Tehran to joining China in preventing U.N. Security Council

resolutions. so **next time you hear a policymaker dismissing Russia with rhetoric about "who**

cares?" ask them to identify nations that matter more to U.S. success, or failure, in advancing

our national interests.

Impacts: Russian Prestige

Loss of prestige causes massive Russian Nationalist Backlash and collapse of foreign policy rationality

(Steven, Department of Politics and International Relations, Macquarie University, Sydney, "Prestige in world politics: History, theory, expression," pg online @ <http://www.palgrave-journals.com/ip/journal/v50/n3/full/ip201313a.html> //um-ef)

States generally do not try to diminish another's prestige. Rather, prestige steers diplomacy's concern to avoid offence, or with how 'we' treat 'them' and are perceived to. Lack of **loss of prestige incites resentment and** occasionally **extreme reaction. The prestige-deprivation inflicted by the Versailles treaty**, Etzioni (1962) argued, **is commonly seen as a factor contributing to the emergence of Nazism** a movement obsessed with national status'. Although **upheaval and attenuation of individual and national fortune instigate heighten sensitivity**, 'in periods of peace, stable economies and integrated social relations, frustrations of national prestige rarely lead to aggressive behavior except student demonstrations before the embassies of the countries which inflict the prestige loss' (Etzioni, 1962, p. 22). People tend to privilege their own nation; the feats and qualities of others are compared with their own. Norkus (2004, p. 397) contends that "'cultural achievements" or "cultural contributions" indicated by the number of famous scientists, writers, architectural monuments' bestow prestige on the nation from which these virtuous or symbolic structures originate. Thus, 'the basis for the feeling of belonging to the world "elite" can be the conviction of the extraordinary value of the culture of "one's own" nation or of its extraordinary contribution to "world culture."' The members or rulers of a nation may consider it as imbued with greatness, whereas others regard it as ordinary, eccentric or overstated, in any case not as something to aspire to. Prestige often correlates with being liked and 'nation brands' marketing links favourable reception to global economic success (Anholt, 2009). Nations regarded as most prestigious are not always most preferred. **Perceived prestige can be a source of envy and resentment.** For Lebow (2008), prestige is bound with beliefs about cultural eminence, heroism and honour. National identity and sentiment permeate his account, through periods that precede the modern phenomenon of nationalism. He argues that 'People seek self-esteem not only through their personal activities, but vicariously through the achievements of social units to which they feel attached, such as sports teams and nations'. Lasswell and Morgenthau are among those said to 'argue that **nationalism involves a degree of transference by individuals of their aspirations on to states**'. This is not a one-way process, at least not in the present. Instead, symbiosis occurs. For **citizenry and rulers, organic and abstract identities merge for performances in which 'standing and honor can be very important and interrelated'** (Lebow, 2008, pp. 122–123). Prestige can induce hubris, an exaggerated or deluded belief by a person, a group or a nation in its capacities. Superficial, if spectacular, display has an appeal that lends a transient prestige. Humility generates a more durable kind. Henrich and Gil-White (2001, p. 179) note that 'Self-deprecation is also common in prestige'. High achievers are often humble in response to praise. Modern nations do the same if they are confident in their accomplishments and inferred status in the world. Political leaders must promote and personify collective prestige. Accent on charismatic features that elevate an individual above the mass is contrasted with an alternative view of the leader's position being sustainable as long as he or she is embedded in the group and fulfils its aspirations. 'The stature of the leader', argued Moos and Koslin (1952), 'is dependent not upon his embodiment of special traits as such, but rather the extent to which a group is aware of those "special qualities"'. Henry Kissinger reportedly said that 'as a professor' he considered 'history as run by impersonal forces. But when you see it in practice, you see the difference personalities make' (cf. Kissinger, 1995; de Gaulle, 2000; Byman and Pollack, 2001, p. 108). In one 'nation brand' index, the United States rose from eighth in 2008 to first in 2009. The rise was attributed to the change in presidents (Anholt, 2009). Nicolson (1939) was sceptical about the participation of politicians in routine international affairs. They were likely to cause problems through interference in negotiation. This was better left to 'professional diplomatists', who must themselves convey prestige. Morgenthau (1978, p. 79) agreed, observing that 'diplomats lend themselves naturally as instruments for a policy of prestige ... respect shown them is really shown their countries ... insult they give or receive is really given or received by their countries'. These accounts pertain chiefly to liberal democracies. Authoritarian regimes take greater offence to slights, and prestige-seeking assumes pathological dimensions. Attempts to generate it often entail effusive display of military might. Collins (2011) impresses connections between endogenous legitimacy and exogenous power-prestige, drawing together realist and historical-sociological interpretations to explain the collapse of the Soviet bloc. For those state-dominated societies, prestige reliant on coercion was exposed as illusory and eroded during the Cold War. Similar fates later befell Ben Ali, Mubarak, Gaddafi and Assad. Prestige as Nexus Prestige is compatible with realist, rationalist, sociological and normative interpretations of international politics. It is a nexus for differing emphases, though largely neglected by scholarship seeking commonalities or convergence (Barkin, 2003; Hellmann, 2003; Barkin, 2004; Jackson and Nexon, 2004; Lebow, 2004; Beardsworth, 2008). The international society school was representative of the endeavour to discover intersections between paradigms (Wight, 1991; Watson, 1992; Alderson and Hurrell, 2000; Linklater and Suganami, 2006), without much focus on prestige. Its tacit presence is weightier than the passing references to it. There are exceptions to this general lack of direct attention. O'Neill (1999) demonstrates how an expansive historiography, symbolic interaction, linguistic analysis and game theory can be effectively combined and applied to illuminate the influence of prestige and honour. Wegener (1992) argued that 'rational and normative foundations of prestige are possible'. He delineated its alignment with achievement, esteem, honour or charisma, and exposition by functionalist, normative and transcendent accounts. Wegener drew on Weber, alternatively a realist (Hobson and Seabrooke, 2001), a 'bourgeois Marx' (Salomon, 1926) or a sociological institutionalist. Weber's understanding of politics went beyond realism and 'various counterpositions based on norms, self-understood social constructions, or cooperative international society' (Breiner, 2004, p. 290). Although he elucidated a predominance of instrumental rationality (Zweckrational) in modernity, his fusion of prestige and interests (Prestigeinteressen) also comprises value rationality (Wertrational) and traditional and affective motivations for action (Weber, 1922). Machtprestige was stimulated by urges for esteem, honour, standing and concerns about relative worth linked to power: All 'power' of political entities (Gebilde) carries in itself a specific dynamic: it can be the basis for a specific 'prestige'-pretension of those who belong to them, which influences their externally focused behaviour ... prestige pretensions have always had a difficult to estimate, generally not precisely definable, but very perceptible impact in the genesis of wars: an empire of 'honour', comparable with the ordering of status groups ['ständischer' Ordnung], extends itself across relations among political entities; feudal rulers, likewise modern military officers or state bureaucrats, are the natural primary bearers of this 'prestige'-striving, oriented purely to the power of its own political entity as such. For the power of their political entity determines their own power and their own power-based feelings of prestige ... (Weber, 1922, p. 619) Lebow (2008, pp. 487–488) notes that for Weber, 'Acquiring prestige is essential for being a great power, just as becoming a great power confers prestige ... **prestige is equivalent to status or standing**'. In Breiner's (2004, p. 299) reading, **prestige is the potential trigger** and protractor of a security dilemma: 'all political communities seek prestige ... large political communities ... aspire to have their superior prestige recognized': **their demand for power to enhance their prestige threatens their neighboring political communities, and so they too are always threatened in return**. This threat in turn prompts the state to compel others to recognize its honor or high standing by amassing more power against its neighbors. This demand by large political communities unleashes a recurrent struggle between states for prestige. **Thus when a large state asserts its claim to prestige in the face of a threat to peace, all other states claiming prestige as well join the 'competition' for dominance**. And this in turn generates new threats ... Reinforced by evidence from earlier, contemporaneous and later societies, prestige is imparted as an intrinsic need or motivation, regardless of the fact that only some attain it to the extent they wish. A large corpus of literature indirectly impresses that prestige may not dictate but is a constant in national and international affairs, connected realms of perceptions, interactions, frailties,

interests and power. If prestige is an innate ingredient of human psychology and behaviour (cf. Brown, 1991; 2004), links to classical realist claims about recurrence in these domains emerge. Observed through the filter of prestige, realism and constructivism are more alike than portrayed by their respective adherents. Lebow (2001) challenged the conventional representation of Thucydides as the prototype 'realist', arguing that he was a 'founding father of constructivism'. However, Lebow notes that some 'nuanced' realist readings present a more accurate picture. These readings comprehended that humans had psychologies and that variation in conditions affected responses and judgements. Lebow (2001, p. 559) concluded that 'Thucydides is both a realist and a constructivist', an entirely plausible observation. Prestige is a binding element between these schools and the different drives they are inclined to prioritise. In the History of the Peloponnesian War, 'People appear driven by their needs for self-preservation, pleasure, recognition, and power but also by needs for love, honor, and esteem' (Lebow, 2001, p. 554). For Morgenthau (1978, pp. 32–33), 'a tendency to reduce political power to the actual application of force or ... successful threats of force' and 'the neglect of prestige as an independent element in international politics' were untenable. Elsewhere (1978, p. 77), he presents prestige as a companion of power, 'rarely an end in itself' but 'one of the instrumentalities' used to pursue 'policies of the status quo and of imperialism'. Markey (1999) investigates the 'mechanics of the prestige motive and conflict' and argues it has been misinterpreted or ignored by most realists. His analysis, conducted among a familiar assemblage of states, anarchy and conflict, finds that Thucydides 'interchangeably employs prestige in both its instrumental and intrinsic variants' and 'Rousseau's prestige begins as an instrumental end and mutates into an intrinsic one': prestige in Rousseau's work holds a possible clue for understanding the (material) objects of prestige motivated behavior ... the types of objects man is likely to seek as instruments of prestige. The character of these objects is 'historically' as well as socially conditioned ... in the earliest stages of social interaction and economic dependence, [man] seeks whatever constitutes an obvious sign of strength, power, or eminence. As society 'flourishes', ... signs of prestige may no longer possess a material value in any concrete sense. (Markey, 1999, pp. 153–154) Compare this with Morgenthau's (1978, pp. 77–78) assessment that: 'the policy of prestige': is as intrinsic an element of the relations between nations as the desire for prestige is of the relations between individuals ... international and domestic politics are but different manifestations of ... the same social fact ... the desire for social recognition is a potent dynamic force determining social relations and creating social institutions ... what others think about us is as important as what we actually are. The image in the mirror of our fellows' minds (that is, our prestige) ... determines what we are as members of society. It is not obvious which passage is that of a 'constructivist' and which is that of a 'classical realist'. Lebow (2008, p. 24) claims Markey 'never effectively distinguishes [prestige] from power'. Yet military victory and defeat, and a warrior ethos that rewards physical prowess with prestige, feature prominently in Lebow's 'cultural theory of international relations'. He writes (2008, p. 101) that 'As external competition becomes more acute, or its material benefits more obvious, warriors increase their standing and authority in the society' and explains (2008, p. 126) that the Greek psyche had three domains or drives: reason, appetite and spirit. Reason has the 'capability to distinguish good from bad' and is contrasted with 'appetite and spirit which can only engage in instrumental reasoning'. These drives are not easy to disentangle. Intuitively, prestige belongs, with honour and esteem, to the spirit domain, but it is also a goal of appetite or calculating reason. Kim's (2004) critique of neorealism suggests that prestige is not independent of the political use of force but supplementary to it. An 'important positive source of prestige is the successful use of power in war' and the 'prestige of the US belatedly caught up with its actual power after the victory in World War II'. Moreover, 'Regardless of the nature of sources states employ to gain prestige, they seek to influence how other states define their interests' (Kim, 2004, pp. 42–44). Lebow, Kim and Markey address prestige and its linguistic connotations in diverse geographic, cultural and historical contexts. Despite wanting to situate prestige and power in different paradigms, these works reveal that discounting the connections between them is erroneous. Wight (1979, p. 97), in contrast, characterised prestige as an 'imponderable' of politics, 'too closely connected with power to be considered as belonging to the moral order. It is the influence derived from power. And unless the power is present power there can be little prestige'. Prestige can be attained without great quantities of the power Wight denotes. Canada, Switzerland and Sweden have developed particular reputations and accrued associated 'prestige capital'. They may be among those that Dore (1975, p. 207) suggests are 'susceptible to the attractions of prestige-as-an-end-in-itself' and 'likely to be constrained to obey whatever norms of international conduct the subterranean movements of world opinion may gradually bring forth'. But is prestige really such a *cul-de-sac*? Canadian policymakers and society want recognition as a 'good international citizen' and for Canada to derive benefits beyond the affective: improved security, an enhanced capacity to set agendas and reliability from others (Jockel and Sokolsky, 2000; Bakhtiari, 2010, p. 21). Wylie (2009, p. 124) proposes that 'powers such as Canada are concerned with their international reputations, and desire prestige both for the influence it might translate into and for its own sake ... Canadians do believe in the rule of law, global governance, and human rights ... it is debatable whether we care even more than others see us promoting these values'. Hafner-Burton and Montgomery (2006, p. 11) posit that 'whether prestige hinders or promotes conflict may depend on the type of social network' and 'if states are like students the more prestigious will expect to receive more social support when they resort to military threats or the use of force in a dispute ...'. However, aggression is a method of gaining or maintaining prestige in these networks. By contrast, in the international system, high-prestige states may be able to get what they need without reverting to aggression since prestige is decoupled from aggression. The extent to which nations will go to defend their prestige and honour has changed in the 'post-heroinic' West, and before all in Europe. Some can attain prestige without aggression. But aggression has been used to exact revenge for the attenuation of prestige, honour and reputation (Elster, 1990; Lebow, 2008, p. 130). These motivations can still incite advanced liberal democracies to the ultimate in risk and sacrifice, Britain's military reclaiming of the Falkland Islands being one example. Their symbolic importance had been canvassed in a 1952 Cabinet memo (NA, 1953, p. 5), which considered disposing of the 'commitment' to the United States, before determining that 'public admission of our inability to maintain these traditional possessions would cause a loss of prestige wholly out of proportion to the saving in money obtained. It might precipitate a scramble by the numerous claimants to various parts of British territory'. In the following sections, a diverse historical selection impresses that prestige is a universal motivation and effect. Other periods, national and regional examples, personalities or events could also be deployed. The ancient world interplay between prestige's internal and external political dimensions, an early two-level game, was present in the Mesopotamian of 1500 BC. Rulers believed that 'Great prestige with the inner public is necessary in order to negotiate from strength, and success in negotiations increases inner prestige' (Liverani, 2001, p. 10). For the same reasons, Ramses II of Egypt, aided by a poet, the 'official record' and pictorial reliefs, presented a defeat at the battle of Kadesh in 1274 BC as an implausible stunning victory. Ramses wanted the 'prodigies of personal valor' recounted (Breasted, 1903; 1906). As Pharaoh, Ramses represented the peak of the Egyptian hierarchy. A level below were priests and magicians, closely linked categories, who practiced 'ritual magic ... on behalf of the state for three thousand years, enhancing its and their prestige. One consequence was the reproduction of Egyptian texts, jewellery and artefacts in Greek, Roman and other Mediterranean societies (Pinch, 1994). Lemche (1985, p. 120) characterised prestige as the 'central concept' explaining leadership in tribal groups in the area of today's Israel and Palestine. Prestige was acquired and sustained by, among other factors and qualities, 'wealth, warlike accomplishments, and eloquence'. Without them, a leader would lose prestige and be deposed. Pfoh's (2008, p. 104) intriguing study of the same region and era elaborates on patronage arrangements that formed a 'pyramidal socio-political network'. Networks were and to some extent are the 'formal expression of a cluster of values that characterizes traditional Mediterranean societies, among others honor and prestige'. This period was contemporaneous to the subject matter of Homer's Iliad and Odyssey, works that embedded battlefield prestige in the Greek world. A distinction can be made between the glory Achilles won as a warrior, and honour, which he did not exhibit in his (initial) treatment of the dead Hector (Homer: Iliad XXIII). Only when Priam comes to his camp as a 'suppliant' does Achilles return Hector's body 'with all honourable courtesies' (Homer: Iliad XXIII; Crotty, 1994). Cornell (2002) vividly illustrates the ritualised conduct of warfare, frequently 'occasioned by the need to exact vengeance for a perceived insult or wrong ... men engage in war for personal and private motives rather than public and political ones ... the aim of the exercise is to obtain prestige and honour, rather than any political or material advantage'. But this form of prestige-seeking did have a political element. Wars are not apolitical events, even if the range of experience and effect transcends politics. Greek warriors were engaged in a political contest as well as one of honour. Lebow (2008, pp. 195–96) suggests the same. Material advantages were not irrelevant. Rather, 'gains ... function as part of the honour system because they are expended in conspicuous displays of rewards to followers, feasting and gift-giving and therefore serve to reinforce': the prestige and standing of successful warriors ... heroes are engaged in an incessant competition for honour and prestige both on and off the battlefield. (Cornell, 2002, p. 32) The Peloponnesian War had material-strategic and ideational-emotive impulses, among which prestige and honour, resentment and indignation are prominent. Preceding military hostilities, Corinth complains of Corcyra that 'we did not found the colony to be insulted by them, but to be their head and to be regarded with a proper respect. At any rate our other colonies honour us' (Thucydides, 1.38; cf. Kagan, 1969, pp. 219–221). Prestige figures in transgressions of protocol, such as the wrong cut of meat being offered to Corinthians, or as influencing alliances with Sparta. Crane (1992, p. 8) conveys its elastic qualities: The symbolic performance of rank was an end in itself, and the accumulation of wealth and allies can properly be seen as a means to attain such public signs of prestige. Material and symbolic power are symbiotic and reinforce each other ... The relationship of the great tyrants of Sicily with mainland Greece reveals clearly enough the complex relationship between material power and intangible prestige. And, 'even those on the "margins" of the Greek world, whose prestige may be lower than their material power would suggest, manipulate the existing value system to legitimate and establish themselves' (Crane, 1992, pp. 9–10). For some participants, prestige was sought through conspicuous heroism or sacrifice, but not only via these means. Here a distinction between prestige and honour emerges. The former is portrayed as standing, the latter as a convention and duty. As the war drags on, honour is threatened and even overwhelmed. So much that 'The ancient simplicity into which honour so largely entered was laughed down and disappeared; and society became divided into camps in which no man trusted his fellow' (Thucydides 3.83). For imperial Rome, Greek civilisation inspired qualified reverence. The Romans introduced other perspectives on war. In contrast to the Greeks, for whom 'the measure of warrior prestige was not actual victory but ideological valour, not the result of the warrior's action but the quality and spirit of his person', 'pure physical strength now has a low valuation, and high esteem is reserved for superior technical skill and static dignity' (Hölscher, 2003, p. 9, 15). In Rome, 'war was not a social and cultural experience but a matter for the state ... Romans do not much care for their fallen dead, because death in war – except for some great heroes of the past – was not glorious but shameful. Only victories counted'. These attitudes were transmitted in art, where 'Life and power' meant 'dignity and status, while defeat and death mean the systematic destruction of such dignity and status'; and religion, which, other than in Greece, 'played a significant role in the conversion of prestige in war into political power' (Hölscher, 2003, pp. 12–14). These passages both preview the force of religion in Christendom, driven by and dependent on a mystical prestige, and glimpse the sentimental modernity that was to challenge and relegate church prestige below that of the state. Reinhold, following Rousseau, maintains that the Romans were the 'most status-symbol-conscious people of the ancient world' (1969, p. 300). Ambitious social climbers attempted to appropriate status associated with purple, ostensibly reserved for nobility, even when dyes and garments were of inferior quality. This early version of upwardly mobile aspiration was galvanised by a socio-political reform under Augustus. Romans also wanted prestige to escort them in death. Political importance and social status were reiterated in the imago, which was to ensure immortality for departed aristocrats and public figures (Flower, 1996). The prosopography (Martindale et al, 1971; 1980; 1992) records the standing ascribed and sought across the empire. It presaged later concerns with 'occupational prestige' (Treiman, 1977; Parcel and Mueller, 1983). Rome had military and civilisational bases for considering itself prestigious. An innovation intended to reflect this to domestic audiences was the triumph, a precursor to modern manifestations of political prestige transmission. When its armies returned victorious, Rome celebrated. The centrepiece was a procession featuring the principal general, the *vir triumphalis*, and officers, soldiers and captives, cheered by onlookers anticipating the spectacles that would follow. Beard (2007) suggests that for all its pomp, the triumph masked republican Rome's frailty, that the prestige it revelled in was shallow and insecure. Miller (2001) describes how the triumph was copied in the age of Elizabeth I and Oliver Cromwell, used by royal and roundhead alike, intent on raising England's and their own prestige at the cost of Spain. The British century and the transition to US predominance Britain's tangible technological, economic and military achievements stimulated a pride and confidence that percolated into the popular consciousness. By the nineteenth century, British influence was manifested by its global empire and role as a balancer of European rivals. Colonies provided raw materials, purchasers, transport routes and transit points for a commercial network. The empire was not established and sustained through trade or intellect, psychological devices and other 'invisible' factors alone. In industrial, economic and naval terms, Britain was the world's most powerful entity. Otte (2001, p. 13) observes that 'Britain's prestige and her international position had rested on her willingness to intervene in European affairs diplomatically or by force'. Nicolson (1937, p. 31) argued, 'Our unchallenged security during the course of the nineteenth century enabled us to build up our Empire': and to create our prestige with a minimum expenditure of force. Yet to contend that we acquired our Empire merely by the exercise of our more agreeable qualities would be to advance a contention which is untrue ... our own navalism was as excessive as it could be. In Savage's (2011) account, prestige is the unstated property that accompanies a superior military and technology to ensure the stability of 'informal empire'. Halvorson (2010, p. 439) claims that 'for a status quo imperial power, the maintenance of prestige is the fundamental interest from which security and wealth flow'. For Kelly (2003), 'Britain's Imperial system had long relied on "prestige" to counter its often chronic material weakness'. Spurred by the British example, competitors, including the Dutch (Kogure, 2008), French (Israeli, 1992) and the unified German state (Wehler, 1970; Hildebrand, 1989), also sought goods, territories and aligned prestige. As challenges mounted, the British genius for prestige projection became crucial. When material power wanes, the importance of prestige increases. When prestige wanes, empires end. British diplomatic dispatches, cabinet papers and Foreign Office memos of the later nineteenth and the twentieth centuries are peppered with references to the maintaining, improving or restoring of British prestige and occasionally to the condition of others' prestige (National Archives (NA), 1914; 1950; 1952; 1953). Despite vast losses during the First World War, Britain and France still had reservoirs of prestige accumulated through economic and industrial capacity, long histories and political-diplomatic standing. Hitler knew this but demoted it below superior war-fighting resources and the will to deploy them. Nicolson (1937, p. 30) emphasises in original had considered that power and reputation were essential for a state to possess prestige, but that 'although you cannot acquire prestige without power, you cannot retain prestige without reputation'. Twenty years later, he declared it 'evident that prestige is based on force alone' (Drinkwater, 2005, p. 73). As Britain's material power declined, its governments were increasingly reliant on the United States to reflate its concomitantly waning prestige. France's similar relative decline encouraged European integration, and embrace of Erbfriede (west) Germany as its main and subordinate partner, as a means to restore prestige. During the Suez crisis, Britain and France were incapable of withstanding their now far more powerful ally, the United States. The then Prime Minister of Australia, Robert Menzies, spoke nostalgically that 'It is apparently not fashionable to speak of prestige'. Yet ... peace in the world and the efficacy of the United Nations Charter ... require that the British Commonwealth and in particular its greatest and most experienced member, the United Kingdom, should retain power, prestige and moral influence. (Menzies, 1958) Meanwhile, United States' policy was guided by calculations of its own geo-strategic interest and prestige. The weakening of European influence in the Middle East resulted in a shift to and intensification of pressures on the United States. Israel demonstrated itself capable of defeating the Arab states in war; however, if a Soviet threat was to be averted or needed to be repelled, the United States had to provide that guarantee. A CIA report articulated the dilemma that the United States and the Soviet Union became embroiled in. In the region for strategic reasons, prestige was an affiliated motivation and snare for both: continuous engagement would result if the Israelis should ever decide

that they must attack Soviet airfields in Egypt or resume the assault on Egyptian facilities ... the USSR would find its prestige more and more heavily pledged on the outcome of this contest and therefore would feel severe pressure to keep funneling more and more air defense forces into Egypt so long as the issue was in doubt. This, in turn, would place increasing pressure on the US to furnish greater and greater assistance to Israel. (CIA, 1971, p. 150) Castro's Cuba had presented a similar problem, exacerbated by the failed Bay of Pigs invasion. Morgenthau (1967) argued that the United States had interests in eliminating Soviet power, especially as it might be projected from Cuba, and in 'avoiding whatever would jeopardize its standing in the new and emerging nations'. But US policymakers and decision makers did not accurately perceive when prestige was most crucial: in order to minimize the loss of prestige, the United States jeopardized the success of the intervention. Instead of using concern for prestige as a datum among others in the political equation – that is, as an interest among others – it submitted to it as though it were an abstract principle imposing absolute limits upon the actions necessary to achieve success ... we lost much prestige as a great nation able to use its power successfully. Thus, prioritising prestige in the short term resulted in a loss of prestige in the longer term. If the Cuba problem had been addressed 'in a rational fashion', US policymakers would have calculated that succeeding in the intervention was more important than preventing 'a temporary loss of prestige among the new and emerging nations' (Morgenthau, 1967, p. 98). The inference is that short-term prestige-seeking is 'non-rational', whereas possessing it in the long term is rational. With advantages of hindsight and sources, Johnson and Tierney (2003) interpret the US policy somewhat differently to Morgenthau but also impress the central role of prestige in the Cuba crisis. In their view, 'Kennedy and the United States subsequently emerged with enhanced prestige: in many

ways the factor that mattered most in the Cold War'. China and Russia **Like change in the international balance of influence, prestige is**

generally **a stronger impetus for revisionist actors than those satisfied with the status quo** Chinese and

Russian concerns about status in the world permeate the respective **national psychologies** (Sun, 2002; Callahan, 2004; Tsygankov, 2008; Larson and Schevchenko, 2010a, 2010b; Tsygankov and Tsygankov, 2010). For China, boosting industrial, technological and military capacity is presumed to result in prestige dividends. Martel and Yoshihara (2003) write that 'China's obsession with national prestige, which forms the backdrop for its commercial and military interests, also animates the country's space policy'. This is one example of direct competition with the United States, which is simultaneously resented for not paying China adequate tribute, and the benchmark against which international status and prestige is measured. For the Chinese Communist Party (CCP), economic progress and display enable the Chinese state and nation to inspire awe in outsiders, and thereby strengthens the party's internal position. Presentation of itself as China's manifest destiny makes the CCP highly sensitive to criticism of the state or nation (Fitzgerald, 1999; Shambaugh, 2008; McGregor, 2010). Setbacks to domestic or international performance are felt as humiliation. Gries (2005) shows how 'rationalist and social psychological variables ... help explain why Chinese diplomats were unable to resolve the Belgrade bombing incident through cool diplomacy – the instrumental stakes were too high, and the assault on Chinese self-esteem was too acute'. Consequently, 'rejecting America's repeated apologies was one of the few ways China's leadership could seek to restore Chinese self-esteem in the eyes of the Chinese people'. A recent instance of attempted face-saving was a cover-up by regime authorities after a high-speed train tragedy (Asian Correspondent, 2011; Hilton, 2011; The

Economist, 2011). Vladimir **Putin's incumbency** as President and Prime Minister **is featured by a reassertion of Russia's global**

standing **Geopolitical and economic interests and resentment at western treatment drive a** **nationalisation agenda and assertive foreign policy.** Feelings of 'Bonapartist revanchism' (Rasizade, 2008) were vehemently expressed in a speech

(Putin, 2007) **attacking American** unipolar assumptions and **encroachment in Russia's rightful sphere of influence**. The speech was a demand for respect and acknowledgment of status. The same year, 9 per cent of Russians, the third and fourth highest response in successive surveys, considered that the principal objective of

'Putin's Plan' was to **'increase Russia's prestige'** (VCIOM, 2007). Baek (2009, p. 457) argues that **Ideational factors are particularly**

important for the decision-making of the Russian leadership, which is preoccupied with national

identity, national status, and prestige in the international system, Russia's historical mission'. **These 'ideational factors' coalesce with**

strategic influence. Energy resources are one means of wielding leverage; the possession and occasional

deployment of still **substantial military force another.** Ambrosio (2006) accents the rise in significance of 'non-material values' in the post-Cold War

era. His analysis is applied to Russia-US relations, especially regarding conflict in and over Yugoslavia. He locates the source of Russian policy as 'dominant **beliefs** in its domestic society and political

establishment; **that Russia had to regain and maintain the status of a 'great power'.** This propelled a contrarian response to the

United States and its allies, despite Yugoslavia (or Serbia) not being a 'matter of Russia's direct, significant security interests'. **Emotional reactions were generated**

and exacerbated because the world was viewed through a realist prism. Similar attitudes and policy have continued in various

phases of intensity since. **The political elite round Putin wants esteem** domestically and **status with commensurate**

respect internationally. These are necessary parts of a virtuous **circle that serves ideational and**

material goals: prestige, status and respect endow influence, which underpins recognition,

which enhances prestige, status and respect. Larson and Schevchenko (2010b) put it simply 'prestige matters'. China and Russia share serious 'concerns for recognition and status, always central to their historic identities'. These concerns were 'intensified by the end of the Cold War' after which both 'experienced major blows to their prestige'. The authors advocate a

'status-enhancement strategy' to draw them into cooperative global governance. **The United States, in particular, should refrain from actions that**

undermine China's and **Russia's prestige'**

Russian prestige necessary for coop on WMD prolif, terror, and stable energy supplies – ONLY the disad can access these impacts

Larson 10

(Deborah, "Prestige Matters: Chinese and Russian Status Concerns and U.S. Foreign Policy," pg online @

http://belfercenter.ksg.harvard.edu/publication/20090/prestige_matters.html//um-ef)

PRESTIGE MATTERS Chinese and Russian cooperation is critical in dealing with key issues such as curbing proliferation of weapons of mass destruction, controlling terrorism, rebuilding Afghanistan and Iraq, and maintaining stable energy supplies. Among rising powers, China and Russia pose problems more difficult and complex than those of other states because, as states that are neither U.S. allies nor Western-style democracies, they are outsiders that do not always accept the rules of the liberal "core" of the international system. As a result, conventional prescriptions for enhancing world order (e.g., admission to international institutions, promotion of liberal democratic norms, and encouragement of economic interdependence) are at best only partially relevant to securing Beijing's and Moscow's contribution to global governance. The authors recommend an alternative approach based on a greater appreciation of China's and Russia's quest for distinctive identities and their heightened international prestige concerns. Chinese and Russian behavior since the beginning of the twenty-first century suggests that the desire for increased international status can motivate both countries to take on more responsibility for global governance.

BEIJING'S AND MOSCOW'S SEARCH FOR STATUS China's and Russia's concerns for recognition and status, always central to their historic identities, were intensified by the end of the Cold War. China has long sought to restore its great power standing after a "century of humiliation" beginning with the Opium War (1839–1842), and Russia has been preoccupied with great power status regardless of whether it had the material wherewithal. In the 1990s, both states experienced major blows to their prestige, as China's rulers were viewed by the West as being "on the wrong side of history" and Russia's leadership was dismissed as unstable, corrupt, and incompetent. President Bill Clinton's administration made China's and Russia's admission to prestigious institutions such as the World Trade Organization, North Atlantic Treaty Organization (NATO), and the Group of Seven (G-7) conditional on greater progress toward liberal democracy and free markets. Frustrated by their continued exclusion, despite having enacted domestic reforms, both states tried to compete for prestige with the United States and its partners. China's provocative missile tests in the Taiwan Strait aroused fears in Asia, however, and Russia's diplomatic balancing could not attract partners to an anti-U.S. diplomatic alliance. Recognizing that their desire for improved status had not been attained and that the U.S.-dominated status hierarchy was secure, China and Russia adopted more innovative strategies for acquiring prestige that did not challenge the United States. China became a strategic partner with all major poles of the international system, participating in multilateral organizations (e.g., the Shanghai Cooperation Organization and Association for Southeast Asian Nations Plus Three), sponsoring six-party talks on North Korea's nuclear program, proposing a new free trade area with Southeast Asia, and after the September 11, 2001, terrorist attacks, supporting U.S. counterterrorism efforts. President George W. Bush showed appreciation for China's constructive behavior by holding formal summits with Chinese leaders and by inaugurating "strategic dialogues" between high-level U.S. and Chinese officials. Russian President Vladimir Putin seized the opportunity provided by the September 11 terrorist attacks to reframe Russia's identity as an equal, special partner with the United States in the war on terror. Russia's cooperation with the United States was both valuable and extensive, including sharing political and military intelligence, allowing U.S. planes to fly over Russian territory, acquiescing to U.S. military bases in Central Asia, and providing a liaison with an anti-Taliban force in Afghanistan, the Northern Alliance. Putin showed that the geopolitical rivalry with the United States was over by withdrawing from a large Russian electronic intelligence-gathering base in Cuba and a naval base in Vietnam; reacting calmly to the U.S. withdrawal from the Antiballistic Missile treaty and the admission of the Baltic states to NATO; and accepting a Strategic Arms Reduction Treaty that allowed the United States to store dismantled warheads. The U.S.-Russian strategic partnership did not last long, however. The Bush administration was unwilling to treat Russia as a partner, much less as an equal. A major irritant among members of Russian political circles was the U.S. failure to graduate Russia from the Cold War–era Jackson-

Vanik amendment, which prevents normal trading relations with a state that restricts emigration. The United States showed indifference to Russia's status concerns by invading Iraq, a former Soviet client, without consulting with Moscow; supporting "color" revolutions in neighboring countries that were regarded as humiliating interference in Russia's sphere of influence; and publicly criticizing Putin's domestic policies as "backsliding" from democracy. Russia's desire to assert its comeback on the world stage, as well as to proclaim a sphere of "privileged interest" in the post-Soviet space, were evident in its August 2008 incursion into Georgia. President Barack Obama's adoption of more respectful policies toward Russia has elicited a more cooperative attitude by Russian President Dmitri Medvedev toward curbing Iran's nuclear program and allowing U.S. cargo flights in Russian air space to supply NATO's military effort in Afghanistan.

THE STRATEGY OF STATUS ENHANCEMENT China and Russia are more likely to engage in constructive status-seeking behavior if the United States finds ways to recognize their international status and distinctive identities. For example, strategic dialogues, formal summits, and strategic partnerships can help to establish issue agendas for future collaboration and symbolize that states are political equals. Engagement through trade and investment does not resolve conflicting political goals. Integration into Western, value-based institutions such as NATO or the G-8 is impractical for aspiring great powers such as China and Russia that want to maintain their distinctive national and cultural identities rather than emulate the established states. Instead of the "Washington Consensus" on neoliberal economic principles espoused by Western financial institutions such as the International Monetary Fund (IMF), China promotes the "Beijing Consensus," advocating adaptation of economic policies to national conditions. Similarly, Putin's team has promoted the concept of "sovereign democracy," arguing that there is more than one definition of democracy and that Russia is following the way best suited to its history and culture. A status enhancement strategy is also superior to a neocontainment policy of imposing ideological criteria for participation in global governance, as reflected in recent calls for a Concert of Democracies that would exclude China and Russia. Such simplistic Wilsonianism is self-defeating because Russia and China would respond by withdrawing cooperation on key issues or by engaging in spoiler behavior.

RECOMMENDATIONS Consultation (such as senior-level strategic dialogues) on issues affecting China's and Russia's interests should be expanded and institutionalized. China and Russia should be encouraged to take greater responsibility in return for sharing leadership roles. For example, the United States could join with China and Russia in a working group on energy security. There could be a consortium on promoting economic development in Central Asia. Chinese and Russian institutional initiatives

(such as President Medvedev's recent proposal for new European security institutions) deserve serious consideration and a positive response from the West. Russia is outside the main European security structures, NATO and the European Union, and an overarching security treaty on the model of the 1975 Helsinki accords would treat Russia as an equal partner with Europe and the United States. **The United States should refrain from actions that undermine** China's and **Russia's prestige**. China is more likely to revalue the renminbi out of self-interest—to reduce its export dependence and to fight inflation—than to comply with humiliating demands from the U.S. Congress or the IMF. Similarly, the United States should avoid antagonizing Russia by further enlarging NATO to include other states in Russia's area of historic interest.

Perceived national humiliation and loss of great power status drive Russia towards nationalism—history proves.

Tuminez '00

(Astrid S. Tuminez, RUSSIAN NATIONALISM SINCE 1856: IDEOLOGY AND THE MAKING OF FOREIGN POLICY, 2000, p. 268.)

A second prominent feature of Russian nationalism is that in cases where it briefly bonded state and society (e.g., in 1876-78 and in 1914), **the sentiments that motivated nationalist fervor were mainly national humiliation and defiance in the face of external threats, crises, and the prospect of further humiliation**. The third and fourth chapters in this book illustrate this. **During the periods studied, an aggressive form of nationalism became widespread, mobilized large numbers of people, and influenced Russian foreign policy, particularly decisions to go to war.** The impact of **nationalism occurred during moments when both Russian state authorities and the articulate public believed that their state had been deeply humiliated, was facing further humiliation, and must respond decisively** to external threats and challenges. Chapters 3 and 4 showed that Russian nationalism, when it manifested itself (however briefly) as an integrative force, was the product not of pride, victory, prosperity, or state-sponsored socioeconomic development or nation-building, but the result of shame and **a desire to compensate for** humiliation and **weakness** in an unfriendly world. In the post-Soviet period, the rise of nationalist discourse has itself been the product of new humiliation and Russian loss and shame. However, as chapter 6 pointed out, such mitigating factors as weaker imperial discourse and a relatively benign international environment have held aggressive nationalism in check in Russia until 1998. How can the impact of national humiliation be further minimized? Can a strong but benign nationalism develop in Russia—a nationalism that articulates primarily a civic definition of the nation; emphasizes a nonchauvinistic self-image and celebrates the interpenetration of Russian and other cultures; and argues for a national purpose focused on internal prosperity, preservation of cultural achievements, and a balancing of political rights and duties between state and society? Can Russia consolidate state-society relations on the basis of nationalism that is not the product of humiliation and resentment against the outside world?

Internals: U.S. Pressure = War

And, U.S. interference causes US/Russia war

Sanz 8

(Daniel, Oxford University educated author, essayist, and financial analyst For U.S. Security, Next Administration Will Have To Repair Relationship With Russia, 1 October 2008, http://www.huffingtonpost.com/daniel-bruno-sanz/for-us-security-next-admi_b_130894.html)

The Obama administration will need to completely overhaul US foreign policy to include de facto recognition of Russia's legitimate security needs and recognition of Russia's sphere of influence including South Ossetia, Abkhazia and Georgia. Only this way can America's own security be assured The profligate Bush administration has pledged \$1 billion to help Georgia recover from its ill-advised invasion of South Ossetia and consequent beating by the Russian army. This arrogant interference of ours will only enrage the Russians and inflame anti-Americanism It is not in our interest to confront and set off a new arms race costing billions of dollars that we will have to borrow from abroad while increased geopolitical tensions keep energy prices sky high. The only way to meet America's national security needs is to work with Russia to create a neutral, demilitarized buffer zone around the Russian border. Enormous oceans to the east and the west and docile neighbors to the north and south act as America's buffer zone. Helping Russia achieve peace of mind about its security and true American intentions will reap untold benefits for the U nited States. The offensive missile batteries in Poland and the Czech Republic need to be withdrawn immediately. The Russians will be more than amenable to a tit-for-tat withdraw of their armed forces from the Western Hemisphere. We need Russian cooperation at the United Nations on a host of issues from nonproliferation to global warming and terrorism. It is not in the interests of the U nited States to alienate this large and powerful country while sticking up for every thorn in its side. Current American policies towards Russia betray a haughty ignorance of her history and contempt for her people , who approve of Vladimir Putin and the Georgia war. **The United States risks military confrontation with Russia at its peril.**

Internals: Russia Relations

US democracy promotion causes Russian backlash

Burnell and Youngs 9 (Peter Burnell, Professor of Politics and International Studies, Richard Youngs, Senior Associate Carnegie Endowment for International Peace and Professor of International Relations, "New Challenges to Democratization," Routledge, December 4, 2009)//AG

In 2006, I and other writers called attention to an emergent international backlash against democracy promotion (Carothers 2006; National Endowment for Democracy 2006). The backlash entails growing hostility and resistance on the part of authoritarian and semi-authoritarian governments to Western, especially US democracy promotion programs and policies. Of course, Western democracy supporters have long encountered a closed door or heavy resistance in many authoritarian countries: This current phenomenon is about governments that once allowed external democracy assistance in their country forcing out or greatly restricting such activities, or it is about governments that never paid much attention to the possibility of such activities on their territory suddenly taking steps to block it. The measures that governments employ against democracy assistance vary. In some cases, governments impose legal restrictions that force democracy aid groups resident in the country to leave or prevent those attempting to work from a distance to do so. Restrictions on the funding and activities of nongovernmental organizations (NGOs)—NGO laws—are a favorite such instrument although laws and regulations relating to political parties and/or elections are also used. Some governments do not force out or completely block external democracy aid groups but harass them. The harassment may be crudely physical—beatings, thefts, and threats against representatives of such groups or against their local partners. Or the harassment may be legal or administrative, such as intrusive tax inspections, administrative fines and office space refusals. Harassment may also take the form of public criticisms or denunciations by government officials of democracy aid groups and their work. The Russian government, under then President Vladimir Putin, was the initial leading force of the backlash but governments in other parts of the world, including Central Asia, East Asia, the Middle East, Sub-Saharan Africa, and Latin America, quickly joined in. In the past few years the backlash has continued and spread. Russia remains the paradigmatic case. In his last two years as president before handing over in mid-2008, Vladimir Putin stepped up his assertive campaign against Western democracy promotion. He denounced Western democracy aid providers in harsh, blunt language as political meddlers who violate Russian sovereignty. Shortly before the December 2007 Duma elections, for example, he denounced Western democracy aid in scathing terms: Unfortunately, some people in this country treacherously gather near foreign embassies, and are hanging around diplomatic missions in hopes of support from foreign funds and governments, not from their own people ... There are those confronting us who do not want us to carry our plans ... They need a weak and feeble state. They need a dis-organized and disoriented society, a split society, so that they can carry out their dirty tricks behind its back.' Russian authorities have harassed and expelled representatives of Western democracy promotion groups. They have made it difficult for

Russian NGOs to receive Western funding and harassed many of those that do. Putin mounted a sustained attack on the election monitoring work of the Organization for Security and Cooperation in Europe (OSCE), imposing such restrictive conditions that the OSCE declined to send observers to the 2007 Duma elections and the 2008 presidential elections. Putin also sought to stir up a similar resistance to Western democracy promotion in other countries, personally warning leaders in China, Central Asia, and elsewhere about what he believed were the dangerous nature of such activities.

China Impacts

2NC Impact: China

US criticism of China on HR tanks relations

Zeng et al 15 (Jinghan Zeng, Vice-Chancellor's 2020 Lecturer in the Department of Politics and Public Policy at De Montfort University and an Associate Fellow in the Centre for the Study of Globalisation and Regionalisation at the University of Warwick, Yuefan Xiao, Postdoctoral Research Fellow at the Amsterdam School for Cultural Analysis, University of Amsterdam, Professor of Politics and International Studies at the University of Warwick and Senior Scientist on the EU funded GR: EEN Project (Global Reordering: Evolution through European Networks) that focuses on the EU's role in a multipolar world, Associate Fellow of the Chatham House Asia Programme and co-editor of The Pacific Review, "Securing China's Core Interests: The State of the Debate in China," International Affairs, March 27 2015, <http://onlinelibrary.wiley.com/doi/10.1111/1468-2346.12233/full>)/AG

By far the biggest problem for China in respect of protecting its core interests is the United States. Taiwan is not only important in itself for China; it is also considered to be the biggest problem in Sino-US relations. Moreover, the US is blamed for trying to sabotage this most important core interest. For example, one article argues that, 'regarding the issue of the most central and important interest [Taiwan], the US has always been interfering, challenging, and damaging China's core interests'.⁷⁹ In total, 14.81 per cent of papers refer to US policy towards China on a range of other issues (especially Xinjiang, Tibet and human rights policies) as threatening China's core interests. It is argued that the US has never 'cared' about China's core interests. For example, one article argues: 'The US has never had any scruples respecting China's core interests ... the more important the issues are concerned with China's national core interests, the more likely that the US will "challenge" them.'⁸⁰ In two articles, Chu Shulong, a professor at Tsinghua University, goes a step further and argues that the core interests of the US and China cannot be resolved because they are 'oppositional'.⁸¹ It is argued that the core interests of the US and China are 'opposite and confrontational ... this fundamentally determines that Sino-US relations cannot be friendly—it may even be an opposing and confrontational relationship'.⁸² This view echoes the prediction of Great Power conflict theory that the core interests of the rising power and the existing hegemon will eventually clash—though without directly engaging with the extant (western) literature on the theme. There is, then, a tendency to treat tensions in US–Chinese relations as an unfortunate but natural fact of life in a changing world order. As one article puts it: 'It is not easy to ask the US to give up its hegemonic attitude and actions; and it is impossible to ask China to continue to tolerate the US actions that damaged China's core interests. So a struggle is inevitable.'⁸³

Relations collapse causes US China War

Goldstein 13

(2013, Avery, Professor of Global Politics and International Relations, Director of the Center for the Study of Contemporary China, University of Pennsylvania, "First Things First: The Pressing Danger of Crisis Instability in U.S.-China Relations," International Security, vol. 37, no. 4, Spring, muse)

Two concerns have driven much of the debate about international security in the post-Cold War era. The first is the potentially deadly mix of nuclear proliferation, rogue states, and international terrorists, a worry that became dominant after the terrorist attacks against the United States on September 11, 2001.¹ The second concern, one whose prominence has waxed and waned since the mid-1990s, is the potentially disruptive impact that China will have if it emerges as a peer competitor of the United States, challenging an international order established during the era of U.S. preponderance.² Reflecting this second concern, some analysts have expressed reservations about the dominant post-September 11 security agenda, arguing that China could challenge U.S. global interests in ways that terrorists and rogue states cannot. In this article, I raise a more pressing issue, one to which not enough attention has been paid. For at least the

next decade, while China remains relatively weak, **the gravest danger in Sino-American relations is the possibility the two countries will find themselves in a crisis that could escalate to open military conflict.** In contrast to the long-term prospect of a new great power rivalry between the United States and China, which ultimately rests on debatable claims about the intentions of the two countries and uncertain forecasts about big shifts in their national capabilities, **the danger of instability in a crisis involving these two nuclear-armed states is a tangible, near-term concern.**³ Even if the probability of such a war-threatening crisis and its escalation to the use of significant military force is low, the potentially catastrophic consequences of this scenario provide good reason for analysts to better understand its dynamics and for policymakers to fully consider its implications. Moreover, **events since 2010**—especially those relevant to disputes **in the East and South China Seas**—suggest that **the danger of a military confrontation in the Western Pacific that could lead to a U.S.-China standoff may be on the rise.** In what follows, I identify not just pressures to use force preemptively that pose the most serious risk should a Sino-American confrontation unfold, but also related, if slightly less dramatic, incentives to initiate the limited use of force to gain bargaining leverage—a second trigger for potentially devastating instability during a crisis.⁴ My discussion proceeds in three sections. The first section explains why, during the next decade or two, **a serious U.S.-China crisis may be more likely** than is currently recognized. The second section examines the features of plausible Sino-American crises that may make them so dangerous. The third section considers general features of crisis stability in asymmetric dyads such as the one in which a U.S. superpower would confront an increasingly capable but still thoroughly overmatched China—the asymmetry that will prevail for at least the next decade. This more stylized discussion clarifies the inadequacy of focusing one-sidedly on conventional forces, as has much of the current commentary about the modernization of China's military and the implications this has for potential conflicts with the United States in the Western Pacific,⁵ or of focusing one-sidedly on China's nuclear forces, as a smaller slice of the commentary has.⁶ An assessment considering the interaction of conventional and nuclear forces indicates why escalation resulting from crisis instability remains a devastating possibility. **Before proceeding, however, I would like to clarify my use of the terms "crisis" and "instability."** For the purposes of this article, I **define a crisis as a confrontation** between states involving a serious threat to vital national interests for both sides, in which there is the expectation of a short time for resolution, and in which there is **understood to be a sharply increased risk of war.**⁷ This definition distinguishes crises from many situations to which the label is sometimes applied, such as more protracted confrontations; sharp disagreements over important matters that are not vital interests and in which military force seems irrelevant; and political disputes involving vital interests, even those with military components, that present little immediate risk of war.⁸ **I define instability as the temptation to resort to force in a crisis.**⁹ **Crisis stability is greatest when both sides strongly prefer to continue bargaining; instability is greatest when they are strongly tempted to resort to the use of military force.** **Stability, then, describes a spectrum**—from one extreme in which neither side sees much advantage to using force, through a range of situations in which the balance of costs and benefits of using force varies for each side, to the other extreme in which the benefits of using force so greatly exceed the costs that striking first looks nearly irresistible to both sides. **Although the incentives to initiate the use of force may not reach this extreme level in a U.S. China crisis, the capabilities that the two countries possess raise concerns that escalation pressures will exist and that they may be highest early in a crisis, compressing the time frame for diplomacy to avert military conflict.**

Impacts: U.S.-China War Outweighs

War with China goes nuclear – safeguards won't prevent escalation

Wittner 11

(11/28/11, Lawrence, PhD in history from Columbia University, Emeritus Professor of History at the State University of New York/Albany, "COMMENTARY: Is a Nuclear War with China Possible?" <http://www.huntingtonnews.net/14446>)

While nuclear weapons exist, there remains a danger that they will be used. After all, for centuries national conflicts have led to wars, with nations employing their deadliest weapons. **The current deterioration of U.S. relations with China might end up providing us with yet another example** of this phenomenon. **The gathering tension** between the United States and China **is clear enough**. Disturbed by China's growing economic and military strength, **the U.S. government recently challenged China's claims in the South China Sea, increased the U.S. military presence in Australia, and deepened U.S. military ties with other nations in the Pacific region**. According to Secretary of State Hillary Clinton, the United States was "asserting our own position as a Pacific power." But **need this lead to nuclear war?** Not necessarily. And yet, **there are signs that it could**. After all, both the United States and China possess large numbers of nuclear weapons. **The U.S. government threatened to attack China with nuclear weapons during the Korean War and, later, during the conflict over** the future of China's offshore islands, **Quemoy and Matsu**. In the midst of the latter confrontation, President Dwight Eisenhower declared publicly, and chillingly, that U.S. nuclear weapons would "be used just exactly as you would use a bullet or anything else." Of course, China didn't have nuclear weapons then. Now that it does, perhaps the behavior of national leaders will be more temperate. But the loose nuclear threats of U.S. and Soviet government officials during the Cold War, when both nations had vast nuclear arsenals, should convince us that, even as the military ante is raised, nuclear saber-rattling persists. **Some pundits argue that nuclear weapons prevent wars between nuclear-armed nations**; and, admittedly, there haven't been very many—at least not yet. **But the Kargil War of 1999, between nuclear-armed India and nuclear-armed Pakistan, should convince us that such wars can occur**. Indeed, in that case, the conflict almost slipped into a nuclear war. Pakistan's foreign secretary threatened that, if the war escalated, his country felt free to use "any weapon" in its arsenal. During the conflict, Pakistan did move nuclear weapons toward its border, while India, it is claimed, readied its own nuclear missiles for an attack on Pakistan. **At the least, though, don't nuclear weapons deter a nuclear attack? Do they? Obviously, NATO leaders didn't feel deterred, for, throughout the Cold War, NATO's strategy was to respond to a Soviet conventional military attack on Western Europe by launching a Western nuclear attack** on the nuclear-armed Soviet Union. **Furthermore, if U.S. government officials really believed that nuclear deterrence worked, they would not have resorted to** championing "Star Wars" and its modern variant, **national missile defense**. Why are these vastly expensive—and probably unworkable—military defense systems needed if other nuclear powers are deterred from attacking by U.S. nuclear might? Of course, **the bottom line for those Americans convinced that nuclear weapons safeguard them from a Chinese nuclear attack might be that the U.S. nuclear arsenal is far greater than its Chinese counterpart. Today, it is estimated that the U.S. government possesses over five thousand nuclear warheads, while the Chinese government has a total inventory of roughly three hundred**. Moreover, only about forty of these Chinese nuclear weapons can reach the United States. **Surely the United States would "win" any nuclear war with China. But what would that "victory" entail? A nuclear attack by China would immediately slaughter at least 10 million Americans in a great storm of blast and fire, while leaving many more dying horribly of sickness and radiation poisoning**, the Chinese death toll in a nuclear war would be far higher. Both nations would be reduced to smoldering, radioactive wastelands. Also, **radioactive debris sent aloft by the nuclear explosions would blot out the sun** and bring on a "nuclear winter"

around the globe—destroying agriculture, creating worldwide famine, and generating chaos and destruction.

Bahrain Impact

1NC/2NC

Good Bahrain relations now and key to provide a safe haven for the US Navy – US's silence on human rights policies is crucial to maintain good relations

Abrams 2/27, (*Elliott Abrams, Elliott Abrams is a senior fellow for Middle Eastern Studies at the Council on Foreign Relations in Washington, DC. He served as deputy assistant to the president and deputy national security advisor in the administration of President George W. Bush, where he supervised U.S. policy in the Middle East for the White House. Mr. Abrams was educated at Harvard College, the London School of Economics, and Harvard Law School. After serving on the staffs of Sens. Henry M. Jackson and Daniel P. Moynihan, he was an assistant secretary of state in the Reagan administration and received the secretary of state's Distinguished Service Award from Secretary George P. Shultz. In 2012, the Washington Institute for Near East Policy gave him its Scholar-Statesman Award. Mr. Abrams was president of the Ethics and Public Policy Center in Washington, DC, from 1996 until joining the White House staff. He was a member of the United States Commission on International Religious Freedom from 1999 to 2001 and chairman of the commission in the latter year, and in 2012 was reappointed to membership for another term. He teaches U.S. foreign policy at Georgetown University's School of Foreign Service. Mr. Abrams joined the Bush administration in June 2001 as special assistant to the president and senior director of the National Security Council for democracy, human rights, and international organizations. From December 2002 to February 2005, he served as special assistant to the president and senior director of the National Security Council for Near East and North African affairs. He served as deputy assistant to the president and deputy national security advisor for global democracy strategy from February 2005 to January 2009, and in that capacity supervised both the Near East and North African Affairs and the democracy, human rights, and international organizations directorates of the NSC. He is the author of four books, Undue Process (1993), Security and Sacrifice (1995), Faith or Fear: How Jews Can Survive in a Christian America (1997), and Tested by Zion: the Bush Administration and the Israeli-Palestinian Conflict (2013); and the editor of three more, Close Calls: Intervention, Terrorism, Missile Defense and "Just War" Today; Honor Among Nations: Intangible Interests and Foreign Policy; and The Influence of Faith: Religion and American Foreign Policy. "How Obama Caved on Bahrain," <http://foreignpolicy.com/2015/02/27/how-obama-caved-on-bahrain-manama-human-rights/>, 2/27/15, //VZ)*)

Once upon a time, President Barack Obama's administration not only followed the crisis in Bahrain closely, but spoke loudly about it. American policy was clearly to press for a compromise between the Sunni royal family and the majority Shiite population. After all, the U.S. Fifth Fleet is based in Bahrain, allowing the United States to project its naval power across the Gulf, and roughly 8,500 Americans live there. Violence and instability in Manama are obviously something the United States wishes to avoid. Way back in 2011, when the Arab Spring began and protests spread across the country, demanding more democracy and better representation for Shiites, Obama himself pressed for change in Bahrain. In February 2011, as protesters massed in the tens of thousands at Manama's Pearl Roundabout, the president issued a statement welcoming reform plans – which, alas, were never really carried through – announced by King Hamad bin Isa Al Khalifa. Obama reaffirmed that it was the U.S. position that Bahrain's stability would be ensured through "respecting the universal rights of the people of Bahrain and reforms that meet the aspirations of all Bahrainis." The king, however, answered Obama's call for reform with more repression. On March 14, he invited in troops from Saudi Arabia and the United Arab Emirates to help put down the protests. Thousands of security forces stormed the Pearl Roundabout demonstrations on

March 16, clearing the protest camp and arresting its leaders. Two days later, the Pearl Monument at the center of the roundabout, which had become an icon of the protests, was demolished, and closed the area off to the public. In the aftermath of the crackdown, Obama's tone on Bahrain noticeably toughened. The message was clear: Stability must depend on respecting the rights of the people, not on foreign troops. When the president gave a major speech on the Middle East in May 2011, he was even more critical of Bahrain and its policy of repression: "We have insisted both publicly and privately that mass arrests and brute force are at odds with the universal rights of Bahrain's citizens, and... such steps will not make legitimate calls for reform go away." Later in that speech, he said that Shiites "must never have their mosques destroyed in Bahrain," raising one of the most explosive aspects of how the Sunni government has attempted to suppress protests by the Shiite majority. In Obama's September 2011 address to the U.N. General Assembly, the tiny country got a whole paragraph. The president said that the United States "will continue to call on the government and the main opposition bloc — the Wifaq — to pursue a meaningful dialogue that brings peaceful change that is responsive to the people." He also said that reforms had been made, but that "more is required" — three words that amounted to a clear message that the monarchy was falling short. The White House was not about to let the king off the hook — and the president himself was

raising the issue, not some spokesperson. **What has happened since then? Not much. There has been little or no progress in Bahrain — domestic tensions have instead risen higher.** Everything President Obama demanded has been refused. In June 2011, an independent commission was established to examine the events during the early months of the uprising, and in November it reported its findings to the king. Its recommendations, however, were roundly ignored: In 2012, the commission's chairman, law professor Cherif Bassiouni, delivered what George Washington University's Marc Lynch termed a "scathing critique of its failure to undertake any deeper political or social reforms." Bassiouni has given the government credit for taking a number of his recommendations — even as he laid out Manama's failings to resolve the underlying grievances of the protests. "There are very, very fundamental social and

economic issues involved in the Shiite population that need to be addressed, and have not been addressed," he said in a 2014 interview. **When you have people who do not have the hope of seeing themselves as equal citizens, as having equal opportunities in a particular country, living in mostly economic underprivileged areas in high-density population areas, they explode.** Others are even more critical. In May 2014, Human Rights Watch issued a report finding that, despite the king's promised reforms, **members of security forces are rarely prosecuted for unlawful killings, including in detention, and the few convictions have carried extremely light sentences.** **The Bahraini government has also adopted new methods to silence opposition voices.** In January 2015, it **stripped 72 citizens of their nationality, rendering many of them stateless.** As Amnesty International pointed out, **the authorities included human rights and political activists on the same list as Bahrainis who allegedly went to fight with the Islamic State (IS).** **so the government of Bahrain is trying to equate peaceful protest with jihadi terrorism.** While the government is painting all protesters as "terrorists" who support the Islamic State, its own policy appears to be one of promoting sectarian divisions. As the human rights activist Ala'a Shehabi wrote in Foreign Policy last year, the monarchy has been "nurturing and nourishing extremist groups and their sectarian ideology to counter the so-called 'Shiite threat' posed by the pro-democracy uprising." For the government, Sunni solidarity appears to trump the need to act against Sunni extremism. "Bahrain's public stance on the war against IS contrasts sharply with its lack of action at home," Shehabi continued.

So far there doesn't appear to have been any documented trial of any person on charges of IS-related terrorist activity despite government vows to pursue and monitor their activities. All of this is not to offer roses to the conduct of the Bahraini opposition, which some observers see as having missed several opportunities to gain ground. It has said no when it should have said yes to occasional government offers, some close students of Bahraini politics have argued, and has a habit of seeing compromise as betrayal. Not every movement has a Nelson Mandela at its head: Many opposition leaders around the world could probably make a good case that the leadership of al-Wefaq, the main Shiite opposition group in Bahrain, has made tactical errors. Yet it is hard to agree to compromise when you or your family are in jail, being beaten, or being called a terrorist. In the case of al-Wefaq, its

leader, Sheikh Ali Salman, has been thrown in jail yet again and charged with plotting a coup and inciting violence against the security forces. As **the Bahrain situation has worsened in the years since 2011,** what has been the Obama administration's reaction? After the tough language and the demands made by the president in 2011, what has come next? The answer is: near silence — accompanied by steps that make it clear to the royal family that there will be no real American pressure for reform. After the firm language in his 2011 U.N. General Assembly speech, Obama's only mention of the worsening situation in his U.N. address two years later was a one-line reference to the need for efforts "to resolve sectarian tensions that continue to surface in places like Iraq, Bahrain, and Syria." No doubt the Bahraini monarchy was unhappy to see Bahrain compared to Iraq and Syria, but there was no blame — and no call for action. In 2012, the president didn't mention Bahrain in his U.N. speech, and that year the White House issued just one statement about Bahrain — from the press secretary rather than from the president. It blamed both the government and the opposition for the continuing violence, urged the government "to redouble its ongoing efforts to implement the recommendations of the Bahrain Independent Commission of Inquiry," and called for "genuine dialogue" and "meaningful reforms." We do not need to wonder whether the government of Bahrain viewed those comments in 2011 and 2012 as real pressure. In May 2011, it orchestrated a campaign against the human rights officer at the U.S. Embassy in Manama, Ludovic Hood, and the State Department pulled him out for his own safety. "It is unacceptable that elements within Bahrain would target an individual for carrying out his professional duties," said the State Department — but Bahrain paid no price. Throughout his term as ambassador to Bahrain, from 2011 until early this year, Tom Krajeski was subject to the same sort of abuse in the press. Krajeski was no hot-head, and said repeatedly that he placed the blame on the lack of political reconciliation in Bahrain on both sides. But the veteran diplomat's mere recognition of serious human rights and political problems in Bahrain was too much for the government, which made sure he was vilified in the press. In May 2013, the Bahraini cabinet

approved a parliamentary proposal to "put an end to the interference of U.S. Ambassador Thomas Krajeski in Bahrain's internal affairs." Then **In July 2014, Bahrain's government actually expelled U.S. Assistant Secretary of State for Human Rights Tom Malinowski for meeting with members of the country's political opposition** — an extraordinary and

unprecedented act for a U.S. ally to take. **What price did Bahrain pay for this? Zero. It gets worse. An American citizen named Tagi Abdalla al-Maidan has been in jail in Bahrain since 2012.** He's accused of violent acts, and the government claims he confessed; he denies the accusations and says the confession was obtained by torture. He was held in prison for almost an entire year before a court hearing, and then handed a 10-year prison sentence. **Last year, the U.N. Working Group on Arbitrary Detention declared that the court had violated a whole series of substantive and procedural rights that rendered his imprisonment a violation of international and Bahraini law.** What has the U.S. government reaction been to the imprisonment of one of its citizens in a faulty legal process? As CNN pointed out in November, the United States "has said little" about Maidan's case. State Department spokesman Jeff Rathke said that the United States was following the case closely, and that "this is a matter of ongoing concern." Were I in a foreign prison, those words — "this is a matter of ongoing

concern” — would not seem to me a tough and energetic demand for my freedom. It’s hard to believe the United States could not spring Maidan if it pushed hard enough.

The United States maintains considerable leverage in Manama. Even a small drawdown of U.S. military personnel would reverberate loudly there, as would moving — or even announcing a study of moving — any piece of the U.S. military presence out of Bahrain. Perhaps more important, there’s a great struggle over whose “narrative” will prevail in Bahrain: the government’s, arguing that its crackdown is designed to oppose terrorism and maintain stability; or that of the opposition, arguing that the country is becoming increasingly repressive toward peaceful protests and human rights. If the United States were to side publicly, and loudly, with the opposition, the outcome of the argument would be affected. **More public pressure might well force the royals to think harder about compromises, and strengthen the hand of those who are privately arguing for reform. Instead, the United States has not only remained largely silent on human rights abuses,** but has acted in ways that can only convince the Bahraini government to ignore any quiet protests that are actually made. In 2012, when Congress objected to arms sales to Bahrain because of the repression there, the Obama administration used a loophole to continue the sales. As Foreign Policy reported, the State Department is required to formally notify Congress of any arms sales over \$1 million. According to a congressional source, rather than going through the notification process, the administration divided up an arms sales package into multiple sales, each of which was less than \$1 million — thereby dodging congressional oversight. That was 2012. **In 2013, the Navy announced that it was adding five more coastal patrol ships to American forces in Bahrain. Last year, the Obama administration went forward with a more than half-billion-dollar expansion of the U.S. presence in Bahrain, which will cement the U.S. presence in the country for decades to come. Now, what signal does that send the royals? “With each passing day, the Bahrain government’s self-fulfilling prophecy of a sectarian war is becoming more and more the reality,”** Reza Aslan wrote in 2013. “If that happens — if the Bahrain uprising descends into the kind of regional holy war between Sunni and [Shiite] — the United States will not be able to avoid the consequences.” **That message holds true for the U.S. Navy’s Fifth Fleet, which makes one wonder why it is smart to assume that the facilities the United States has in Bahrain will in fact be available — or safe to use — in the coming decades.** Meanwhile, the announcement of the expansion can only be read one way by the Bahraini authorities: The American protests about human rights conditions are not serious. It didn’t have to be this way — nobody forced the United States to turn a blind eye to Bahrain’s explosive domestic situation. Consider an alternative path: Suppose a top-level messenger, such as the chief of naval operations or chairman of the Joint Chiefs of Staff, had been sent to Bahrain to say, “Look, I personally would like this base expansion. But there’s no way it’s going to happen until the repression stops. In fact, we are going to announce that naval facilities elsewhere in the Gulf will be examined for future expansion to replace Bahrain, because Bahrain is viewed as increasingly unstable. Guys, you’ve got three months to start showing us something.” Such a message — and if necessary, a public statement a few months later — would have had a huge impact. It would have shown the Bahraini government and its supporters the risks they face; it would have made the business community nervous, and perhaps more supportive of reform; and above all, it might have given additional ammunition to those in the royal family who favor reconciliation over repression. **Instead, the Obama administration is sending the clear message that its loud protests are over, the president won’t speak about Bahrain, and the monarchy can relax.** In fact, no one should relax about Bahrain. It is on a path toward increasing instability, featuring growing Sunni extremism, growing Shiite outrage, and ever-widening sectarian divisions. **The Fifth Fleet is a hostage, and the Obama administration is spending hundreds of millions of dollars there as if America’s welcome will be permanent.** That’s a suspect assumption: As the majority of Bahrainis conclude that the United States is indifferent to the crackdown and siding with the most regressive elements of the royal family, **support for the Fifth Fleet’s presence will start to disappear.** As will Bahrain’s very sovereignty, as it is caught up in the regional rivalry between Iran and Saudi Arabia. Once upon a time, Bahrain was an outpost of civility and moderation in the Middle East. Now, it is coming to share the pathologies of its neighbors. That’s tragic, and it is in part the result of weak American policy. By placing security matters — Bahrain’s minuscule participation in the anti-Islamic State coalition and its hosting of the Fifth Fleet — above all other considerations, the Obama administration is putting that very security relationship at risk. Once upon a time, Bahrain was also an example of a sensible Obama human rights policy. Today, one can sadly say that it’s a good example of how that human rights policy has vanished into thin air.

The US’s stronghold in Bahrain is crucial to Middle East stability and preventing Iran’s control of the Strait of Hormuz

McDaniel 13, (Richard, a Commander of the US Navy, Foreign Policy at Brookings, “No “Plan B” U.S. Strategic Access in the Middle East and the Question of Bahrain,” <http://www.brookings.edu/~media/research/files/papers/2013/06/24-us-strategic-access-middle-east-bahrain-mcdaniel/24-us-strategic-access-middle-east-bahrain-mcdaniel.pdf>, June 2013, //VZ)

To say that Bahrain holds immense strategic and operational value is an understatement. Functionally and geographically, the small island state serves as the **strategic centerpiece for U.S. maritime strategy, security, and stability** in the Persian Gulf. As mentioned earlier, the base serves numerous purposes. First and foremost it serves as home to U.S. Naval Forces Central Command and Fifth Fleet. The Fifth Fleet Area of Operations is immense and covers approximately “2.5 million square miles with three critical choke points: the Suez Canal, the Bab al Mandeb, and the Strait of Hormuz.”¹ The value of its close proximity to the Strait of Hormuz cannot be overemphasized. The short distance to the Strait acts as a deterrent to Iran, which has threatened to close this critical waterway. Lying only 300 miles to the southwest of the Strait, U.S. and coalition ships can routinely patrol the area to ensure safe passage for international maritime traffic on a daily basis. These routine patrols are essential; over a fifth of the world’s oil supply passes through the Strait each year, and if Iran ever attempted to close the critical chokepoint, the price of oil would skyrocket and global markets would plummet. Finally, basing in Bahrain sustains U.S. and coalition naval forces operating in international waters of the Persian Gulf, particularly off the coast of Iran, and provides the United States Navy with a convenient logistics and maintenance hub.

Internal Link: Extra Cards

More US HR cred means countries like Bahrain will open their ears to US policies

Al-Gharbi 3/10, (Musa al-Gharbi is a social epistemologist affiliated with the Southwest Initiative for the Study of Middle East Conflicts (SISMEC), “Why America Lacks Credibility in the Middle East,” <http://fpif.org/america-lacks-credibility-middle-east/>, 3/10/15, //VZ)

To hear politicians and beltway pundits tell it, credibility in international relations boils down to this: Do others believe that the United States is willing and able to follow through on its word? Actually, this is a sloppy and often pernicious way to think, leading policymakers to senselessly commit themselves to failing policies (like enforcing a “red line,” for instance) for the sake of “maintaining credibility” — and actually undermining it in the process. Credibility is not about resolve. Strategic credibility is actually about assuring partners that things will work out well for them if they throw their lot in with you. This perception plays a pivotal role in determining whether others will support or resist U.S. interests abroad. The primary way agents establish themselves as credible is by making good decisions, which means forming and executing policies that generate positive outcomes for the relevant stakeholders. The stronger an agent’s track record, the more likely others will be willing to get behind them — that is, the more credibility they will have. Incidentally, this is the secret to ISIS’ success: Regardless of how distasteful many find their methods and ideology, they have established themselves as one of the most effective forces at seizing territory from the governments of Iraq and Syria, making tangible progress in restoring a caliphate, and resisting the prevailing international order. America, on the other hand, has a serious credibility problem in the Middle East. The results of U.S. interventions in the region have been consistently catastrophic: Whether in Afghanistan, Pakistan, Iraq, Yemen, Libya, or Syria, direct U.S. involvement is usually followed by an erosion of state governance, the empowerment of exploitative sub-state and non-state actors, and a dramatic rise in violence, civil tension, and unrest. American indirect involvement, meanwhile, tends to empower corrupt, oppressive, and undemocratic forces — such as in Pakistan, Egypt, Palestine, Saudi Arabia, and Bahrain. In terms of achieving positive outcomes, America simply has absolutely no credibility in the Middle East. However, character is also important: **Moral credibility means a nation’s intentions and motivations are more likely to be trusted.** Strategic and moral credibility are interrelated: Consistently generating good outcomes goes a long way toward bolstering one’s reputation. Even if the methods for achieving an objective seem questionable, they tend to be justified retrospectively if things turn out all right. In the interim, people are much more willing to extend the benefit of doubt to those with a strong track record of success. Conversely, moral credibility can help make up for occasional bad outcomes — an agent is afforded slack when things go awry if it’s perceived as being genuinely well-intentioned. However, when there are glaring inconsistencies between a government’s declared aspirations (say, promotion of democracy and human rights) and their means of realization (imposing Western socio-economic models at the expense of indigenous self-determination) — especially when paired with a general failure to realize stated objectives (producing chaos rather than order, be it liberal or otherwise) — these generate suspicion about its real intentions and motives. Hypocrisy Undermines “Resolve” Part of what contributes to America’s cycle of diplomatic and military failures in the Middle East is an underlying distrust of the United States among most Arabs, which inspires widespread ambivalence or resistance to U.S. efforts in the region. The source of this deficit has nothing to do with U.S. follow-through or resolve, as foreign policy hawks love to allege. One can be consistent with regards to backing up threats, etc. while still being a hypocrite in the moral sphere. Indeed, this is precisely the problem America faces. After decades of supporting the region’s dictators with arms and money, Washington has now formed a coalition with both the surviving local autocrats and the Middle East’s former imperial powers to “bring democracy” to Syria and (once more) to Iraq. Is it any surprise the “Arab street” is mistrustful? It further fuels skepticism when America attempts to fight ISIS — a group largely empowered by previous U.S. support for other non-state actors in

Iraq, Libya, and Syria — by training and arming new, ineffective, and unpopular proxy militias. Moreover, these new groups are often aligned with, and trained in, Saudi Arabia — the power most responsible for proliferating the ideology embraced by the so-called “Islamic State.” It seems disingenuous when the U.S. condemns Russia for funding non-state actors in Ukraine, or Pakistan for doing so in Afghanistan, or Iran in Lebanon — even as America expands its own support of insurgents in Syria. The Arab public is outraged when U.S. policymakers decry human rights violations elsewhere while continuing to support Israel and shield it from international accountability for its occupation of the West Bank or its wars on Gaza. And it doesn’t help at all when the Obama administration, among other failings, declines to prosecute clear and grievous infractions like torture by its own intelligence agencies, while calling for regime change in other countries for the same sorts of infractions. When American representatives lecture others about upholding the very international rules and norms the U.S. government systematically and unapologetically violates through its drone strikes and mass surveillance, enhanced interrogation, and extraordinary rendition programs, others will not take American rhetoric or ideals seriously. These glaring contradictions imbue the entire ethical project with a cynical hue — undermining not just American credibility, but the general value of moral discourse on the world stage more generally. This breakdown, in turn, disrupts consensus building and cooperation, threatening the long-term viability of the rules-based international order Americans sacrificed so much in years past to establish and preserve.

Political Pressure and Human Rights clashes will cause the US 5th Navy to be moved – silence is key

Tomlinson 11, (Hugh Tomlinson, The Australian, “US fleet may quit troubled Bahrain,” <http://www.theaustralian.com.au/news/world/us-fleet-may-quit-troubled-bahrain/story-e6frg6so-1226098580227>, 6/21/11, //VZ)

THE US Navy is looking at plans to move its Fifth Fleet away from Bahrain amid fears over violence and continued instability in the Gulf kingdom. Sources in Washington and the Gulf have confirmed a growing consensus around the idea of relocating the fleet after the recent crackdown on anti-government protests that left at least 32 dead. Politicians in Washington are concerned the navy's continued presence a few kilometres from the centre of the capital Manama lends tacit support to Bahrain's suppression of the opposition, amid allegations of systematic human rights abuses. "There was talk on Capitol Hill about moving the fleet within days of the protests breaking out, and that increased in March and April as people realised that what was happening in Bahrain ran counter to our interests," one source said. The Fifth Fleet is a key component of US military power in the Gulf. Possible alternative locations include the United Arab Emirates and Qatar. However, neither has the current capacity for the fleet and a potential move remains some years off. The UAE is considered the most likely destination. The US already moors its aircraft carriers at Dubai's main port, Jebel Ali, and has other military capabilities in the country. Qatar would offer a logistical link with the large US airbase in the emirate. A new port under construction outside Doha has been expanded to include a naval base adjoining the commercial port, though sources in the Qatari capital say the port is being built to accommodate the domestic navy and "occasional visitors". The US Navy has little desire to move, fearing the operation would be costly and pose a logistical nightmare. The fleet comprises 40 vessels and close to 30,000 personnel. But among naval commanders there is an acceptance that political pressure could force the transition.

US silence on rights abuses in Bahrain is key to prevent undermining the Bahrain government and to not give the perception that the US is supporting Iran

Slackman 11, (Michael Slackman, New York Times, graduated from Northwestern, quotes Mustafa el-Labbad, director of Al Sharq Center for Regional and Strategic Studies in Cairo, “The Proxy Battle in Bahrain,” <http://www.nytimes.com/2011/03/20/weekinreview/20proxy.html>, 3/19/11, //VZ)

CAIRO — King Abdullah of Saudi Arabia has demonstrated one lesson learned from the course of pro-democracy uprisings across the Middle East: The world may cheer when autocrats resign, but it picks carefully which autocrats to punish for opening fire on their citizens. That cynical bit of realpolitik seems to have led the king to send troops last week over the causeway from Saudi Arabia to Bahrain, where they backed up a violent crackdown on unarmed

protesters by Bahrain's own security forces. The move had immediate consequences for Middle East politics, and for American policy: It transformed Bahrain into the latest proxy battle between Iran and Saudi Arabia for regional dominance. And it called into question which model of stability and governance will prevail in the Middle East, and which Washington will help build: one based on consensus and hopes for democracy, or continued reliance on strongmen who intimidate opponents, sow fear and co-opt reformist forces while protecting American interests like ensuring access to oil and opposing Iran. **For Saudi Arabia, the issue in Bahrain is less whether Bahrain will attain popular rule than whether Iranian and Shiite influence will grow.** Iran and Saudi Arabia have sparred on many fronts since the Iranian Revolution of 1979 — a Shiite Muslim theocracy in Tehran versus a deeply conservative Sunni Muslim monarchy in Riyadh — in a struggle for supremacy in the world's most oil-rich region. The animosity was evident in Saudi Arabia's support for Iraq during its war with Iran, and it still shows in Iran's backing for Hezbollah in Lebanon. Now, **after a decade that seemed to tilt the regional balance toward Iran, Saudi Arabia decided that Bahrain was the place to put its thumb more heavily on the scale. It sent troops under the auspices of the Gulf Cooperation Council to help crush pro-democracy demonstrations because most of the protesters were Shiites challenging a Sunni king.** "If the political opposition in Bahrain wins, Saudi loses in this regional context," said Mustafa el-Labbad, director of Al Sharq Center for Regional and Strategic Studies in Cairo. **"Saudi is regarding itself as the defender of Sunnis. And Iran is trying to defend Shiites in the region."** The problem for the United States, however, is that Bahrain, at Saudi urging, chose to resolve its fears with force, rather than by addressing the protesters' demands for democratic reform, as American officials had publicly encouraged.

Impacts: Middle East War

Middle East instability causes Nuclear War – miscalc, offensive posturing, and escalation – deterrence doesn't check

Warren 13, (Roslyn, is an M.A. candidate in Georgetown University's Security Studies Program, "Miscalculating Nuclear Deterrence in the Middle East: Why Kenneth Waltz Gets It Wrong," <http://georgetownsecuritystudiesreview.org/2013/12/19/miscalculating-nuclear-deterrence-in-the-middle-east-why-kenneth-waltz-gets-it-wrong/>, 12/19/13, //VZ)

In his Foreign Affairs article, "Why Iran Should Get the Bomb," Kenneth Waltz suggests that a nuclear-armed Iran is nothing to fear. Indeed, he goes so far as to claim that Iran's membership in the nuclear club will actually increase stability in the Middle East. However, Waltz misses an essential point: nuclear deterrence does not rule out the potential for conventional escalation, which can destabilize regions in unpredictable and potentially catastrophic ways. When it comes to nuclear-armed adversaries, the outbreak of "full-scale war"[1] cannot be the only definition of instability. Tense relations between nuclear-armed foes, be they offensive posturing or limited conventional conflict, create opportunities for miscalculation and escalation to the nuclear level. A closer examination of relations between India and Pakistan reveals that nuclear weapons embolden revisionist nuclear states – i.e., states dissatisfied with the existing regional balance of power – and raises the propensity for and incidence of conventional conflict. Taking Pakistan as a model, a weaponized Iran, believing it has a significant deterrent capability, will, at a minimum, increasingly antagonize Israel without fear of nuclear reprisal. Another, more frightening, side effect of Iranian weaponization runs contrary to Waltz's deterrence model: Both Israel and Iran could each believe a preemptive strike lay in its favor. For these reasons, Waltz's assertion that a nuclear Iran will increase stability in the Middle East is wrong. Waltzian neorealists claim that states are rational actors seeking, above all, security within an anarchical international system. States maximize their own security by attempting to balance their power against the status quo power; i.e., a state content with the existing, regional balance of power. Security imbalances spur instability. For Waltz, such is currently the case in the Middle East. Because of Israel's nuclear dominance, it can project undeterred hostility towards its neighbors.[2] The defensive realist remedy for this type of instability is nuclear balance. Waltz suggests that, "By reducing imbalances in military power, new nuclear states generally produce more regional and international stability, not less." [3] Given that all states are rational actors seeking to maximize their relative security, Waltz argues that fear of nuclear reprisal vis-à-vis a second-strike capability acts as a sufficient deterrent between two nuclear-armed adversaries.[4] Hence, if Iran developed nuclear weapons, relations between the two most powerful actors in the Middle East would become more stable. In contrast, many nuclear proliferation experts use the stability-instability paradox to explain how regions with rival nuclear powers become increasingly unstable. The stability-instability paradox posits that two nuclear-armed, adversarial states, believing that neither will initiate a nuclear strike, can and will increasingly engage in offensive posturing and limited conflict with one another.[5] The newly-weaponized, revisionist state – for example, Pakistan or potentially Iran – feels emboldened, and more freely resorts to adventurism in the form of enhanced offensive posturing, increasing low-level conflict, and perhaps stronger support for terrorists. On the other hand, the status quo state – India or Israel in these cases – perceives its freedom of action constrained by its adversary's new status.[6] Instability at the conventional level in the form of more pronounced aggressive posturing and/or limited conflict heightens tensions between major regional powers, and leaves the door open for escalation and miscalculation at the nuclear level. For Waltz, India and Pakistan prove his point: These two nuclear-armed adversaries have not launched a nuclear war against one another because they fear a reciprocal strike, thereby balancing each other and stabilizing their relations. However, Waltz's analysis only explains why India and Pakistan have not yet launched a calculated nuclear attack against one another. He fails to consider how tensions across the conflict spectrum have increased since India and Pakistan both weaponized, which could inadvertently escalate to the nuclear level. Flashpoints between India and Pakistan highlight the stability-instability paradox clearly. S. Paul Kapur reveals how Pakistan's weaponization has "encouraged aggressive Pakistani behavior," whereby it can challenge India "without fearing catastrophic Indian retaliation." [7] In the Kashmir crisis, Pakistan supported a violent insurgency in Kashmir and the Indian state of Jammu. While the extent to which Pakistan involved itself in the initial fighting remains unclear, Pakistani forces did engage in their "largest-ever peacetime military exercise" and announced a strategic shift to a "policy of offensive defense" in relations with India.[8] Former Pakistani Prime Minister Benazir Bhutto acknowledged, "Nuclear weapons 'came out' as an important tool in that struggle," allowing Pakistan to "provide extensive support for 'a low-scale insurgency'...while

insulat[ing it] from a full-scale Indian response.”[9] Similarly, in the Kargil crisis, the Pakistani military “marshaled a substantial body of forces” and crossed the Line of Control (the military border between the Indian and Pakistani-controlled parts of the disputed region), resulting in Indian air and ground mobilization and significant casualties on both sides.[10] Sumit Ganguly explains, “Absent nuclear weapons, Pakistan would not have undertaken the...misadventure.”[11] Relations between India and Pakistan reveal that weaponization emboldens revisionist nuclear states and raises the propensity for conventional conflict. While exhibiting nuclear restraint in both of these situations, India has made “aggressive changes” to its “conventional military posture.”[12] India’s new Cold Start doctrine, for example, “enable[s] India to rapidly launch a large-scale attack against Pakistan.”[13] Responding to this, the director-general of Pakistan’s military intelligence agency, Inter-Services Intelligence (ISI), illustrates how conventional instability can escalate to the nuclear level: Cold Start “is destabilizing; it is meant to circumvent nuclear deterrence [...]. If it becomes too threatening we [Pakistan] will have to rely on our nuclear capability.”[14] While the line at which Pakistan would employ nuclear weapons remains unclear, this statement suggests that Pakistan’s strategic calculations in responding to conventional conflicts with India now include a nuclear contingency plan. Equally disconcerting, Indian officials believe they can “calibrate” their actions relative to Pakistan’s tolerance, “stopping short of Pakistan’s strategic nuclear thresholds.”[15] Erroneously appraising another country’s red lines could have catastrophic effects, leading to unintended drastic escalation.[16] The India-Pakistan relationship displays how the stability-instability paradox subjects the region to escalation and miscalculation on a nuclear scale. The stability-instability paradox also holds true for the Israel-Iran case. Colin Kahl, Melissa Dalton, and Matthew Irvine point out that a nuclear-armed Iran could stir regional conflict, producing high-stakes miscalculations with “some inherent risk of inadvertent escalation to nuclear war.”[17] A Middle East where “conflict below the nuclear threshold seem[s] ‘safe’” will likely “encourage Iranian adventurism, reduce Israeli freedom of action, and increase aggressive actions by Iranian proxies.”[18] Geographic proximity and mutual distrust could lead “Israel and Iran [to] adopt ‘launch-on-warning’” doctrines for their nuclear arsenals, increasing the chances that “false warnings of an impending attack by one side” could unravel into an “accidental nuclear war.”[19] When it comes to a weaponized Iran, Waltz’s contention fails to follow its own rational deterrence logic. In this scenario, it is not fear of a second strike that deters Israel and Iran, but vulnerability to a first strike that could lead one side or the other to initiate a nuclear attack. Kahl notes, “Reciprocal fears of surprise attack could produce incentives for either side to launch a deliberate pre-emptive attack.”[20] Israel, with its nuclear superiority, fearing a nuclear-armed Iran, could seek to annihilate Iran’s small arsenal by initiating a first strike. Even if Iran only feared an Israeli conventional attack, Iran’s nascent nuclear arsenal, extremely vulnerable to an Israeli strike, could generate an Iranian “use them or lose them” sentiment, where Iran could also calculate that a first strike lay in its favor.[21] This would leave two nuclear-armed adversaries without diplomatic relations living in close proximity to one another, both feeling vulnerable and potentially believing a first strike could work to its advantage.[22] In the Middle East, even the prospect of a weaponized Iran heightens the potential for conflict to escalate to nuclear levels. While no one can know with certainty what the regional security environment will look like if Iran joins the nuclear club, one thing is certain: nuclear weapons sustain the possibility of nuclear war. The Waltzian deterrence model may hold true in a Cold War retrospective, but unintended accidents and escalation are still possible. When adversarial states both possess a nuclear second-strike capability, relative security gains cannot be achieved at the nuclear level. Waltz concedes that because states seek to maximize their relative security, nuclear states may choose to develop a massive conventional weapons arsenal as well. In this way, even Waltz acknowledges the paradoxical nature of nuclear weapons, admitting heightened aggression and limited war is possible even when both states are nuclear-armed.[23] As demonstrated by the nuclear standoff between India and Pakistan, nuclear weapons generate increasingly aggressive behavior, creating greater opportunities for conflict, not fewer. A likely scenario between Israel and a nuclear Iran involves increased low-intensity conflict where low-level skirmishes could lead to unintended escalation or accidental nuclear detonation. At worst, nuclear-armed foes could decide that a first strike is worth the risk.

Impacts: US-Russia

Middle East conflicts trigger a US-Russia arms race

Deen 4/27, (Thalif Deen, an IPS UN Bureau Chief, has been covering the United Nations since the late 1970s, quotes Natalie J. Goldring, a senior fellow with the Security Studies Program in the Edmund A. Walsh School of Foreign Service at Georgetown University, "Middle East Conflicts Trigger New U.S.-Russia Arms Race," <http://www.globalissues.org/news/2015/04/27/20914>, 4/27/15, //VZ)

UNITED NATIONS, Apr 27 (IPS) - The escalating military conflicts in the Middle East – and the month-long aerial bombings of Yemen by an Arab coalition led by Saudi Arabia – have triggered a new arms race in the politically-volatile region. The primary beneficiaries are the United States and Russia, two of the world's largest arms suppliers, who are feeding the multiple warring parties in Syria, Iraq, Libya, and most recently in Yemen.³ Dr. Natalie J. Goldring, a senior fellow with the Security Studies Program in the Edmund A. Walsh School of Foreign Service at Georgetown University, told IPS "once again, the Middle East seems to be mired in an arms race." The New York Times, she pointed out, recently published a provocative article titled, "Sale of U.S. Arms Fuels the Wars of Arab States," mentioning several potential U.S. arms sales to the region in the near future. "But this isn't likely to be the whole story," she added. In all likelihood, said Dr. Goldring, if the proposed U.S. sales go forward, the Russian government will use them as an excuse to supply its clients with more weapons. "It's an easy cycle to predict -- the United States makes major sales to clients such as Saudi Arabia, Qatar, or the United Arab Emirates. Then Russia sells weapons to Iran and perhaps Syria with the argument they're simply balancing U.S. sales. And the cycle continues," she added. The six-member Arab coalition engaged in bombarding Yemen is led by Saudi Arabia and includes the United Arab Emirates (UAE), Bahrain, Qatar, Jordan and Egypt – all of them equipped primarily with U.S. weapons systems. The jets used in the attacks inside Yemen are mostly F-15s and F-16s – both front line fighter planes in Middle East arsenals. The London Economist says "oblivious to the unfolding humanitarian crisis," Prince Al-Waleed bin Talal, described as a billionaire member of the Saudi royal family, is offering 100 super luxury Bentley cars to each of the fighter pilots participating in the bombing raids inside Yemen. Last week, Russia announced it was lifting a five year voluntary embargo on a long-pending sale of S-300 anti-aircraft missiles to Iran, which is accused of arming the Houthi rebels under attack by Saudi Arabia and its allies. The Saudi coalition, which temporarily halted the aerial attacks last week, resumed its bombings over the weekend. As the Wall Street Journal reported Monday, the air campaign has transformed Yemen into a battlefield for broader contest over regional power between Shiite Iran and Sunni Muslim countries led by Saudi Arabia. There were also reports the Russian government has offered to sell advanced surface-to-air missiles to Iran, providing Tehran with a mobile system that could attack both missiles and aircraft. The system, the Antey-2500, apparently has the capacity to defend against – and attack – ballistic missiles, cruise missiles, and fixed-wing aircraft. Meanwhile, Russia has also continued to be the primary arms supplier to Syria, another military hot spot in the Middle East.

US-Russian arms race causes nuclear prolifer

Heuvel 2/10, (Katrina vanden Heuvel, Washington Post, "An arms race won't help Ukraine," http://www.washingtonpost.com/opinions/an-arms-race-wont-help-ukraine/2015/02/10/d3f30ee4-b086-11e4-827f-93f454140e2b_story.html, 2/10/15, //VZ)

The U.S. interest should be avoiding another arms race with Russia — nuclear or otherwise — and rebuilding the trust that will be necessary to stabilize Ukraine. **Further U.S. involvement** in the conflict **would have the opposite effect, potentially ending the last remnants of cooperation between the countries to contain the spread of nuclear weapons.** Moreover, the Obama administration **should consider the impact on relations with important European allies, who are pushing hard for a diplomatic resolution, and may even break with Washington policy.** Arming Kiev seems to have been a step too far, especially with Ukraine on the point of financial collapse. (It is estimated that in order to survive, Ukraine needs more than \$50 billion, which will be largely up to Europe to provide.) The more weapons Washington provides Kiev, the more the price tag will increase.

Impacts: Oil

Iran's control over the Strait of Hormuz would collapse the global economy – oil chokepoint

Fontevicchia 11, (Agustino, Forbes, quotes Stratfor, and Iranian MP Parviz Sorouri of the Majlis National Security and Foreign Policy Committee, and Stratfor, an American publisher and global intelligence company, "Oil: Iran's Hormuz Strait Threats Could Wreak Global Economic Havoc," <http://www.forbes.com/sites/afontevicchia/2011/12/13/oil-irans-hormuz-strait-threats-could-wreak-global-economic-havoc/>, 12/13/2011, //VZ)

The pop in crude oil prices came after Iranian MP Parviz Sorouri of the Majlis National Security and Foreign Policy Committee said: Currently, **the Middle East region supplies 70 percent of the world's energy needs, (most of) which are transported through the Strait of Hormuz.** We will hold an exercise to close the Strait of Hormuz in the near future. **If the world wants to make the region insecure, we will make the world insecure.** The comments, picked up by the quasi-official Iranian Student News Agency, and reported by the Tehran Times, were later complemented by a statement by the Iranian Foreign Ministry noting the Strait remains open, according to Bloomberg. **Hormuz is one of the world's most important waterways, with daily flow of about 15 million barrels of oil. That's 90% of Persian Gulf Exports and 40% of global consumption, according to geopolitical analysts at Stratfor. "The importance of this waterway to both American military and economic interests is difficult to overstate. Considering Washington's more general — and fundamental — interest in securing freedom of the seas, the U.S. Navy would almost be forced to respond aggressively to any attempt to close the Strait of Hormuz,"** explained analysts at Stratfor. Iran's intentions, though, are to avoid an attack and therefore would use the threat for deterrence rather than as an offensive or defensive action. Iran is being pushed by what the analysts call a "covert intelligence war" carried on by the U.S., Israel, and other U.S. allies. A recent U.S. drone, shot down over Iranian airspace, added to other recent examples of escalation like "the defection to the West of Iranian officials with knowledge of Tehran's nuclear program; the Iranian seizure of British servicemen in the Shatt al Arab Waterway; the assassination of Iranian nuclear scientists; the use of the Stuxnet worm to cripple Iranian uranium enrichment efforts," according to Stratfor. On the markets front, Iran could cause substantial crude oil price movements if it chose to take action. From Stratfor: **A single ship striking a naval mine (or even a serious Iranian move to sow mines) could quickly and dramatically drive up global oil prices and maritime insurance rates. This combination is bad enough in the best of times. But the Iranian threat to the Strait of Hormuz could not be more effective than at this moment, with the world just starting to show signs of economic recovery. The shock wave of a spike in energy prices — not to mention the wider threat of a conflagration in the Persian Gulf — could leave the global economy in even worse straits** than it was a year ago.

Economic decline causes war and miscalculation – diversionary theory

Royal 10 — Jedidiah Royal, Director of Cooperative Threat Reduction at the U.S. Department of Defense, M.Phil. Candidate at the University of New South Wales, 2010 ("Economic Integration, Economic Signalling and the Problem of Economic Crises," *Economics of War and Peace: Economic, Legal and Political Perspectives*, Edited by Ben Goldsmith and Jurgen Brauer, Published by Emerald Group Publishing, ISBN 0857240048, p. 213-215)

Less intuitive is how periods of economic decline may increase the likelihood of external conflict. Political science literature has contributed a moderate degree of attention to the impact of economic decline and the security and defence behaviour of interdependent states. Research in this vein has been considered at

systemic, dyadic and national levels. Several notable contributions follow. ¶ First, on the systemic level, Pollins (2008) advances Modelski and Thompson's (1996) work on leadership cycle theory, finding that rhythms in the global economy are associated with the rise and fall of a pre-eminent power and the often bloody transition from one pre-eminent leader to the next. As such, exogenous shocks such as economic crises could usher in a redistribution of relative power (see also Gilpin. 1981) that leads to uncertainty about power balances, increasing the risk of miscalculation (Feaver, 1995). Alternatively, even a relatively certain redistribution of power could lead to a permissive environment for conflict as a rising power may seek to challenge a declining power (Werner. 1999). Separately, Pollins (1996) also shows that global economic cycles combined with parallel leadership cycles impact the likelihood of conflict among major, medium and small powers, although he suggests that the causes and connections between global economic conditions and security conditions remain unknown. ¶ Second, on a dyadic level, Copeland's (1996, 2000) theory of trade expectations suggests that 'future expectation of trade' is a significant variable in understanding economic conditions and security behaviour of states. He argues that interdependent states are likely to gain pacific benefits from trade so long as they have an optimistic view of future trade relations. However, if the expectations of future trade decline, particularly for difficult [end page 213] to replace items such as energy resources, the likelihood for conflict increases, as states will be inclined to use force to gain access to those resources. Crises could potentially be the trigger for decreased trade expectations either on its own or because it triggers protectionist moves by interdependent states.⁴ ¶ Third, others have considered the link between economic decline and external armed conflict at a national level. Blomberg and Hess (2002) find a strong correlation between internal conflict and external conflict, particularly during periods of economic downturn. They write, ¶ The linkages between internal and external conflict and prosperity are strong and mutually reinforcing. Economic conflict tends to spawn internal conflict, which in turn returns the favour. Moreover, the presence of a recession tends to amplify the extent to which international and external conflicts self-reinforce each other. (Blomberg & Hess, 2002. p. 89) ¶ Economic decline has also been linked with an increase in the likelihood of terrorism (Blomberg, Hess, & Weerapana, 2004), which has the capacity to spill across borders and lead to external tensions. ¶ Furthermore, crises generally reduce the popularity of a sitting government. "Diversionary theory" suggests that, when facing unpopularity arising from economic decline, sitting governments have increased incentives to fabricate external military conflicts to create a 'rally around the flag' effect. Wang (1996), DeRouen (1995). and Blomberg, Hess, and Thacker (2006) find supporting evidence showing that economic decline and use of force are at least indirectly correlated. Gelpi (1997), Miller (1999), and Kisangani and Pickering (2009) suggest that the tendency towards diversionary tactics are greater for democratic states than autocratic states, due to the fact that democratic leaders are generally more susceptible to being removed from office due to lack of domestic support. DeRouen (2000) has provided evidence showing that periods of weak economic performance in the United States, and thus weak Presidential popularity, are statistically linked to an increase in the use of force. ¶ In summary, recent economic scholarship positively correlates economic integration with an increase in the frequency of economic crises, whereas political science scholarship links economic decline with external conflict at systemic, dyadic and national levels.⁵ This implied connection between integration, crises and armed conflict has not featured prominently in the economic-security debate and deserves more attention. ¶ This observation is not contradictory to other perspectives that link economic interdependence with a decrease in the likelihood of external conflict, such as those mentioned in the first paragraph of this chapter. [end page 214] Those studies tend to focus on dyadic interdependence instead of global interdependence and do not specificall

Impacts: Saudi-Iran

US key to check Iranian influence – allowing the regime’s undemocratic policies is key to keep the US base there

Ziezulewicz 12, (Geoff, “With Bahrain home to 5th Fleet, US faces dilemma over crackdown on protests,” <http://www.stripes.com/with-bahrain-home-to-5th-fleet-us-faces-dilemma-over-crackdown-on-protests-1.168370>, 2/12/12, //VZ)

But unlike the other Arab Spring flashpoints, Bahrain’s unrest unfolds a few hundred yards from the gates of the Naval Support Activity Bahrain, home to the U.S. Navy’s 5th Fleet, with some 6,200 sailors, civilians and family members. Yet thanks to realpolitik and the imperative to safeguard American strategic interests in the Arabian Gulf, U.S. policymakers find themselves on the opposite side of the protesters, backing an undemocratic regime that continues to brutalize its citizens.

“There is a tension between the U.S. rhetoric and preference for democratic systems and regional requirements when it comes to Bahrain,” said Emile Hokayem, senior fellow for regional security at the Bahrain offices of the International Institute for Strategic Studies. This tiny island of 1.2 million people has served as a crucial American ally in the region for decades, providing the U.S. military a base for naval forces that are a vital counterweight to Iranian influence in the oil-rich Gulf.

Fifth Fleet key to check Iranian takeover of Bahrain

Barnes 11, (Julian E., Pentagon reporter at The Wall Street Journal, got an AB in social studies from Harvard, “U.S. Takes Cautious Line on Fifth Fleet’s Base,” <http://www.wsj.com/articles/SB10001424052748703561604576150662599202064>, 2/18/11, //VZ)

A U.S. ally in a geographically strategic perch, Bahrain is positioned near the world’s most important oil reserves, and its Sunni government has been seen as a reliable bulwark against nearby Shiite-led Iran. At the center of U.S. strategy there is the headquarters of the U.S. Fifth Fleet—a base that is home to 3,000 military personnel who oversee the 30 naval ships and some 30,000 sailors that patrol the Persian Gulf and Arabian and Red seas. The Bahrain base isn’t the most important U.S. base in the Middle East, but it oversees all of its naval operations there, a critical task. While it could conceivably be moved, former officials say no other country has been as reliably welcoming to the U.S. presence as Bahrain. “Could we find some other place to put a fleet headquarters? Probably we could,” said Anthony Cordesman, a defense analyst at the Center for Strategic and International Studies. “But if Bahrain becomes unstable, if it comes under Iranian influence...[that] threatens the entire structure of world oil markets.” The U.S. has so far been relatively quiet in condemning Bahrain’s moves against protesters. President Barack Obama, at a news conference this week, pointedly avoided criticizing Bahrain’s leaders as he eventually did amid building protests against Egypt’s now-deposed Hosni Mubarak. But the State Department on Thursday expressed its sharpest concerns yet over the events in Bahrain, highlighting the delicate path it continues to carve between guarding its longtime alliances in the region and supporting its emerging democracy movements. On Thursday, Secretary of State Hillary Clinton spoke with her Bahraini counterpart to express “deep concern about recent events and [urge] restraint moving forward,” according to a State Department official. “This is something that the Bahraini government needs to address in a greater fashion,” said Mark Toner, a State Department spokesman. He said the U.S. was “expressing our full support for the right of these people to express themselves.” Defense Secretary Robert Gates called Crown Prince Salman Bin Hamad Al Khalifa; officials declined to give details of the call. American ties to Bahrain go back to the 1940s, when U.S. Navy vessels first began to use the port. The U.S. took over the navy base in Bahrain from the British in 1971. Though Bahrain was heavily used in the Gulf war, the U.S. presence remained modest until Sept. 11, 2001, when the U.S. dramatically rebuilt its naval presence in the Persian Gulf. Today the base is a logistics resupply point and command and control node. Two carrier battle groups, one led by the USS Carl Vinson the other by the USS Enterprise, are under Fifth Fleet command. Bahrain has little in

the way of its own energy reserves and a small military. **But its location near key Saudi fields, and its rulers' pro-American track record, have given it outsized importance. U.S. efforts to build up defense cooperation among the Arab gulf states would be undermined if Bahrain's Sunni royal family were to be replaced with a pro-Iranian administration.** Some analysts see Iranian influence among the Shiite protesters in Bahrain, and few doubt Tehran would like to see the U.S. forced to pull out of the kingdom. **"It is a natural goal of Iran to try and expel the Fifth Fleet from Bahrain,"** said Elliott Abrams, a former senior State Department official. In recent years, the U.S. and its military have quietly pushed for political liberalization in Bahrain. Current and former officials have said that while the king and crown prince remain reform-minded, they say the prime minister—the king's uncle—remains a strong obstacle. The prime minister, on his website, says he has supported the royal family's move to support press freedom and other reform efforts. Retired Adm. William Fallon said the administration is right to take a different approach to Bahrain. "This is a different case than Egypt, and we really need to tread lightly," said Adm. Fallon, the former head of U.S. Central Command in the Middle East. "This leadership does not abuse its people." Adm. Fallon said it would be difficult for the Navy to find a Middle Eastern home as open as Bahrain. Unlike in other Middle Eastern countries, U.S. personnel are not confined to compounds. Navy personnel stationed in Bahrain often bring their families. **"With many other places, their affinity for us waxes and wanes. Bahrain has been a staunch ally, unwavering,"** Adm. Fallon said. **"It is very, very handy to have that foothold there."**

Iran takeover of Bahrain leads to direct Saudi-Iran war with American draw-in
Slackman 11, (Michael Slackman, New York Times, graduated from Northwestern, quotes Mustafa el-Labbad, director of Al Sharq Center for Regional and Strategic Studies in Cairo and Abdulaziz O. Sager, chairman of the Gulf Research Center, "The Proxy Battle in Bahrain," <http://www.nytimes.com/2011/03/20/weekinreview/20proxy.html>, 3/19/11, //VZ)

CAIRO — King Abdullah of Saudi Arabia has demonstrated one lesson learned from the course of pro-democracy uprisings across the Middle East: The world may cheer when autocrats resign, but it picks carefully which autocrats to punish for opening fire on their citizens. That cynical bit of realpolitik seems to have led the king to send troops last week over the causeway from Saudi Arabia to Bahrain, where they backed up a violent crackdown on unarmed protesters by Bahrain's own security forces. The move had immediate consequences for Middle East politics, and for American policy: It transformed Bahrain into the latest proxy battle between Iran and Saudi Arabia for regional dominance. And it called into question which model of stability and governance will prevail in the Middle East, and which Washington will help build: one based on consensus and hopes for democracy, or continued reliance on strongmen who intimidate opponents, sow fear and co-opt reformist forces while protecting American interests like ensuring access to oil and opposing Iran. For Saudi Arabia, the issue in Bahrain is less whether Bahrain will attain popular rule than whether Iranian and Shiite influence will grow. Iran and Saudi Arabia have sparred on many fronts since the Iranian Revolution of 1979 — a Shiite Muslim theocracy in Tehran versus a deeply conservative Sunni Muslim monarchy in Riyadh — in a struggle for supremacy in the world's most oil-rich region. The animosity was evident in Saudi Arabia's support for Iraq during its war with Iran, and it still shows in Iran's backing for Hezbollah in Lebanon. Now, after a decade that seemed to tilt the regional balance toward Iran, Saudi Arabia decided that Bahrain was the place to put its thumb more heavily on the scale. It sent troops under the auspices of the Gulf Cooperation Council to help crush pro-democracy demonstrations because most of the protesters were Shiites challenging a Sunni king. "If the political opposition in Bahrain wins, Saudi loses in this regional context," said Mustafa el-Labbad, director of Al Sharq Center for Regional and Strategic Studies in Cairo. "Saudi is regarding itself as the defender of Sunnis. And Iran is trying to defend Shiites in the region." The problem for the United States, however, is that Bahrain, at Saudi urging, chose to resolve its fears with force, rather than by addressing the protesters'

demands for democratic reform, as American officials had publicly encouraged. And for that reason, the military deployment may now have a profound impact on the United States and its primary strategic interest in Bahrain, the Navy base it maintains there. Because Washington did not ultimately support the protesters' demands — as it came to do in Egypt and as it has now, very late in the game, come to back foreign intervention in Libya — many protesters believe that the Saudi troops were sent in with American complicity, or at least with an expectation of American acquiescence. So, among the protesters, who turned out by the tens of thousands, the crackdown may well yield animosity toward America and its Navy when events finally settle down. One American expert in the Persian Gulf who advises policymakers in Washington said the Saudi king's action was taken without regard for what might happen if it fails — if the **violence leads only to more violence. The Saudi policy, he said, "is risky and could potentially draw us into conflicts we have not looked for."** "What if the Bahrain venture fails, **who will bail them out? It will have to be us.**" Saudi Arabia's supporters acknowledge that **this confrontation can escalate,** but they tend to place the responsibility on Iran. "It can lead to that direct conflict if Iran were to interfere and use this as an excuse to interfere," said Abdulaziz O. Sager, chairman of the Gulf Research Center, which is based in Dubai. "I hope Iran can understand that any interference will not be acceptable."

Leads to World War III, threatening humanity

Chossudovsky 7, (Michel is an award-winning author, Professor of Economics (emeritus) at the University of Ottawa, Founder and Director of the Centre for Research on Globalization (CRG), Montreal, Editor of Global Research. He has taught as visiting professor in Western Europe, Southeast Asia, the Pacific and Latin America. He has served as economic adviser to governments of developing countries and has acted as a consultant for several international organizations. He is the author of eleven books including *The Globalization of Poverty and The New World Order* (2003), *America's "War on Terrorism"* (2005), *The Global Economic Crisis, The Great Depression of the Twenty-first Century* (2009) (Editor), *Towards a World War III Scenario: The Dangers of Nuclear War* (2011), *The Globalization of War, America's Long War against Humanity* (2015). He is a contributor to the Encyclopaedia Britannica. His writings have been published into more than twenty languages. In 2014, he was awarded the Gold Medal for Merit of the Republic of Serbia for his writings on NATO's war of aggression on Yugoslavia. "The Unthinkable: The US- Israeli Nuclear War on Iran," <http://www.globalresearch.ca/the-unthinkable-the-us-israeli-nuclear-war-on-iran/4536>, 1/21/7, //VZ)

The World is at the crossroads of the most serious crisis in modern history. The US has embarked on a military adventure, "a long war", which threatens the future of humanity. **At no point** since the first atomic bomb was dropped on Hiroshima on August 6th, 1945, **has humanity been closer to the unthinkable, a nuclear holocaust which could potentially spread,** in terms of radioactive fallout, **over a large part of the Middle East.** There is **mounting evidence** that the Bush Administration in liaison with Israel and NATO is planning the launching of a **nuclear war against Iran,** ironically, in retaliation for its nonexistent nuclear weapons program. The US-Israeli military operation is said to be in "an advanced state of readiness". If such a plan were to be launched, the war would escalate and eventually engulf the entire Middle-East Central Asian region. **The war could extend beyond the region,** as some analysts have suggested, **ultimately leading us into a World War III scenario.** In this regard, the structure of military alliances is crucial. China and Russia have entered into far-reaching military cooperation agreements with Iran. The latter have a **direct bearing on the conflict.** Iran possesses an advanced air defense system as well as capabilities to target US and allied positions in Iraq and the Gulf States, as demonstrated in recent military exercises. The US-led naval deployment (involving a massive

deployment of military hardware) is taking place in two distinct theaters: the Persian Gulf and the Eastern Mediterranean. The militarization of the Eastern Mediterranean is broadly under the jurisdiction of NATO in liaison with Israel. Directed against Syria, it is conducted under the façade of a UN peace-keeping mission. In this context, the war on Lebanon last Summer must be viewed as a stage of the broader US sponsored military road-map. The naval armada in the Persian Gulf is largely under US command, with the participation of Canada. The naval buildup is coordinated with the air attacks. The planning of aerial bombings of Iran started in mid-2004, pursuant to the formulation of CONPLAN 8022 in early 2004. In May 2004, National Security Presidential Directive NSPD 35 entitled Nuclear Weapons Deployment Authorization was issued. While its contents remain classified, the presumption is that NSPD 35 pertains to the stockpiling and deployment of tactical nuclear weapons in the Middle East war theater in compliance with CONPLAN 8022. Despite Pentagon statements which describe tactical nuclear weapons as “safe for the surrounding civilian population”, **the use of nukes in a conventional war theater would trigger a nuclear holocaust. The resulting radioactive contamination, which threatens future generations, would by no means be limited to the Middle East.**

Impacts: Piracy

The US 5th fleet leads international anti-piracy force and deters piracy in the Straits of Hormuz and Suez Canal

Shanker and Goodman 11, (Thom Shanker, a Pentagon correspondent for The New York Times, routinely spends time embedded with troops in Iraq and Afghanistan and he was formerly a foreign editor and correspondent for the Chicago Tribune, based in Moscow, Berlin, and Sarajevo, J. David Goodman, "Pentagon Watching Unrest in Bahrain," <http://www.nytimes.com/2011/02/18/world/middleeast/18fleet.html>, 2/17/11, //VZ)

WASHINGTON — The United States Navy headquarters in Bahrain, the tiny Persian Gulf nation whose capital was rocked Thursday by a violent police crackdown on antigovernment protesters, oversees warships and combat aircraft that carry out long-range missions across Afghanistan and Iraq, conduct antipiracy patrols off the Horn of Africa — and keep a wary eye on the activities of a bellicose Iran. But the Fifth Fleet compound itself looks like little more than a modern office park in a quiet neighborhood of Manama, the capital, whose piers occasionally host a warship but never a sustained presence of hulking vessels comparable to bases in, say, Norfolk, Va., or Yokosuka, Japan. Day by day, the Fifth Fleet is at sea and in the air, across 2.5 million square miles of water. In Manama, a city that is more open and socially welcoming to foreigners than those in much of the restrictive Arab world, American personnel live out in the community, and not in isolation. And thus far, Navy officers are quick to point out, the street protests have given voice to a disenfranchised Shiite majority's complaints about Bahrain's leadership — but the United States has not been cast as a villain, despite six decades of close ties with the governing Sunni elite. "We are monitoring what's going on," said Cmdr. Amy Derrick-Frost, the Fifth Fleet spokeswoman. "The protests and demonstrations are not against the United States or the United States military or anything of that nature." Military personnel, Defense Department civilians, contractors and their families — numbering about 6,100 in total — have been advised to avoid areas where the protests were taking place, but as of late Thursday there was no order to evacuate dependents. "We do not have any information at this time that suggests that planned protests are likely to cause significant disruptions," said Jennifer Stride, a spokeswoman for the Naval Support Activity, which oversees the military complex. "We will continue to monitor the situation." The Navy has had a presence in Bahrain since Franklin Roosevelt's presidency, well before it took over a British army base east of Manama, in 1971, when the country achieved full independence. The 100-acre naval base is in Juffair, a suburb six miles from Pearl Square in the center of the capital, where thousands of mostly Shiite protesters were attacked by security forces early Thursday morning. Though the base is physically separated from its piers, Ms. Stride said there was "no concern" about being cut off if protests were to widen. "There are no demonstrations at all in the vicinity of the base or those piers," she said. The broad mission of the Fifth Fleet includes combat, counterterrorism, air support for the operations in Afghanistan and Iraq, antipiracy efforts and military exercises with regional allies, including Bahrain. Much of the fleet's time is spent watching Iran's two navies — the more professional Iranian state fleet and the less predictable Revolutionary Guard navy that has harassed American warships in recent years. The United States and Bahrain signed a 10-year defense pact in 1991 that includes American training of Bahraini forces; it was renewed in 2001, according to a Congressional Research Service report. "Bahrain has few external security options other than relying on some degree of U.S. security guarantee," said a study by the research service released last month. "The United States has designated Bahrain as a 'major non-NATO ally,' and it provides small amounts of security assistance to Bahrain." The Fifth Fleet's area of responsibility includes waters that touch 20 countries along the Persian Gulf, the Red Sea, the Gulf of Oman and parts of the Indian Ocean. The area includes the Strait of Hormuz, the Suez Canal and the Strait of Bab el Mandeb at the southern tip of Yemen — all strategic passages for international shipping.

Piracy will collapse the global economy

Glick 8, (Caroline, "Column One: Civilization walks the plank,"

<http://www.jpost.com/Opinion/Columnists/Column-One-Civilization-walks-the-plank>

US defense secretary are flying to London for vacation. One of them is stopped at immigration at Heathrow airport and arrested on suspicion of committing war crimes. Which one do you think it was? On Tuesday, Somali pirates, sailing in little more than motorized bathtubs, armed with automatic rifles and rocket-propelled grenades, and

sustained by raw fish and narcotics, successfully hijacked the Sirius Star, a Saudi-owned oil tanker the size of a US aircraft carrier. The tanker was carrying some \$100 million worth of crude oil. **News of its capture caused global oil prices to rise by a dollar a barrel.** The next day, Somali pirates attempted to hijack the Trafalgar, a British frigate, but were forced to flee by a German naval helicopter dispatched to the scene. They did manage to hijack a Chinese trawler and a cargo ship from Hong Kong. They nearly got control of an Ethiopian ship, but it, too, was saved by the German Navy that heeded its call for help in time. **Piracy is fast emerging as the newest old threat to stage a comeback in recent years. Over the past week and a half alone, 12 vessels have been hijacked. And according to the International Maritime Bureau, in the three months that ended on September 30, Somali pirates attacked 26 vessels, capturing 576 crew members. Britain's Chatham House (the Royal Institute of International Affairs) assesses the ransoms they netted at between \$18m. and \$30m.** And with financial strength comes increased military sophistication. The US Navy expressed shock at the pirates' successful hijacking of the Sirius Star. **The pirates staged the hijacking much farther from shore than they had ever done previously. Beyond the personal suffering incurred by thousands of crew members taken hostage in recent years, piracy's potential impact on global economic stability is enormous. In the Gulf of Aden, where the Somali pirates operate, US shippers alone transport more than \$1.5 trillion in cargo annually.** One of the unique characteristics of pirates is that they appear to be equal opportunity aggressors. They don't care who owns the ships they attack. On August 21, Somali pirates hijacked the Iran Deyanat, a ship owned and operated by the Iranian Revolutionary Guards-linked Islamic Republic of Iran Shipping Line (IRISL). In September, the US Treasury Department designated IRISL as a company that assists Iran's nuclear weapons program and placed it under stiff financial sanctions. Iran Deyanat's manifest asserted that its cargo included minerals. Yet shortly after the pirates went on board they began developing symptoms such as hair loss that experts claim are more in line with radiation exposure. According to reports, some 16 pirates died shortly after being exposed to the cargo. Just this week, a second Iranian ship - this one apparently carrying wheat - was similarly captured. Then, too, in September, pirates seized the Faina, a Ukrainian ship carrying 33 Russian-made T-72 tanks. The Ukrainians and Russians claimed that the tanks were destined for Kenya, but it later emerged that they may have been seized en route to Sudan. So, ironically, in the case of both the Faina and the Deyanat, pirates may have inadvertently saved thousands of lives. THE INTERNATIONAL community is at a loss for what to do about the emerging danger of piracy. This is not due to lack of capacity to fight the pirate ships. On Monday an Indian naval frigate, the INS Tabar, sank a pirate "mother ship" whose fleet members were attacking the Tabar in the Gulf of Aden. NATO has deployed a naval task force while the American, French, German and other navies have aggressively worked to free merchant ships under attack by pirates. As David Rivkin and Lee Casey explained in The Wall Street Journal on Wednesday, the problem with contending with piracy is not so much military, as legal and political. Whereas customary international law defined piracy as a threat against all nations and therefore a crime for which universal jurisdiction must be applied to perpetrators, in today's world, states are unwilling to apprehend pirates or to contend with them because they are likely to find themselves in a sticky legal mess. In centuries past, in accordance with established international law, it was standard practice for naval captains to hang pirates after capturing them. Today, when Europe has outlawed capital punishment, when criminal defendants throughout the West are given more civil rights than their victims, and when irregular combatants picked off of battlefields or intercepted before they attack are given - at a minimum - the same rights as those accorded to legal prisoners of war, states lack the political will and the moral clarity to prosecute offenders. As Casey and Rivkin note, last April the British Foreign Office instructed the British Navy not to apprehend pirates lest they claim that their human rights were harmed, and request and receive asylum in Britain. THE WEST'S perverse interpretations of human rights and humanitarian law, which bar it from handling one of the most acute emerging threats to the international economy, is a consequence of the West's abdication of moral and legal sanity in its dealings with international terror. In the 1960s and 1970s, when international terrorism first emerged as a threat to international security, the West adopted international treaties and conventions that tended to treat terrorism as a new form of piracy. Like piracy, terrorism was to be treated as an attack on all nations. Jurisdiction over terrorists was to be universal. Such early views were codified in early documents such as the Convention for the Suppression of Unlawful Seizure of Aircraft from 1970 that established a principle of universal jurisdiction over aircraft hijackers. Similarly, in the wake of the September 11 attacks on the US, the UN Security Council passed binding Resolution 1373, which also compelled member states not only to treat terrorists as illegal combatants who must be universally denied any support of any kind, but to take action against anyone involved with or supporting terrorists in any way. That is, as in piracy, the tendency of states contending with terrorism has been to view it as an act requiring universal jurisdiction, compelling all UN member states to prosecute offenders. And yet, over the years, states have managed to ignore or invert international laws on terrorism to the point where today terrorists are among the most protected groups of individuals in the world. Due to political sympathy for terrorists, hostility toward their victims, or fear of terrorist reprisals against a state that dares to prosecute terrorists found on its territory, states have managed to avoid not only applying existing laws against terrorists. They have

also refrained from updating laws to meet the growing challenges of terrorism. Instead, international institutions and "enlightened" Western states have devoted their time to condemning and threatening to prosecute the few states that have taken action against terrorists. The inversion of international law from an institution geared toward protecting states and civilians from international lawbreakers to one devoted to protecting international menaces from states and their citizens is nowhere more evident than in the international community's treatment of Hamas-controlled Gaza. One of the reasons the international community has failed so abjectly to take reasonable measures to combat terrorism is because international terrorism as presently constituted is the creation of Palestinian Arabs and their Arab brethren. Since the 1960s, and particularly since the mid-1970s, Europe, and to varying degrees the US, have been averse to contending with terrorism because their hostility toward Israel leads them to condone Palestinian Arab terrorism against the Jewish state. THE INTERNATIONAL community's treatment of Hamas-controlled Gaza epitomizes this victory of politics over law. Both the US and the EU have labeled Hamas a terror group. That designation places Gaza, which is controlled by Hamas, under the regime of UN Security Council Resolution 1373. Among other things, Resolution 1373 requires states to "freeze without delay funds and other financial assets or economic resources of... entities owned or controlled directly or indirectly by [terrorists]." That is, the resolution requires UN member states to end all financial and other support for Hamas-controlled Gaza. The resolution also requires UN member states to "cooperate [with other states] to prevent and suppress terrorist attacks and take action against perpetrators of such acts." This means that states are required to assist one another - and in the case of Hamas, to assist Israel - in combating Hamas and punishing its members and supporters. While it can be argued that given the absence of a binding legal definition of terrorism, states that do not designate Hamas as a terrorist organization are not required to abide by the terms of 1373 in dealing with Hamas, it is quite clear that for states that do recognize Hamas as a terror group, 1373's provisions must be upheld. And yet, the EU and the US have willfully ignored its provisions. They have steadily increased their budgetary support for the Palestinian Authority while knowing full well that the Fatah-led PA in Judea and Samaria is transferring money to Hamas-controlled Gaza to pay the salaries of Hamas employees. More disturbingly, the US and the EU as well as the UN demand that Israel itself sustain Hamas-controlled Gaza economically. The UN, EU and the US have consistently demanded that Israel provide Gaza with fuel, food, water, medicine, electricity, telephone service, port services and access to Israeli markets, in spite of the fact that international law actually prohibits Israel from providing such assistance, and in fact arguably requires Israel to deny it. Recently, supported by the UN, and in connivance with Hamas, European leaders began supporting illegal moves to end Israel's maritime blockade of Gaza, which was established to block weapons and terror personnel from entering and exiting the area. Expanding this trend, this week Navanethem Pillay, the UN's High Commissioner for Human Rights, called for Israel to end its blockade of the Gaza Strip, perversely calling the blockade a breach of international and humanitarian law. This inversion of the aims of international law - from protecting states and innocent civilians from attack to protecting aggressors from retaliation - has brought about the absurd situation where terrorist ideologues and commanders such as Sheikh Yusuf Qaradawi are feted in Britain while retired Israeli and American generals are threatened with arrest. Germany welcomed Iranian President and genocide proponent Mahmoud Ahmadinejad to visit and indicted former US defense secretary Donald Rumsfeld for crimes against humanity. Belgium allows Hamas and Hizbullah supporters like Dyab Abu Jahjah, who calls for attacks against Jews, to operate freely, but indicted former prime minister Ariel Sharon for crimes against humanity. The consequence of this absurd state of affairs is obvious. The international law champions who argue that international humanitarian law provides a nonviolent means for nations to defend themselves against aggressors have perverted the purpose and meaning of international humanitarian law to such a degree that the only way for nations to protect themselves against pirates, terrorists and other international rogues is to ignore international law aficionados and secure their interests by force.

Impacts: Saudia-Iran

US key to check Iranian influence – allowing the regime’s undemocratic policies is key to keep the US base there

Ziezulewicz 12, (Geoff, “With Bahrain home to 5th Fleet, US faces dilemma over crackdown on protests,” <http://www.stripes.com/with-bahrain-home-to-5th-fleet-us-faces-dilemma-over-crackdown-on-protests-1.168370>, 2/12/12, //VZ)

But unlike the other Arab Spring flashpoints, Bahrain’s unrest unfolds a few hundred yards from the gates of the Naval Support Activity Bahrain, home to the U.S. Navy’s 5th Fleet, with some 6,200 sailors, civilians and family members. Yet thanks to realpolitik and the imperative to safeguard American strategic interests in the Arabian Gulf, U.S. policymakers find themselves on the opposite side of the protesters, backing an undemocratic regime that continues to brutalize its citizens.

“There is a tension between the U.S. rhetoric and preference for democratic systems and regional requirements when it comes to Bahrain,” said Emile Hokayem, senior fellow for regional security at the Bahrain offices of the International Institute for Strategic Studies. This tiny island of 1.2 million people has served as a crucial American ally in the region for decades, providing the U.S. military a base for naval forces that are a vital counterweight to Iranian influence in the oil-rich Gulf.

Fifth Fleet key to check Iranian takeover of Bahrain

Barnes 11, (Julian E., Pentagon reporter at The Wall Street Journal, got an AB in social studies from Harvard, “U.S. Takes Cautious Line on Fifth Fleet's Base,” <http://www.wsj.com/articles/SB10001424052748703561604576150662599202064>, 2/18/11, //VZ)

A U.S. ally in a geographically strategic perch, Bahrain is positioned near the world's most important oil reserves, and its Sunni government has been seen as a reliable bulwark against nearby Shiite-led Iran. At the center of U.S. strategy there is the headquarters of the U.S. Fifth Fleet—a base that is home to 3,000 military personnel who oversee the 30 naval ships and some 30,000 sailors that patrol the Persian Gulf and Arabian and Red seas. The Bahrain base isn't the most important U.S. base in the Middle East, but it oversees all of its naval operations there, a critical task. While it could conceivably be moved, former officials say no other country has been as reliably welcoming to the U.S. presence as Bahrain. "Could we find some other place to put a fleet headquarters? Probably we could," said Anthony Cordesman, a defense analyst at the Center for Strategic and International Studies. "But if Bahrain becomes unstable, if it comes under Iranian influence...[that] threatens the entire structure of world oil markets." The U.S. has so far been relatively quiet in condemning Bahrain's moves against protesters. President Barack Obama, at a news conference this week, pointedly avoided criticizing Bahrain's leaders as he eventually did amid building protests against Egypt's now-deposed Hosni Mubarak. But the State Department on Thursday expressed its sharpest concerns yet over the events in Bahrain, highlighting the delicate path it continues to carve between guarding its longtime alliances in the region and supporting its emerging democracy movements. On Thursday, Secretary of State Hillary Clinton spoke with her Bahraini counterpart to express "deep concern about recent events and [urge] restraint moving forward," according to a State Department official. "This is something that the Bahraini government needs to address in a greater fashion," said Mark Toner, a State Department spokesman. He said the U.S. was "expressing our full support for the right of these people to express themselves." Defense Secretary Robert Gates called Crown Prince Salman Bin Hamad Al Khalifa; officials declined to give details of the call. American ties to Bahrain go back to the 1940s, when U.S. Navy vessels first began to use the port. The U.S. took over the navy base in Bahrain from the British in 1971. Though Bahrain was heavily used in the Gulf war, the U.S. presence remained modest until Sept. 11, 2001, when the U.S. dramatically rebuilt its naval presence in the Persian Gulf. Today the base is a logistics resupply point and command and control node. Two carrier battle groups, one led by the USS Carl Vinson the other by the USS Enterprise, are under Fifth Fleet command. Bahrain has little in the way of its own energy reserves and a small military. But its location near key Saudi fields,

and its rulers' pro-American track record, have given it outsized importance. U.S. efforts to build up defense cooperation among the Arab gulf states would be undermined if Bahrain's Sunni royal family were to be replaced with a pro-Iranian administration. Some analysts see Iranian influence among the Shiite protesters in Bahrain, and few doubt Tehran would like to see the U.S. forced to pull out of the kingdom. **"It is a natural goal of Iran to try and expel the Fifth Fleet from Bahrain,"** said Elliott Abrams, a former senior State Department official. In recent years, the U.S. and its military have quietly pushed for political liberalization in Bahrain. Current and former officials have said that while the king and crown prince remain reform-minded, they say the prime minister—the king's uncle—remains a strong obstacle. The prime minister, on his website, says he has supported the royal family's move to support press freedom and other reform efforts. Retired Adm. William Fallon said the administration is right to take a different approach to Bahrain. "This is a different case than Egypt, and we really need to tread lightly," said Adm. Fallon, the former head of U.S. Central Command in the Middle East. "This leadership does not abuse its people." Adm. Fallon said it would be difficult for the Navy to find a Middle Eastern home as open as Bahrain. Unlike in other Middle Eastern countries, U.S. personnel are not confined to compounds. Navy personnel stationed in Bahrain often bring their families. **"With many other places, their affinity for us waxes and wanes. Bahrain has been a staunch ally, unwavering,"** Adm. Fallon said. **"It is very, very handy to have that foothold there."**

Iran takeover of Bahrain leads to direct Saudi-Iran war with American draw-in

Slackman 11, (Michael Slackman, New York Times, graduated from Northwestern, quotes Mustafa el-Labbad, director of Al Sharq Center for Regional and Strategic Studies in Cairo and Abdulaziz O. Sager, chairman of the Gulf Research Center, "The Proxy Battle in Bahrain," <http://www.nytimes.com/2011/03/20/weekinreview/20proxy.html>, 3/19/11, //VZ)

CAIRO — King Abdullah of Saudi Arabia has demonstrated one lesson learned from the course of pro-democracy uprisings across the Middle East: The world may cheer when autocrats resign, but it picks carefully which autocrats to punish for opening fire on their citizens. **That cynical bit of realpolitik seems to have led the king to send troops last week over the causeway from Saudi Arabia to Bahrain, where they backed up a violent crackdown on unarmed protesters by Bahrain's own security forces. The move had immediate consequences for Middle East politics, and for American policy: It transformed Bahrain into the latest proxy battle between Iran and Saudi Arabia for regional dominance.** And it called into question which model of stability and governance will prevail in the Middle East, and which Washington will help build: one based on consensus and hopes for democracy, or continued reliance on strongmen who intimidate opponents, sow fear and co-opt reformist forces while protecting American interests like ensuring access to oil and opposing Iran. For Saudi Arabia, the issue in Bahrain is less whether Bahrain will attain popular rule than whether Iranian and Shiite influence will grow. **Iran and Saudi Arabia have sparred on many fronts since the Iranian Revolution of 1979 — a Shiite Muslim theocracy in Tehran versus a deeply conservative Sunni Muslim monarchy in Riyadh — in a struggle for supremacy in the world's most oil-rich region. The animosity was evident in Saudi Arabia's support for Iraq during its war with Iran, and it still shows in Iran's backing for Hezbollah in Lebanon. Now, after a decade that seemed to tilt the regional balance toward Iran, Saudi Arabia decided that Bahrain was the place to put its thumb more heavily on the scale. It sent troops under the auspices of the Gulf Cooperation Council to help crush pro-democracy demonstrations because most of the protesters were Shiites challenging a Sunni king.** "If the political opposition in Bahrain wins, Saudi loses in this regional context," said Mustafa el-Labbad, director of Al Sharq Center for Regional and Strategic Studies in Cairo. **"Saudi is regarding itself as the defender of Sunnis. And Iran is trying to defend Shiites in the region."** The problem for the United States, however, is that Bahrain, at Saudi urging, chose to resolve its fears with force, rather than by addressing the protesters' demands for democratic reform, as American officials had publicly encouraged. And for that reason,

the military deployment may now have a profound impact on the United States and its primary strategic interest in Bahrain, the Navy base it maintains there. Because Washington did not ultimately support the protesters' demands — as it came to do in Egypt and as it has now, very late in the game, come to back foreign intervention in Libya — many protesters believe that the Saudi troops were sent in with American complicity, or at least with an expectation of American acquiescence. So, among the protesters, who turned out by the tens of thousands, the crackdown may well yield animosity toward America and its Navy when events finally settle down. One American expert in the Persian Gulf who advises policymakers in Washington said the Saudi king's action was taken without regard for what might happen if it fails — if the violence leads only to more violence. The Saudi policy, he said, "is risky and could potentially draw us into conflicts we have not looked for." "What if the Bahrain venture fails, who will bail them out? It will have to be us." Saudi Arabia's supporters acknowledge that this confrontation can escalate, but they tend to place the responsibility on Iran. "It can lead to that direct conflict if Iran were to interfere and use this as an excuse to interfere," said Abdulaziz O. Sager, chairman of the Gulf Research Center, which is based in Dubai. "I hope Iran can understand that any interference will not be acceptable."

Leads to World War III, threatening humanity

Chossudovsky 7, (Michel is an award-winning author, Professor of Economics (emeritus) at the University of Ottawa, Founder and Director of the Centre for Research on Globalization (CRG), Montreal, Editor of Global Research. He has taught as visiting professor in Western Europe, Southeast Asia, the Pacific and Latin America. He has served as economic adviser to governments of developing countries and has acted as a consultant for several international organizations. He is the author of eleven books including The Globalization of Poverty and The New World Order (2003), America's "War on Terrorism" (2005), The Global Economic Crisis, The Great Depression of the Twenty-first Century (2009) (Editor), Towards a World War III Scenario: The Dangers of Nuclear War (2011), The Globalization of War, America's Long War against Humanity (2015). He is a contributor to the Encyclopaedia Britannica. His writings have been published into more than twenty languages. In 2014, he was awarded the Gold Medal for Merit of the Republic of Serbia for his writings on NATO's war of aggression on Yugoslavia. "The Unthinkable: The US- Israeli Nuclear War on Iran," <http://www.globalresearch.ca/the-unthinkable-the-us-israeli-nuclear-war-on-iran/4536>, 1/21/7, //VZ)

The World is at the crossroads of the most serious crisis in modern history. The US has embarked on a military adventure, "a long war", which threatens the future of humanity. At no point since the first atomic bomb was dropped on Hiroshima on August 6th, 1945, has humanity been closer to the unthinkable, a nuclear holocaust which could potentially spread, in terms of radioactive fallout, over a large part of the Middle East. There is mounting evidence that the Bush Administration in liaison with Israel and NATO is planning the launching of a nuclear war against Iran, ironically, in retaliation for its nonexistent nuclear weapons program. The US-Israeli military operation is said to be in "an advanced state of readiness". If such a plan were to be launched, the war would escalate and eventually engulf the entire Middle-East Central Asian region. The war could extend beyond the region, as some analysts have suggested, ultimately leading us into a World War III scenario. In this regard, the structure of military alliances is crucial. China and Russia have entered into far-reaching military cooperation agreements with Iran. The latter have a direct bearing on the conflict. Iran possesses an advanced air defense system as well as capabilities to target US and allied positions in Iraq and the Gulf States, as demonstrated in recent military exercises. The US-led naval deployment (involving a massive deployment of military hardware) is taking place in two distinct theaters: the Persian Gulf and the Eastern Mediterranean. The

militarization of the Eastern Mediterranean is broadly under the jurisdiction of NATO in liaison with Israel. Directed against Syria, it is conducted under the façade of a UN peace-keeping mission. In this context, the war on Lebanon last Summer must be viewed as a stage of the broader US sponsored military road-map. The naval armada in the Persian Gulf is largely under US command, with the participation of Canada. The naval buildup is coordinated with the air attacks. The planning of aerial bombings of Iran started in mid-2004, pursuant to the formulation of CONPLAN 8022 in early 2004. In May 2004, National Security Presidential Directive NSPD 35 entitled Nuclear Weapons Deployment Authorization was issued. While its contents remain classified, the presumption is that NSPD 35 pertains to the stockpiling and deployment of tactical nuclear weapons in the Middle East war theater in compliance with CONPLAN 8022. Despite Pentagon statements which describe tactical nuclear weapons as “safe for the surrounding civilian population”, **the use of nukes in a conventional war theater would trigger a nuclear holocaust. The resulting radioactive contamination, which threatens future generations, would by no means be limited to the Middle East.**

A2: No tradeoff necessary (US Navy and HR in Bahrain)

Human rights are a necessary tradeoff in Bahrain to keep US national interests like Naval power

HRW 2/11, (Human Rights First, a nonprofit, nonpartisan human rights organization based in New York City and Washington D.C., “How to Bring Stability to Bahrain,” <http://www.humanrightsfirst.org/sites/default/files/How-to-Bring-Stability-to-Bahrain.pdf>, 2/11/15, //VZ)

Existing U.S. policy has neither compelled the government of Bahrain to honor its stated commitments, nor contributed to improving its relationship with the United States. U.S. security interests in Bahrain, including the presence of the Fifth Fleet, now depend on an increasingly erratic and internally divided host government. If U.S. entreaties to Bahrain are to be taken seriously, the United States must urgently revise its approach. The arrival of William Roebuck as the new U.S. Ambassador to Bahrain provides an opportunity to develop and implement a new approach in Bahrain. The U.S.-Bahrain relationship has a number of diplomatic, economic, and strategic dimensions that should be considered in a comprehensive strategic review. **Bahrain is among Washington’s most repressive allies** The King’s family controls the government and judiciary in Bahrain. The King’s uncle has been the country’s unelected prime minister since 1971 and through him the King makes all cabinet appointments. The King has the authority to amend the constitution and appoints all judges by royal decree. The alKhalifa family members generally fill about half of all ministerial slots, including those on defense, internal security, and foreign policy. The country’s majority Shi’a sect is underrepresented in the cabinet and other government posts, notably in the security services where they serve mainly in administrative functions, if at all. Bahrain hosts the U.S. Fifth Fleet headquarters and since 1991 has enjoyed “major non-NATO ally” status with the United States. There are about 7,000 members of the U.S. armed forces stationed in Bahrain, mostly located at the navy base. Apparently in reaction to the violent crackdown against protestors since 2011, the U.S. government has held up some arms sales to Bahrain that could be used against protestors, but has continued sales of other weapons systems. Some **U.S. officials make the case that the U.S. government should not be too hard on a loyal military ally, like Bahrain,** especially at a time when the United States needs Arab partners in the fight against ISIS. In this view, Bahrain remains key to countering Iranian aggression and **not pressing Bahrain on human rights is a necessary tradeoff that serves U.S. national interests.** Though not ideal, they argue, the current situation is tolerable and serves the United States adequately enough.

A2: Unlikely

Losing Bahrain is probable – Iran and the Philippines disprove their ‘experts’

McDaniel 13, (Richard, a Commander of the US Navy, Foreign Policy at Brookings, “No “Plan B” U.S. Strategic Access in the Middle East and the Question of Bahrain,” <http://www.brookings.edu/~media/research/files/papers/2013/06/24-us-strategic-access-middle-east-bahrain-mcdaniel/24-us-strategic-access-middle-east-bahrain-mcdaniel.pdf>, June 2013, //VZ)

Recent history, such as **the loss of access in Iran and the Philippines, has taught us to expect the unexpected and highlights the reality that the U.S. does not influence every factor that contributes to the loss of access.** The Navy would be wise to learn from historical lessons to best posture the force should these improbable “**Black Swan**” situations arise. While **losing Bahrain** is not a foregone conclusion, it **remains a distinct possibility** under a variety of different circumstances and scenarios. The absence of a U.S. presence could potentially create a **power vacuum, destabilize the region,** and eliminate the moderating effect of U.S. influence in any **Bahraini crisis.** Therefore, the United States must investigate viable alternatives as a hedge strategy.

Other Scenarios

Impacts: Promo = ME Backlash

US democracy promotion causes Central Asian and Middle Eastern backlash

Burnell and Youngs 9 (Peter Burnell, Professor of Politics and International Studies, Richard Youngs, Senior Associate Carnegie Endowment for International Peace and Professor of International Relations, "New Challenges to Democratization," Routledge, December 4, 2009)//AG

The backlash has also widened in two key regions: Central Asia and the Middle East. In Central Asia, Western democracy promoters are finding less and less room to maneuver. Most Western organizations have given up trying to support civil society in Uzbekistan in the face of the obstacles put up by the government there. Tajikistan presents similar difficulties. Although open to Western assistance in some areas, such as the economic domain, the Kazakh government has blocked political party aid and established high-tened controls over civil society programming. Even Kyrgyzstan, which was relatively open to Western democracy assistance for many years, became a more difficult environment for such work in the period during its 2007 elections, elections that provoked conflict within the country over issues of fairness and openness. The increased attention to the Middle East by Western, especially US, democracy promoters in recent years has produced a backlash in various parts of the region. In early 2007, the Iranian government arrested and imprisoned for several months two Iranian-Americans, one a staff member of the Washington-based Woodrow Wilson International Center for Scholars and the other a Tehran-based consultant for the Open Society Institute, accusing them of being part of US efforts to foment a "velvet revolution" in Iran. Both were released later the same year but the arrests had a powerful chilling effect on the willingness of Iranians to take part in any Western-sponsored activities involving Iranian civil society. Further crackdowns on Iranian intellectuals and civic activists have followed. The Egyptian government has blocked the efforts of some US democracy groups to set up offices in Cairo. The government of Bahrain backed away from its initial receptivity towards US democracy promotion earlier in the current decade to a more restrictive approach. Other Arab governments, such as in Algeria and Yemen, have also shown signs of increasingly cold feet about US democracy programs.

Impacts: Lat Am Backlash

US democracy promotion causes Latin American backlash

Burnell and Youngs 9 (Peter Burnell, Professor of Politics and International Studies, Richard Youngs, Senior Associate Carnegie Endowment for International Peace and Professor of International Relations, "New Challenges to Democratization," Routledge, December 4, 2009)//AG

In Latin America, the florid criticisms by Venezuela's President Hugo Chavez of US democracy assistance activities have been taken up by some of President Chavez's regional allies. In September 2008, for example, Bolivia's President Evo Morales declared the US ambassador to La Paz persona non grata, accusing him and the US Agency for International Development of conspiring against Bolivian democracy by supporting groups in eastern Bolivia that have opposed the Bolivian government's policies concerning the use of the country's ample natural gas revenues.² As the backlash continues, exploring the causes of it becomes more possible and also more important. The initial explanations—such as the view that the backlash is primarily due to a resurgence of authoritarianism in the world—have tended to be too unidimensional. A complex set of causal factors is clearly at work. The passage of time also permits some examination of the reactions of the Western democracy promotion community to the backlash. Examining these reactions leads to consideration of the question of norms—which international norms cover democracy promotion and whether some formalization of norms would be useful in attempting to limit the backlash.

AT: HR Scenarios/1AC Impacts

Defense

No Impact

HR cred fails- morality isn't universal and no enforcers

Posner 14 (Eric Posner, professor at the University of Chicago Law School, "The Case Against Human Rights," The Guardian, December 4, 2014,

[//AG">http://www.theguardian.com/news/2014/dec/04/-sp-case-against-human-rights\)//AG](http://www.theguardian.com/news/2014/dec/04/-sp-case-against-human-rights)

We live in an age in which **most** of the major **human rights treaties** – there are nine “core” treaties – **have been ratified by the vast majority of countries.** Yet it seems that the human rights agenda has fallen on hard times. In much of the Islamic world, **women lack equality, religious dissenters are persecuted and political freedoms are curtailed.** The Chinese model of development, **which combines political repression and economic liberalism, has attracted numerous admirers** in the developing world. Political **authoritarianism has gained ground in Russia, Turkey, Hungary and Venezuela.** Backlashes against LGBT rights have taken place in countries as diverse as Russia and Nigeria. **The traditional champions of human rights – Europe and the United States – have floundered.** Europe has turned inward as it **has struggled with a sovereign debt crisis, xenophobia towards its Muslim communities and disillusionment with Brussels.** **The United States, which used torture in the years after 9/11 and continues to kill civilians with drone strikes, has lost much of its moral authority.** Even age-old scourges such as slavery continue to exist. **A recent report estimates that nearly 30 million people are forced against their will to work.** It wasn't supposed to be like this. At a time when human rights violations remain widespread, the discourse of human rights continues to flourish. The use of “human rights” in English-language books has increased 200-fold since 1940, and is used today 100 times more often than terms such as “constitutional rights” and “natural rights”. Although people have always criticised governments, it is only in recent decades that they have begun to do so in the distinctive idiom of human rights. **The United States and Europe have recently condemned human rights violations in Syria, Russia, China and Iran.** Western countries often make foreign aid conditional on human rights and have even launched military interventions based on human rights violations. Many people argue that the incorporation of the idea of human rights into international law is one of the great moral achievements of human history. Because human rights law gives rights to all people regardless of nationality, it deprives governments of their traditional riposte when foreigners criticise them for abusing their citizens – namely “sovereignty” (which is law-speak for “none of your business”). Thus, international human rights law provides people with invaluable protections against the power of the state. **And yet it is hard to avoid the conclusion that governments continue to violate human rights with impunity.** Why, for example, do more than 150 countries (out of 193 countries that belong to the UN) engage in torture? Why has the number of authoritarian countries increased in the last several years? Why do women remain a subordinate class in nearly all countries of the world? Why do children continue to work in mines and factories in so many countries? **The truth is that human rights law has failed to accomplish its objectives. There is little evidence that human rights treaties, on the whole, have improved the wellbeing of people.** The reason is that **human rights were never as universal as people hoped, and the belief that they could be forced upon countries as a matter of international law was shot through with misguided assumptions from the very beginning.** The human rights movement shares something in common with the hubris of development economics, which in previous decades tried (and failed) to alleviate poverty by imposing top-down solutions on developing countries. But where development economists have reformed their approach, the human rights movement has yet to acknowledge its failures. It is time for a reckoning.

Human rights diplomacy fails- language is too vague and enforcement trades off with other efforts

Posner 14 (Eric Posner, professor at the University of Chicago Law School, “The Case Against Human Rights,” The Guardian, December 4, 2014,

[//AG](http://www.theguardian.com/news/2014/dec/04/-sp-case-against-human-rights)

The central problem with human rights law is that it is hopelessly ambiguous. The ambiguity, which allows governments to rationalise almost anything they do, is not a result of sloppy draftsmanship but of the deliberate choice to overload the treaties with hundreds of poorly defined obligations. In most countries people formally have as many as 400 international human rights – rights to work and leisure, to freedom of expression and religious worship, to nondiscrimination, to privacy, to pretty much anything you might think is worth protecting. The sheer quantity and variety of rights, which protect virtually all human interests, can provide no guidance to governments. Given that all governments have limited budgets, protecting one human right might prevent a government from protecting another. Take the right not to be tortured, for example. In most countries torture is not a matter of official policy. As in Brazil, local police often use torture because they believe that it is an effective way to maintain order or to solve crimes. If the national government decided to wipe out torture, it would need to create honest, well-paid investigatory units to monitor the police. The government would also need to fire its police forces and increase the salaries of the replacements. It would probably need to overhaul the judiciary as well, possibly the entire political system. Such a government might reasonably argue that it should use its limited resources in a way more likely to help people – building schools and medical clinics, for example. If this argument is reasonable, then it is a problem for human rights law, which does not recognise any such excuse for failing to prevent torture. Or consider, as another example, the right to freedom of expression. From a global perspective, the right to freedom of expression is hotly contested. The US takes this right particularly seriously, though it makes numerous exceptions for fraud, defamation, and obscenity. In Europe, most governments believe that the right to freedom of expression does not extend to hate speech. In many Islamic countries, any kind of defamation of Islam is not protected by freedom of speech. Human rights law blandly acknowledges that the right to freedom of expression may be limited by considerations of public order and morals. But a government trying to comply with the international human right to freedom of expression is given no specific guidance whatsoever.

Credibility is useless – it doesn't affect perception

Walt '15 (Stephen, Academic Dean at the John F. Kennedy School of Government at Harvard University, where he holds the Robert and Renee Belfer Professorship in International Affairs, serves on the editorial boards of Foreign Policy, Security Studies, International Relations, and the Journal of Cold War Studies, has his own Wikipedia page, “The Credibility Addiction”,

Foreign Policy, <http://foreignpolicy.com/2015/01/06/the-credibility-addiction-us-iraq-afghanistan-unwinnable-war/>, 1/6/2015)//HW

Unfortunately, this obsession with credibility was misplaced. For one thing, a state's "reputation" for being tough or reliable didn't work the way most foreign-policy elites thought it did. American leaders kept worrying that other states would question the United States' resolve and capability if it ever abandoned an unimportant ally, or lost some minor scrap in the developing world. But as careful research by Ted Hopf, Jonathan Mercer, and Daryl Press has shown, states do not judge the credibility of commitments in one place by looking at how a country acted somewhere far away, especially when the two situations are quite different. In fact, when the United States did lose, or when it chose to cut its losses and liquidate some unpromising position, dominos barely fell and its core strategic relations remained unaffected. In other words, how the United States responds to a challenge in Southeast Asia or sub-Saharan Africa tells you nothing about how it would or should respond somewhere else, and other states understood this all along. When trying to figure out what the United States is going to do, other states do not start by asking what the United States did in some conflict on the other side of the world. Instead, they ask whether it is in America's interest to act in the situation at hand. And guess what? This implies that U.S. commitments are most credible when the American interest is obvious to all. I mean, nobody really doubts that the United States would fight like a tiger to defend its own soil, right? Exaggerated worries about U.S. credibility had a number of unfortunate consequences. They encouraged American leaders to act in places that didn't matter, in order to convince others that it would also act in places that did. Squandering resources on marginal conflicts undermined confidence in U.S. protection, however, because it consumed resources that could have been committed elsewhere and it sometimes made a war-weary American public even less interested in far-flung foreign adventures. Ironically, misguided efforts to bolster U.S. credibility may have weakened it instead. ¶ The credibility obsession also made it easier for U.S. allies to free-ride (something they were already inclined to do), because they could always get Uncle Sucker to take on more burdens by complaining that they had doubts about American resolve. I don't blame them for trying this ploy, but I do blame American officials for falling for it so often.

Inevitable

Low international HR inevitable- China

Posner 14 (Eric Posner, professor at the University of Chicago Law School, "The Case Against Human Rights," The Guardian, December 4, 2014,

[//AG](http://www.theguardian.com/news/2014/dec/04/-sp-case-against-human-rights)

The rise of China has also undermined the power of human rights. In recent years, China has worked assiduously behind the scenes to weaken international human rights institutions and publicly rejected international criticism of the political repression of its citizens. It has offered diplomatic and economic support to human rights violators, such as Sudan, that western countries have tried to isolate. Along with Russia, it has used its veto in the UN security council to limit western efforts to advance human rights through economic pressure and military intervention. And it has joined with numerous other countries – major emerging powers such as Vietnam, and Islamic countries that fear western secularisation – to deny many of the core values that human rights are supposed to protect.

Counterintelligence efforts in federal agencies prevents insider leaks now— status quo detection protects vital security information

Davenport 14 [Christian Davenport (reporter), "Federal agencies embrace new technology and strategies to find the enemy within," Washington Post, 3/7/2014] AZ

After a string of high-profile incidents from the Ft. Hood shooter to Wikileaks and NSA contractor Edward Snowden, government agencies and contractors have started monitoring their own employees and networks with unprecedented scrutiny. After years of focusing on outside threats, the federal government and its contractors are turning inward, aiming a range of new technologies and counterintelligence strategies at their own employees to root out spies, terrorists or leakers. Agencies are now monitoring their computer networks with unprecedented scrutiny, in some cases down to the keystroke, and tracking employee behavior for signs of deviation from routine. At the Pentagon, new rules are being written requiring contractors to institute programs against "insider threats," a remarkable cultural change in which even workers with the highest security clearances face increased surveillance. The "if you see something, say something" mind-set of the post-9/11 world has fully arrived in the workplace, with new urgency following high-profile leaks such as the revelations of former National Security Agency contractor Edward Snowden. "People's sensitivity to this has changed substantially," said Lynn Dugle, president of a Raytheon business unit that markets an insider threat detection system called SureView. "I can tell you five years ago, when we were talking to agencies or companies about insider threat, we would normally be talking to (chief information officers) who were under budget stress. . . . And that was a very tough sell. Now we see boards of directors and CEOs really understanding what the threat can mean to them, and the risk it poses to them." In response to the breach by former Army intelligence analyst Pfc. Bradley Manning, President Obama in 2011 issued an executive order that established a National Insider Threat Task Force and required all federal agencies that handle classified material to institute programs designed to seek out saboteurs and spies. While corporate security has long been part of Beltway culture, the heightened focus and the emergence of new monitoring technology touched off a burgeoning industry. In addition to Raytheon, Lockheed Martin has developed an insider-threat detection service, as have several start-ups in the Washington area. Even Booz Allen Hamilton, which faced national embarrassment when Snowden, one of its employees, walked off with some of the country's most guarded secrets, counsels its clients on how to detect rogue employees. A recent job posting said the company was looking for an "insider threat analyst," which required a security clearance and more than five years of experience in counterintelligence. The posting spread on the Web and sparked ridicule over the notion that the company that employed Snowden was now looking to help turn the historic breach into a profitable lesson learned. Raytheon's SureView program allows agencies to create all sorts of internal alerts indicating when something may be amiss. A company could, for example, program the software to detect whenever a file containing the words "top secret" or "proprietary" is downloaded, e-mailed or moved from one location on the system to another. Once that wire is tripped, an alert almost immediately pops up on a security analyst's monitor,

along with a digital recording of the employee's screen. All the employee's actions — the cursor scrolling over to open the secure file, the file being copied and renamed — can be watched and replayed, even in slow motion. It's the cyber equivalent of the security camera that records robbers sticking up a convenience store. Lockheed Martin provides a service called Wisdom, which acts as "your eyes and ears on the Web," according to a company official. At its broadest use, the service can monitor mountains of data on the Web — Facebook, Twitter, news sites or blogs — to help predict everything from a foreign coup or riot to political elections. But it can also be turned inward, at employees' online habits, to predict who within the organization might go rogue. Counterintelligence officials use Wisdom to "evaluate employee behavior patterns, flagging individuals who exhibit high risk characteristics," the company says in a brochure. "I like to think of it as a digital intuition that is being developed," said Jason O'Connor, Lockheed's vice president for analysis and mission solutions.

NSA surveillance key to address insider threats—foreign counter-espionage

Gellman 13 [Barton Gellman and Greg Miller, 'Black budget' summary details U.S. spy network's successes, failures and objectives," Washington Post, 8/29/2013, https://www.washingtonpost.com/world/national-security/black-budget-summary-details-us-spy-networks-successes-failures-and-objectives/2013/08/29/7e57bb78-10ab-11e3-8cdd-bcdc09410972_story.html] AZ

Counterintelligence The budget includes a lengthy section on funding for counterintelligence programs designed to protect against the danger posed by foreign intelligence services as well as betrayals from within the U.S. spy ranks. The document describes programs to "mitigate insider threats by trusted insiders who seek to exploit their authorized access to sensitive information to harm U.S. interests." The agencies had budgeted for a major counterintelligence initiative in fiscal 2012, but most of those resources were diverted to an all-hands emergency response to successive floods of classified data released by the anti-secrecy group WikiLeaks. For this year, the budget promised a renewed "focus . . . on safeguarding classified networks" and a strict "review of high-risk, high-gain applicants and contractors" — the young, nontraditional computer coders with the skills the NSA needed. Among them was Snowden, then a 29-year-old contract computer specialist whom the NSA trained to circumvent computer network security. He was copying thousands of highly classified documents at an NSA facility in Hawaii, and preparing to leak them, as the agency embarked on the new security sweep. "NSA will initiate a minimum of 4,000 periodic reinvestigations of potential insider compromise of sensitive information," according to the budget, scanning its systems for "anomalies and alerts."

Insider threats risk exposing knowledge of nuclear weapons to terrorists

Kirkham 12 [Lara Dawn Kirkham (American attorney with Jackson Walker L.L.P), UT Austin Approved Report, "The Insider Threat in the Digital Age: A Case for Electronic Monitoring in the Nuclear Weapons Complex,"

https://books.google.com/books/about/The_Insider_Threat_in_the_Digital_Age.html?id=qaFQmwEACAAJ AZ

DoD defines the insider threat as, “A person with authorized access, who uses that access, wittingly or unwittingly, to harm national security interests or national security through unauthorized disclosure, data modification, espionage, terrorism, or kinetic actions resulting in personal injury or loss or degradation of resources or capabilities.”⁶ In the context of this paper, **an insider has authorized access, authority, and knowledge of DoD’s nuclear weapons complex.** The DoD nuclear weapons complex consists of the sites in the United States and abroad that maintain a modern arsenal of strategic nuclear warheads and special nuclear material.⁷ An insider becomes a threat once he is willing to exploit his position and knowledge of operations or security systems to further unauthorized activities.⁸ **The insider threat to the nuclear weapons complex concerns an insider’s potential to abuse his authorized level of system access to endanger the physical integrity of nuclear assets through theft, sabotage, or the deliberate unauthorized release of classified technical or command-and-control system information.**⁹ **Insider attacks against nuclear targets are likely to be attempted by** anti-nuclear protest groups, mentally unstable individuals, criminals, **terrorists**, or foreign agents.¹⁰ Terrorists or foreign agents present the most serious threat since they are likely a more capable adversary and the nuclear material would be the most valuable to them for political uses.¹¹ Insider adversaries acting in the following three ways are of particular concern to DoD: (1) active non-violent agents who may covertly assist external actors or directly participate in an attack, but will not use force or violence and will surrender if engaged; (2) active violent agents who will use physical force or violence to covertly assist external actors or to directly participate in an attack; or (3) passive agents who weaken the overall security of the system by failing to report unusual behavior or by inadvertently supplying information to external adversaries.¹² In the context of the DoD nuclear weapons complex, the most plausible scenarios are a single active non-violent insider colluding with an outsider,¹³ an active non-violent insider acting alone,¹⁴ and a passive insider. Electronic monitoring inputs should initially focus on identifying these types of insiders.

Nuclear terrorism is an existential threat—it escalates to nuclear war with Russia and China.

Robert **Ayson**, Professor of Strategic Studies and Director of the Centre for Strategic Studies: New Zealand at the Victoria University of Wellington, 2010 (“After a Terrorist Nuclear Attack: Envisaging Catalytic Effects,” *Studies in Conflict & Terrorism*, Volume 33, Issue 7, July, Available Online to Subscribing Institutions via InformaWorld)

A terrorist nuclear attack, and even the use of nuclear weapons in response by the country attacked in the first place, would not necessarily represent the worst of the nuclear worlds imaginable. Indeed, there are reasons to wonder whether nuclear terrorism should ever be regarded as belonging in the category of truly existential threats. A contrast can be drawn here with the global catastrophe that would come from a massive nuclear exchange between two or more of the sovereign states that possess these weapons in significant numbers. Even the worst terrorism that the twenty-first century might bring would fade into insignificance alongside considerations of what a general nuclear war would have

wrought in the Cold War period. And it must be admitted that as long as the major nuclear weapons states have hundreds and even thousands of nuclear weapons at their disposal, there is always the possibility of a truly awful nuclear exchange taking place precipitated entirely by state possessors themselves. But these two nuclear worlds—a non-state actor nuclear attack and a catastrophic interstate nuclear exchange—are not necessarily separable. It is just possible that some sort of terrorist attack, and especially an act of nuclear terrorism, could precipitate a chain of events leading to a massive exchange of nuclear weapons between two or more of the states that possess them. In this context, today's and tomorrow's terrorist groups might assume the place allotted during the early Cold War years to new state possessors of small nuclear arsenals who were seen as raising the risks of a catalytic nuclear war between the superpowers started by third parties. These risks were considered in the late 1950s and early 1960s as concerns grew about nuclear proliferation, the so-called n+1 problem. It may require a considerable amount of imagination to depict an especially plausible situation where an act of nuclear terrorism could lead to such a massive inter-state nuclear war. For example, in the event of a terrorist nuclear attack on the United States, it might well be wondered just how Russia and/or China could plausibly be brought into the picture, not least because they seem unlikely to be fingered as the most obvious state sponsors or encouragers of terrorist groups. They would seem far too responsible to be involved in supporting that sort of terrorist behavior that could just as easily threaten them as well. Some possibilities, however remote, do suggest themselves. For example, how might the United States react if it was thought or discovered that the fissile material used in the act of nuclear terrorism had come from Russian stocks,⁴⁰ and if for some reason Moscow denied any responsibility for nuclear laxity? The correct attribution of that nuclear material to a particular country might not be a case of science fiction given the observation by Michael May et al. that while the debris resulting from a nuclear explosion would be "spread over a wide area in tiny fragments, its radioactivity makes it detectable, identifiable and collectable, and a wealth of information can be obtained from its analysis: the efficiency of the explosion, the materials used and, most important ... some indication of where the nuclear material came from."⁴¹ Alternatively, if the act of nuclear terrorism came as a complete surprise, and American officials refused to believe that a terrorist group was fully responsible (or responsible at all) suspicion would shift immediately to state possessors. Ruling out Western ally countries like the United Kingdom and France, and probably Israel and India as well, authorities in Washington would be left with a very short list consisting of North Korea, perhaps Iran if its program continues, and possibly Pakistan. But at what stage would Russia and China be definitely ruled out in this high stakes game of nuclear Cluedo? In particular, if the act of nuclear terrorism occurred against a backdrop of existing tension in Washington's relations with Russia and/or China, and at a time when threats had already been traded between these major powers, would officials and political leaders not be tempted to assume the worst? Of course, the chances of this occurring would only seem to increase if the United States was already involved in some sort of limited armed conflict with Russia and/or China, or if they were confronting each other from a distance in a proxy war, as unlikely as these developments may seem at the present time. The reverse might well apply too: should a nuclear terrorist attack occur in Russia or

China during a period of heightened tension or even limited conflict with the United States, could Moscow and Beijing resist the pressures that might rise domestically to consider the United States as a possible perpetrator or encourager of the attack? **Washington's early response to a terrorist nuclear attack** on its own soil **might** also **raise the possibility of an unwanted (and nuclear aided) confrontation with Russia and/or China.** For example, in the noise and confusion during the immediate aftermath of the terrorist nuclear attack, the U.S. president might be expected to place the country's armed forces, including its nuclear arsenal, on a higher stage of alert. In such a tense environment, when careful planning runs up against the friction of reality, it is just possible that Moscow and/or China might mistakenly read this as a sign of U.S. intentions to use force (and possibly nuclear force) against them. In that situation, the temptations to preempt such actions might grow, although it must be admitted that any preemption would probably still meet with a devastating response. As part of its initial response to the act of nuclear terrorism (as discussed earlier) Washington might decide to order a significant conventional (or nuclear) retaliatory or disarming attack against the leadership of the terrorist group and/or states seen to support that group. Depending on the identity and especially the location of these targets, Russia and/or China might interpret such action as being far too close for their comfort, and potentially as an sinfringement on their spheres of influence and even on their sovereignty. One far-fetched but perhaps not impossible scenario might stem from a judgment in Washington that some of the main aiders and abettors of the terrorist action resided somewhere such as Chechnya, perhaps in connection with what Allison claims is the "Chechen insurgents' ... long-standing interest in all things nuclear."⁴² American pressure on that part of the world would almost certainly raise alarms in Moscow that might require a degree of advanced consultation from Washington that the latter found itself unable or unwilling to provide. There is also the question of how other nuclear-armed states respond to the act of nuclear terrorism on another member of that special club. It could reasonably be expected that following a nuclear terrorist attack on the United States, both Russia and China would extend immediate sympathy and support to Washington and would work alongside the United States in the Security Council. But there is just a chance, albeit a slim one, where the support of Russia and/or China is less automatic in some cases than in others. For example, what would happen if the United States wished to discuss its right to retaliate against groups based in their territory? If, for some reason, Washington found the responses of Russia and China deeply underwhelming, (neither "for us or against us") might it also suspect that they secretly were in cahoots with the group, increasing (again perhaps ever so slightly) the chances of a major exchange. If the terrorist group had some connections to groups in Russia and China, or existed in areas of the world over which Russia and China held sway, and if Washington felt that Moscow or Beijing were placing a curiously modest level of pressure on them, what conclusions might it then draw about their culpability? If Washington decided to use, or decided to threaten the use of, nuclear weapons, the responses of Russia and China would be crucial to the chances of avoiding a more serious nuclear exchange. They might surmise, for example, that while the act of nuclear terrorism was especially heinous and demanded a strong response, the response simply had to remain below the nuclear threshold. It would be one thing for a non-state actor to have broken the nuclear use taboo, but an entirely different thing for a

state actor, and indeed the leading state in the international system, to do so. If Russia and China felt sufficiently strongly about that prospect, there is then the question of what options would lie open to them to dissuade the United States from such action: and as has been seen over the last several decades, the central dissuader of the use of nuclear weapons by states has been the threat of nuclear retaliation. If some readers find this simply too fanciful, and perhaps even offensive to contemplate, it may be informative to reverse the tables. Russia, which possesses an arsenal of thousands of nuclear warheads and that has been one of the two most important trustees of the non-use taboo, is subjected to an attack of nuclear terrorism. In response, Moscow places its nuclear forces very visibly on a higher state of alert and declares that it is considering the use of nuclear retaliation against the group and any of its state supporters. How would Washington view such a possibility? Would it really be keen to support Russia's use of nuclear weapons, including outside Russia's traditional sphere of influence? And if not, which seems quite plausible, what options would Washington have to communicate that displeasure? If China had been the victim of the nuclear terrorism and seemed likely to retaliate in kind, would the United States and Russia be happy to sit back and let this occur? In the charged atmosphere immediately after a nuclear terrorist attack, how would the attacked country respond to pressure from other major nuclear powers not to respond in kind? The phrase "how dare they tell us what to do" immediately springs to mind. Some might even go so far as to interpret this concern as a tacit form of sympathy or support for the terrorists. This might not help the chances of nuclear restraint.

They might surmise, for example, that while the act of nuclear terrorism was especially heinous and demanded a strong response, the response simply had to remain below the nuclear threshold. It would be one thing for a non-state actor to have broken the nuclear use taboo, but an entirely different thing for a state actor, and indeed the leading state in the international system, to do so. If Russia and China felt sufficiently strongly about that prospect, there is then the question of what options would lie open to them to dissuade the United States from such action: and as has been seen over the last several decades, the central dissuader of the use of nuclear weapons by states has been the threat of nuclear retaliation. If some readers find this simply too fanciful, and perhaps even offensive to contemplate, it may be informative to reverse the tables. Russia, which possesses an arsenal of thousands of nuclear warheads and that has been one of the two most important trustees of the non-use taboo, is subjected to an attack of nuclear terrorism. In response, Moscow places its nuclear forces very visibly on a higher state of alert and declares that it is considering the use of nuclear retaliation against the group and any of its state supporters. How would Washington view such a possibility? Would it really be keen to support Russia's use of nuclear weapons, including outside Russia's traditional sphere of influence? And if not, which seems quite plausible, what options would Washington have to communicate that displeasure? If China had been the victim of the nuclear terrorism and seemed likely to retaliate in kind, would the United States and Russia be happy to sit back and let this occur? In the charged atmosphere immediately after a nuclear terrorist attack, how would the attacked country respond to pressure from other major nuclear powers not to respond in kind? The phrase "how dare they tell us what to do" immediately springs to mind. Some might even go so far as to interpret this concern as a tacit form of sympathy or support for the terrorists. This might not help the chances of nuclear restraint.

Deterrence Module

Insider threats pass on critical information on locations of bombers, submarines, and military operations

Hall 14 [Caitlin Squire Hall (Strategic Intelligence Graduate, Officer in the United States Air Force, Combat Intelligence analyst), "The Trusted Shadow and Trojan Horse of the United States Government: Human Behavior and the Insider Threat," Small Wars Journal, 3/20/2014, <http://smallwarsjournal.com/jrnl/art/the-trusted-shadow-and-trojan-horse-of-the-united-states-government>] AZ

An insider threat is irrefutably one of the greatest threats to United States national security. Greg Chung, Chi Mak, Robert Philip Hanssen, and Edward Snowden are a few of the dozens of personalities who have leaked or passed secrets to foreign governments over the past thirty years. Rita M. Barrios elaborates on the significance of the insider threat stating, "The theft and exposure of the critical data components that resides in a relational database by the authorized insider is on the rise" (Barrios 2013, 54). In comparison to threats such as weapons of mass destruction, cyber, and nuclear, the insider threat can often be overlooked; however, the threat of the insider is not the method of attack, rather the threat is the individual (Blades 2010, 32). The insider threat is comparable to a Trojan horse and is identifiable as a trusted shadow of the government who, despite the extensive background checks, obtains a security clearance providing access to classified information. Furthermore, the United States can strategically mission plan for all divisions of the military, yet it takes one individual to take those plans and pass that information to the enemy, or make it public knowledge. One individual can obtain classified information on the location of United States submarines, specs on the B-2 stealth bomber, or tactics, techniques, and procedures of the United States military and pass that intelligence to a news agency or foreign government easily. With the ever growing world of electronics and advancements in technology, a young adult could walk in and out of the work place with dozens of classified documents saved on a CD. In addition, with websites like Wikileaks, secrets can be published anonymously adding to the elusive nature of an insider threat. These factors make all government employees with a security clearance dangerous as there is no patch to an insider threat, only prevention and minimization. But is that what makes an insider threat so challenging to acknowledge and track? Or is it the fact that these individuals are a trusted shadow whose motivation is prompted by unknown factors? Ellen Messmer highlights this noting, "While the U.S. military is building up defenses to fend off network-based attacks from enemy states and terrorists, some say the more-insidious security problem is the threat is an insider bent on sabotage or stealing data" (Messmer 2003, 12). Messmer, in a sense, simply acknowledges that the motivation of an individual can be as minuet as 'I felt like it.' That being said, is it only the fault of the insider for a leak or do co-workers impact the process of detection as well? This realm of threat to a government entity is challenging due to the fact that, for any organization, they are dealing with the unknown. The state of unknown bears the foremost question; what then are the underlying complexities making the insider threat so dangerous to Department of Defense agencies? Furthermore, how will, if at all, the

current instability of the United States' economy impact the ability to combat the insider threat over the course of the next decade?

Nuclear submarine positioning deters multiple hotspots for conflict and reduces proliferation—key part of the deterrence triad—survivability and secrecy are absolutely key. Revealing nuclear posture causes extinction.

Mies 99 [Admiral Richard W. Mies (Commander in Chief, United States Strategic Command, Offutt Air Force Base, Nebraska), "The SSBN in National Security," Undersea Warfare, Vol. 2, No. 1, Fall 1999]

Without fanfare and recognition, our ballistic missile submarines patrolled the oceans of the Cold War in silent vigil, undetected and invulnerable, ready to strike, to deter our adversaries, and reassure our allies. And just as quietly, they set the standard for strategic deterrence and became the **dominant leg of our strategic deterrent triad** - our "ultimate insurance policy." As Colin Powell said on the occasion of the completion of the strategic submarine force's 3,000th patrol by USS Tennessee (SSBN-734), "...the Cold War was won especially by...America's Blue and Gold crews manning America's nuclear powered ballistic missile submarine fleet...no one has done more to prevent conflict, no one has made a greater sacrifice for the cause of Peace, than... America's proud missile submarine family. You stand tall among all our heroes of the Cold War." Today, the Cold War has been over for a decade, and in its wake we have emerged as the only true superpower in the international arena. At the same time, the world has changed dramatically since the fall of the Berlin Wall. The predictable, monolithic world we once faced has now been replaced by a multi-polar world of greater uncertainty - uncertainty in the hills of the Balkans, the streets of Somalia, the deserts of Iraq, and the bunkers of North Korea. And despite our singular superpower status, we find ourselves in a world of more diverse, asymmetric threats. Strategic Nuclear Policy Deterrence of both aggression and coercion is a cornerstone of our national security strategy. Our strategic nuclear forces serve as the most visible and important element of our commitment to this principle. Although the risk of massive nuclear attack has decreased significantly, and the role of nuclear weapons in our national military strategy has diminished, deterrence of major military attack on the United States and its allies, especially attacks involving weapons of mass destruction, remains our highest defense priority. Our National security strategy reaffirms that: "Nuclear weapons serve as a hedge against an uncertain future, a guarantee of our security commitments to allies, and a disincentive to those who would contemplate developing or otherwise acquiring their own nuclear weapons." - A National Security Strategy for a New Century, 1998 Strategic Deterrence in the Post-Cold War Environment As outlined in our National Military Strategy, although our Nation is at peace and the Cold War has ended, there remain a number of potentially serious threats to national security, including regional dangers, asymmetric challenges, transnational threats, and "wild cards." Russia still possesses, and continues to modernize, their substantial strategic and non-strategic nuclear forces. Because of the deterioration of their conventional forces and severe economic turmoil, Russia has placed increased reliance on nuclear weapons. Russia has made great progress toward creation of a stable democracy, but that transition is not assured. Hence our strategic forces serve as a hedge against the possibility of Russia's reemergence as a threat to the U.S. and its allies. Although China possesses a much smaller nuclear force, it is modernizing its strategic forces, and we cannot discount the emergence of China as a potential threat. The proliferation of weapons of mass destruction and their means of delivery pose the greatest threat to global stability and security and the greatest challenge to strategic deterrence. The issue may not be whether weapons of mass destruction will be used against the West by a rogue nation or transnational actor, but where and when. Accordingly, our present strategic force's mission reflects continuity with the past: "To deter major military attack on the United States and its allies; and if deterrence fails, to employ forces," while simultaneously providing support to the geographic Commanders-in-Chief for countering the proliferation of weapons of mass destruction and the means of their delivery. Strategic Force Structure To deter a broad range of threats, our National Security Strategy requires a robust triad of strategic forces. Both the Nuclear Posture Review and the Quadrennial Defense Review have reaffirmed the wisdom of preserving a complementary strategic triad of land-based intercontinental ballistic missiles, strategic bombers, and submarine-launched ballistic missiles. Each leg of the triad contributes unique attributes that enhance deterrence and reduce risk: Intercontinental ballistic missiles provide prompt response, bombers

provide flexibility, and submarines provide survivability. Together they comprise a robust deterrent that complicates a potential adversary's offensive and defensive planning. The triad is also a synergistic force that provides protection against the failure of any single one of its legs. Ballistic missile submarines (SSBNs) will continue to carry the largest portion of our strategic power, regardless of whether they are subject to START I or START II treaty ceilings. With approximately two-thirds of the force at sea at any one time, the SSBN force is the most survivable leg of the triad, providing the United States with a powerful, assured, retaliatory capability against any adversary. Submarines at sea are stabilizing; by contrast, submarines in port are more vulnerable and could offer an extremely lucrative target in time of crisis. Thus, in any foreseeable arms control scenario, the United States must preserve a large enough SSBN force to enable two-ocean operations, with sufficient assets to ensure a retaliatory force at sea capable of dissuading any adversary in a crisis. Because the Russian Duma has failed to ratify the START II treaty, we have a Congressional mandate to maintain our strategic forces at START I levels. At the same time, the TRIDENT I, C4 missile is already beyond its design service life and can only be sustained at substantial cost and considerable risk to the middle of the next decade. Consequently, we have recently sought Congressional authority to transition the strategic submarine commitment from an 18-boat, mixed-missile force to a 14-boat, all TRIDENT II, D5 missile force. Backfit of four TRIDENT submarines to carry the D5 missile is the most cost-effective means to ensure a reliable sea-based deterrent well into the next century. A modernized 14-boat, two ocean, all D5 missile force is in many ways a more robust, credible, and reliable deterrent than the present 18-boat force. Our strategic forces, particularly our strategic submarines, are postured to provide an assured response capability to inflict unacceptable damage to a potential enemy. Our strategic plans provide a wide range of options to ensure our Nation can react appropriately to any provocation, rather than being limited to an "all or nothing" response. Additionally, our forces are postured such that we have the capability to respond promptly to any attack, without relying upon "launch on warning" or "launch under attack." The high flexibility, survivability, and diversity of our strategic forces are designed to complicate any adversary's offensive and defensive planning calculations. With the end of the Cold War, the United States has changed dramatically our strategic force posture: Our strategic forces no longer target other countries during normal peacetime operations. Our strategic bombers and their supporting tankers have not been on alert since 1991. Our Strategic Submarine Force, while positioned at sea for survivability, patrols under more relaxed and flexible conditions of alertness. Strategic Force Reductions From an historical perspective, the end of the Cold War has brought dramatic change to our strategic forces. Cooperative threat reduction, arms control, Presidential initiatives, and numerous confidence-building measures have brought about many positive developments in the strategic postures of the U.S. and Russia. Since the end of the Cold War, we have reduced our strategic nuclear systems by over 50 percent and non-strategic nuclear systems by over 75 percent. We have reduced the number of people involved in our strategic forces by approximately one-half and the number of military bases supporting them by approximately 60 percent. While overall defense spending has declined roughly 11 percent since the end of the Cold War, strategic force costs have dropped from eight percent of DoD's total obligation authority in 1990 to less than three percent today. This represents a pretty good "peace dividend" and a cost-effective premium on our Nation's "ultimate insurance policy." These changes also reflect a new, constructive relationship between the United States and Russia - a relationship in which stability is a central consideration. Stability is the most important criterion to satisfy as we proceed down the glide slope to lower numbers of nuclear weapons. Dr. Thomas Schelling, a noted writer on international strategic matters has written: "The dimension of 'strength' is an important one, but so is the dimension of 'stability' - the assurance against being caught by surprise, the safety in waiting, the absence of a premium on jumping the gun." Because of their stabilizing attributes of survivability and assured response, strategic submarines will play an increasingly prominent role in future START environments. Both the Nuclear Posture Review and Quadrennial Defense Review reaffirmed the importance of 14 TRIDENT SSBNs each equipped with 24 D5 missiles as a part of the START II-compliant nuclear force structure. These capital ships will form the backbone of the Nation's strategic nuclear force well into the 21st century. The SSBN Contribution: Survivable Deterrence The TRIDENT submarine provides a formidable array of capabilities to the National Command Authorities (NCA). As previously mentioned, these ships are the most survivable leg of the triad. Additionally, TRIDENT submarines provide unsurpassed reliability. To date there have been nearly 3,500 SSBN patrols which account for almost 130,000 man-years spent on patrol; at the same time the D-5 missile system has established an unprecedented record of 85 consecutive successful test flights. In addition to survivability, several specific characteristics of this formidable platform make it an indispensable part of our Nation's triad: Responsiveness. Because of its survivability, the TRIDENT weapon system can be effective under any strategic scenario. SSBNs can provide a sufficiently prompt response to meet any required mission, but their attack can be delayed as desired. Because TRIDENT submarines cannot be preempted, they are inherently stabilizing. There is no need to "use them or lose them." Response is assured, thus providing a highly credible deterrent.

Bioterror Module

Insider threats cause bioterror—pathogenic materials, equipment, and empirics prove. The risk is seriously underestimated

Culp 13 [Derrin Culp (research associate at the National Center for Disaster Preparedness, a unit of Columbia University), "Lessons not learned: Insider threats in pathogen research," Bulletin of Atomic Scientists, 04/03/2013] AZ

Ivins repeatedly authorized the Army to obtain and review his medical and psychiatric treatment records. According to the panel, however, the Army neither examined Ivins' mental health records nor paid close attention to his daily behavior. The expert panel urged organizations to retain the right to examine such records, to keep that access as broad as possible, to use it even in the "absence of specific symptoms or diagnoses," and to withhold access to pathogens from scientists who don't renew privacy waivers. However, the national press and microbiology journals paid little attention to the audacious conclusions. The H5N1 controversy. During the winter of 2011 and 2012, Americans witnessed a prime-time discussion about research on the avian flu virus, known to scientists as H5N1. This organism kills millions of birds annually but, unlike the seasonal flu that makes so many people miserable every winter, H5N1 rarely infects humans. When it does, however, it is incredibly lethal; the World Health Organization estimates that 59 percent of all human cases end in death. The US National Institutes of Health funded two unclassified studies to better understand the likelihood that the H5N1 virus might naturally mutate in ways that would make it more transmissible among humans and, therefore, much more dangerous. When it appeared that at least one of the studies had created in the lab a strain of H5N1 that might be able to spread easily among humans, numerous commentators weighed in on whether publishing the studies would be tantamount to giving terrorists the blueprints for a biological weapon of mass destruction. Scientists and scholars not prone to hyperbole or histrionics indicated that, under certain conditions, the intentional release of a similarly modified virus could cause deaths in the tens or even hundreds of millions. The NSABB, which historically has been strongly opposed to publication restrictions, recommended unanimously that science journals limit what they published, arguing that "the deliberate release of a transmissible highly pathogenic influenza A/H5N1 virus would be an unimaginable catastrophe." The controversy was so intense that virus researchers around the world adopted an open-ended moratorium on similar research, which they maintained for a year. The risk from "terrorists" dominated the H5N1 discussion, and the potential for scientists to do harm barely lit up the radar -- as if that hadn't happened in a spectacular way just a decade earlier. One of the few people who thought it was germane to worry about researchers using their own findings in malevolent ways was Australian immunologist Ian Ramshaw: "I'm not so worried about bioterrorism. It's the disgruntled researcher who is dangerous." Rutgers microbiologist Richard Ebright, commenting at the time on the proposed Select Agent updates, wrote that failure to mandate video monitoring, a two-person rule, and psychological assessments for scientists working with the most dangerous pathogens "would represent a failure to learn lessons from the 2001 anthrax mailings [and] to address the 'insider threat' responsible for the 2001 anthrax mailings."

Bioterror attacks cause extinction

Mhyrvold '13

Nathan, Began college at age 14, BS and Masters from UCLA, Masters and PhD, Princeton "Strategic Terrorism: A Call to Action," Working Draft, The Lawfare Research Paper Series Research paper NO . 2 – 2013

As horrible as this would be, such a pandemic is by no means the worst attack one can imagine, for several reasons. First, most of the classic bioweapons are based on 1960s and 1970s technology because the 1972 treaty halted bioweapons development efforts in the United States and most other Western countries. Second, the Russians, although solidly committed to biological weapons long after the treaty deadline, were never on the cutting edge of biological research. Third and most important, **the science and technology of molecular biology have made enormous advances, utterly transforming the field in the last few decades.** High school biology students routinely perform molecular-biology manipulations that would have been impossible even for the best superpower-funded program back in the heyday of biological-weapons research. The biowarfare methods of the 1960s and 1970s are now as antiquated as the lumbering mainframe computers of that era. **Tomorrow's terrorists will have vastly more deadly bugs to choose from.** Consider this sobering development: in 2001, Australian researchers working on mousepox, a nonlethal virus that infects mice (as chickenpox does in humans), accidentally discovered that a simple genetic modification transformed the virus.^{10, 11} Instead of producing mild symptoms, the new virus killed 60% of even those mice already immune to the naturally occurring strains of mousepox. The new virus, moreover, was unaffected by any existing vaccine or antiviral drug. A team of researchers at Saint Louis University led by Mark Buller picked up on that work and, by late 2003, found a way to improve on it: Buller's variation on mousepox was 100% lethal, although his team of investigators also devised combination vaccine and antiviral therapies that were partially effective in protecting animals from the engineered strain.^{12, 13} Another saving grace is that the genetically altered virus is no longer contagious. Of course, it is quite possible that future tinkering with the virus will change that property, too. Strong reasons exist to believe that the genetic modifications Buller made to mousepox would work for other poxviruses and possibly for other classes of viruses as well. Might **the same techniques allow** chickenpox or **another** pox**virus** that infects humans **to be turned into a 100% lethal bioweapon,** perhaps one that is **resistant to any known antiviral therapy**? I've asked this question of experts many times, and no one has yet replied that such a manipulation couldn't be done. This case is just one example. Many more are pouring out of scientific journals and conferences every year. Just last year, the journal Nature published a controversial study done at the University of Wisconsin–Madison in which virologists enumerated the changes one would need to make to a highly lethal strain of bird flu to make it easily transmitted from one mammal to another.¹⁴ **Biotechnology is advancing so rapidly that it is hard to keep track of all the new potential threats.** Nor is it clear that anyone is even trying. **In addition to lethality and drug resistance, many other parameters can be played with, given that the infectious power of an epidemic depends on many properties,** including the length of the latency period during which a

person is contagious but asymptomatic. **Delaying the onset of serious symptoms allows each new case to spread to more people and thus makes the virus harder to stop.** This dynamic is perhaps best illustrated by HIV, which is very difficult to transmit compared with smallpox and many other viruses. Intimate contact is needed, and even then, the infection rate is low. The balancing factor is that HIV can take years to progress to AIDS, which can then take many more years to kill the victim. What makes HIV so dangerous is that infected people have lots of opportunities to infect others. This property has allowed HIV to claim more than 30 million lives so far, and approximately 34 million people are now living with this virus and facing a highly uncertain future.¹⁵ **A virus genetically engineered to infect its host quickly, to generate symptoms slowly—say, only after weeks or months—and to spread easily through the air or by casual contact would be vastly more devastating than HIV. It could silently penetrate the population to unleash its deadly effects suddenly. This type of epidemic would be almost impossible to combat because most of the infections would occur before the epidemic became obvious.** A technologically sophisticated terrorist group could develop such a virus and kill a large part of humanity with it. Indeed, **terrorists may not have to develop it** themselves: **some scientist may do so first** and publish the details. Given the rate at which biologists are making discoveries about viruses and the immune system, **at some point in the near future, someone may create artificial pathogens that could drive the human race to extinction.** Indeed, a detailed species-elimination plan of this nature was openly proposed in a scientific journal. The ostensible purpose of that particular research was to suggest a way to extirpate the malaria mosquito, but **similar techniques could be directed toward humans.**¹⁶ When I've talked to molecular biologists about this method, they are quick to point out that it is slow and easily detectable and could be fought with biotech remedies. If you challenge them to come up with improvements to the suggested attack plan, however, they have plenty of ideas. **Modern biotechnology will soon be capable, if it is not already, of bringing about the demise of the human race— or at least of killing a sufficient number of people to end high-tech civilization and set humanity back 1,000 years or more.** That terrorist groups could achieve this level of technological sophistication may seem far-fetched, but keep in mind that it takes only a handful of individuals to accomplish these tasks. Never has lethal power of this potency been accessible to so few, so easily. Even more dramatically than nuclear proliferation, modern biological science has frighteningly undermined the correlation between the lethality of a weapon and its cost, a fundamentally stabilizing mechanism throughout history. Access to extremely lethal agents—lethal enough to exterminate Homo sapiens—will be available to anybody with a solid background in biology, terrorists included.

Competitiveness Module

The US is a target for espionage. An attack would hurt the economy, military, and economic competitiveness.

Poteat, '14 (Gene, president of the Association of Former Intelligence Officers (AFIO) and a former senior technical intelligence officer in the CIA, "COUNTERINTELLIGENCE, HOMELAND SECURITY AND DOMESTIC INTELLIGENCE", 04/03,

[http://www.afio.com/publications/Counterintelligence_\(Poteat\)_2014Apr03_DRAFT.pdf](http://www.afio.com/publications/Counterintelligence_(Poteat)_2014Apr03_DRAFT.pdf)) JL

In the present global economy, economic competition has been increasingly important in relation to military confrontations in world affairs. America's intellectual property, industrial and trade secrets are not only the basis of our strong economy and military, but also our economic competitiveness—and the loss of it through economic espionage to foreign governments poses a serious threat to the future of our nation. Economic espionage is a relatively low risk enterprise with extremely high pay off—with little consequences even when caught. The technologically-advanced strong U.S. economy is a priority target for our competitors and the present economic espionage feeding frenzy taking place is now being carried out by both friend and foe alike, for both economic and defense reasons. This economic espionage is an entirely new challenge for counterintelligence and led to the passing of the Economic Intelligence Act of 1996. There is, nonetheless, a widely held perception that the end of the Cold War means that other than a few scattered terrorism and drug problems we no longer face a truly serious foreign threat to our national security, and that these past threats have turned into nothing more than normal economic competition, or business as usual. The Economic Intelligence Act of 1996 thus far has failed to have much impact.⁵

Competitiveness solves great power war – it's an impact filter

Colby 14 (Elbridge, the Robert M. Gates fellow at the Center for a New American Security; and Paul Lettow, was senior director for strategic planning on the U.S. National Security Council staff from 2007 to 2009, 7/3/14, "Have We Hit Peak America?,"

http://www.foreignpolicy.com/articles/2014/07/03/have_we_hit_peak_america)

Many foreign-policy experts seem to believe that retaining American primacy is largely a matter of will -- of how America chooses to exert its power abroad. Even President Obama, more often accused of being a prophet of decline than a booster of America's future, recently asserted that the United States "has rarely been stronger relative to the rest of the world." The question, he continued, is "not whether America will lead, but how we will lead." But will is unavailing without strength. If the United States wants the international system to continue to reflect its interests and values -- a system, for example, in which the global commons are protected, trade is broad-based and extensive, and armed conflicts among great nations are curtailed -- it needs

to sustain not just resolve, but relative power. That, in turn, will require acknowledging the uncomfortable truth that global power and wealth are shifting at an unprecedented pace, with profound implications. Moreover, many of the challenges America faces are exacerbated by vulnerabilities that are largely self-created, chief among them fiscal policy. Much more quickly and comprehensively than is understood, those vulnerabilities are reducing America's freedom of action and its ability to influence others. Preserving America's international position will require it to restore its economic vitality and make policy choices now that pay dividends for decades to come. America has to prioritize and to act. Fortunately, the United States still enjoys greater freedom to determine its future than any other major power, in part because many of its problems are within its ability to address. But this process of renewal must begin with analyzing America's competitive position and understanding the gravity of the situation Americans face.

Trade Module

Economic espionage hurts the world economy. Fair competition develops better products and services that will spur world economic growth.

Schwartz & Talley, '15 (Felicia & Ian, Schwartz: a reporter in the Washington, D.C. bureau, where she writes about national security. She is a graduate of Dartmouth College, Talley: writes about international finance from the Wall Street Journal's Washington, DC bureau, "U.S. Officials Warn Chinese Cyber Espionage Imperils Ties", "The Wall Street Journal", 06/23, <http://www.wsj.com/articles/biden-urges-honest-direct-talks-between-u-s-china-1435071461>) JL

WASHINGTON—Top U.S. officials issued stern admonitions Tuesday about China's behavior in cyberspace, warning it could threaten one of the most important geopolitical relationships in the world. The blunt warning came as high-level officials from the two major economies met for annual Cabinet-level talks on strategic and economic issues. With talks taking place amid rising tensions over cyberspace and maritime security, officials on both sides played down expectations for substantial progress in the seventh round of what is known as the U.S.-China Strategic and Economic Dialogue. U.S. Treasury Secretary Jacob Lew, speaking at the start of the day's meetings, said Washington remains "deeply concerned about government-sponsored cyber theft from companies and commercial sectors." Beijing's leadership, Mr. Lew said, has a responsibility "to abide by certain standards of behavior within cyberspace." U.S. investigators believe a recently disclosed breach of millions of personnel records originated in China, but the Obama administration hasn't said whether it was considered a government-sanctioned hack. Both Chinese and U.S. officials said Tuesday they hoped to find some common ground even in the areas where their disagreements are sharpest. "There's an urgent need to agree on a rule-based system for rapidly evolving areas ranging from cyberspace to outer space," said Vice President Joe Biden, who spoke at the opening of talks. "We have an obligation, China and the United States, to shape these rules. Let me be clear, the United States believes strongly that whenever possible China needs to be at the table as these new rules are written." China's State Councilor Yang Jiechi, speaking through an interpreter, backed the principle of China working with the U.S. and other countries to develop an "international code of conduct for cyber information sharing." "We will work with the U.S. and other countries to work in a spirit of openness to properly address the relevant issues," Mr. Yang said. Washington has also taken a stiffer stance against suspected economic espionage by Chinese citizens, including charging six Chinese citizens last month with stealing trade secrets from U.S. technology companies. Last year, the Justice Department brought charges against five Chinese military employees the U.S. believed hacked into U.S. companies to steal trade secrets in what was the first time Washington publicly charged employees of a foreign government with cybercrimes against U.S. businesses. On Tuesday, Mr. Biden said China would ultimately suffer from pursuing economic espionage. "Nations that use cyber technology and economic weapons to profit from the theft of intellectual property are sacrificing tomorrow's gains for short term gains today," Mr. Biden said. "They diminish the innovative drive and determination of their own people when they do not reward and protect intellectual property." U.S. officials said ahead of the talks they would raise cybersecurity concerns throughout the two days of Cabinet-level talks in both the strategic

and economic tracks. Secretary of State John Kerry also spoke at the opening of the talks, and said the U.S. anticipates candid talks on cybersecurity. "We look forward to a very frank discussion of cybersecurity and other ongoing concerns," Mr. Kerry said. Mr. Biden also warned China to keep international waterways open for trade as the U.S. has repeatedly voiced concerns about China's reclamation work in the South China Sea. "Responsible countries adhere to international law and work together to keep international sea-lanes open for unimpaired commerce," Mr. Biden said. "The notion of sea lanes being open and protected is even more crucial today than any time in human history, because of the interconnectedness of the world." Chinese Vice Premier Liu Yandong, also speaking through an interpreter, warned the U.S. against taking a combative tone. "Confrontation is a negative-sum game in which both sides will pay heavy prices and the whole world will suffer too," Ms. Liu said. The vice premier also appeared to try to manage administration officials' expectations for progress in talks. "Although dialogue may fall short of expectation, and sometimes nothing much is achieved, leaving everybody unhappy, yet, it would always be more preferable than confrontation," she said. In arguing for Beijing to address U.S. trade, investment and security concerns, Mr. Biden appealed to China's need to spur growth as the country's economy appears to be cooling faster than Beijing expects. International rules-based order, he said, propagates economic prosperity. "Fair competition not only spurs our companies to develop better products and services, it spurs economic growth around the world." the vice president said. "On a level playing field, our growth contributes to yours, and your growth in China contributes to ours." The U.S. delegation is being led by Messrs. Biden, Kerry and Lew. The Chinese Delegation includes Vice Premier Wang Jang; State Councilor Yang and Vice Premier Liu. About 400 Chinese officials are in Washington to attend the annual dialogue.

Risk of Chinese espionage in the US is hampering scientific and economic relationships.

Gray, '15 (Charles, "Espionage charges risk hurting science", "Global Times", 06/02,

<http://www.globaltimes.cn/content/924991.shtml>) JL

The recent arrest of Professor Zhang Hao from Tianjin University and the indictment of five other Chinese nationals on charges of violating the Economic Espionage Act (EEA) raises difficult questions when it comes to the relationship between the US and China. Scientific cooperation between the two nations is at a higher level than ever before, with hundreds of thousands of Chinese students and professionals working in the US. But there is nothing more likely to hamper this mutually beneficial relationship than a perception that the US government is going out of its way to target these individuals for prosecution. The EEA occupies a gray area when it comes to protecting trade secrets. It does not refer to military espionage, or the transmission of classified information, nor does it refer to the theft of trade secrets for private gain. The EEA is intended to combat the theft of trade secrets for the benefit of another nation. However, the prosecution must be able to prove that the theft was both intended for and benefited the foreign government in question. American prosecutors currently argue that because Tianjin University is a State-run institution, the alleged espionage falls under the ambit of this law, even though the company these individuals formed, ROFS Microsystem, was the primary beneficiary

of this alleged theft. However, proving such a link will be very challenging for US prosecutors. Attempting to extend this law to cover cases where an alleged theft may benefit a government or where there is an incidental relationship between the suspect and his or her nation could see virtually every alleged theft of trade secrets coming under its ambit. Furthermore, without direct evidence such as stolen blueprints, the question must be raised whether the information was actually stolen as opposed to the accused individuals making use of the knowledge gained during their employment. While this might be seen as a violation of non-disclosure or non-competition agreements made by the individual, it would not be actionable under the EEA. This is especially true given that none of the current indictments allege the use of hacking or other illegal techniques to obtain the information in question. Another issue with the EEA is the fact that it currently has no explicit exception for the process of reverse engineering another business' product. However, the reverse engineering of an existing product or technology is generally considered a legitimate tactic, so long as the company engages in the process of developing its own version of the product or technique in question. Past prosecutions have had a mixed record, such as that of Sherry Chen in 2014. That case was especially notable due to the fact that Chen is a naturalized US citizen. This case, initially proclaimed as an example of espionage directed at the US by China, eventually collapsed and ended with the dismissal of all the charges facing Chen as well as the reinstatement of her benefits and salary. Perhaps the most dangerous issue regarding these prosecutions is the widely held perception that there is a racial bias at play. There is wide concern that Chen's national origins may have played a role in her prosecution, especially given US society's history of anti-Chinese sentiment. When combined with the potential overreach found within the EEA, **further prosecutions could lead to the perception that it is dangerous to be a Chinese national or Chinese American working in any field that is seen as economically important to the US.** Ultimately, **such a perception could damage or destroy what has been an extremely profitable economic and scientific relationship for both nations. There will always be economic tension between the US and China.** However, the economies of both nations are dependent upon maintaining friendly and mutually beneficial trade relations. While the protection of a nation's intellectual property is always an important issue, moves to expand the use of the EEA against Chinese businesspersons and scientists may very well do more harm than good. As Chen's experience shows, the improper use of espionage laws can result in an embarrassing failure for prosecutors and a personally trying experience for the accused.

Econ decline goes nuclear and escalates

Auslin 9 (Michael, Resident Scholar – American Enterprise Institute, and Desmond Lachman – Resident Fellow – American Enterprise Institute, “The Global Economy Unravels”, Forbes, 3-6, <http://www.aei.org/article/100187>)

What do these trends mean in the short and medium term? The Great Depression showed how social and **global chaos followed hard on economic collapse.** The mere fact that parliaments across the globe, from America to Japan, are unable to make responsible, economically sound recovery plans suggests that they do not know what to do and are simply hoping for the least disruption. Equally worrisome is the adoption of more statist economic programs around the globe, and the concurrent decline of trust in free-market systems. **The threat of instability is a pressing concern.** China, until last year the world's fastest growing economy, just reported that 20 million migrant laborers lost their jobs. Even in the flush times of recent

years, **China faced** upward of **70,000 labor uprisings a year**. **A sustained downturn poses grave and possibly immediate threats to Chinese internal stability**. The regime in Beijing may be faced with a choice of repressing its own people or diverting their energies outward, leading to conflict with China's neighbors. **Russia**, an oil state completely dependent on energy sales, **has had to put down riots in its Far East as well as in downtown Moscow**. Vladimir Putin's rule has been predicated on squeezing civil liberties while providing economic largesse. If that devil's bargain falls apart, then **wide-scale repression inside Russia, along with a continuing threatening posture toward Russia's neighbors, is likely**. Even apparently stable societies face increasing risk and the threat of internal or possibly external conflict. As Japan's exports have plummeted by nearly 50%, one-third of the country's prefectures have passed emergency economic stabilization plans. Hundreds of thousands of temporary employees hired during the first part of this decade are being laid off. Spain's unemployment rate is expected to climb to nearly 20% by the end of 2010; Spanish unions are already protesting the lack of jobs, and the specter of violence, as occurred in the 1980s, is haunting the country. Meanwhile, in Greece, workers have already taken to the streets. **Europe as a whole will face dangerously increasing tensions** between native citizens and immigrants, largely from poorer Muslim nations, who have increased the labor pool in the past several decades. Spain has absorbed five million immigrants since 1999, while nearly 9% of Germany's residents have foreign citizenship, including almost 2 million Turks. The xenophobic labor strikes in the U.K. do not bode well for the rest of Europe. **A prolonged global downturn, let alone a collapse, would dramatically raise tensions inside these countries**. **Couple that with** possible protectionist legislation in the United States, **unresolved ethnic and territorial disputes in all regions of the globe** and a loss of confidence that world leaders actually know what they are doing. **The result may be a series of small explosions that coalesce into a big bang**.

UQ

UQ—Monitoring Checks

Counterintelligence stops Russian spies.

Burton & West, '10 (Fred & Ben, "The Dismantling of a Suspected Russian Intelligence Operation

", "Stratfor Global Intelligence", 07/01,

https://www.stratfor.com/weekly/20100630_dismantling_suspected_russian_intelligence_operation) JL

Counterintelligence According to authorities, the suspected operatives were under heavy surveillance by U.S. counterintelligence agents for 10 years. Working out of Boston, New York and Washington, the FBI employed its Special Surveillance Group to track suspects in person; place video and audio recorders in their homes and at meeting places to record communications; search their homes and safe-deposit boxes; intercept e-mail and electronic communications; and deploy undercover agents to entrap the suspects. **Counterintelligence operations don't just materialize out of thin air.** There has to be a tip or a clue that puts investigators on the trail of a suspected undeclared foreign agent. **As suggested by interviews with the suspects' neighbors, none of them displayed unusual behavior that would have tipped the neighbors off.** All apparently had deep (but not airtight) legends going back decades that allayed suspicion. The criminal complaint did not suggest how the U.S. government came to suspect these people of reporting back to the SVR in Russia, although we did notice that the beginning of the investigation coincides with the time that a high-level SVR agent stationed at Russia's U.N. mission in New York began passing information to the FBI. Sergei Tretyakov (who told his story in the book by Pete Earley called "Comrade J," an abbreviation of his SVR codename, "Comrade Jean"), passed information to the FBI from the U.N. mission from 1997 to 2000, just before he defected to the United States in October 2000. According to the criminal complaint, **seven of the 11 suspects were connected to Russia's U.N. mission**, though evidence of those links did not begin to emerge until 2004 (and some as late as 2010). The timing of Tretyakov's cooperation with the U.S. government and the timing of the beginning of this investigation resulting in the arrest of the 11 suspects this week suggests that Tretyakov may have been the original source who tipped off the U.S. government. So far, the evidence is circumstantial — the timing and the location match up — but Tretyakov, as the SVR operative at Russia's U.N. mission, certainly would have been in a position to know about operations involving most of the people arrested June 27. Why Now? Nothing in the complaint indicates why, after more than 10 years of investigation, the FBI decided to arrest the 11 suspects June 27. It is not unusual for investigations to be drawn out for years, since **much information on tradecraft and intent can be obtained by watching foreign intelligence agencies operate without knowing they are being watched. Extended surveillance can also reveal additional contacts and build a stronger case.** As long as the suspects aren't posing an immediate risk to national security (and judging by the criminal complaint, these 11 suspects were not), there is little reason for the authorities to show their hand and conclude a fruitful counterintelligence operation. It has been suggested that some of the suspects were a flight risk, so agents arrested all of them in order to prevent them from escaping the United States. Metsos left the United States on June 17 and was arrested in Cyprus on June 29, however, his whereabouts are

currently unknown, as he has not reported back to Cypriot authorities after posting bail. A number of the suspects left and came back to the United States numerous times, and investigators appear not to have been concerned about these past comings and goings. It isn't clear why they would have been concerned about someone leaving at this point. The timing of the arrests so soon after U.S. President Barack Obama's June 25 meeting with Russian President Dmitri Medvedev also raises questions about political motivations. Medvedev was in Washington to talk with Obama in an attempt to improve relations between the two countries on the day the FBI officially filed the criminal complaint. The revelation of a network of undeclared foreign agents operating in the United States would ordinarily have a negative effect on relations between the United States and the foreign country in question. In this case, though, officials from both countries made public statements saying they hoped the arrests would not damage ties, and neither side appears to be trying to leverage the incident. Indeed, if there were political motivations behind the timing of the arrests, they remain a mystery. Whatever the motivations, now that the FBI has these suspects in custody it will be able to interrogate them and probably gather even more information on the operation. The charges for now don't include espionage, but the FBI could very well be withholding this charge in order to provide an incentive for the suspects to plea bargain. We expect considerably more information on this unprecedented case to come out in the following weeks and months, revealing much about Russian clandestine operations and their targets in the United States.

Monitoring checks insider threats--empirics

Messmer 3 [Ellen Messmer (Senior editor at Network World), "Security experts: Insider threat looms largest," Network World, 12/8/2013, <http://www.networkworld.com/article/2329002/lan-wan/security-experts--insider-threat-looms-largest.html>] AZ

The FBI has started its own study of those who commit computer crimes - not necessarily focusing on IT administrators - by interviewing those now in jail, said John Jarvis, an FBI behavioral research scientist. "Cybercrime is primarily an insider phenomenon," Jarvis said. Only a quarter can be classified as "outsider," he said. Guarding against that minority is the job of insiders such as Timothy Vieregge, deputy of the systems and architecture branch in computer network operations at Fort Belvoir's First Information Operations Command in Virginia. Vieregge helped set up a network-monitoring system for the Army before the start of the war in Iraq. The system, based on more than 500 intrusion-detection monitors at Army network facilities around the globe, captured information on cyberattacks and sent it to the security information management product the Army uses, Symantec's CyberWolf, with NSA-developed visualization software called Renoir. While Vieregge said he couldn't say where attacks against Army computers originated, the monitoring systems showed which attacks succeeded and which failed. While attempted attacks increased 84% between October 2002 through March, the number of successful intrusions against Army facilities has dropped from a high of 16 in October to six in March. Vieregge said the monitoring system helped the Army prioritize areas that needed strengthening - where proper software patching hadn't been done, for example - and

setting up routers to block IP addresses from attack points. Viergge said the Army isn't using intrusion-prevention systems yet to automatically block attacks but is following the technology's development.

UQ—TSA

Surveillance checks insider threats in the TSA

Sternstein 15

Aliya Sternstein, Aliya Sternstein reports on cybersecurity and homeland security systems. She's covered technology for more than a decade at such publications as *National Journal's Technology Daily*, *Federal Computer Week* and *Forbes*. Before joining *Government Executive*, Sternstein covered agriculture and derivatives trading for *Congressional Quarterly*. She's been a guest commentator on C-SPAN, MSNBC, WAMU and Federal News Radio. Sternstein is a graduate of the University of Pennsylvania., 4-20-2015, "Feds Heighten Scrutiny of TSA Screeners and Aviation Staff to Thwart Insider Threat," Nextgov, <http://www.nextgov.com/defense/2015/04/big-brother-oversee-tsa-screeners-and-other-airport-employees/110590/>

Transportation Security Administration and aviation industry employees will be subjected to heightened electronic surveillance following several incidents involving insiders who abused their badges to traffic guns, federal officials announced Monday. Among the actions that kick in immediately are random passenger-like screening of airline employees throughout the workday and biennial criminal history checks, until there is a system in place for "real-time recurrent" FBI background checks for all aviation workers, officials said. TSA potentially also might monitor social media communications of individuals near certain airports, as well as suspect employees. And threat assessments of employees could be expanded to include cross-checks of employee information against additional U.S. and international watch lists. "I am confident that the potential insider threat posed by aviation industry employees will be significantly mitigated as a result of these recommendations," DHS Secretary Jeh Johnson said in a statement Monday. The background check system under development, called "Rap Back," will provide immediate notifications about criminal and, in some cases, civil activity of individuals in the FBI's mammoth biometric database. The Aviation Security Advisory Committee called for an "immediate pilot" and full operation by the end of 2015. One potentially divisive recommendation: "When a threat stream is identified, monitoring of social media via keyword GEO Fencing at the appropriate airport, or monitoring of the social media of suspect employees, can be effective tools to determine the existence of an insider threat." Other inspection techniques suggested include feeding security camera footage into prediction software that can flag odd activity. "CCTV monitoring, video analytics or predictive analytical software would focus on anomalies, behavioral patterns, carriage of bags, etc.," the report states.

A2 UQ Overwhelms/2NC Ext

Federal surveillance checks counterespionage now, but metadata collection and bulk surveillance are crucial tools—Chinese and Russian espionage prevented by information gathering

Miller, '14 (Chris, U.S. Army veteran and Purple Heart recipient following two tours in Baghdad, Iraq and has worked as a military contractor in the Middle East. His work currently focuses on strategic studies. His interests are CBRN, military and veterans issues, the Cold War, and international security affairs, “Cold War Lessons for Counterintelligence Today”, “Cicero Magazine”, 07/07, <http://ciceromagazine.com/features/cold-war-lessons-for-counterintelligence-today/>) JL

The first responsibility of counterintelligence is to protect information. If the enemy cannot access information, he cannot obtain it. Passive or defensive measures to protect information can be called “security”. “Physical Security” includes guard forces, protective barriers, flood lighting, intrusion and camera systems, and locking and alarm devices, as well as personnel and material controls such as ID cards, passwords, exit controls and access logs. “Information Control” includes items such as security clearances following background inquiries, polygraphs, locking containers, educating staff on security, document tracking, censorship, and coding and encryption. In 1945, a serving OSS officer found himself reading a report in Amerasia magazine he had written a year before. Upon investigation it was discovered that the publication had been receiving documentation smuggled out of the U.S. State Department. This incident and its aftermath led to a major expansion of the U.S. Bureau of Diplomatic Security under Robert L. Bannerman, including the establishment of a program for “Documentary and Physical Security”. In 1961 the Bureau instituted a standardized system of laminated ID cards in response to the more than 2,000 badges of different types lost by employees over the previous 12 years. John Anthony Walker, a U.S. Navy COMSEC custodian who sold communications information to Moscow, exhibits why these measures are important. Walker was able not only to get away with selling information he accessed over a period of 22 years, he was so trusted in a system with inadequate information controls and re-investigations that he was given access by others to information he would not otherwise have had—a violation of the “need to know” principle. CIA officer and Soviet spy Aldrich Ames was also granted access by trusting colleagues to information he would not have been entitled to access alone. Though not as glamorous as chasing spies, erecting physical, procedural and electronic barriers to the access and removal of documents and data is a vital counterintelligence function. Indeed after a foreign intelligence agent has successfully penetrated or a domestic colleague has turned inside an organization, security barriers may be the last thing standing in their way. Today, physical and information security is arguably an even bigger issue considering the amount of data that can be stored on computers or external drives. There has been an abundance of examples in both the U.S. (see here, here, and here) and UK (see here and here) of government information being compromised, sometimes at cabinet level, by the loss of computers. The cases of Edward Snowden and Private Manning exhibit how much easier the digital age has made leaking, smuggling, and transmitting large amounts of data. Though it isn't as sexy as spy hunting, **the**

security of intelligence information is as important today, if not more so, as during the Cold War. Although movies frequently feature embassy break-ins or hunting undercover spies, much of the Cold War spying by the Soviets was done by “legals,” or Soviet citizens or diplomats openly working in the West. Frustrating foreign intelligence operatives is the second major function of counterintelligence and accurate record keeping is the heart of any counterintelligence program. The U.S. Senate Select Committee on Intelligence in its 1994 investigation into the Ames affair criticized CIA for failing to share counterintelligence records and information within the agency and externally with the FBI and recommended greater cooperation in counterintelligence within the CIA Operations Directorate. As a counterespionage function, it is important to track who visited where and when and how and whom when attempting to identify potential foreign intelligence operatives. The most effective technique to counter foreign spies is to deny them entry to the country or to expel them if already in place. Throughout the 1960s, the KGB overwhelmed MI5 by placing more agents in London than any other Western capital. In 1971, using fantastical sabotage plans from a KGB defector as a pretext, MI5’s Operation Foot led to expelling 90 Soviet intelligence gatherers and notification of Moscow that an additional 15 would not be allowed re-entry, a setback from which Soviet espionage never recovered. Oleg Gordievsky, a KGB agent who defected to the West, remembered the operation as, “A bombshell . . . an event that shocked the [Moscow] center profoundly.” Eighty suspected Soviet spies were expelled from the U.S. in similar fashion in 1985. Expelling or excluding foreign intelligence agents causes embarrassment for their masters and ends the career of a covert agent. This is still a tool used today. In 2010, a Russian intelligence officer informed the FBI of a 10-person spy ring, the most famous of whom was Anna Chapman, who became a celebrity upon return to Russia. The U.S. arrested and expelled them in exchange for four agents held by Moscow. Russia attempted to mitigate embarrassment by greeting the exposed spies, who had achieved virtually nothing, as heroes, much as the USSR did following the exchange of Vilyam ‘Abel’ Fisher for F. Gary Powers in 1962. Physical surveillance of foreign intelligence operatives has proven effective. There are three general methods: Static surveillance of a known place such as residence or embassy; mobile surveillance by following on foot, by car, or even aircraft, and; electronic surveillance such as phone taps, wireless radio transmitters, mail interception, or geographic tracking devices. A study found that between 1976 and 1991 no less than 16 would-be spies telephoned or walked into the Soviet embassy in the U.S. to sell information and in every case they were caught by FBI surveillance. Cold War history on both sides is rich with such stories. Oleg Penkovsky, perhaps the highest-placed spy the West ever had, was supposedly uncovered through KGB surveillance. Recent headlines have been filled with controversy over the electronic surveillance programs revealed by Edward Snowden. The heads of intelligence agencies in the U.S. and UK have responded by publicly discussing how vital the controversial surveillance programs are and claim it has foiled “dozens” of plots. The continuing need to counter electronic surveillance through penetration by foreign governments is shown by constant attacks on U.S. government computers by Chinese government agencies. Though the methods and players have changed with the times after the Cold War, the opponents and counterintelligence requirements remain much the same.

UQ—XO 12333

Executive Order 12333 solving cyber espionage now

Gonnella 14

Cynthia Gonnella. May 2014, "CYBER COUNTERINTELLIGENCE, DEFENDING THE UNITED STATES"
Gonnella is a Cyber Crimes Instructor at the National White Collar Crime Center. She specializes in teaching Cyber Crime & Cyber Security.

http://media.proquest.com/media/pq/classic/doc/3333324431/fmt/ai/rep/NPDF?_s=RWOlr5G3chitdEVF5%2FhoOyLni4%3D

The question that remains questions how the United States defeats cyber espionage. Executive order 12333 stated that: Timely, accurate, and insightful information about the activities, capabilities, plans, and intentions of foreign powers, organizations, and persons, and their agents, is essential to the national security of the United States. All reasonable and lawful means must be used to ensure that the United States will receive the best intelligence possible. Originally published in 1981 and amended several times since, Executive Order 12333 is as relevant today as it was when President Ronald Reagan signed it into existence. Laying the foundation for the IC and its structure, the executive order is broad in scope but clear in its intent CI is a crucial part of the IC process of defending the United States and its interests both foreign and domestic. Domestically, the FBI is the controlling agency and coordinator of CI activities and remains the focal point for communications and integration into the defense process of the United States National Security Council's intelligence activities. Conversely, the CIA has a similar task, but does so with a projected foreign focus. The activities of the FBI and the CIA play significant roles in defeating espionage and defending technologies and systems that form the foundation for the Communications and IT sectors.

Link—Generic

Federal intelligence is needed to monitor counterintelligence.

Meiman, '07 (Kathryn L. , "What's that I hear? : domestic surveillance and

counterintelligence on antiwar musicians in the 1960s", "Lehigh University",

<http://preserve.lehigh.edu/cgi/viewcontent.cgi?article=1982&context=etd>) JL

COINTELPRO tactics took many forms, including surveillance techniques such as wiretaps, and more active techniques such as "black bag jobs," sending of anonymous letters to promote distrust or fear, and writing and publishing negative information about members of the Communist Party in the national media through sympathetic media outlets. Counterintelligence techniques are significantly different from those that constitute intelligence gathering. The goal of such a program seeks to "actively restrict a target's ability to carry out actions (prevention), or to encourage acts of wrongdoing (facilitation)."¹³ In comparison to simple intelligence gathering, counterintelligence work requires the carrying out of actions in response to the information gathered. Intelligence work is necessary for counterintelligence programs to exist, but not vice versa. By the 1960s, the FBI had developed COINTELPROs that focused not only on the Communist Party, but had branched out to encompass numerous other groups that 1. Edgar Hoover had identified as threats to national security. Under the broad headings which Hoover used to classify his targets, the Socialist Workers Party, the Ku Klux Klan and other "White Hate Groups," several black Civil Rights organizations referred to by the Bureau as the "Black Nationalist-Hate Groups," and the New Left, notably the anti-Vietnam war movement, were now considered to be the greatest threats to America. ¹⁴ Hoover saw any action that challenged the status quo as "subversive," and protesters of any type drew his ire. The younger generation who wore long hair and spoke out against the Vietnam War appeared downright dangerous and, as quoted in the New York Times, Hoover alerted police that it was "vitally important to recognize that these militant extremists are not simply faddists or 'college kids' at play. Their cries for revolution and their advocacy of guerilla warfare evolve out of a pathological hatred for our way of life and a determination to destroy it." ¹⁵ This belief fueled his decision to investigate protest of any type in attempt to quash it.

Counterintelligence operations key to solve—surveillance checks espionage

McConnell, '07 (J.M., Director of National Intelligence, "The National Counterintelligence Strategy of the United States of America, <http://www.ncsc.gov/publications/strategy/docs/CIstrategy.pdf>) JL

The United States faces a wide range of threats to its security from foreign intelligence activities, terrorist elements, and other non-traditional adversaries designed to achieve advantage over US military, diplomatic, and economic interests at home and abroad. The counterintelligence community must act jointly to understand, confound, manipulate, and thwart these threats, which exceed the ability or resources of any single US agency or department to overcome. When necessary, we will disrupt these activities through arrest and expulsion. The counterintelligence community will therefore identify and prioritize adversarial intelligence

activities targeting US interests and leverage its collection, analytical, investigative, and operational resources to defeat these activities. We will also expand our capabilities in cyberspace. The cyber environment provides unprecedented opportunities for adversarial activities and is particularly vulnerable because of the nation's heavy reliance on information systems. The counterintelligence community will exploit and defeat adversary intelligence activities through the application of the full range of intelligence techniques. In collaboration with our colleagues in the broader Intelligence elements will assess the intelligence capabilities and activities of foreign powers and non-state groups including terrorists and will describe their resources, plans, methods of operations, and worldwide reach. Foreign intelligence establishments and terrorist groups acquire resources, train and deploy personnel, and execute both clandestine and covert intelligence operations against us. The counterintelligence community must understand who they are, who their intelligence allies are, what they do, why they do it, and what they can do. Counterintelligence elements will use this knowledge to direct activities that counter, exploit, and defeat adversary intelligence activities – particularly the rooting out of spies in our nation's midst. Accordingly, the counterintelligence community will conduct aggressive, strategically directed operations against priority intelligence targets around the world using the full range of operational means. The intelligence activities of foreign powers afford us opportunities to exploit their operations and gain access to their intelligence in order to corrupt its integrity. We will conduct worldwide operations to disrupt or defeat our intelligence adversaries as they assess and respond to the United States. Each agency and department will contribute its own unique capabilities, authorities, and resources in a unified effort.

Link—Bulk Collection

New Freedom Act allows enough surveillance to check insider threats—the plan is too strict and prevents the data collection key to prevent another leak—status quo detection is key

Sternstein 6/4 [Aliya Sternstein (covered technology for more than a decade at such publications as National Journal's Technology Daily, Federal Computer Week and Forbes, commentator on C-SPAN), "WATCHDOG SAYS PENTAGON NEEDS TO CRANK UP 'INSIDER THREAT' MONITORING," NextGov, 6/4/2015, <http://www.nextgov.com/cybersecurity/2015/06/watchdog-says-dod-needs-crank-insider-threat-monitoring/114430/?oref=ng-relatedstories>] AZ

Work to rein in some post-Sept. 11 domestic surveillance practices ended with passage of a bill that limits the National Security Agency's collection of U.S. call records. But regular Joes inside the Pentagon -- or at least those with access to sensitive or classified information -- should expect even greater scrutiny on their workplace digital activities. Just before the Senate cleared the USA Freedom Act, the Government Accountability Office released a report recommending the Defense Department take new steps to set up so-called "insider threat" programs, which aim to stop information leaks by disgruntled employees. The unclassified version of the report found only half of military components GAO reviewed have logged system and user behaviors to develop "a baseline of normal activity patterns." The purpose of tracing the activities of Pentagon personnel is to zero in on network "anomalies," computer usage that might be indicative of a leaker, the watchdogs said. NSA is part of the Defense Department. The employee insider threat program was borne out of various laws and White House policies issued since 2010 that require all departments to do a better job of fortressing classified information. That year, former soldier Chelsea Manning shared top secret files with the WikiLeaks website. The ability of ex-NSA contractor Edward Snowden to reveal classified intelligence in 2013 suggests anti-leak programs need more muscle, Patricia Larsen, co-director of the governmentwide National Insider Threat Task Force, said last December. This week, GAO agreed. A key element of the Pentagon's program has not consistently been incorporated Defensewide, the auditors said, noting "three of the six components [evaluated] have developed a baseline of normal activity" on Defense networks. They did not identify the organizations by name. "Anomalous activities are network activities that are inconsistent with the expected norms, the watchdogs added. "These activities, such as network activity outside of normal work hours or changes in typical data download patterns, could indicate the exploitation of cyber vulnerabilities, among other things." To detect anomalies, three of the components GAO examined plan to buy or upgrade analytic tools that allow them to monitor user behavior suggesting insider-threat activities. One entity that already has such technology said the enhanced model it expects to obtain will be able to watch a user's behavior across unclassified, secret and top-secret networks. A handful of policies published between 2000 and 2012 call for establishing a normal activity baseline. Auditors also pointed to a post-Snowden, nonpublic February 2014 directive on protecting national security systems from insider threats. The U.S. military's 2000 Final Report of the Insider Threat Integrated Process Team instructs organizations to come up with a specific list

of employee behaviors that should be tracked online, because otherwise managers will suffer information overload. It will be impossible to baseline normal activity patterns "with the sheer volume of user characteristics data" unless supervisors establish an "inventory of **behavior attributes** and **patterns** grounded in **counterintelligence experience** and stored to allow for **rapid automatic analysis** and monitoring," the authors of that Defense report wrote. Once a Pentagon organization has selected which employee and system activities to keep tabs on, those attributes should be studied for more than a couple of days. A December 2012 Carnegie Mellon Software Engineering Institute manual, Common Sense Guide to Mitigating Insider Threats, states "the longer the organization monitors the chosen data points, the more reliable the baseline will be." Recommended data points to observe include: Communications between devices: the devices a workstation communicates with and the devices a server communicates with; Bandwidth consumed, especially noting the differences between bandwidth use during and after business hours; Virtual private network users: **times of access**, **bandwidth consumed**, **geolocation information**; Ports and protocols; Normal firewall and IDS alerts—Normal alerts may occur when business processes change (e.g., there is increased website traffic). The Carnegie Mellon researchers note, "Organizations may find it challenging to maintain employee privacy while collecting data to establish a baseline."

Link—Data Mining

Computerized data mining key to checking insider threats—squid monitoring solves

Braun 14 [Stephen Braun (reporter at Associated Press), "U.S. intelligence officials to monitor federal employees with security clearances," PBS News, 3/10/2014, <http://www.pbs.org/newshour/rundown/us-intelligence-officials-monitor-federal-employees-security-clearances/>] AZ

WASHINGTON — U.S. intelligence officials are planning a sweeping system of electronic monitoring that would tap into government, financial and other databases to scan the behavior of many of the 5 million federal employees with secret clearances, current and former officials told The Associated Press. The system is intended to identify rogue agents, corrupt officials and leakers, and draws on a Defense Department model under development for more than a decade, according to officials and documents reviewed by the AP. Intelligence officials have long wanted a computerized system that could continuously monitor employees, in part to prevent cases similar to former National Security Agency analyst Edward Snowden. His disclosures bared secretive U.S. surveillance operations. An administration review of the government's security clearance process due this month is expected to support continuous monitoring as part of a package of comprehensive changes. Privacy advocates and government employee union officials expressed concerns that continuous electronic monitoring could intrude into individuals' private lives, prompt flawed investigations and put sensitive personal data at greater risk. Supporters say the system would have safeguards. Workers with secret clearances are already required to undergo background checks of their finances and private lives before they are hired and again during periodic re-investigations. "What we need is a system of continuous evaluation where when someone is in the system and they're cleared initially, then we have a way of monitoring their behavior, both their electronic behavior on the job as well as off the job," Director of National Intelligence James Clapper told Congress last month. Clapper provided lawmakers with few details but said the proposed system would extend "across the government," drawing on "six or seven data streams." Monitoring of employees at some agencies could begin as early as September and be fully operational across the government by September 2016. The price tag, Clapper conceded, "is going to be costly." In separate comments last week, retiring NSA Director Keith Alexander said intelligence, Defense and Cyber Command officials are collaborating on "insider threat" planning. Recently declassified federal documents show that the NSA is already conducting electronic monitoring of agency staffers involved in surveillance operations. Budget documents released this week show the Pentagon requesting nearly \$9 million next year for its insider threat-related research. Current and former officials familiar with the DNI's planning said the monitoring system will collect records from multiple sources of information about employees. They will use private credit agencies, law enforcement databases and threat lists, military and other government records, licenses, data services and public record repositories. During random spot checks, the system's software will sift through the data to spot unusual behavior patterns. The system could also link to outside databases to flag questionable behavior, said the officials, who spoke anonymously because they were not authorized to publicly discuss the plans. Investigators will analyze the information along with data separately collected from social media and, when necessary, polygraph tests, officials said.

The proposed system would **mimic monitoring systems** already in use by the airline and banking industries, but it most closely draws from a 10-year-old Pentagon research project known as the Automated Continuous Evaluation System, officials said. The ACES program, designed by researchers from the Monterey, Calif.,-based Defense Personnel and Security Research Center and defense contractor Northrop Grumman, has passed several pilot tests but is not yet in full operation.

Link—FBI Spying

The FBI uses forms of domestic communication surveillance cut by the aff to catch foreign spies on US soil

Swarts, investigative reporter for the Washington Times, 2/17/15 (Phillip, “FBI surveillance tactics jeopardized by fight over NSA phone snooping program”, The Washington Times, 2/17/15, <http://www.washingtontimes.com/news/2015/feb/17/fbi-surveillance-tactics-jeopardized-by-fight-over/?page=all>, accessed 6/23/15, ZW)

Congressional discord may cause the FBI to lose its ability to collect hotel bills, credit card slips and other “tangible things” they use to hunt down terrorists, spies and criminals. The FBI uses the authority of Section 215 of the Patriot Act to take “books, records, papers, documents, and other items,” with a court order, to covertly gather evidence against those suspected of spying on America on U.S. soil. Last month, **the FBI rounded up a ring of Russian spies in New York by presenting phone conversations and email communications between two Russian diplomats and a businessman.** Similarly, U.S. officials say, the Patriot Act helped nab Kremlin spy Anna Chapman and nine other Russians who were sent back to their country in a spy swap. **However, Section 215 of the Patriot Act is set to expire in June, and lawmakers are conflicted about whether to renew it, reform it or let it expire.** Section 215 has become a political lightning rod because it also gives legal justification to the National Security Agency’s bulk collection of phone records on American citizens. Sen. Rand Paul, Kentucky Republican, and civil liberties groups have criticized the program and are determined to end its surveillance practices. The move has pitted them against hawks such as Senate Majority Leader Mitch McConnell, Kentucky Republican, who say repeal would threaten national security as Islamist terrorism gains ground in the Middle East. Lawmakers who are seeking a middle-ground, allowing the FBI to keep its surveillance programs but stripping the NSA of its authority, are facing an uphill climb. The two opposing sides could prevent any extension from getting the votes needed before Section 215 simply expires altogether. Senior lawmakers said **if extension efforts are sunk, then some of the FBI’s counterterrorism and spy surveillance tools also will be lost.** “Law enforcement officials often use Section 215 to obtain necessary individual business records, such as hotel records, in connection with national security investigations,” Sen. Chuck Grassley, Iowa Republican and chairman of the Senate Judiciary Committee, said in a statement to The Washington Times. “It’s a useful tool that helps them investigate potential threats to national security.” **The FBI is worried about losing its ability to chase down evidence quickly if Section 215 is not renewed**

FBI programs need more intelligence capabilities in programs including counterintelligence and counterterrorism.

Baginski, '05 (Maureen A., Executive Assistant Director-Intelligence Federal Bureau of Investigation, "Subcommittee on Crime, Terrorism, and Homeland Security House Committee on the Judiciary", "The Federal Bureau of Investigation", 4/19, <https://www.fbi.gov/news/testimony/importance-of-usa-patriot-act-to-fbi-information-sharing>)
JL

Good morning Mr. Chairman and Members of the Subcommittee. I am pleased to be here today with Barry Sabin, Chief of the Counterterrorism Section, Department of Justice Criminal Division to talk with you about the ways in which **the USA Patriot Act has assisted the FBI with its information-sharing efforts**. I will address the overall benefits of the information sharing provisions of the Act, including: the relevant amendments to the Foreign Intelligence Surveillance Act; Section 203(b), which authorizes the sharing of foreign intelligence information obtained in a Title III electronic surveillance with other federal officials, including intelligence officers, DHS/DOD/ICE officials, and national security officials; and Section 203(d), which specifically authorizes the sharing of foreign intelligence information collected in a criminal investigation with intelligence officials. It is important to place the information sharing provisions of the USA Patriot Act in the context of subsequent Congressional action formalizing the FBI Intelligence Directorate in 2004. The Statement of Managers accompanying the Conference Report on H.R. 4818, Consolidated Appropriations Act, 2005 (House of Representatives--November 19, 2004), states: "...the conference agreement adopts the House report language directing the FBI to create a new Directorate of Intelligence....**The need for effective intelligence capabilities cuts across all FBI programs including the counterterrorism, counterintelligence, criminal and cyber crime programs**. This new directorate will ensure that intelligence is shared across these programs, eliminate information stove-piping, and allow the FBI to quickly adapt as threats change.... It shall also work to improve the FBI's capability to share intelligence, not only within the Bureau and the Intelligence Community, but also with State and local law enforcement." I am here today to express to you how crucial renewal of the USA Patriot Act provisions related to information and intelligence sharing is to fulfilling the responsibilities of the FBI's new Directorate of Intelligence as envisioned by Congress. There are two components to this subject: first, the issue of collecting intelligence and the legal authorities and policies that govern that collection; and second, how that information is actually shared once it is collected. I will address both in turn. I realize that the collection authorities granted under the Patriot Act are of concern to many individuals and organizations. In that regard I want to say two things. First, the FBI is committed to carrying out its mission in accordance with the protections provided by the Constitution. **FBI agents are trained to understand and appreciate that the responsibility to respect and protect the law is the basis for their authority to enforce it**. Respect for Constitutional liberties is not optional, it is mandatory for all FBI employees. The FBI could not be effective--and would not exist--without it. Second, the FBI's authority to collect information is very clearly laid out in law and is directed by the Attorney General--the chief law enforcement officer for the United States. Intelligence collection is only done in accordance with the intelligence priorities set by the President, and is guided at every step by procedures mandated by the Attorney General. As soon as an international terrorism intelligence or

counterintelligence case is opened, both Headquarters and the Department of Justice are notified. We are subject to and follow Attorney General's guidelines and procedures for FBI National Security Investigations and Foreign Intelligence Collection (NSIG); and all terrorism-related cases are subject to in-progress review by the Department of Justice (DOJ) Office of Intelligence Policy and Review, the DOJ Criminal Division, and local offices of U.S. Attorneys. We report annually to the Department of Justice on the progress of intelligence cases. The FBI's collection authorities are also controlled by the Federal Courts. Under the USA Patriot Act, a federal judge must still approve search warrants and wiretaps for counterintelligence and counterterrorism investigations and Agents must establish probable cause in order to obtain a FISA warrant. The FBI only collects and disseminates intelligence under guidelines designed specifically to protect the privacy of United States persons, and we are committed to using our authorities and resources responsibly.

Link—DoD Specific

Monitoring social media addresses insider threats within the DoD

Kirkham 12 [Lara Dawn Kirkham (American attorney with Jackson Walker L.L.P), UT Austin Approved Report, “The Insider Threat in the Digital Age: A Case for Electronic Monitoring in the Nuclear Weapons Complex,”

https://books.google.com/books/about/The_Insider_Threat_in_the_Digital_Age.html?id=qaFQmwEACAAJ] AZ

Social media sources can potentially provide much more information about employees than would be contained in DoD personnel files, with the additional benefits of being up-to-the-minute, electronically searchable, and automated.⁹⁷ The term social media includes six different types of content: social networking sites⁹⁸ (Facebook, LinkedIn, MySpace), blogs and micro blogs⁹⁹ (Twitter), content communities¹⁰⁰ (Flickr, YouTube), collaborative projects¹⁰¹ (Wikipedia), virtual game worlds¹⁰² (World of Warcraft), and virtual social worlds¹⁰³ (Second Life).¹⁰⁴ The main difference between these social media and other media content, such as e-mail or instant messaging, is the public sharing aspect. **The social media with the most potential use in prediction of insider threats are social networking sites and blogs. As of October 2012, Facebook reached over 1 billion active monthly users,¹⁰⁵ which includes many military members and DoD employees.**¹⁰⁶ Networking sites allow users to share unprecedented personal information in real-time, and many users post personal photos and comments ranging from office gossip to political opinions. Surprisingly, such a platform does not lead to an “idealized virtual identity,” but rather, the information posted on **social networking sites can reveal the true personality of the user.**¹⁰⁷ **Many of the indicators supervisors would use to evaluate the mental state of an employee can be determined by reading a user’s daily comments and exchanges with friends.** **Data** from Facebook profiles can be combined with visualization applications to create informative graphics about the connections among friends and contacts in a user’s profile. For example, the locations of an employee’s friends can be superimposed on a map to display patterns that might indicate foreign influence or allegiance.¹⁰⁸ Such graphic representations can reveal patterns of locations and connections among individuals that might not reveal themselves in conventional searches and can help to detect changes in who employees consider to be their “friends.” Additionally, **statistical analysis of data posted on Facebook profiles can provide information about users not readily apparent from observation.** For example, an MIT undergraduate project analyzed more than 4,000 Facebook profiles of students and was able to predict with 78 percent accuracy whether a particular profile belonged to a gay male.¹⁰⁹ **Statistical correlations like that used in the MIT project can be accomplished using other data found in social network profiles, perhaps to determine which users are likely to display psychosocial indicators like confrontational behavior or selfcenteredness.** Word choice analysis also shows promise in detection of certain psychosocial indicators. Various text analysis programs take a quantitative approach to analyzing text content and style by counting the individual words related to particular themes.¹¹⁰ “A growing body of research has shown that word use can provide an invaluable means of assessing cognitive, emotional, and behavioral processes.”¹¹¹ **Word use can provide**

insight into personality, social and situational processes, and psychological and health changes.¹¹² Social media like **blogs** not only provide an outlet for an individual to express opinions and personal reflections, but they **can reveal personality characteristics based on differences in linguistic style.**¹¹³ **By evaluating employee word choice in various social media, PRP certifying officials can avoid the uneven reporting that comes from reliance on sporadic observation of employee behavior and the subjective evaluations of supervisor and peer monitoring.**

Link—Vigilance

Counterintelligence uses all information and if it is limited, many scenarios will be overlooked.

Tripwire, '14 (“Cyber Counterintelligence: From Theory to Practice”, “The State of Security”, 05/05, <http://www.tripwire.com/state-of-security/security-data-protection/cyber-counterintelligence-from-theory-to-practice/>)
JL

In the previous article, Cyber Intelligence Collection Operations, the types of collection and the types of data that could be obtained were discussed. At the end of the discussion I pointed out that analysts must be critical of the data they evaluate as at any time it could be compromised. Specifically, adversary actors could employ counterintelligence or deception type techniques to push analysts to draw wrong conclusions or discount the data entirely. In this article we will cover this topic of Cyber Counterintelligence (CCI) and discuss its two main branches: Offensive CCI and Defensive CCI. Counterintelligence is as old of a tradecraft as intelligence operations. The concept is simple: provide protection against foreign intelligence operations. The goal with counterintelligence is to prevent, deter, defeat, or manipulate the adversary from conducting intelligence operations on you, those you protect, or your organization to include its operations. With the unique aspects of cyberspace though, we have to draw some contrasts between traditional counterintelligence and cyber counterintelligence. Many compromises and data loss scenarios are intrusions and espionage attempts for the purpose of some type of economic or political gain even if not orchestrated by a foreign government. If we limited CCI to only focus on intrusions by adversary foreign governments or intelligence services many of the scenarios would be overlooked. However, we cannot simply apply all defensive actions meant to prevent intrusions into the field of CCI. If we labeled CCI as all efforts related to stopping intrusions then CCI would become an overused term and the skillset would not be restricted in a useful way; an overused term and tradecraft quickly loses benefit to an organization. Therefore, CCI could best be described as the tradecraft and actions employed to identify and protect against an adversary’s cyber intelligence collection operations. There is a focus here not only on the intrusion but the intent of the intrusion and tradecraft used. Defensive Cyber Counterintelligence Defensive CCI can be thought of as actions taken to identify and counter adversary intrusions before they occur as well as the efforts in identifying and minimizing the threat landscape. In many ways this seems like the role of many cyber security actions: bolster defenses and prevent an intrusion. However, the intent of Defensive CCI is to understand the adversary and minimize the threat landscape to which they might exploit; the product of this effort is usually reports and analyses that defenders can use to complement their overall personnel, network, and information security. One of the most performed Defensive CCI actions is a red team assessment. Think of the team that is tasked to perform a network assessment to determine where weak points exist and where an adversary might gain access to information systems. The red team must have an understanding of adversary tactics, techniques, and procedures to accurately act like the adversary. The red team looks at the network (to include those that operate on it) and information systems, they evaluate the security systems in place, and they bypass the defenses to infiltrate the target. The assessment that they provide when

they are done helps network defenders to know where extra security systems or controls are needed and better prepare for adversaries. In essence, the red team helped identify the threat landscape to the organization and inform the organization on how they could reduce it. Performing regular vulnerability assessments internally or externally is another way to help accomplish this; the vulnerability assessment does not fix the issues but instead identifies where and how adversaries might attempt an intrusion. The real power in these actions comes in the analysis of the CCI analysts though and not simply the automated reports. A second example of a Defensive CCI action is the performing of threat analysis. Threat analysis should be performed with all available information whether it is from OSINT, HUMINT, or technical analysis performed through things such as reverse engineering malware. Threat intelligence is largely a Defensive CCI type effort; threat intelligence analysts track and understand threats such as the APT1 group identified by Mandiant. With an understanding of the threat, their capabilities and tactics, and their intelligence collection operations it is possible to proactively encourage network defenses thus thwarting their intrusion attempts.

I/L—Cybersecurity

Cybersecurity key to solving foreign cyber attacks

Gonnella 14

Cynthia Gonnella. May 2014, "CYBER COUNTERINTELLIGENCE, DEFENDING THE UNITED STATES!" Gonnella is a Cyber Crimes Instructor at the National White Collar Crime Center. She specializes in teaching Cyber Crime & Cyber Security. http://media.proquest.com/media/pq/classic/doc/3333324431/fmt/ai/rep/NPDF?_s=RWOlr5G3chitdEVF5%2FhoOyLni4%3D

Cyber counterintelligence (CCI) could be the United States' best defense against Chinese cyber aggression of Critical Infrastructure and Key Resources (CIKR). The need to defend CIKR is essential to public safety and national defense. As technology evolves and continues to march towards the inevitable connectedness that brings systems in sync with one another, the United States becomes more vulnerable. Of the 16 total sector specific areas of United States' assets, the Communications and Information Technology (IT) sectors are constantly under attack from threats both foreign and domestic. United States network defense claims billions of dollars invested in legacy protections such as traditional and next-generation firewalls, intrusion prevention systems, anti-virus, and web gateways, all of which no longer stop advanced malware or targeted Advanced Persistent Threats (APTs). The purpose of this research was to examine the use of CCI in defending the United States' Communications and IT sectors against Chinese cyber threats. Why is CCI important to CIKR defense? How does CCI fit into the United States Intelligence Community's (USIC) plan? What are some methodologies used to conduct CCI? What motives does China have for targeting critical infrastructure? The nation relies on the Intelligence Community (IC) to be the eyes and ears of national defense. Information warfare needs active counterintelligence (CI) to act as an offensive weapon, a tool for rooting out attackers. Through misdirection, deception, and denial, cybersecurity professionals and the IC can prevent the next disaster. CI by nature can be offensive and active and it can be the first line of defense meant to mark targets and prevent them from harming essential systems.

2NC Blocks

A2 No ! to Insider Threats

Insider threats are the largest risk for cyber-threats

Holder 11 [William Eberle (Professor at Department of Computer Science, Tennessee Technological University), Jeffrey Graves, Lawrence Holder, "Insider Threat Detection Using a Graph-Based Approach," Journal of Applied Security Research, 6:32–81, 2011] AZ

The ability to mine structurally complex data has become the focus of many initiatives, ranging from business process analysis to cybersecurity. Since September 11, 2001, there has been an increasing emphasis on applicable methods for analyzing everything from bank transactions to network traffic, as our nation scours individual communications for possible illegal or terrorist activity. Protecting our nation's cyberinfrastructure and securing sensitive information are critical challenges for both industry and homeland security. One of the primary concerns is the deliberate and intended actions associated with malicious exploitation, theft, or destruction of data, or the compromise of networks, communications or other information technology resources, of which the most harmful and difficult to detect threats are those perpetrated by an insider.

Insider threats outweigh external threats—cybercrime comes from within— expert consensus

Messmer 3 [Ellen Messmer (Senior editor at Network World), "Security experts: Insider threat looms largest," Network World, 12/8/2013, <http://www.networkworld.com/article/2329002/lan-wan/security-experts--insider-threat-looms-largest.html>] AZ

WASHINGTON, D.C. - While the U.S. military is building up defenses to fend off network-based attacks from enemy states and terrorists, some say the more-insidious security problem is the threat of an insider bent on sabotage or stealing data. At last week's Forum on Information Warfare, researchers from the FBI and George Washington University emphasized the insider threat during presentations that drew military personnel and academics from around the world. In particular, IT systems administrators increasingly are seen as the most potentially dangerous insider threat - and military concern - because of their power over networks. In his keynote speech, Lt. Gen. Kenneth Minihan, former head of the National Security Agency (NSA), compared today's systems administrators to the encryption-code clerks of past wars who broke enemy secrets. He said systems administrators deserve greater attention from the military and should be better paid. Some researchers say they have seen the systems administrator go bad and see it as the Achilles' heel of national defense. FBI and George Washington researchers have studied the case histories of criminal computers use, including interviews with prisoners. "The systems administrator responsible for designing computer systems has the extraordinary ability to do damage," said Jerrold Post, professor of psychiatry, political psychology and international affairs at George Washington. He cited cases that occurred at Fort Bragg in North Carolina, and in banking and other industries, to underscore the danger posed by IT insiders who exploit power over networks. Post noted that insiders who commit computer-based crimes, such as fraud, extortion, sabotage and espionage, have a variety of motivations, including revenge and

financial gain. He said it is critical to understand the psychology of IT administrators in general to recognize possible danger signs. IT specialists are "overwhelmingly represented by introverts" who "internalize stress and express themselves only online," he said. A study of IT specialists caught for computer-based crimes reveals them typically to share some character traits. Post said close analysis of work histories of IT administrators who sabotaged their employers' networks or did other damage reveals that they often first commit less-serious infractions, such as refusing to train their backup. Intervention by management early on could help prevent problems from escalating, because introverted people usually don't seek help. The FBI has started its own study of those who commit computer crimes - not necessarily focusing on IT administrators - by interviewing those now in jail, said John Jarvis, an FBI behavioral research scientist. "Cybercrime is primarily an insider phenomenon," Jarvis said. **Only a quarter can be classified as "outsider,"** he said.

A2 Spywar Exag

The US is an international target—41 countries are attempting to spy on us

Olson, '01 (James M., served in the Directorate of Operations and is now on the faculty of the George Bush School of Government and Public Service at Texas A&M University, "The Ten Commandments of Counterintelligence", "Central Intelligence Agency", http://www.au.af.mil/au/awc/awcgate/cia/ten_cmdmts_counterintel.htm) JL

The need for counterintelligence (CI) has not gone away, nor is it likely to. The end of the Cold War has not even meant an end to the CI threat from the former Soviet Union. The foreign intelligence service of the new democratic Russia, the Sluzhba Vneshney Razvedki Rossii (SVRR), has remained active against us. It was the SVRR that took over the handling of Aldrich Ames from its predecessor, the KGB, in 1991. It was the SVRR that ran CIA officer Harold James Nicholson against us from 1994 to 1996. It was the SVRR that was handling FBI special agent Earl Pitts when he was arrested for espionage in 1996. It was the SVRR that planted a listening device in a conference room of the State Department in Washington in the summer of 1999. And it was the SVRR that was handling FBI special agent Robert Hanssen when he was arrested on charges of espionage in February 2001. The Russians are not alone. There have been serious, well-publicized concerns about Chinese espionage in the United States. The Department of Energy significantly increased security at its national laboratories last year in response to allegations that China had stolen US nuclear weapons secrets. Paul Redmond, the former Associate Deputy Director of Operations for Counterintelligence at the CIA, told the House Permanent Select Committee on Intelligence in early 2000 that a total of at least 41 countries are trying to spy on the United States. Besides mentioning Russia, China, and Cuba, he also cited several "friends," including France, Greece, Indonesia, Israel, the Philippines, South Korea, and Taiwan. He warned of a pervasive CI threat to the United States. The United States, as the world's only remaining superpower, will be the constant target of jealousies, resentments, rivalries, and challenges to its economic well-being, security, and leadership in the world. This inevitably means that the United States will be the target of large-scale foreign espionage.

A2 Nuclear Threat Exag

Not fearmongering—the risk is seriously underestimated

Bunn 14 [Matthew Bunn (American nuclear and energy policy analyst, currently a professor of practice at the Harvard Kennedy School at Harvard University) and Scott Sagan, "A Worst Practices Guide to Insider Threats: Lessons from Past Mistakes," the American Academy of Arts and Sciences, 2014,

<https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>] AZ

Conspiracies of multiple insiders, familiar with the weaknesses of the security system (and in some cases including guards or managers), are among the most difficult threats for security systems to defeat. Many nuclear security systems include only a single insider in the threats they are designed to protect against. And many nuclear security experts do not see groups of insiders as a credible threat: in a recent survey of nuclear security experts from most of the countries where HEU and separated plutonium exist, most agreed that a single insider was a highly credible threat; but no one rated multiple insiders as highly credible, and only a few rated insider conspiracies as "somewhat credible."²⁷ Yet insider conspiracies routinely occur. In one database, they constituted approximately 10 percent of the crimes examined.²⁸ In 1998, for example, an insider conspiracy at one of Russia's largest nuclear weapons facilities attempted to steal 18.5 kilograms of HEU—potentially enough for a bomb.²⁹ The Northern Bank case described above is another example, involving two trusted, senior insiders working together—both under coercion from threats to their families. The Gandhi case is yet another example—again involving two insiders working together, both trusted enough to be personal guards to the prime minister. The fact that two of the major cases selected above to illustrate other points also involved insider conspiracies is a telling indicator of how important such conspiracies are. The lesson here is clear: wherever possible, nuclear security systems should be designed to offer substantial protection against even a small group of insiders working together. Nuclear security managers should set up "red team" processes for identifying approaches that groups of insiders might use to steal material and for finding cost-effective approaches to stop them.

A2 HUMINT Link Turn

Counterintelligence and more surveillance key for warnings on insurgent and other force protection threats.

ATAB, '13 (Anti-Terrorism Accreditation Board , "Counterintelligence", 07/26,

file:///Users/jilllin925/Downloads/Chapter+5.pdf) JL

Attacks against military and related facilities are a very real threat, as demonstrated by the Naxalite attack against CRPF personnel in Chattisgarh's Dantewada district and many others. On April 6, Naxalites had killed 75 CRPF personnel and a police officer also succumbed in the massacre. **We must have a doctrine for protecting our facilities and conserving the potential of our forces.** Insurgents deliberately attack the forces -- for example in the rear to destroy camps, housing, support units and ammunition dumps with the intent to undermine the fighting potential and morale of the troops and loot and destroy its ordnance and weapons simultaneously. This is a grave threat and needs to be addressed. Counterintelligence, like it protects the intelligence services it also provides the necessary intelligence to combatant commanders for force protection. Standard intelligence disciplines all provide relevant intelligence but very less or no HUMINT relevant to counterintelligence. Yes we incorporate standard physical security measures but that is not sufficient for force protection. It is never a substitute for protection gained through intelligence. Moreover physical security can never override the value of counterintelligence. It is only HUMINT collected by intelligence and counterintelligence agencies that function as the indications and warning provider with respect to insurgent and other force protection threats.

A2 Privacy Violations

Government employees already give up their privacy when they agree to work in top-security fields. They face extensive background checks and interviews that non-unique any privacy violation argument. Surveillance is a minimal violation of personal space when almost everything is known already.

Audits, encryption, and other precautions check

Braun 14 [Stephen Braun (reporter at Associated Press), "U.S. intelligence officials to monitor federal employees with security clearances," PBS News, 3/10/2014, <http://www.pbs.org/newshour/rundown/us-intelligence-officials-monitor-federal-employees-security-clearances/>] AZ

Officials familiar with the DNI's system said internal guidelines, audits, encryption and other precautions built into the proposal were designed to minimize abuses of private information. A 2007 Homeland Security review of the ACES project concluded that "the system contains security and procedural controls to ensure that data is made available to only those with a legitimate need as defined by the underlying legal authorities." Congressional officials said the DNI already has sufficient permission under U.S. law to launch the new electronic monitoring on its own, but a bill recently introduced by Sen. Susan Collins, R-Maine, would provide additional legal support. Collins' bill calls for at least two random computerized reviews every five years for each of the 5 million government workers with a secret clearance.

Constant cyberwarfare from China and Russia cause economic and political damage and also non-unique any privacy violations

Naim 6/25 [Moises Naim (Reporter at the Atlantic), "Why Cyber War Is Dangerous for Democracies," the Atlantic, 6/25/2015] AZ

Around the time that Snowden published his article, hackers broke into the computer systems of the U.S. Office of Personnel Management and stole information on at least 4 million (and perhaps far more) federal employees. The files stolen include personal and professional data that government employees are required to give the agency in order to get security clearances. The main suspect in this and similar attacks is China, though what affiliation, if any, the hackers had with the Chinese government remains unclear. According to the Washington Post, "China is building massive databases of Americans' personal information by hacking government agencies and U.S. health-care companies, using a high-tech tactic to achieve an age-old goal of espionage: recruiting spies or gaining more information on an adversary." But these attacks are not limited to espionage, and there is not always a government behind them. Many independent hackers make a living off their criminal activities on the Internet; extortion, thefts of commercial secrets and people's identities, breaches of databases belonging to retailers and other companies, and the sabotage of critical infrastructure are all proliferating. To cite just four recent examples: Hackers have stolen personal information from 83 million JPMorgan Chase accounts, 56 million Home Depot payment cards, 110 million Target customer records, and 80 million accounts belonging to Anthem, one of America's largest health-insurance companies. "Our information systems are attacked multiple times a day, every day," the president of one of the world's

largest electricity companies told me. Nowadays, he added, “We spend 10 times more protecting ourselves from cyber attacks than we did three years ago. And despite that we feel we are always a step behind our attackers.” Numerous reports indicate that the frequency of and damage inflicted by cyber attacks is steadily increasing. According to a recent Verizon report on data breaches in the United States, the main victims are the government and the financial-services and information and technology industries, with the healthcare sector, and especially hospitals and health-insurance companies, also frequent targets. And the threat isn’t only coming from China—experts emphasize that attacks from Russia are as aggressive, frequent, and sophisticated.

Need for security against bioterror threats outweighs microbiologists' right to privacy

Culp 13 [Derrin Culp (research associate at the National Center for Disaster Preparedness, a unit of Columbia University), "Lessons not learned: Insider threats in pathogen research," Bulletin of Atomic Scientists, 04/03/2013] AZ

What if, instead of mailing anthrax spores, a microbiologist had released an aerosolized and highly transmissible pathogen near the ticket counters and security lines at Washington's Reagan National Airport, ultimately causing 5,000 deaths instead of five? Would the prescription for addressing the insider threat risk be the same as the current approach? We don't have to get anywhere near the seven-digit fatality numbers mentioned during the H5N1 controversy to be fairly certain that a "culture of responsibility" and regulatory delegation of screening and monitoring choices to scientists and their laboratories would be deemed a naïve and utterly inadequate level of protection. Something akin to the Department of Energy's Human Reliability Program -- one of those "extremely intrusive" regimes cited by the Defense Science Board -- would be much more likely. Microbiologists' claims to an exemption from intrusive personal scrutiny in unclassified research are motivated by sincere (and perhaps even correct) beliefs that restricting them would impede scientific progress and unnecessarily constrain the abundant benefits that their work otherwise would deliver to humankind. But those claims also arise from understandable concerns for personal privacy and dignity. Identifying the extremely high-risk types of pathogen research (both classified and unclassified) for which the government should mandate more oversight -- and picking the right mix of screening and monitoring techniques -- would undoubtedly be a complex and imperfect undertaking. Even with decades of evidence about what has and has not worked in nuclear research, intelligence gathering, and classified microbiological research environments, mistakes would be made and some blameless scientists might be faulted. Ultimately, though, microbiologists can't be exempt from such scrutiny. They lost that privilege when they acquired the ability -- or merely the potential -- to generate mass casualties.

Insider threat programs do not infringe on civil liberties or target individuals.

National Counterintelligence and Security Center, NO DATE ("NATIONAL INSIDER THREAT TASK FORCE

Insider threat programs are developed and operated in coordination with an agency's records management office, legal counsel, and civil liberties and privacy officials to build in protections against infringing upon employees' civil liberties/civil rights, privacy or whistleblower protections. Departments and agencies are required to provide training in these areas to program personnel, as well as the general workforce.

Department and agency heads also have a responsibility to ensure these protections are maintained through oversight of their insider threat programs. Insider threat programs target anomalous activities, not individuals. Additionally, government employees who handle classified information understand that, to hold a security clearance, they accept additional oversight of their workplace activities. Employees sign authorizations for the conduct of investigations to obtain and retain security clearances and there are warning banners on computers and in certain areas of facilities that alert people that they have less expectation of privacy.

A2 Bulk Collection Turn

Behavior analysis and bulk collection key to stopping insider threats

Kopan 14 [Tal Kopan, "Insider threats top to-do lists — New Snowden docs link NSA surveillance, cyber mission — Today: CJS debate should finally begin," Politico, 6/19/2014, <http://www.politico.com/morningcybersecurity/0614/morningcybersecurity14345.html>] AZ

SHOT: INSIDER THREATS TOP TO-DO LISTS – Eliminating the cyber-threat from within was the dominating topic of conversation yesterday in separate events across Washington, which looked at both how organizations can detect inappropriate behavior within their networks and what kind of evaluation process is appropriate for individuals given security clearances. While the “insider threat” has become a buzzword of sorts in security circles, misbehavior by those trusted in the system is still a real concern for companies, government agencies and defense institutions alike, which are looking to shore up defenses against attacks from the outside and the inside in the wake of high-profile insider incidents. Stopping the next Edward Snowden requires deploying technology and human resources intelligence at machine speed, said top defense intelligence officials at a panel discussion yesterday. “Unfortunately, perhaps we all haven’t put as much attention into the insider threat — as the NSA or I can raise my hand and say we were burned by that as much as anyone in recent memory,” said Philip Quade, chief operating officer of the information assurance directorate of the National Security Agency, acknowledging the former intelligence contractor by name at yesterday’s MeriTalk Cybersecurity Brainstorm. “There’s no badguy.com and there’s no stupidguy.com, where there’s this one corner of your network [you can] say, ‘This is where I’m going to optimize my hunting for the insider or remote threat. ... The good news, is that’s where computing can come in, where analysis and big data analysis and behavior-based analysis can really, really directly address this problem,’” he said. More from Quade and officials at the Defense Intelligence Agency and Defense Security Service, from your host:

Behavior analysis key—only algorithms solve

SIFMA 14 [SIFMA (US industry trade group representing securities firms, banks, and asset management companies), "INSIDER THREAT BEST PRACTICES GUIDE," Securities Industry and Financial Markets Association, July 2014, http://www.sifma.org/uploadedfiles/issues/technology_and_operations/cyber_security/insider-threat-best-practices-guide.pdf?n=43757] AZ

The core components of an insider threat mitigation program mirror those denoted in the National Institute of Standards and Technology (NIST) Cybersecurity Framework: Identify, Protect, Detect, Respond, and Recover. This structure encourages firms to individually assess threats most relevant to their firm and to develop a risk-based approach to resource allocation. The structure is also flexible enough to allow firms to scale implementation based on their business models and available resources. However, unlike in a general cybersecurity program, each component in an insider threat mitigation program has a distinctly human element. While external cybersecurity threats can usually only be prevented or detected through technical tools, insider threats commonly exhibit human behaviors that foreshadow the attacker’s intent.

An appropriately trained insider threat mitigation team can leverage technical tools, such as network monitoring software, and counterintelligence skills to detect and investigate suspicious insider behavior. While all personnel in a firm have a role in maintaining an effective insider threat program, an insider threat mitigation team is essential to coordinate firm-wide prevention efforts and alert relevant personnel to suspected or detected threats. Best practices for insider threat mitigation therefore involve both technical cybersecurity defenses, which typically reside within information technology, and human expertise, that resides across the firm.

A2 Background Checks Solve

Background checks don't solve—not comprehensive enough and don't prevent changes

Bunn 14 [Matthew Bunn (American nuclear and energy policy analyst, currently a professor of practice at the Harvard Kennedy School at Harvard University) and Scott Sagan, "A Worst Practices Guide to Insider Threats: Lessons from Past Mistakes," the American Academy of Arts and Sciences, 2014,

<https://www.amacad.org/multimedia/pdfs/publications/researchpapersmonographs/insiderThreats.pdf>] AZ

The belief that personnel who have been through a background check will not pose an insider problem is remarkably widespread—a special case of the “not in my organization” fallacy. There are two reasons why this belief is mistaken. First, background checks are **often not very effective**. Second, even completely **trustworthy employees** may become insiders, especially if **they are coerced**. Background checks as they are conducted today often fail to catch indicators of potential problems. Even in-depth, ongoing monitoring can miss key insider issues: after all, Aldrich Ames famously passed lie detector tests. Moreover, in many cases at non-nuclear facilities, there was no indication that employees were not trustworthy until long after they were hired: they became criminals only once on the job. This was the case with the trusted guards discussed in the previous section; and Leonid Smirnov, who perpetrated one of the first well-documented thefts of weapons-usable nuclear material (1.5 kilograms of 90 percent enriched HEU from the Luch Production Association in Podolsk in 1992), was a trusted employee who had worked at the facility for many years.¹⁵ Even if all the insiders at a facility are highly reliable, coercion remains a danger. In a case in Northern Ireland in 2004, for example, thieves allegedly linked to the Provisional Irish Republican Army made off with £26 million from the Northern Bank. The bank’s security system was designed so that the vault could be opened only if two managers worked together, but the thieves kidnapped the families of two bank managers and blackmailed them into helping the thieves carry out the crime.¹⁶ (The thieves also used deception in this case, appearing at the managers’ homes dressed as policemen.)

A2 States CP

1. The federal government is necessary for successful counterespionage efforts.

National Counterintelligence and Security Center, **NO DATE** ("NATIONAL INSIDER THREAT TASK FORCE

MISSION FACT SHEET", "National Counterintelligence and Security Center", <http://www.ncsc.gov/issues/economic/index.php>) JL

America's adversaries throughout history have routinely taken their competitive efforts beyond the battlefield. They frequently avoid using standing armies, shirk traditional spy circles, and go after the heart of what drives American prosperity and fuels American might. Nazi spies during World War II tried to penetrate the secrets behind our aviation technology, just as Soviet spies in the Cold War targeted our nuclear and other military secrets. Today, foreign intelligence services, criminals, and private sector spies are focused on American industry and the private sector. These adversaries use traditional intelligence tradecraft against vulnerable American companies, and they increasingly view the cyber environment—where nearly all important business and technology information now resides—as a fast, efficient, and safe way to penetrate the foundations of our economy. Their efforts compromise intellectual property, trade secrets, and technological developments that are critical to national security. Espionage against the private sector increases the danger to long-term U.S. prosperity. Without corrective action that mobilizes the expertise of both the Federal Government and the private sector, the technologies cultivated by American minds and within American universities are at risk of becoming the plunder of competing nations at the expense of long-term U.S. security. The private sector alone lacks the resources and expertise to thwart foreign efforts to steal critical American know-how. This is in large part because counterintelligence is not a typical corporate function, even for well-trained and well-staffed security professionals. Counterintelligence is a challenge for corporations for two reasons. Cost is the first reason. CI measures absorb company resources that would otherwise be used for growth. The second CI challenge is tied to the nature of public corporations. American companies are driven into developing markets by shareholders, growth ambitions, and the desire to beat Wall Street's quarterly earnings expectations. The requirement to move quickly and unabashedly leaves American companies vulnerable as they flock into spy-rich developing nations. China and Russia are our most aggressive and capable adversaries using economic espionage. China and Russia are not the only perpetrators of espionage against sensitive US economic information and technology. Some US allies abuse the access they have been granted to try to clandestinely collect critical information that they can use for their own economic or political advantage.

2. Multiple actor fiat bad

- A. Real world—50 states never act exactly in unison—key to education**
- B. Not logical—no one policymaker who has jurisdiction over each state government**

3. Perm do both

Circumvention

Laws don't check—executive agencies go around Congress

Papandrea 14 [Mary-Rose Papandrea (professor of law at Boston College Law School), "Leaker Traitor Whistleblower Spy: National Security Leaks and the First Amendment," Boston College Law School Faculty Papers, 3/1/2014] AZ

The executive branch needs some control over the dissemination of national security information in order to conduct effective military actions, foreign policy, and diplomatic relations. In some instances, the disclosure of national security information outside of the executive branch can pose a genuine threat to our nation's national security.⁸² Although the Constitution makes little mention of secrecy,⁸³ the Framers certainly recognized that some governing must take place outside of the public eye to be effective.⁸⁴ The problem is that the Framers "did not fully explain how citizens and lawmakers could know whether the president is in fact exercising this power responsibly."⁸⁵ Various reforms in the last several decades, including the passage of the Freedom of Information Act and the creation of congressional oversight committees, have failed to serve as significant counterweights to the executive's ability to control the flow of national security information.⁸⁶ Since September 11, the Bush and Obama Administrations have both aggressively asserted their power to control the dissemination of national security information and undermined the checking function of Congress and the judiciary.⁸⁷ The very nature of the executive branch's duties and responsibilities makes true transparency and accountability difficult. The executive is charged with "executing" the law, and the vast administrative state enables the execution of many laws to transpire in the dark.⁸⁸ The difficulties of monitoring the executive are exponentially greater whenever national security is involved. The executive exercises tight control over national security information through the classification system; the assertion of the executive and state secrets privileges; and general assertions time and time again that the executive has the power to keep information from Congress whenever disclosure would harm foreign relations, national security, or the executive's deliberative processes or constitutional duties.⁸⁹ The executive branch has repeatedly asserted its power to control the dissemination of national security information during battles with Congress over Congress's efforts to exercise some meaningful oversight of presidential power.⁹⁰ Although Congress sometimes appears to accept the executive's assertions of national security power without putting up much of a fight or exercising meaningful oversight,⁹¹ Congress generally disputes the executive's theory of the separation of powers. Instead, Congress contends that it shares authority over national security matters with the executive.⁹² Congress has a number of tools at its disposal to encourage disclosures – for example, it can conduct hearings, subpoena testimony and documents, leverage its power in the appropriations and appointments process, and pass statutes that require periodic reports from the executive branch. The executive, however, strongly resists Congress's attempts to force the disclosure of information, and there is very limited opportunity for judicial review of these inter-branch disputes.⁹³ Congress has not been particularly effective in forcing the executive to reveal national security information.⁹⁴ Even when the executive is willing to share information regarding its national security initiatives, it generally does so with only a select group of

congressional members, and the executive may – or may not – share all of the relevant details of its programs with these select members.⁹⁵ Those members who do have access to information about the President’s activities may feel they have no meaningful way of voicing their concerns about them.⁹⁶ While some have argued that the Constitution’s Speech and Debate Clause would immunize from prosecution disclosures of national security information a member might make on the House or Senate floor,⁹⁷ such disclosures would violate House and Senate procedures regarding the release of classified information obtained from the executive branch.⁹⁸ Although Congress could certainly repeal these rules, it is not clear it would be wise to do so. It is likely that at some point a member would reveal information that causes serious national security harm; in addition, a relaxation of these rules could give the President another justification for refusing to share information with Congress.⁹⁹ The executive’s disclosures to Congress may also be misleading, incomplete, or even false. For example, in March 2013 Senator Ron Wyden directly asked James Clapper, the Director of National Intelligence: “[D]oes the NSA collect any type of data at all on millions, or hundreds of millions, of Americans?”¹⁰⁰ Clapper stated that the government did not collect such data, at least “not wittingly.”¹⁰¹ After the Snowden leaks made clear that this response was false, Clapper explained that his response was the “least untruthful” answer he could give when asked about a classified program in an open session.¹⁰²

A2 Targeted Warrants Solve

2NC Extensions

2NC Ext—Gelman [Link]

Federal government intelligence capabilities are key to solve for espionage.

FBI 11 (“FBI Counterintelligence National Strategy”, “The Federal Bureau of Investigation”, 11/04, https://www.fbi.gov/news/stories/2011/november/counterintelligence_110411) JL

Espionage may seem like a throwback to earlier days of world wars and cold wars, but the threat is real and as serious as ever. We see it—and work hard to counter it—all the time. It’s not just the more traditional spies passing U.S. secrets to foreign governments, either to fatten their own wallets or to advance their ideological agendas. **It’s also students and scientists and plenty of others stealing the valuable trade secrets of American universities and businesses—the ingenuity that drives our economy—and providing them to other countries.** It’s nefarious actors sending controlled technologies overseas that help build bombs and weapons of mass destruction designed to hurt and kill Americans and others. In late October, in fact, we took part in a multi-agency and multi-national operation that led to the indictment of five citizens of Singapore and four of their companies for illegally exporting thousands of radio frequency modules from the U.S. Allegedly, at least 16 of these modules were later found in unexploded improvised explosive devices in Iraq. **As the lead agency for exposing, preventing, and investigating intelligence activities on U.S. soil, the FBI continues to work to combat these threats using our full suite of investigative and intelligence capabilities.** We’ve mapped out our blueprint in what we call our Counterintelligence National Strategy, which is regularly updated to focus resources on the most serious current and emerging threats. The strategy itself is classified, but we can tell you what its overall goals are: Keep weapons of mass destruction, advanced conventional weapons, and related technology from falling into the wrong hands—using intelligence to drive our investigative efforts to keep threats from becoming reality. Our new Counterproliferation Center will play a major role here. **Protect the secrets of the U.S. intelligence community—again, using intelligence to focus our investigative efforts and collaborating with our government partners to reduce the risk of espionage and insider threats. Protect the nation’s critical assets—like our advanced technologies and sensitive information in the defense, intelligence, economic, financial, public health, and science and technology sectors.** We work to identify the source and significance of the threats against these assets, and to help their “owners” to minimize vulnerabilities. Counter the activities of foreign spies—whether they are representatives of foreign intelligence agencies or governments or are acting on their behalf, they all want the same thing: to steal U.S. secrets. Through proactive investigations, we identify who they are and stop what they’re doing. One important aspect of our counterintelligence strategy involves strategic partnerships. And on that front, we focus on three specific areas: **The sharing of expertise and resources of the FBI, the U.S. intelligence community, other U.S. government agencies, and global partners to combat foreign intelligence activities;** Coordination of U.S. intelligence community efforts to combat insider threats among its own ranks; and Partnerships with businesses and colleges and universities to strengthen information sharing and counterintelligence awareness. Focus on cyber activities. Another key element of our counterintelligence strategy, according to FBI Counterintelligence Assistant Director Frank Figliuzzi, is its emphasis on detecting and deterring foreign-sponsored cyber intelligence threats to government and private sector information systems. “Sometimes,” he said, “the bad guys don’t have to physically be in the U.S. to steal targeted information...sometimes they can be

halfway around the world, sitting at a keyboard." The FBI's Counterintelligence National Strategy supports both the President's National Security Strategy and the National Counterintelligence Strategy of the United States.

Federal intelligence is needed to monitor counterintelligence.

Meiman, '07 (Kathryn L. , "What's that I hear? : domestic surveillance and

counterintelligence on antiwar musicians in the 1960s", "Lehigh University", <http://preserve.lehigh.edu/cgi/viewcontent.cgi?article=1982&context=etd>) JL

COINTELPRO tactics took many forms, including surveillance techniques such as wiretaps, and more active techniques such as "black bag jobs," sending of anonymous letters to promote distrust or fear, and writing and publishing negative information about members of the Communist Party in the national media through sympathetic media outlets. Counterintelligence techniques are significantly different from those that constitute intelligence gathering. The goal of such a program seeks to "actively restrict a target's ability to carry out actions (prevention), or to encourage acts of wrongdoing (facilitation)."¹³ In comparison to simple intelligence gathering, counterintelligence work requires the carrying out of actions in response to the information gathered. Intelligence work is necessary for counterintelligence programs to exist, but not vice versa. By the 1960s, the FBI had developed COINTELPROs that focused not only on the Communist Party, but had branched out to encompass numerous other groups that 1. Edgar Hoover had identified as threats to national security. Under the broad headings which Hoover used to classify his targets, the Socialist Workers Party, the Ku Klux Klan and other "White Hate Groups," several black Civil Rights organizations referred to by the Bureau as the "Black Nationalist-Hate Groups," and the New Left, notably the anti-Vietnam war movement, were now considered to be the greatest threats to America. ¹⁴ Hoover saw any action that challenged the status quo as "subversive," and protesters of any type drew his ire. The younger generation who wore long hair and spoke out against the Vietnam War appeared downright dangerous and, as quoted in the New York Times, Hoover alerted police that it was "vitaly important to recognize that these militant extremists are not simply faddists or 'college kids' at play. Their cries for revolution and their advocacy of guerilla warfare evolve out of a pathological hatred for our way of life and a determination to destroy it." ¹⁵ This belief fueled his decision to investigate protest of any type in attempt to quash it.

Counterintelligence is hard to defeat. All possible information is needed.

CIA, '96 ("The Anatomy of Counterintelligence", "The Central Intelligence Agency", 07/02, https://www.cia.gov/library/center-for-the-study-of-intelligence/kent-csi/vol13no1/html/v13i1a02p_0001.htm) JL

The first purpose of this study was to help the authorities in emerging or young nations in which a counterintelligence capability is lacking or deficient. Such countries are especially vulnerable in this era, when Soviet skills in espionage, counterespionage, and subversion have been refined for half a century. Even within the US intelligence community, however, some confusion and disagreement about counterintelligence persists. For example, it is often misunderstood as

another name for security. Because the article strips away the flesh and reveals the bones of its subject, it may be useful to us here as well as to others overseas. The paper describes the basic structure and functions of a counterintelligence service in a free society. The subject is not, however, a model CI service, if "model" is understood to mean an ideal or a pattern of excellence, created to be imitated. In this sense of the word, no model service exists. There are wide national variations in such matters as laws governing espionage and security, in budgets and manpower, and in the kind and intensity of threats. These differences are so great that a single model would not do for all countries, so that each must develop its own CI organization specifically adapted to its own environment and its own special requirements. It is possible, on the other hand, to describe the essential or standard functions which most such services share, and to show the kind of organization that derives from these functions. The inquirers should also be put on clear notice concerning the gravity of the commitments they propose to undertake, and of the eventual dimensions of the task. The fact is that a defensive service usually must accept responsibilities which exceed the requirements of security if security is construed, as it often is, to consist of passive defenses against clandestine and covert attacks upon the installations, personnel, and activities of official or semi-official bodies whose methods and sources the government desires to protect against unauthorized disclosure. Although it is possible to describe and even to create a security service concerned solely with these defenses, such an organization would soon find itself unequal to its task. Established intelligence and counterintelligence services, especially those of the USSR, are too competent and too strong to be defeated or even contained by purely defensive tactics. The counterintelligence service must be aggressive. It must learn all it can about its country's enemies. It must learn their secrets and be privy to their councils. This essay is intended as a short course in how these things can be done.

2NC Ext—Vigilance [Link]

Insiders are the largest threat—the threat is real

Fung citing DuBose 13 [Brian Fung, DuBose (a former Justice Department official and head of the cyber investigations unit at the risk-management firm Kroll Advisory Solutions), "Why Insiders, Not Hackers, Are the Biggest Threat to Cybersecurity," National Journal, 6/10/2013] AZ

However common they are, cases like Snowden's show how devastating one insider can be. The extent of the damage depends on what's being exfiltrated and from where, and there aren't many standards for calculating losses. Most companies estimate the value of their trade secrets based on how much money they sank into the research and development of that knowledge. But for the government, it's the potential security impact that takes precedence—and that turns the question into a matter of subjective debate. Last month, The Washington Post reported that Chinese spies compromised the designs for some of the Pentagon's most sensitive weapons systems, including the F-35 Joint Strike Fighter, the V-22 Osprey tiltrotor aircraft, and the Navy's new Littoral Combat Ship. If true, the report could have major consequences for national security. But Snowden's case is equally consequential, if for different reasons, and it bolsters DuBose's point about the relevance of insiders. Snowden may have rightfully uncovered evidence of government overreach, but if a mid-level contractor can steal top-secret information about the NSA and give it to the public in a gesture of self-sacrifice, someone else could do the same—but hand the intelligence to more nefarious actors.

2NC Ext—Kirkham [Nuclear !]

Insiders will betray nuclear organizations in the DoD and compromise either nuclear materials or warheads—that's Kirkham. The threat is coming now. Insiders can steal nuclear materials or engineer meltdowns—2012 case proves – more info is key

Parker 14 [Clifton Parker, "Insider threats biggest challenge to nuclear security," Center for International Security and Cooperation, April 2014, http://cisac.fsi.stanford.edu/news/insider_threats_biggest_challenge_to_nuclear_security_20140409] AZ

A diesel generator at the San Onofre Nuclear Generating Station in Southern California was possibly sabotaged, likely by an insider, in 2012. Insider threats are the most serious challenge confronting nuclear facilities in today's world, a Stanford political scientist says. In every case of theft of nuclear materials where the circumstances of the theft are known, the perpetrators were either insiders or had help from insiders, according to Scott Sagan and his co-author, Matthew Bunn of Harvard University, in a research paper published this month by the American Academy of Arts and Sciences. "Given that the other cases involve bulk material stolen covertly without anyone being aware the material was missing, there is every reason to believe that they were perpetrated by insiders as well," they wrote. And theft is not the only danger facing facility operators; sabotage is a risk as well, said Sagan, who is a CISAC senior fellow and professor of political science. While there have been sabotage attempts in the United States and elsewhere against nuclear facilities conducted by insiders, the truth may be hard to decipher in an industry shrouded in security, he said. "We usually lack good and unclassified information about the details of such nuclear incidents," Sagan said. The most recent known example occurred in 2012, an apparent insider sabotage of a diesel generator at the San Onofre nuclear facility in California. Arguably the most spectacular incident happened at South Africa's Koeberg nuclear power plant (then under construction) in South Africa in 1982 when someone detonated explosives directly on a nuclear reactor.

2NC Ext—Poteat [Competition]

Espionage efforts from other countries damage US competitiveness—spies steal military, economic, and political secrets that compromise our ability to compete as a world leader in various areas—that's 1NC Poteat.

Absent counterintel efforts, American competitiveness declines

ATAB, '13 (Anti-Terrorism Accreditation Board , “Counterintelligence”, 07/26,

file:///Users/jilllin925/Downloads/Chapter+5.pdf) JL

Why does counterintelligence factor so much in COIN missions? Firstly insurgents place a very high emphasis on the usage of informants, double agents, reconnaissance, surveillance, open source collection of media and imagery. Thus it could well be that we have sources who have switched loyalties or who may be working for both the parties with little or no loyalty to the government. We must locate these individuals who are a threat to operational security. Secondly insurgents resort to counter-surveillance. They hide among the local populace, use couriers to transfer money, intelligence and orders to run their ops. Finally and very important is the need for counterintelligence for Force protection. Another definition is CI both ‘information gathered’ and ‘activities conducted’ in order to ‘protect against espionage, other intelligence activities, sabotage or assassination conducted on behalf of foreign powers, organisations or persons, or international insurgent activities but not including personnel, physical documents or communications security’. In order to neutralize hostile intent CI conducts various activities such as acquiring information about plans , operations and capabilities of those organizations whose intent is subversion. CI informs policy. It aids military commanders and allied agency heads to take effective decisions. We don't have a clear doctrine on CI. It is the most misunderstood , most sensitive arcane intelligence discipline. But it performs the very important function of protecting the intelligence cycle. Counterintelligence is both an activity and its product. The product is reliable timely information about enemy/foreign intelligence organizational structure , the personnel profile , the operations of the enemy/foreign intelligence service and how they recruit personnel both from outside and insiders. To this end “counterintelligence intelligence collection” activities are conducted. It is an organization too as it consists of personnel with specialized skills to whom are allocated various functions , which after proper execution an information database is created which provides knowledge to decision makers. Summing up CI is in a way different from all other intelligence disciplines. Intelligence seeks to acquire information through collection methods wherein the result is not the objective but in CI collection activities enemy intent is always in the horizon..and activities..both offensive and defensive are conducted to neutralize this intent or to exploit the enemy itself to our advantage. Counterintelligence interacts with other intelligence disciplines such as SIGINT and IMINT to locate hostile entities and also to acquire knowledge about the capabilities and targeting of hostile SIGINT/IMINT. CI is multidisciplinary. It is different from security in that like security it does not only seek to implement defensive measures but also to aggressively target hostile intent. One of these offensive CI operations is Deception. Deception ops are designed at senior echelon levels such as Command. The CI body/unit executes the deception operation. Just as tactical military intelligence supports combat ops , similarly CI must support

deception ops. CI is not policing. Once a crime is committed the law enforcement authorities resort to arrest of the perpetrator so as to prosecute him as per law. But a CI agent has no arrest authorities. All these doctrinal differences make it more difficult to promulgate a clear CI doctrine. The CI functions include collection of all information about the activities and the organization itself of the enemy intelligence service. To this end source operations and clandestine methods are resorted to. The analytical component of CI holds significant importance because accurate analysis predicates CI operations designed to defeat hostile intent and also conduct exploitation ops to our advantage. Infiltration/penetration and deception operations, to name a few are the offensive operations resorted to by the CI body. A specialized function is the evaluation of defectors and debriefing of returned defectors. There are also defensive operations designed to protect installations/personnel/information and formal security programmes. Protecting secrets High up on its priority list CI has information protection. CI attempts to ensure that classified information doesn't fall into the hands of unauthorized users such as foreign agents /foreign intelligence service (physical security part of CI) and also making certain that all those people who do have access to sensitive information, say due to "need to know" authority or by virtue of portfolio in the intelligence deptt.—these people are protecting that information from being accessed. Here I used the term "CI attempts to ensure" as no amount of security controls can ever guarantee that the employee will observe the rules. Lapses will and do happen. Lapses which may be involuntary or voluntary with multiple intent scenarios ..ranging from yearning for self sufficiency in terms of wealth etc to disgruntled officials. If an official has the authorization to access sensitive information we must accept the fact that the information can also be compromised. To prevent this from happening and thus protect the intelligence information (or in a larger context the intelligence cycle itself) the intelligence organization resorts to psychological/behavioural evaluation/monitoring and profiling those personnel who have a propensity for betrayal. But the former evaluation techniques are below 100% accuracy thus leading to the recruitment of personnel who have intent to do harm. As for the latter profiling method those personnel who are adept in evading detection remain out of scrutiny and more resources are wastefully allocated in profiling the wrong person. Hence I had earlier stated that no amount of security control or vetting can ensure 100% information protection. We have to live with this risk and CI primary function is to resort to all available means so as to minimize this risk.

Chinese hackers steal economic secrets—key to economic growth

Mick, '12 (Jason, "NSA: China is Destroying U.S. Economy Via Security Hacks", "Daily Tech", 03/28, <http://www.dailytech.com/NSA+China+is+Destroying+US+Economy+Via+Security+Hacks/article24328.htm>) JL

NSA director fingers China in recent RSA intrusion and subsequent data thefts, U.S. oblivious its at war Well, no more hemming and hawing about, it's official -- the Chinese hacked EMC Corp. (EMC) subsidiary RSA and stole the secrets of its proprietary security algorithm according to the chief of the U.S. National Security Agency. I. A Grave Threat U.S. Cyber Command leader and NSA director Gen. Keith Alexander made the information public on Tuesday in a briefing to the Senate Armed Services Committee, in which he testified, "I can't go into the specifics here, but we do see [thefts] from defense industrial base companies. There are some very public [attacks],

though. The most recent one was the RSA exploits." China successfully used the information to hack into Lockheed Martin Corp. (LMT), a top U.S. defense contractor. It is thought that China's remarkable progress in stealth fighter technology has been fueled by stolen U.S. Department of Defense Secrets. Indeed a massive amount of intellectual property is being stolen from both the public and private sector by Chinese hackers, according to Gen. Alexander. The U.S. has done precious little to protect its own economic prosperity, as it has been overwhelmed by the Chinese thieves. One official in past commentary graphically described a cyberwarfare campaign of an unnamed nation state (suspected to be China) as "raping" the world. Whether the Chinese government is perpetrating these attacks first hand, sponsoring third parties to conduct them, or merely condoning corporate interests to conduct them is almost as hazy as the sketchy financial ties the Chinese government holds to many of its private sector business (to be fair such allegations have increasingly been raised about the U.S. gov't). But at the end of the day, the result is the same -- the destruction of the U.S. economy at the hands of the Chinese attackers.

Classified information in the wrong hands would damage US defense, transportation, health, financial, and communications.

National **C**ounterintelligence and **S**ecurity **C**enter, **NO DATE** ("NATIONAL INSIDER THREAT TASK FORCE

MISSION FACT SHEET", "National Counterintelligence and Security Center",
http://www.ncsc.gov/nittf/docs/National_Insider_Threat_Task_Force_Fact_Sheet.pdf) JL

When classified information is divulged in an unauthorized manner outside the confines of the U.S. Government (USG) national security structure, that information can create situations that are harmful to U.S. interests and, in some cases, could be life-threatening. Classified information in the wrong hands can provide a unique and potentially dangerous advantage to those states and non-state actors whose interests are opposed to those of the United States. For example, the unauthorized release of classified information could: provide details about weapons systems we rely on to defend our country; expose our overseas intelligence operations and personnel; and identify critical vulnerabilities in the U.S. national infrastructure which, if exploited, could damage internal U.S. defense, transportation, health, financial, and/or communications capabilities.

2NC Ext—Schwartz [Free Trade !]

US trade secrets are stolen from Chinese agents sent over to the US.

Kellen, '13 (Patrick, "China's Cheating and Cyber-Espionage Is Killing Us!", "Economy in Crisis", 10/01, <http://economyincrisis.org/content/chinas-cheating-and-cyber-espionage-is-killing-us>) JL

Across the Pacific Ocean lies a nation which is ruining the United States. That nation is China, a country with its priorities straight and enough self interest to look after itself. The United States, on the other hand, cannot figure out how it should conduct its affairs and does not lift a finger to protect itself in the game of international trade. It has been said that the United States is in an economic war and does not realize it. A brief review of the last couple decades would seem to confirm that diagnosis, and nowhere is this more apparent than in the cyber-espionage carried out by China against a clueless America. As detailed by Greg Autry in his eye-opening book, Death by China, a war on many levels and on many fronts is being waged against us. Many U.S. companies have been the victims of cyber hacking. Precious secrets and technologies are stolen, the American firms are never compensated for the crimes and China advances for free on the back of U.S. sweat and genius. Not only are the U.S. firms prohibited from retaliating, our government does nothing to address the issue and right the wrongs done to them. There have even been several suspected instances of blackmail. Soon after a company's servers get hacked into from Chinese locations, the company execs suddenly agree to sell off and/or move the company overseas. When the technological know-how is transferred from the American company to the Chinese one, the American company is stripped bare, cast off and left to wither. One has to wonder what secrets were discovered and used to strong-arm the owners into such a deal. Chinese agents even get sent over to our shores to befriend American execs, and false fronts are created on social networking sites, all with the purpose of getting to know execs well enough to be able to guess their passwords. When this is successful, a new round of corporate larceny begins. It is no wonder the Chinese economy has grown seven times faster than the American one over the last decade. As if our stupid trade policies were not enough, the Chinese cheat to get even more advantages. While we can do little to change China's behavior, we could at least take some smart steps to protect ourselves. Unfortunately, our politicians do not seem to care. If they did, they surely would have taken action to shore up America's defenses and prevent the long slide into economic obscurity in which we find ourselves. What will it take for them to wake up? What will it take for the entire nation to wake up? Those of us who see and recognize the danger need to sound the alarm. Either we change our course, or we crash and burn, and the choice really is that stark. You can start by calling your representative and telling them we can no longer afford to roll over and play dead. Send this article to five of your friends, and have them do the same!

Impact Work

Successful acquisition causes nuclear spoofing – extinction

Barrett et al. 13—PhD in Engineering and Public Policy from Carnegie Mellon University, Fellow in the RAND Stanton Nuclear Security Fellows Program, and Director of Research at Global Catastrophic Risk Institute—AND Seth Baum, PhD in Geography from Pennsylvania State University, Research Scientist at the Blue Marble Space Institute of Science, and Executive Director of Global Catastrophic Risk Institute—AND Kelly Hostetler, BS in Political Science from Columbia and Research Assistant at Global Catastrophic Risk Institute (Anthony, 24 June 2013, “Analyzing and Reducing the Risks of Inadvertent Nuclear War Between the United States and Russia,” Science & Global Security: The Technical Basis for Arms Control, Disarmament, and Nonproliferation Initiatives, Volume 21, Issue 2, Taylor & Francis)

War involving significant fractions of the U.S. and Russian nuclear arsenals, which are by far the largest of any nations, could have **globally catastrophic effects** such as severely **reducing food production** for years, ¹ potentially **leading to collapse of modern civilization worldwide, and even the extinction of humanity.** ² Nuclear war between the United States and Russia could occur by various routes, including accidental or unauthorized launch; deliberate first attack by one nation; and inadvertent attack. In an accidental or unauthorized launch or detonation, system safeguards or procedures to maintain control over nuclear weapons fail in such a way that a nuclear weapon or missile launches or explodes without direction from leaders. In a deliberate first attack, the attacking nation decides to attack based on accurate information about the state of affairs. In an inadvertent attack, the attacking nation mistakenly concludes that it is under attack and launches nuclear weapons in what it believes is a counterattack. ³ (Brinkmanship strategies incorporate elements of all of the above, in that they involve intentional manipulation of risks from otherwise accidental or inadvertent launches. ⁴) Over the years, nuclear strategy was aimed primarily at minimizing risks of intentional attack through development of deterrence capabilities, and numerous measures also were taken to reduce probabilities of accidents, unauthorized attack, and inadvertent war. For purposes of deterrence, both U.S. and Soviet/Russian forces have maintained significant capabilities to have some forces survive a first attack by the other side and to launch a subsequent counter-attack. However, concerns about the extreme disruptions that a first attack would cause in the other side's forces and command-and-control capabilities led to both sides' development of capabilities to detect a first attack and launch a counter-attack before suffering damage from the first attack. ⁵ Many people believe that with the end of the Cold War and with improved relations between the United States and Russia, the risk of East-West nuclear war was significantly reduced. ⁶ However, it also has been argued that inadvertent nuclear war between the United States and Russia has continued to present a **substantial risk.** ⁷ While the United States and Russia are not actively threatening each other with war, they have remained ready to launch nuclear missiles in response to indications of attack. ⁸ False indicators of nuclear attack could be caused in several ways. First, a wide range of events have already been mistakenly interpreted as indicators of attack, including weather phenomena, a faulty computer chip, wild animal activity, and control-room training tapes loaded at the wrong time. ⁹ Second, **terrorist groups** or other actors might **cause attacks** on either the United States or Russia that **resemble some kind of nuclear attack by the other nation** by actions such as exploding a stolen or improvised nuclear bomb, ¹⁰ especially if such an event occurs during a crisis between the United States and Russia. ¹¹ A variety of nuclear terrorism scenarios are **possible.** ¹² Al Qaeda has sought to obtain or construct nuclear weapons and to use them against the United States. ¹³ Other methods could involve attempts to circumvent nuclear weapon launch control safeguards or exploit holes in their security. ¹⁴ It has

long been argued that the probability of inadvertent nuclear war is significantly higher during U.S.–Russian crisis conditions,¹⁵ with the Cuban Missile Crisis being a prime historical example. It is possible that U.S.–Russian relations will significantly deteriorate in the future, increasing nuclear tensions. There are a variety of ways for a third party to raise tensions between the United States and Russia, making one or both nations more likely to misinterpret events as attacks.¹⁶

2nc yes nuke terrorism

Nuclear terrorism is feasible---high risk of theft and attacks escalate

Vladimir Z. **Dvorkin 12** Major General (retired), doctor of technical sciences, professor, and senior fellow at the Center for International Security of the Institute of World Economy and International Relations of the Russian Academy of Sciences. The Center participates in the working group of the U.S.-Russia Initiative to Prevent Nuclear Terrorism, 9/21/12, "What Can Destroy Strategic Stability: Nuclear Terrorism is a Real Threat," belfercenter.ksg.harvard.edu/publication/22333/what_can_destroy_strategic_stability.html

Hundreds of scientific papers and reports have been published on nuclear terrorism. International conferences have been held on this threat with participation of Russian organizations, including IMEMO and the Institute of U.S. and Canadian Studies. Recommendations on how to combat the threat have been issued by the International Luxembourg Forum on Preventing Nuclear Catastrophe, Pugwash Conferences on Science and World Affairs, Russian-American Elbe Group, and other organizations. The UN General Assembly adopted the International Convention for the Suppression of Acts of Nuclear Terrorism in 2005 and cooperation among intelligence services of leading states in this sphere is developing. ¶ At the same time, these efforts fall short for a number of reasons, partly because various acts of nuclear terrorism are possible. Dispersal of radioactive material by detonation of conventional explosives ("dirty bombs") is a method that is most accessible for terrorists. With the wide spread of radioactive sources, raw materials for such attacks have become much more accessible than weapons-useable nuclear material or nuclear weapons. The use of "dirty bombs" will not cause many immediate casualties, but it will result into long-term radioactive contamination, contributing to the spread of panic and socio-economic destabilization. ¶ Severe **consequences can be caused by sabotaging nuclear power plants, research reactors, and radioactive materials storage facilities. Large cities are especially vulnerable to such attacks. A large city may host dozens of research reactors with a nuclear power plant or a couple of spent nuclear fuel storage facilities and dozens of large radioactive materials storage facilities located nearby.** The past few years have seen significant efforts made to enhance organizational and physical aspects of security at facilities, especially at nuclear power plants. Efforts have also been made to improve security culture. But these efforts do not preclude the possibility that well-trained terrorists may be able to penetrate nuclear facilities. ¶ Some estimates show that sabotage of a research reactor in a metropolis may expose hundreds of thousands to high doses of radiation. A formidable part of the city would become uninhabitable for a long time. ¶ Of all the scenarios, it is building an improvised nuclear device by terrorists that poses the maximum risk. There are no engineering problems that cannot be solved if terrorists decide to build a simple "gun-type" nuclear device. Information on the design of such devices, as well as implosion-type devices, is available in the public domain. It is the acquisition of weapons-grade uranium that presents the sole serious obstacle. Despite numerous preventive measures taken, we cannot rule out the possibility that such materials can be bought on the black market. Theft of weapons-grade uranium is also possible. Research reactor fuel is considered to be particularly vulnerable to theft, as it is scattered at sites in dozens of countries. There are about 100 research reactors in the world that run on weapons-grade uranium fuel, according to the International Atomic Energy Agency (IAEA). ¶ A terrorist "gun-type" uranium bomb can have a yield of least 10-15 kt, which is comparable to the yield of the bomb dropped on Hiroshima. The explosion of such a bomb in a modern metropolis can kill and wound hundreds of thousands and cause serious economic damage. There will also be long-term sociopsychological and political consequences. ¶ The vast majority of states have introduced unprecedented security and surveillance measures at transportation and other large-scale public facilities after the terrorist attacks in the United States, Great Britain, Italy, and other countries. These measures have proved burdensome for the countries' populations, but the

public has accepted them as necessary. A nuclear terrorist attack will make the public accept further measures meant to enhance control even if these measures significantly restrict the democratic liberties they are accustomed to. Authoritarian states could be expected to adopt even more restrictive measures. ¶ If a nuclear terrorist act occurs, nations will delegate tens of thousands of their secret services' best personnel to investigate and attribute the attack. Radical Islamist groups are among those capable of such an act. We can imagine what would happen if they do so, given the anti-Muslim sentiments and resentment that conventional terrorist attacks by Islamists have generated in developed democratic countries. Mass deportation of the non-indigenous population and severe sanctions would follow such an attack in what will cause **violent protests in the Muslim world. Series of armed clashing terrorist attacks may follow.** The prediction that Samuel Huntington has made in his book "The Clash of Civilizations and the Remaking of World Order" may come true. Huntington's book clearly demonstrates that it is not Islamic extremists that are the cause of the Western world's problems. Rather there is a deep, intractable conflict that is rooted in the fault lines that run between Islam and Christianity. This is especially dangerous for Russia because these fault lines run across its territory. To sum it up, the political leadership of Russia has every reason to revise its list of factors that could undermine strategic stability. BMD does not deserve to be even last on that list because its effectiveness in repelling massive missile strikes will be extremely low. BMD systems can prove useful only if deployed to defend against launches of individual ballistic missiles or groups of such missiles. Prioritization of other destabilizing factors—that could affect global and regional stability—merits a separate study or studies. But even without them I can conclude that nuclear terrorism should be placed on top of the list. The threat of nuclear terrorism is real, and a successful nuclear terrorist attack would lead to a radical transformation of the global order. All of the threats on the revised list must become a subject of thorough studies by experts. States need to work hard to forge a common understanding of these threats and develop a strategy to combat them.

Threat is real - most qualified

Us Russia Joint **Threat Assessment** May 11

<http://belfercenter.ksg.harvard.edu/files/Joint-Threat-Assessment%20ENG%2027%20May%202011.pdf>

ABOUT THE U.S.-RUSSIA JOINT THREAT ASSESSMENT ON NUCLEAR TERRORISM The U.S.-Russia Joint Threat Assessment on Nuclear Terrorism is a collaborative project of Harvard University's Belfer Center for Science and International Affairs and the U.S.A. and Canada Studies Institute of the Russian Academy of Sciences led by Rolf Mowatt-Larssen and Pavel Zolotarev. Authors: • Matthew Bunn. Associate Professor of Public Policy at Harvard Kennedy School and Co-Principal Investigator of Project on Managing the Atom at Harvard University's Belfer Center for Science and International Affairs. • Colonel Yuri Morozov (retired Russian Armed Forces). Professor of the Russian Academy of Military Sciences and senior fellow at the U.S.A and Canada Studies Institute of the Russian Academy of Sciences, chief of department at the General Staff of the Russian Armed Forces, 1995–2000. • Rolf Mowatt-Larssen. Senior fellow at Harvard University's Belfer Center for Science and International Affairs, director of Intelligence and Counterintelligence at the U.S. Department of Energy, 2005–2008. • Simon Saradzhyan. Fellow at Harvard University's Belfer Center for Science and International Affairs, Moscow-based defense and security expert and writer, 1993–2008. • William Tobey. Senior fellow at Harvard

University's Belfer Center for Science and International Affairs and director of the U.S.-Russia Initiative to Prevent Nuclear Terrorism, deputy administrator for Defense Nuclear Nonproliferation at the U.S. National Nuclear Security Administration, 2006–2009. • Colonel General Viktor I. Yesin (retired Russian Armed Forces). Senior fellow at the U.S.A and Canada Studies Institute of the Russian Academy of Sciences and advisor to commander of the Strategic Missile Forces of Russia, chief of staff of the Strategic Missile Forces, 1994–1996. • Major General Pavel S. Zolotarev (retired Russian Armed Forces). Deputy director of the U.S.A and Canada Studies Institute of the Russian Academy of Sciences and head of the Information and Analysis Center of the Russian Ministry of Defense, 1993–1997, deputy chief of staff of the Defense Council of Russia, 1997–1998. Contributor: • Vladimir Lukov, director general of autonomous non-profit organization “Counter-Terrorism Center.”

The expert community distinguishes pathways terrorists might take to the bomb (discussed in detail in the next section of the report). One is the use of a nuclear weapon that has been either stolen or bought on the black market. The probability of such a development is very low, given the high levels of physical security (guards, barriers, and the like) and technical security (electronic locks and related measures) of modern nuclear warheads. But we cannot entirely rule out such a scenario, especially if we recall the political instability in Pakistan, where the situation could conceivably develop in a way that would increase the chance that terrorist groups might gain access to a Pakistani nuclear weapon. A second pathway is the use of an improvised nuclear device built either by terrorists or by nuclear specialists that the terrorists have secretly recruited, with use of weapons-usable fissile material either stolen or bought on the black market.¹ The probability of such an attack is higher than using stolen nuclear warheads, because the acceleration of technological progress and globalization of information space make nuclear weapons technologies more accessible while the existence of the nuclear black market eases access of terrorists to weapons-usable fissile materials. A third pathway is the use of an explosive nuclear device built by terrorists or their accomplices with fissile material that they produced themselves—either highly enriched uranium (HEU) they managed to enrich, or plutonium they managed to produce and reprocess. Al-Qaeda and associated groups appear to have decided that enriching uranium lies well beyond the capabilities that they would realistically be able to develop. A fourth pathway is that terrorists might receive a nuclear bomb or the materials needed to make one from a state. North Korea, for example, has been willing to sell its missile technology to many countries, and transferred its plutonium production reactor technology to Syria, suffering few consequences as a result. Transferring the means to make a nuclear bomb to a terrorist group, however, would be a dramatically different act, for the terrorists might use that capability in a way that could provoke retaliation that would result in the destruction of the regime. A far more worrisome transfer of capability from state to group could occur without the witting cooperation of the regime. A future A.Q. Khan-type rogue nuclear supplier network operating out of North Korea or out of a future nuclear-armed Iran could potentially transfer such a capability to a surrogate group and/or sell it for profit to the highest bidder. Global trends make nuclear terrorism a real threat. Although the international community has recognized the dangers of nuclear terrorism, it has yet to develop a comprehensive strategy to lower the risks of nuclear terrorism. Major barriers include

complacency about the threat and the adequacy of existing nuclear security measures; secrecy that makes it difficult for states to share information and to cooperate; political disputes; competing priorities; lack of funds and technical expertise in some countries; bureaucratic obstacles; and the sheer difficulty of preventing a potentially small, hard-to-detect team of terrorists from acquiring a small, hard-to-detect chunk of nuclear material with which to manufacture a crude bomb. These barriers must not be allowed to stand in the way of the panhuman universal priority of preventing this grave threat from materializing. If current approaches toward eliminating the threat are not replaced with a sense of urgency and resolve, **the question will become not if, but when, where, and on what scale the first act of nuclear terrorism occurs.**

Nukes feasible – HEU is uniquely vulnerable and catastrophic attack

Kuperman '13 (Alan J. Kuperman, Ph.d., Associate Professor at the LBJ School of Public Affairs @ UT Austin, Coordinator of the Nuclear Proliferation Prevention Project, *Nuclear Terrorism and Global Security*, 2013)

Global commerce in nuclear weapons-usable, highly enriched uranium (HEU) -ostensibly for non-weapons purposes - poses **significant risks of nuclear terrorism and nuclear proliferation.**¹

The international community first recognized these dangers in the 1970s and, ever since, has taken progressive action to minimize and secure such trade. Much has been accomplished, but much more could be done, given that the vast majority of non-weapons HEU commerce persists. This ongoing usage also hinders adoption and implementation of a major international arms-control agreement - the Fissile Material Cutoff Treaty (FMCT) - intended to cap nuclear-weapons arsenals by prohibiting the production of 11KU (and plutonium) for weapons. So long as states may claim to require additional HEU for non-weapons purposes, which could be diverted to weapons, the FMCT has a loophole that undermines its intent and thereby its attractiveness to some potential signatories. For all these reasons, this book explores the prospects and challenges of a total, global phase-out of HEU commerce.

This introductory chapter starts by reviewing the dangers of HEU commerce and the international steps already taken towards a phase-out. Next, it provides an overview of remaining global, non-weapons HEU use. Following that, it explains the scope, organization, and methodology of the book's studies, and summarizes the findings. The chapter closes with policy recommendations to promote and accelerate a global HEU phase-out

Past Efforts: Commendable But Inadequate

The HEU used in non-weapons applications is often identical to, and in some cases even more **optimized for nuclear weapons,** than that contained in military arsenals. By definition, "HEU" is enriched to at least 20 percent in the fissile isotope U-235 that sustains a chain reaction. As indicated in Figure 1.1, this distinguishes it from natural uranium, which contains less than one percent U-235, and from the low-enriched uranium (LEU) fuel for nuclear energy plants that typically is enriched to less than 5 percent. (Enrichment is a process that preferentially selects

the fissile isotope U-235 from the rest of the uranium, which is composed mainly of U-238 that hinders a chain reaction.) The Hiroshima atom bomb utilized uranium enriched to an average of 80 percent.

The HEU in most of today's nuclear weapons has enrichment of 90 to 93 percent. The HEU for non-weapons applications is typically drawn from identical stocks and so has the same weapons-grade enrichment, whether used as fuel for nuclear research reactors, in targets to produce medical isotopes, in critical assemblies to model nuclear reactors, or for other purposes. In at least one application, the fuel for U.S. (and reportedly also UK) naval propulsion reactors, the non-weapons HEU has been enriched to 97 percent, even higher than typical for nuclear weapons. (As the stockpile of such "super-grade" HEU is exhausted, these naval reactors will be converted to fuel of weapons-grade HEU, which ironically is slightly less enriched.)

Compared to the other main fissile material in military arsenals, plutonium. HEU is **much easier for terrorists or states to make into a nuclear weapon.** Its low spontaneous neutron-emission rate permits a gun-type design - much simpler than the implosion design required for plutonium - and its low radiation level represents little danger to those handling it. The resulting threat was famously summed up by Manhattan Project physicist Luis Alvarez in his memoirs:

With modern weapons-grade uranium ... terrorists, if they had such material, would have a good chance of setting off a high-yield explosion simply by dropping one half of the material onto the other half ... **Even a high school student could make a bomb in short order.**

Hundreds of nuclear weapons could be made with the HEU used today for non-weapons purposes. The amount required for one bomb depends on several factors including the enrichment level and weapon design. The simplest design, a gun type-weapon, works by slamming two sub-critical masses together to form a super-critical mass. A "reflector" around the outside of the assembly **reduces the critical mass** by reflecting back in neutrons, which otherwise would escape, to help **sustain the chain reaction.**

A 1998 study by Los Alamos National Laboratory' reports the critical mass of various 1-KU spheres, as summarized in Figure 1.2. // indicates that the critical mass is less than 20 kg for 9-1%-enriched HEU surrounded by a 4-inch reflector of natural uranium? This critical mass could be reduced by use of a more sophisticated reflector, but up to two critical masses would be required to optimize the yield of a gun-type weapon. Accordingly, 20 kg of HEU may be considered.

A nuclear attack in the US is possible – preventing group organization is key

Neely 13 (Meghan, 21 March 2013, "Doubting Deterrence of Nuclear Terrorism," CSIS, <http://csis.org/blog/doubting-deterrence-nuclear-terrorism>)

Assessing the Threat of Nuclear Terrorism The risk that terrorists will set off a nuclear weapon on U.S. soil is **disconcertingly high.** While a terrorist organization may experience difficulty constructing nuclear weapons facilities, **there is significant concern that terrorists can obtain a nuclear weapon or nuclear materials. The fear**

that an actor could steal a nuclear weapon or fissile material and transport it to the United States has long-existed. It takes a great amount of time and resources (including territory) to construct centrifuges and reactors to build a nuclear weapon from scratch. Relatively easily-transportable nuclear weapons, however, present one opportunity to terrorists. For example, exercises similar to the recent Russian movement of nuclear weapons from munitions depots to storage sites may prove attractive targets. Loose nuclear materials pose a second opportunity. Terrorists could use them to create a crude nuclear weapon similar to the gun-type design of Little Boy. Its simplicity – two subcritical masses of highly-enriched uranium – may make it attractive to terrorists. While such a weapon might not produce the immediate destruction seen at Hiroshima, the radioactive fall-out and psychological effects would still be damaging. These two opportunities for terrorists differ from concerns about a “dirty bomb,” which mixes radioactive material with conventional explosives. According to Gary Ackerman of the National Consortium for the Study of Terrorism and Responses to Terrorism, the number of terrorist organizations that would detonate a nuclear weapon is probably small. Few terrorist organizations have the ideology that would motivate nuclear weapons acquisition. Before we breathe a sigh of relief, we should recognize that this only increases the “signal-to-noise ratio”: many terrorists might claim to want to detonate a nuclear weapon, but the United States must find and prevent the small number of groups that actually would. Transportable nuclear weapons and loose fissile materials grant opportunities to terrorists with nuclear pursuits. How should the United States seek to undercut the efforts of the select few with a nuclear intent?

2nc yes obtain – loose nukes

Yes loose nukes---Ukraine crisis destroys US-Russian cooperation

Matthew **Bunn** is a professor at Harvard Kennedy School's Belfer Center for Science and International Affairs and is co-principal investigator with the Belfer Center's Project on Managing the Atom. He is a former adviser on nonproliferation in the White House Office of Science and Technology Policy, where he focused on control of nuclear weapons and materials, "The Real Nuclear Nightmare When It Comes to U.S.-Russian Ties," **1/24/'15**, <http://nationalinterest.org/feature/the-real-nuclear-nightmare-when-it-comes-us-russian-ties-12102>

In the dark days at the turn of the year, all but a few bits of U.S.-Russian cooperation to strengthen nuclear security in Russia came to a halt. No longer, for now at least, will U.S. experts work with counterparts at major Russian nuclear facilities to implement better means to prevent insiders from stealing fissile material, or to improve accounting, so a theft would be quickly detected. The crisis in Ukraine, adding to issues that have chilled relations with Moscow for years, provoked a deep freeze in U.S.-Russian relations. A two-decade era in which the United States and Russia worked together to dismantle and secure the deadly legacies of the Cold War appears to have drawn almost entirely to a close. **The danger of nuclear bomb material falling into terrorist hands will be higher as a result of this downturn in cooperation – putting U.S., Russian, and global security at greater risk.**

Russian insider threat is real

Matthew **Bunn** is a professor at Harvard Kennedy School's Belfer Center for Science and International Affairs and is co-principal investigator with the Belfer Center's Project on Managing the Atom. He is a former adviser on nonproliferation in the White House Office of Science and Technology Policy, where he focused on control of nuclear weapons and materials, "The Real Nuclear Nightmare When It Comes to U.S.-Russian Ties," **1/24/'15**, <http://nationalinterest.org/feature/the-real-nuclear-nightmare-when-it-comes-us-russian-ties-12102>

But nuclear security is never "finished." It must be **constantly improving** in the face of evolving threats. There are still weaknesses in nuclear security in Russia that thieves could exploit – particularly corrupt insiders who understand how security systems work. And no one knows whether Russia will devote the resources necessary to sustain the levels of security that are now in place. **The insider threat is real:** in 2012, for example, the director and two of the deputy directors of one of Russia's largest plutonium and highly enriched uranium facilities were arrested for millions of dollars' worth of corruption (though not stealing nuclear material).

Bioterror

2nc yes extinction

Extinction

Makhan **Saikia 14**, researcher at the Tata Institute of Social Sciences in Mumbai, was an Assistant Professor at the Symbiosis School of Economics, Challenges of Globalization, Journal of Politics & Governance, Vol. 3, No. 1

The unique feature of invisibility of the biological weapons make them the worst predators. Their ability to disseminate fear and cause chaos amongst the victims has a much more grim effect than a bomb attack. By impinging on the Governing bodies from the roots and snatching away every viable option to control them from the authorities, has made this type of terrorist attack the best innovation brought out of the evil side of the humanity. In order to fight back the horrifying potential of a biological weapon global preparedness and individual response capabilities are the only viable option that come our way at this point of time. This transition of the anti-humane weapons from concrete metal objects to undetectable micro-organisms has quite detrimental effects which need to be dealt [with] effectively and intelligently in order to save life on this Earth.

Bioterror causes extinction

Matheny 7 [Jason, research associate with the Future of Humanity Institute at Oxford University, where his work focuses on technology forecasting and risk assessment - particularly of global catastrophic risks and existential risks.[1] He previously worked for the World Bank, the Center for Biosecurity, the Center for Global Development, and on national security projects for the US government. He is a Sommer Scholar and PhD candidate in Applied Economics at Johns Hopkins University. He holds an MPH from Johns Hopkins, an MBA from Duke University, and a BA from the University of Chicago, Department of Health Policy and Management, Bloomberg School of Public Health, Johns Hopkins University, "Reducing the Risk of Human Extinction," http://www.physics.harvard.edu/~wilson/pmpmta/Mahoney_extinction.pdf]

Of current extinction risks, the most severe may be bioterrorism. The knowledge needed to engineer a virus is modest compared to that needed to build a nuclear weapon; the necessary equipment and materials are increasingly accessible and because biological agents are self-replicating, a weapon can have an exponential effect on a population (Warrick, 2006; Williams, 2006). 5
Current U.S. biodefense efforts are funded at \$5 billion per year to develop and stockpile new drugs and vaccines, monitor biological agents and emerging diseases, and strengthen the capacities of local health systems to respond to pandemics (Lam, Franco, & Shuler, 2006). **There is currently no independent body assessing the risks of high-energy physics experiments. Posner (2004) has recommended withdrawing federal support for such experiments because the benefits do not seem to be worth the risks.**

Bioterror leads to extinction

Sandberg 08 (Anders, is a James Martin Research Fellow at the Future of Humanity Institute at Oxford University; Jason G. Matheny, PhD candidate in Health Policy and

Management at Johns Hopkins Bloomberg School of Public Health and special consultant to the Center for Biosecurity at the University of Pittsburgh Medical Center; Milan M. Ćirković, senior research associate at the Astronomical Observatory of Belgrade and assistant professor of physics at the University of Novi Sad in Serbia and Montenegro, 9/8/8, "How can we reduce the risk of human extinction?," Bulletin of the Atomic Scientists, <http://www.thebulletin.org/web-edition/features/how-can-we-reduce-the-risk-of-human-extinction>)

The risks from anthropogenic hazards appear at present larger than those from natural ones. Although great progress has been made in reducing the number of nuclear weapons in the world, humanity is still threatened by the possibility of a global thermonuclear war and a resulting nuclear winter. **We may face even greater risks from emerging technologies. Advances in synthetic biology might make it possible to engineer pathogens capable of extinction-level pandemics.** The knowledge, equipment, and materials needed to engineer pathogens are more accessible than those needed to build nuclear weapons. And unlike other weapons, pathogens are self-replicating, allowing a small arsenal to become exponentially destructive. Pathogens have been implicated in the extinctions of many wild species. Although most pandemics "fade out" by reducing the density of susceptible populations, pathogens with wide host ranges in multiple species can reach even isolated individuals. The intentional or unintentional release of **engineered pathogens** with high transmissibility, latency, and lethality **might be capable of causing human extinction.** While such an event seems unlikely today, the likelihood may increase as biotechnologies continue to improve at a rate rivaling Moore's Law.

2nc yes motive

Al-Qaeda is gearing up for bioterror attacks – disrupting groups key

Obwale 12 [David, Clinical and Experimental Medicine graduate, University College London Clinical and Experimental Medicine graduate, 8/5/12, The Observer, “Ebola a potential bio-terror weapon,”

http://www.observer.ug/index.php?option=com_content&view=article&id=20215:ebola-a-potential-bio-terror-weapon&catid=37:guest-writers&Itemid=66, accessed 9/3/12, JTF]

Ebola has capabilities of biological weaponization with catastrophic consequences, especially due to the fact that it lacks adequate and effective vaccines and therapeutics that would counter any prospective mass attacks. Its zoonotic origin, distribution route and exposure in the tropical climatic conditions conceal its incubation and concurrence in these belligerent conditions.¶ Also, **Ebola, being highly contagious, presents an adaptability factor likely to be exploited by biological terrorists** willing to be infected by these bio-hazardous agents. **The terrorists would** then have to **deliberately transport themselves into their targeted areas during the incubation period in order to initiate person-to-person transmission**, either by secretion contact or airborne dissemination.¶ **The relatively low production cost, that only entails human contact and enormous availability of willing volunteers, which already exists amongst Al Qaeda radicals, poses a threat of unprecedented scale. Al Qaeda and its extremist networks have already carried out numerous terrorist attacks** around the globe. Needless to say, **arming themselves with Ebola**, as a highly effective weapon, **would lend them the capacity to unleash a high-impact attack causing mass civilian casualties.**¶ **Proliferation** of the Ebola virus **for bioterrorism may** also **arise from the way biological specimens are stored**, which is unique to agents of viral hemorrhagic fevers. **Most virological laboratories are not specialized and equipped adequately for rapid diagnosis and appropriate examination** of the Ebola samples. **The storage of Ebola virus samples requires maximum security** in the specimen laboratories.¶ **This has resulted into the monopoly by some reference laboratories** dealing with scientific repositories’ management. **This raises the issues of sharing specimens and the illicit use of these infectious agents which can stream into the possible risk of bioterrorism during diagnostic research and procedures.**

A2 contained

Bioterror spreads – defense fails

Metcalfe 13 (John Metcalfe, Staff Writer for Atlantic Cities, 7/24/2013, "Cities Might Not Be as Prepared as They Think for a Bioterrorism Attack", www.defenseone.com/threats/2013/07/cities-might-not-be-prepared-they-think-bioterrorism-attack/67352/)

Imagine that a small group of terrorists deliberately infect themselves with smallpox and then walk around London, spreading it to the populace. How much could the terrible disease proliferate before the world realized something was amiss?

This unsettling question is at the heart of new computer model showing how a bioterrorism attack in one city could quickly become the world's problem. Scientists started off with the hypothetical release of smallpox in London, New York, Paris and other major cities, then simulated how travelers would carry the virus to a host of other countries. Their conclusion: In the best-case scenario, smallpox could spread to two to four nations before doctors managed to diagnose it. Still ahead would lie the monumental task of quarantining the infected, distributing vaccines and tracing the source of the outbreak.

Previous research into bioterrorism have indicated that Western cities, with their protocols and vaccines, are pretty well prepared to handle a biological attack, says Alessandro Vespig-nani, a computer and health-sciences professor at Boston's Northeastern University. But in a paper in this month's Scientific Reports (don't worry, it was vetted for international-security issues), he and his fellow researchers argue that the assumption of local readiness is missing the big picture. "The problem is that most of those studies don't consider the global dimensions of the event," Vespig-nani says. "**Before you even realize there is an outbreak, it might already be in other places. That changes the game.**"

One major danger: From London, the smallpox might spread to countries that don't have the health infrastructure of the Western world. In these places it could become potent pandemics that might wash over into still more nations. And that's not only possible for attacks in cities near the less-developed corners of the world. No matter what metropolis a bioterrorist targets for harm, the dispersion of disease unfolds more or less the same way, at least according to the computer model.

Vespig-nani says there are two big things that people should take away from these findings. The first is that governments and international health organizations, whether it be WHO, the CDC or whoever, need to develop contingency plans for a pandemic that originates from afar. "They need to think about sharing resources," he says.

The second is that wanna-be terrorists playing with pathogenic agents ought to consider that a biological attack is a double-edged sword. "They think they're going to affect only the area that they target. But quickly and easily, it will spread all over the world," perhaps even right back to their own motherland. "Using these kinds of weapons, there is no winner, for sure."

A2 quarantine

Air travel means their quarantine defense doesn't apply

OCC '10 [Office of the Coordinator for Counterterrorism, August 5, 2010, Global Security, "Country Reports on Terrorism 2009," http://www.globalsecurity.org/security/library/report/2010/c-rprt-terrorism_2009-04.htm, accessed 10/2/12, JTF]

Bioterrorism, another deadly threat, **is the deliberate dispersal of pathogens through food, air, water, or living organisms to cause disease.** The 2009 Commission on the Prevention of WMD Proliferation and Terrorism concluded that it is more likely that terrorists would be able to acquire and use biological agents than nuclear weapons due to the difficulty in controlling the proliferation of biotechnologies and biological agent information. If **properly produced and released, biological agents can kill on a massive scale and, if terrorists use a pathogen that can be transmitted from person to person, the disease could quickly spread through commercial air travel across oceans and continents before authorities realize their nations have been attacked.**

Econ

Global Econ not resilient

() Global Econ not resilient – a shock could reverse growth.

UNECE '14

UNECE is the The United Nations Economic Commission for Europe. “Global economy is improving, but remains vulnerable to new and old headwinds that could derail growth”– UNECE Report – Published:20 January 2014 – <http://www.unece.org/index.php?id=34621>

Global economic growth should increase over the next two years with continuing signs of improvement, according to the United Nations World Economic Situation and Prospects 2014 (WESP) report, launched today. The global economy is expected to grow at a pace of 3.0 per cent in 2014 and 3.3 per cent in 2015, compared with an estimated growth of 2.1 per cent for 2013. The world economy experienced subdued growth for a second year in 2013, but some **improvements in the last quarter have led to the UN's more positive forecast.** The euro area has finally ended a protracted recession. Growth in the United States strengthened somewhat. A few large emerging economies, including China and India, managed to backstop the deceleration they experienced in the past two years and veered upwards moderately. These factors point to increasing global growth. According to WESP, inflation will remain tame worldwide, but the employment situation will continue to be challenging. While growth in international trade flows is expected to pick up moderately to 4.7 per cent in 2014, the prices of most primary commodities are projected to be flat, although any unexpected supply-side shocks, including geo-political tensions, could push some of these prices higher. The report warns that international capital flows to emerging economies are expected to become more volatile. **“Our forecast is made in the context of many uncertainties and risks coming from possible policy missteps** as well as non-economic factors **that could stymie growth,”** said Shamshad Akhtar, UN Assistant Secretary-General for Economic Development. Developed economies In the United States, fiscal tightening and a series of political gridlocks over budgetary issues weighed heavily on growth; however, quantitative monetary easing boosted equity prices. The U.S. labour market and housing sector continued to recover. Gross Domestic Product (GDP) in the U.S. is expected to increase 2.5 per cent in 2014. Western Europe emerged from recession in 2013, but growth prospects remain weak, as fiscal austerity will continue and the unemployment rates remain elevated. GDP in Western Europe is expected to grow by 1.5 per cent in 2014. Growth in Japan has been boosted by a set of expansionary policy packages, but the effects of forthcoming structural reforms remain uncertain and an anticipated increase in Japan's consumption tax rate is expected to curb growth. GDP is forecast to grow by 1.5 per cent in 2014. Developing countries and economies in transition Growth prospects among large developing countries and economies in transition are mixed. Growth in Brazil has been hampered by weak external demand, volatility in international capital flows and tightening monetary policy, but growth is expected to rebound to 3 per cent in 2014. A slowdown in China has been stabilized and growth is expected to maintain at a pace of about 7.5 per cent in the next few years. India experienced its lowest growth in two decades, along with large current account and government budget deficits plus high inflation, but growth is forecast to improve to above 5 per cent in 2014. In the Russian Federation growth weakened further in 2013, as industrial output and investment faltered, and is expected to recover modestly to 2.9 per cent in 2014. Among developing regions, growth prospects in Africa remain relatively robust. After an estimated growth of 4.0 per cent in 2013, GDP is projected to expand by 4.7 per cent in 2014. The report emphasized the dependence of Africa's growth on investment in infrastructure, trade and investment ties with emerging economies, and improvements in economic governance and management. More detailed regional forecasts from WESP will be released in January 2014. Risks and uncertainties threaten global economy The report stressed that the risks associated with a possible bumpy exit from the quantitative easing programmes by the U.S Federal Reserve (Fed) threaten the global economy. As already seen somewhat during the summer of 2013, efforts by the Fed to pull out of quantitative easing programmes could lead to a surge in long-term interest rates in developed and developing countries. Tapering could also lead to a sell-off in global equity markets, a sharp decline of capital inflows to emerging economies and a spike in the risk premium for external financing in emerging economies. These first-round shocks in international financial markets could transmit quickly to developed and developing economies. The report warns that as the Fed is expected to taper and eventually unwind its quantitative easing programmes, emerging economies will face more external shocks. While economic fundamentals and the policy space in many emerging economies are better than when the Asian financial crisis erupted in 1997, emerging economies with large external imbalances remain particularly vulnerable. Other uncertainties and risks include the remaining fragility in the banking system and the real economy in the euro area and the continued political wrangling in the U.S. on the debt ceiling and the budget. Beyond the economic domain, geopolitical tensions in Western Asia and elsewhere remain serious risks. These and other **risk factors, unfolding unexpectedly, could derail the world economy far beyond the report's projections.**

() Global econ not resilient – last financial crisis means reversals still possible.

Hawkins '14

(et al Adam Hawkins – and all of the authors of this paper – are from the International Finance and Development Division, the Australian Treasury. “Is the global financial safety net at a tipping point to fragmentation?” – April 9th – www.treasury.gov.au/~media/.../01_Global_financial_safety_net.ashx)

As with any insurance, **the ideal state** of the world **would be where the safety net is not needed at all.** During the so called Great Moderation years, a sanguine view of the international monetary system, expressed by Rose (2006) for example, was that advanced economies with floating exchange rates and inflation targeting central banks had no need for a safety net. **That rosy view has been laid to rest by the events of the past few years. The Global Financial Crisis and subsequent** ongoing **volatility in** financial **markets** and capital movements **has** triggered a reassessment of the size and use of the safety net, and **reignited debates** about its role. This is very much a live debate, as **continued volatility in financial markets around the world suggests that the global economy remains vulnerable to shocks.** There have been arguments that the safety net should be expanded from its current insurance role to a more active role including intervening in markets to smooth volatility. Against this backdrop, it is timely to reassess the role, size and composition of the global financial safety net.

A2 Econ Defense/Impact Boosters

Global economic decline causes nuclear war

Auslin '9

(Michael, Resident Scholar – American Enterprise Institute, and Desmond Lachman – Resident Fellow – American Enterprise Institute, “The Global Economy Unravels”, Forbes, 3-6, <http://www.aei.org/article/100187>)

What do these trends mean in the short and medium term? The Great Depression showed how social and **global chaos** followed hard on **economic collapse**. The mere fact that parliaments across the globe, from America to Japan, are unable to make responsible, economically sound recovery plans suggests that they do not know what to do and are simply hoping for the least disruption. Equally worrisome is the adoption of more statist economic programs around the globe, and the concurrent decline of trust in free-market systems. **The threat of instability is a pressing concern**. China, until last year the world's fastest growing economy, just reported that 20 million migrant laborers lost their jobs. Even in the flush times of recent years, **China faced** upward of **70,000 labor uprisings a year**. **A sustained downturn poses grave and possibly immediate threats to Chinese internal stability**. The regime in Beijing may be faced with a choice of repressing its own people or diverting their energies outward, leading to conflict with China's neighbors. **Russia**, an oil state completely dependent on energy sales, **has had to put down riots in its Far East as well as in downtown Moscow**. Vladimir Putin's rule has been predicated on squeezing civil liberties while providing economic largesse. If that devil's bargain falls apart, then **wide-scale repression inside Russia, along with a continuing threatening posture toward Russia's neighbors, is likely**. Even apparently stable societies face increasing risk and the threat of internal or possibly external conflict. As Japan's exports have plummeted by nearly 50%, one-third of the country's prefectures have passed emergency economic stabilization plans. Hundreds of thousands of temporary employees hired during the first part of this decade are being laid off. Spain's unemployment rate is expected to climb to nearly 20% by the end of 2010; Spanish unions are already protesting the lack of jobs, and the specter of violence, as occurred in the 1980s, is haunting the country. Meanwhile, in Greece, workers have already taken to the streets. **Europe as a whole will face dangerously increasing tensions** between native citizens and immigrants, largely from poorer Muslim nations, who have increased the labor pool in the past several decades. Spain has absorbed five million immigrants since 1999, while nearly 9% of Germany's residents have foreign citizenship, including almost 2 million Turks. The xenophobic labor strikes in the U.K. do not bode well for the rest of Europe. **A prolonged global downturn, let alone a collapse, would dramatically raise tensions** inside these countries. **Couple that with** possible protectionist legislation in the United States, **unresolved ethnic and territorial disputes in all regions of the globe** and a loss of confidence that world leaders actually know what they are doing. **The result may** be a series of **small explosions that coalesce into a big bang**.

() Economic decline risks global nuclear conflicts – studies confirm.

Ferguson '9

(Niall, Laurence A. Tisch Professor of History at Harvard University, “The Axis of Upheaval,” Foreign Policy, February 16th, http://www.foreignpolicy.com/articles/2009/02/16/the_axis_of_upheaval)

The Bush years have of course revealed the perils of drawing facile parallels between the challenges of the present day and the great catastrophes of the 20th century. Nevertheless, there is reason to fear that the biggest financial crisis since the Great Depression could have comparable consequences for the international system. For more than a decade, I pondered the question of why the 20th century was characterized by so much brutal upheaval. I pored over primary and secondary literature. I wrote more than 800 pages on the subject. And ultimately I concluded, in *The War of the World*, that three factors made the location and timing of lethal organized violence more or less predictable in the last century. The first factor was ethnic disintegration: Violence was worst in areas of mounting ethnic tension. The second factor was economic volatility: The greater the magnitude of economic shocks, the more likely conflict was. And the third factor was empires in decline: When structures of imperial rule crumbled, battles for political power were most bloody. In at least one of the world's regions—the greater Middle East—two of these three factors have been present for some time: Ethnic conflict has been rife there for decades, and following the difficulties and disappointments in Iraq and Afghanistan, the United States already seems likely to begin winding down its quasi-imperial presence in the region. It likely still will. Now the third variable, economic volatility, has returned with a vengeance. U.S. Federal Reserve Chairman Ben Bernanke's "Great Moderation"—the supposed decline of economic volatility that he hailed in a 2004 lecture—has been obliterated by a financial chain reaction, beginning in the U.S. subprime mortgage market, spreading through the banking system, reaching into the "shadow" system of credit based on securitization, and now triggering collapses in asset prices and economic activity around the world. After nearly a decade of unprecedented growth, the global economy will almost certainly sputter along in 2009, though probably not as much as it did in the early 1930s, because governments worldwide are frantically trying to repress this new depression. But no matter how low interest rates go or how high deficits rise, there will be a substantial increase in unemployment in most economies this year and a painful decline in incomes. Such economic pain nearly always has geopolitical consequences. Indeed, we can already see the first symptoms of the coming upheaval. In the essays that follow, Jeffrey Gettleman describes Somalia's endless anarchy. Arkady Ostrovsky analyzes Russia's new brand of aggression, and Sam Quinones explores Mexico's drug-war-fueled misery. These, however, are just three case studies out of a possible nine or more. In Gaza, Israel has engaged in a bloody effort to weaken Hamas. But whatever was achieved militarily must be set against the damage Israel did to its international image by killing innocent civilians that Hamas fighters use as human shields. Perhaps more importantly, social and economic conditions in Gaza, which were already bad enough, are now abysmal. This situation is hardly likely to strengthen the forces of moderation among Palestinians. Worst of all, events in Gaza have fanned the flames of Islamist radicalism throughout the region—not least in Egypt. From Cairo to Riyadh, governments will now think twice before committing themselves to any new Middle East peace initiative. Iran, meanwhile, continues to support both Hamas and its Shiite counterpart in Lebanon, Hezbollah, and to pursue an alleged nuclear weapons program that Israelis legitimately see as a threat to their very existence. No one can say for sure what will happen next within Tehran's complex political system, but it is likely that the radical faction around President Mahmoud Ahmadinejad will be strengthened by the Israeli onslaught in Gaza. Economically, however, Iran is in a hole that will only deepen as oil prices fall further. Strategically, the country risks disaster by proceeding with its nuclear program, because even a purely Israeli air offensive would be hugely disruptive. All this risk ought to point in the direction of conciliation, even accommodation, with the United States. But with presidential elections in June, Ahmadinejad has little incentive to be moderate. On Iran's eastern border, in Afghanistan, upheaval remains the disorder of the day. Fresh from the success of the "surge" in Iraq, Gen. David Petraeus, the new head of U.S. Central Command, is now grappling with the much more difficult problem of pacifying Afghanistan. The task is made especially difficult by the anarchy that prevails in neighboring Pakistan. India, meanwhile, accuses some in Pakistan of having had a hand in the Mumbai terrorist attacks of last November, spurring yet another South Asian war scare. Remember: The sabers they are rattling have nuclear tips. The democratic governments in Kabul and Islamabad are two of the weakest anywhere. Among the biggest risks the world faces this year is that one or both will break down amid escalating violence. Once again, the economic crisis is playing a crucial role. Pakistan's small but politically powerful middle class has been slammed by the collapse of the country's stock market. Meanwhile, a rising proportion of the country's huge population of young men are staring unemployment in the face. It is not a recipe for political stability. This club is anything but exclusive. Candidate members include Indonesia, Thailand, and Turkey, where there are already signs that the economic crisis is exacerbating domestic political conflicts. And let us not forget the plague of piracy in Somalia, the renewed civil war in the Democratic Republic of the Congo, the continuing violence in Sudan's Darfur region, and the heart of darkness that is Zimbabwe under President Robert Mugabe. The axis of upheaval has many members. And it's a fairly safe bet that the roster will grow even longer this year. The problem is that, as in the 1930s, most countries are looking inward, grappling with the domestic consequences of the economic crisis and paying little attention to the wider world crisis. This is true even of the United States, which is now so preoccupied with its own economic problems that countering global upheaval looks like an expensive luxury. With the U.S. rate of GDP growth set to contract between 2 and 3 percentage points this year, and with the official unemployment rate likely to approach 10 percent, all attention in Washington will remain focused on a nearly \$1 trillion stimulus package. Caution has been thrown to the wind by both the Federal Reserve and the Treasury. The projected deficit for 2009 is already soaring above the trillion-dollar mark, more than 8 percent of GDP. Few commentators are asking what all this means for U.S. foreign policy. The answer is obvious: The resources available for policing the world are certain to be reduced for the foreseeable future. That will be especially true if foreign investors start demanding higher yields on the bonds they buy from the United States or simply begin dumping dollars in exchange for other currencies. Economic volatility, plus

ethnic disintegration, plus an empire in decline: That combination is about the most lethal in geopolitics. We now have all three. The age of upheaval starts now

() Decline magnifies the severity of other conflicts – WWII proves Miller '8

G. Robert M. Miller, journalist for Digital Journal, 10-25, 2008, "Guns vs. Shovels – The Central Question Behind Our Next Economy," online: <http://www.digitaljournal.com/article/261595>

But before we look at **the modern 'Guns versus Butter' model**, it first has to be noted that this phrase **was originally popularized in a time where securing economic prosperity was a primary concern in nearly every nation**. More importantly, **when these nations did experience economic collapse, nearly all of them chose Guns**. There is no question that **Nazi aggression spawned World War II, however, what was happening in Europe became a world war for** a purpose as central to the heart of the capitalist as was the instantaneous end of the holocaust to the heart of the compassionate; **economic prosperity**. Simply said, **big wars are big money**; and **to truly break from the embrace of the Great Depression, a big commitment to the economy was necessary**. And **due to the leadership that guided the balance between 'Guns and Butter' in the US through World War II, the economy was considerably improved**; this was true for many western nations.

() Economic decline cause nuclear war. Bearden 2K

(Lieutenant Colonel in the U.S. Army, 2000, The Unnecessary Energy Crisis: How We Can Solve It, 2000, <http://groups.yahoo.com/group/Big-Medicine/message/642>)

Bluntly, we foresee these factors - and others { } not covered - converging to a catastrophic collapse of the world economy in about eight years. **As the collapse of the Western economies nears, one may expect catastrophic stress** on the 160 developing nations as the developed nations are forced to dramatically curtail orders. International Strategic Threat Aspects History bears out that **desperate nations take desperate actions**. Prior to the final economic collapse, **the stress on nations will have increased the intensity and number of their conflicts, to the point where the arsenals of** weapons of mass destruction (**WMD**) now possessed by some 25 nations, **are almost certain to be released**. As an example, suppose a starving North Korea launches nuclear weapons upon Japan and South Korea, including U.S. forces there, in a spasmodic suicidal response. Or suppose a desperate China - whose long range nuclear missiles can reach the United States - attacks Taiwan. In addition to immediate responses, the mutual treaties involved in such scenarios will quickly draw other nations into the conflict, escalating it significantly. Strategic nuclear studies have shown for decades that, under such extreme stress conditions, once a few nukes are launched, adversaries and potential adversaries are then compelled to launch on perception of preparations by one's adversary. The real legacy of the MAD concept is his side of the MAD coin that is almost never discussed. Without effective defense, **the only chance a nation has to survive at all, is to launch immediate full-bore pre-emptive strikes** and try to take out its perceived foes as rapidly and massively as possible. As the studies showed, **rapid escalation to full WMD exchange occurs**, with a great percent of the WMD arsenals being unleashed. **The resulting great Armageddon will destroy civilization as we know it**, and perhaps most of the biosphere, at least for many decades.

Yes, Diversionary war

() Economic decline causes war – studies prove

Royal '10

(Jedediah, Director of Cooperative Threat Reduction at the U.S. Department of Defense, 2010, Economic Integration, Economic Signaling and the Problem of Economic Crises, in Economics of War and Peace: Economic, Legal and Political Perspectives, ed. Goldsmith and Brauer, p. 213-215)

Less intuitive is how periods of economic decline may increase the likelihood of external conflict.

Political science literature has contributed a moderate degree of attention to the impact of economic decline and the security and defence behaviour of interdependent states. Research in this vein has been considered at systemic, dyadic and national levels.

Several notable contributions follow. First, on the systemic level. Pollins (2008) advances Modolski and Thompson's (1996) work on leadership cycle theory, finding that rhythms in the global economy are associated with the rise and fall of a pre-eminent power and the often bloody transition from one pre-eminent leader to the next.

As such, exogenous shocks such as economic crises could usher in a redistribution of relative power (see also Gilpin, 1951) that leads to uncertainty about power balances, increasing the risk of miscalculation (Fcaron, 1995). Alternatively, even a relatively certain redistribution of power could lead to a permissive environment for conflict as a rising power may seek to challenge a declining power (Werner, 1999). Separately, Pollins (1996) also shows that global economic cycles combined with parallel leadership cycles impact the likelihood of conflict among major, medium and small powers, although he suggests that the causes and connections between global economic conditions and security conditions remain unknown. Second, on a dyadic level. Copeland's (1996, 2000) theory of trade expectations suggests that 'future expectation of trade' is a significant variable in understanding economic conditions and security behaviour of states. He argues that interdependent states are likely to gain pacific benefits from trade so long as they have an optimistic view of future trade relations. However, if the expectations of future trade decline, particularly for difficult to replace items such as energy resources, the likelihood for conflict increases, as states will be inclined to use force to gain access to those resources. Crises could potentially be the trigger for decreased trade expectations either on its own or because it triggers protectionist moves by interdependent states.⁴ Third, others have considered the link between economic decline and external armed conflict at a national level. Momberg and Hess (2002) find a strong correlation between internal conflict and external conflict, particularly during periods of economic downturn. They write.

The linkage, between internal and external conflict and prosperity are strong and mutually reinforcing. Economic conflict tends to spawn internal conflict, which in turn returns the favour. Moreover, the presence of a recession tends to amplify the extent to which international and external conflicts self-reinforce each other (Hromben? & Hess, 2002, p. X9) Economic decline has also been linked with an increase in the likelihood of terrorism (Blomberg, Hess, & Weerapan, 2004), which has the capacity to spill across borders and lead to external tensions. Furthermore, crises generally reduce the popularity of a sitting government. "Diversionary theory" suggests that, when facing unpopularity arising from economic decline, sitting governments have increased incentives to fabricate external military conflicts to create a 'rally around the flag' effect. Wang (1996), DeRouen (1995), and Blomberg, Hess, and Thacker (2006) find supporting evidence showing that economic decline and use of force are at least indirectly correlated. Gelpi (1997), Miller (1999), and Kisangani and Pickering (2009) suggest that the tendency towards diversionary tactics are greater for democratic states than autocratic states, due to the fact that democratic leaders are generally more susceptible to being removed from office due to lack of domestic support. DeRouen (2000) has provided evidence showing that periods of weak economic performance in the United States, and thus weak Presidential popularity, are statistically linked to an

increase in the use of force. In summary, rccni economic scholarship positively correlates economic integration with an increase in the frequency of economic crises, whereas political science scholarship links economic decline with external conflict at systemic, dyadic and national levels.' This implied connection between integration, crises and armed conflict has not featured prominently in the economic-security debate and deserves more attention.

() Crisis makes diversionary theory true – states will start wars to head off domestic discontent – and use force to settle old disputes with rivals.

Rothkopf '9

David Rothkopf, Visiting Scholar at the Carnegie Endowment for International Peace, 3-11, 2009, "Security and the Financial Crisis," Testimony Before the House Armed Services Committee, CQ Congressional Testimony, lexis

--Destabilizing Bilateral or Regional Effects of the Crisis: The weakening of states can produce instability that spills across borders or can produce social pressures that increase migration and create associated tensions along borders. The rise of opposition groups can create an opportunity for like-minded neighbors to support their activities and thus cause rifts and potential conflicts to spread. Political and economic weakness in nations can be seen by opportunistic neighbors (some wishing to produce distractions from their own crises) as an invitation to intervene in their neighbors politics or even to step in and take control of neighboring territories or to seek to use force to resolve in their favor long-simmering disputes. In the same vein, old animosities may be inflamed by the crisis either because they produce tensions that play into the origins of old rivalries or because political leaders seek to play on those rivalries to produce a distraction from their inability to manage the economic crisis. Need may enhance tensions and produce conflicts over shared or disputed resources. A desire to preserve national resources, jobs, or capital may produce reactive economic, border or other policies that can increase tension with neighbors. This can include both trade and capital markets protectionism (in traditional and new forms see below), closed or more tightly monitored borders, more disputes on cross-border issues and thus both an increase in tensions and a decreased ability to effectively cooperate with neighbors on issues of common concern.

Notes

The fbi and the cia have been having tons of coop over domestic surveillance

Causes people to focus on that means there's interagency coop- the aff by reducing that means it sends the signal that interagency coop won't happen- interagency coop is good

Drone platforms- ISR capabilities- curtailing domestic means we can't test drones on domestic soil- means we can't make the next developments and we fall behind like China- good inroads to important part of the topic

A2: N/U: Freedom Act

FBI Spying Still

The Freedom Act didn't do enough to curtail surveillance

Desvarieux 6-2-15, producer at TRNN

Jessica, "3 Ways USA Freedom Act Fails to Stop FBI Spying on Americans",
http://therealnews.com/t2/index.php?option=com_content&task=view&id=31&Itemid=74&jumival=13954

JESSICA DESVARIEUX, PRODUCER, TRNN: If you've made a phone call, sent a text or an email, the Federal Bureau of Investigation could be monitoring your online activities without a warrant. Critics of the Patriot Act have pointed out this fact, and now Congress is doing something about it. On Tuesday, the U.S. Senate is likely to pass a bill called the US Freedom Act, which advocates say will reform the Patriot Act of 2001, and some of its surveillance provisions.¶ The House of Representatives already passed their version of the USA Freedom Act last month, which includes a change that makes sure the government can no longer hold on to phone records but instead it will remain in the hands of phone providers that can be compelled to turn over those records to the government. President Obama said in his weekly address that he's ready to sign the bill into law.¶ PRESIDENT BARACK OBAMA: Politics aside, put our national security first. Pass the USA Freedom Act now, and let's protect the security and civil liberties of every American.¶ DESVARIEUX: But critics say it doesn't go far enough to protect Americans' 4th Amendment rights, especially against unwarranted seizures, and the right that all warrants be supported by probable cause.¶ SEN. RAND PAUL (R-KY): Our forefathers would be aghast. One of the things they despised was general warrants. This is a debate that should be had, and the reason I am objecting is because I've made a very simple request: to have amendments, to have them voted on, and to have a guarantee that they're voted on.¶ DESVARIEUX: But Republican Kentucky Senator Rand Paul's two amendments were never brought up for a vote. Director of the nonpartisan organization Bill of Rights Defense Committee Sue Udry says without amendments the US Freedom Act comes short of protecting citizens from not just the NSA but the FBI in three major ways.¶ Number one, under the USA Freedom Act there will be no change to the FBI's national security letters, or NSL, policy.¶ SUE UDRY, BILL OF RIGHTS DEFENSE COMMITTEE: NSL letters are a way that the FBI can demand information from telephone companies and internet service providers and banks to get information about people without any court oversight whatsoever.¶ DESVARIEUX: Number two, the bill fails to challenge Section 215, where the FBI's expansive use of the term 'business records' originates.¶ UDRY: The Department of Justice general inspector has looked into the way the FBI uses these national security letters and found all sorts of problems with them, and in fact referred to them as kind of like an ATM machine for FBI agents. They were pretty much going through no process whatsoever, and just demanding information from phone companies about people that they were curious about, whether they were suspected of a crime or not.¶ DESVARIEUX: Number three, congressional oversight of the FBI is still weak.¶ UDRY: But the FBI has very loose guidelines about who they can investigate and what they can do to investigate them. So my particular concern with the FBI that's absolutely not addressed by USA Freedom is the FBI's use of informants. And we know that they're infiltrating peace groups and environmental groups and animal rights groups on the basis of national security. It was just revealed through a FOIA request that the FBI have been spying on

people who are opposed to the [inaud.] pipeline, and they were doing that on the basis that, well, oil is important to the economy and to national security, so therefore these protesters are threats to national security. And the FBI was spying on them.¶ And there's absolutely nothing in USA Freedom that prevents the FBI from doing that. And we know they're doing it, and Congress doesn't seem to care. And that's where we come in, and we really need to be holding Congress's feet to the fire to reform the FBI.¶ DESVARIEUX: For The Real News Network, Jessica Desvarieux, Washington.

Other Acts Still Cause Surveillance

Freedom Act didn't curtail surveillance- other programs prove it's still strong as ever

Vijayan 6-3-15, Correspondent

Jaikumar, CSMonitor, <http://www.csmonitor.com/World/Passcode/2015/0603/For-privacy-advocates-USA-Freedom-doesn-t-end-push-for-surveillance-reform>

But most reform groups also noted that the Freedom Act leaves unchanged many other controversial surveillance practices. For instance, the Freedom Act does not change a FISA provision referred to as Section 702, which the government has used as its authority to conduct extensive surveillance on online communications. The government has cited Section 702 as its authority for programs like PRISM for collecting huge quantities of data directly from servers and networks belonging to several Internet giants including Google, Microsoft, Yahoo, and Facebook.¶ The amount of records collected under Section 702 likely dwarfs the amount of records collected under the NSA's bulk phone records collection program Mr. Geiger said.¶ Though Section 702 is meant to enable surveillance of terror suspects based outside the US, Mr. Geiger and others say that in practice it enables warrantless backdoor collection of Internet communications belonging to many Americans. Sen. Ron Wyden (D) of Oregon is one of several lawmakers who have said they want additional reforms passed to rein in the "dragnet surveillance" enabled by Sec. 702. The provision is scheduled to sunset in 2017 and the effort has already begun to either kill it or reform it before renewal.¶ Also unchanged by the Freedom Act are authorities granted to government under Executive Order 12333 and statutes like the Electronic Communications Privacy Act (ECPA) of 1986.¶ EO 12333 is a President Reagan era artifact that among other things assigns specific roles, responsibilities and rules for spying for more than a dozen intelligence agencies including the CIA, the NSA, and the FBI.¶ Groups such as the Electronic Privacy Information Center have cautioned that the executive order often serves as an "alternate basis of authority for surveillance activities, above and beyond Section 215 and 702." Activities such as the NSA's efforts to break online encryption and security technologies were likely conducted under the authority granted to the agency under the executive order.¶ The Privacy and Civil Liberties Oversight Board, an independent advisory board within the executive branch, has said it wants to examine surveillance activities conducted under EO 12333 with an eye to reforming them. In May, after House of Representatives overwhelmingly passed the Freedom Act, the PCLOB held a public meeting to discuss the constitutional and oversight implications of counterterrorism activities conducted under the EO.¶ The ECPA, which sets standards for government monitoring of cellphone conversations, is another target for major overhaul. As with many of the other statutes, the government has claimed that the communications privacy act gives it the authority to conduct warrantless tracking of cellphone users and for accessing e-mail and other stored content in the cloud.¶ Earlier this year, Senators Orrin Hatch (R) of Utah, Chris Coons (D) of Delaware, and Dean Heller (R) of Nevada introduced a bill titled the Law Enforcement Access to Data Stored Abroad (LEADS) Act that seeks to reform ECPA. Among other things, the law would require law enforcement to obtain a court-issued warrant in order to obtain the content of stored communications from an Internet service provider and limit the extra territorial reach of US-issued search warrants.¶ While the Freedom

Act has put an end to one instrument for mass surveillance, similar reforms are needed to the various other statutes being used by US law enforcement and spy agencies, Geiger said. "Framing this issue in the context of just one phone records collection program makes it appear smaller than it is."

The Freedom Act covers up other surveillance techniques

RT 6-1-15

"USA Freedom Act vs expired Patriot Act provisions: How do the spy laws differ?",
<http://rt.com/usa/264005-freedom-patriot-act-surveillance/>

Many in opposition to the Patriot Act say the USA Freedom Act is not a meaningful check on government spying capabilities. A leading critic of government surveillance in the US House, Rep. Justin Amash (R-Mich.) described the Freedom Act as a "step in the wrong direction by specifically authorizing such collection in violation of the Fourth Amendment." Others have pointed out that the USA Freedom Act will not address other surveillance powers the government can employ. Should the Senate approve the reform bill, "it'll be suspicionless spying as usual until the next big surveillance provision, section 702 of the FISA Amendments Act sunsets at the end of 2017," said Jennifer Granick, director of Civil Liberties at the Stanford Center for Internet and Society. Edward Snowden revealed the government uses Section 702 of the FISA Amendments Act to authorize digital surveillance on foreign persons, which, tech experts say has involved exploiting security weaknesses on behalf of the government and, as a result, secretly undermining the protocols meant to protect online activity. "Section 702 of the FISA Amendments Act conceals some of the worst mass surveillance operations," he said recently. "In basic terms, the government here prefers to ignore that the 4th Amendment prohibits not just the unwarranted search of private records, but also the initial seizure of them as well. I suspect that's likely to haunt not only them, but all of us as well." Read more. Obama can end NSA bulk surveillance by himself – Rand Paul. Snowden also pointed to Executive Order 12333, signed by President Ronald Reagan in 1981, which requires government agencies to comply with data requests made by the CIA. He said the order, which has been used to justify the collection of unencrypted material, is a "skeleton in the closet," but that changing it will be difficult "because the White House argues these operations are simply above the law and cannot be regulated by congress or the courts." Several civil liberties advocates are strictly opposing the USA Freedom Act because it does not go far enough in curbing unchecked surveillance. "The sacrifices made by the USA FREEDOM Act of 2015 are unacceptable," wrote several groups and intelligence community whistleblowers in a letter urging a vote against the reform bill. "The modest changes within this bill, in turn, fail to reform mass surveillance, of Americans and others, conducted under Section 702 of the FISA Amendments Act of 2008 and Executive Order 12333. Given intelligence agencies' eagerness to subvert any attempts by Congress to rein in massive surveillance programs by changing the legal authorities under which they operate, the modest, proposed changes are no reform at all."

Reviving Other Tech

180 day extension period is an independent uniqueness booster- gives the NSA more power than before

RT 6-30-15

“License to snoop: Court revives NSA spy program through December”,
<http://rt.com/usa/270820-nsa-fisa-extended-spying/>

The NSA can reboot its bulk collection program, which expired on June 1, for a period of five more months. This was the decision of a federal spy court put in charge of reviewing the agency’s future petitions for records under the USA Freedom Act.¶ Judge Michael Mosman of the Foreign Intelligence Surveillance Court (FISC) opened his 26-page decision with a French phrase meaning “the more things change, the more they stay the same,” before granting the government’s request, filed mere minutes after the USA Freedom Act was signed into law on June 2.¶ Drafted before another federal judge ruled that the Patriot Act’s Section 215 did not, in fact, authorize bulk collections, the Freedom Act envisioned a six-month window for the NSA to wind down the program. A bipartisan group of lawmakers held up the law’s adoption until Section 215 had expired, however, hoping to force the program to shut down.¶ “This application presents the question whether the recently-enacted USA Freedom Act ... ended the bulk collection of telephone metadata,” says the order, obtained by National Journal on Tuesday. “The short answer is yes. But in doing so, Congress deliberately carved out a 180-day period following the date of enactment in which such collection was specifically authorized. For this reason, the Court approves the application in this case.”¶ Read more¶ Let us spy for 6 months more: NSA asks court for extension of expired surveillance program¶ Opponents of Section 215 criticized the government’s request as disingenuous, since the assumption behind the Freedom Act’s six-month window to shut down the program was based on it actually running. Once it had been shut down, the need no longer existed. Senator Ron Wyden (D-Oregon) called it “disappointing” that the administration would seek to “resurrect this unnecessary and invasive program after it has already been shut down.”¶ Judge Mosman, however, sided with government lawyers, who claimed the 180-day period intended to ease the program’s shut down, in fact authorized them to restart it. He also accepted the government’s argument that the Second Circuit Court’s ruling that bulk collections were illegal did not apply to the FISC.¶ “Second Circuit rulings are not binding on the FISC, and this Court respectfully disagrees with that Court’s analysis, especially in view of the intervening enactment of the USA Freedom Act,” he wrote in the order. “To a considerable extent, the Second Circuit’s analysis rests on mischaracterizations of how this program works and on understandings that, if they had once been correct, have been superseded by the USA Freedom Act.”¶ Seeking to block the government’s motion, former Virginia Attorney General Ken Cuccinelli and the conservative group FreedomWorks filed their own brief against restarting bulk collections, citing the Fourth Amendment’s prohibition of unreasonable searches and seizure. Judge Mosman rejected that challenge. He did, however, appoint Cuccinelli an “amicus” in future NSA cases, in the absence of a privacy panel envisioned by the Freedom Act as a consulting body for the FISC.¶ Under Judge Mosman’s order, the government will have until November 29 of this year to continue running the bulk collection program. After this date, the Freedom Act will allow the NSA to request

records from phone companies based on specific search terms after obtaining approval from the FISC. Monday's ruling indicates, however, that such approval won't be too difficult to obtain.[¶] Described by Senator Wyden as "illegal dragnet surveillance," Section 215 bulk collection was one of the programs exposed two years ago by NSA whistleblower Edward Snowden. When not hearing government requests at the FISC, Judge Mosman serves on the Federal District Court in Wyden's home state of Oregon.

Privacy advocates are at the threshold, but mass data collection continues

Ryan et al '14, staff correspondent

Laura, "NSA Critics Gain Momentum", <http://www.nationaljournal.com/tech-edge/nsa-critics-gain-momentum-20140623>

TODAY'S TOP PARAGRAPH: Privacy advocates have a new spring in their step after last week's House vote to curb NSA spying. The administration, however, gained approval to continue its bulk collection of phone records. The FCC unveiled its proposal to pump money into WiFi in schools, and all eyes are on the Supreme Court this week with the Aereo decision looming. ¶ TOP NEWS, HOUSE VOTE BOOSTS NSA CRITICS: A strong House vote to close "backdoor" NSA spying programs has given privacy advocates a new boost of momentum as they try to toughen up surveillance reform legislation in the Senate. "That overwhelming vote changes the trajectory of this issue moving forward," Rep. Zoe Lofgren, a sponsor of one of the amendment to the defense bill, said. Lawmakers also approved an amendment from Rep. Alan Grayson to bar the NSA from undermining encryption standards. ¶ Lofgren argued that the votes are a "better reflection of the actual views" of House members than the USA Freedom Act, which leaders scaled back with last minute changes before a floor vote last month. Even if the provisions don't become law through the appropriations process, they put pressure on the Senate to adopt stronger reform. ¶ "I'll be urging my colleagues in the Senate to follow the House's lead," Sen. Ron Wyden said in a statement. "It is time to slam this back door shut." ¶ ADVERTISEMENT ¶ ..BUT BULK COLLECTION CONTINUES: The NSA's phone data collection will continue for at least three more months. The Foreign Intelligence Surveillance Court approved the Justice Department's request Thursday, extending the program until Sept. 12. ¶ Sens. Wyden, Mark Udall, and Martin Heinrich had urged the administration to allow the controversial program to lapse, but the Justice Department and Director of National Intelligence said the administration sought reauthorization "given that legislation has not yet been enacted, and given the importance of maintaining the capabilities" of the program.

Privacy supporters are rallying behind momentum from the Freedom Act, but Congress is putting up a fight

Volz and Fox 6-3-15, staff correspondents

Dustin and Lauren, "The War Over NSA Spying Is Just Beginning", <http://www.nationaljournal.com/tech/the-war-over-nsa-spying-is-just-beginning-20150603>

June 3, 2015 Now that Congress has passed the USA Freedom Act, a surveillance overhaul bill that will shutter the National Security Agency's bulk gathering of U.S. call data—having done so while shutting down attempts from the Senate Majority Mitch McConnell to weaken it—reform-minded legislators are emboldened. ¶ But while reformers hope Tuesday's victory is an appetizer to a multiple-course meal to rein in the NSA, security hawks—many of them Republicans vying for the White House—hope to halt the post-Snowden momentum behind surveillance reform. And some already are talking about unraveling the Freedom Act. ¶ "What you are seeing on the floor of the Senate is just the beginning," said Sen. Ron Wyden, a civil-liberties stalwart in the

upper chamber who serves on the intelligence committee and has worked for more than a decade to reform government surveillance. "There is a lot more to do when—in effect—you can ensure you protect the country's safety without sacrificing our liberty."¶ Wyden used the Freedom Act's passage to call for additional intelligence-gathering reforms that he has long advocated, such as closing the so-called "backdoor search loophole" that allows U.S. spies to "incidentally" and warrantlessly sweep up the email and phone communications—including some content—of Americans who correspond with foreigners. He added he plans to move quickly on reworking Section 702 of the Foreign Intelligence Surveillance Act, before Congress is up backed up against its renewal deadline in 2017.¶ The Oregon Democrat also supports tech companies in their ongoing tussle with the administration over smartphone encryption as a key priority. While Google and Apple have begun to build their phones with "too-tough-to-crack" encryption standards, the FBI has warned that the technology locks out the bad guys and the good—and can impede law-enforcement investigations.¶ ADVERTISEMENT¶ Wyden and his allies, though, are bumping up against an impending presidential campaign, where many Republicans will jockey with one another to look toughest on national security.¶ Few issues divide the GOP White House contenders more than NSA surveillance, as defense hawks such as former Florida Gov. Jeb Bush and Sen. Marco Rubio continue to defend the NSA bulk metadata program as necessary to protect the homeland, while libertarian-leaning agitators such as Sens. Rand Paul and Ted Cruz warn voters of the privacy perils associated with the government's prying eyes.¶ Rubio, who has said he'd prefer that the NSA's phone dragnet be made permanent, issued a statement after the Freedom Act's passage saying it fell to the next president to undo its policies.¶ "The failure to renew the expiring components of the PATRIOT Act was a mistake," Rubio said in a statement after the vote. "The 'USA Freedom Act' weakens U.S. national security by outlawing the very programs our intelligence community and the FBI have used to protect us time and time again. A major challenge for the next president will be to fix the significantly weakened intelligence system that the current one is leaving behind."¶ Paul, meanwhile, continues to fundraise on social media and in campaign emails off his hardline opposition to "illegal NSA bulk data collection." The Kentucky senator succeeded in drawing enormous attention to the issue by forcing a temporary lapse this week of the Patriot Act's spy authorities, and has vowed to limit the agency's mass surveillance practices "on day one" if elected president.¶ But Paul also was a major obstacle for the Freedom Act's passage, repeatedly voting against it and helping delay its consideration on grounds it didn't go far enough—and codified parts of the Patriot Act he thinks should stay dead.¶ Cruz, meanwhile, represented the middle ground and was a chief GOP backer of the legislation, setting up a potential argument with Paul on debate stages about who has done more to fight against mass surveillance. Any jockeying between the two will expose them to sniping from candidates on the other side of the debate, including potential candidate Chris Christie, the New Jersey governor, who often goes out of his way to condemn those who criticize government snooping. Rand Paul already has become a regular punching bag for the GOP field's security hawks.¶ DON'T MISS TODAY'S TOP STORIES¶ "I read the Tech Edge every morning." Ashley, Senior Media Associate Sign up form for the newsletter¶ Back on Capitol Hill, many of the same members who were trying to block reform warn that it only takes one security setback for Congress to stop taking powers away from the NSA.¶ "The next time there is a terrorist act within the United States, the same people are going to be coming to the floor seeking changes to the tools that our intelligence community, our law

enforcement community has at their disposal because the American people will demand it," said Sen. Richard Burr, the chairman of the Intelligence Committee.¶ Sen. Susan Collins, who also serves on the intelligence panel, recognized that reforms and oversight will likely continue now that the USA Freedom Act has passed, but she said she's not so sure supporters of the Freedom Act won't have buyer's remorse down the line.¶ "I believe it is actually going to expose Americans' data to greater privacy risk and to vulnerability from computer data breaches," Collins said.¶ The momentum to end the NSA's phone dragnet snowballed over the past year and a half as two review panels deemed it ineffective. President Obama pledged to end it "as it currently exists" and a federal appeals court deemed it illegal.¶ But further reforms—such as to the Internet surveillance program known as PRISM, which Snowden also revealed—are likely to be tougher sells in Congress. For PRISM especially, that's in part because the program is considered more useful and because it deals primarily with surveillance of foreigners. U.S. tech companies that are subject to PRISM, including Facebook, Yahoo, and Google, have called for changes to the program. Yet when asked about whether he would work to take down PRISM, even Wyden bristled at the question.¶ "I am going to keep it to the three that I am going to change," Wyden said.¶ Even reformers outside the confines of the Senate recognize that ending PRISM is a complicated pursuit.¶ "It is not going to be quite as easy to drum up the same support," says Liza Goitein, codirector for the Liberty & National Security Program at the Brennan Center for Justice.¶ Though PRISM may prove difficult to upend, other efforts, such as a broadly supported push to update the decades-old Electronic Privacy Communications Act, may prove more palatable. Sens. Patrick Leahy and Mike Lee, the lead authors of the Freedom Act in the upper chamber, indicated their desire to move quickly on passing legislation that would update the law to require law enforcement obtain warrants before accessing the content of Americans' old emails.¶ The immediate next battlefield for civil liberties groups will find them on the defense, as they attempt to prevent legislation that would increase the sharing of certain cyber data among the private sector and the government in order to better fend off data breaches. Such proposals, which already passed the House and are likely to be before the Senate in the coming weeks, could grant the NSA access to more personal data, privacy advocates warn.¶ No matter how the looming debates shake out, for now, one thing is clear: the fight over the government's surveillance operations is far from over.

Precedent

The Freedom Act passage proves we're at a critical point

Diamond 5-23-15, Reporter

Jeremy, "Everything you need to know about the Patriot Act debate",
<http://www.cnn.com/2015/05/22/politics/patriot-act-debate-explainer-nsa/>

Washington (CNN) Two years after Edward Snowden exposed the National Security Agency's secret collection of the data of millions of Americans' private communications, the bulk of those programs remain intact. But the key section of the Patriot Act that the NSA used to authorize that program is set to expire on June 1. Early Saturday morning, the Senate failed to pass both a two-month extension of the current program, as well as a House alternative that sought to keep many of the NSA's surveillance abilities intact. With the Senate set to take a week-long recess, Senate Majority Leader Mitch McConnell said the chamber will meet again on Sunday, May 31, to consider ways that would not let the program expire. As the debate roils, get up to speed on NSA surveillance, how the Patriot Act authorized it and why Congress may -- or may not -- reform the program. What is the Patriot Act? The law goes back to the 9/11 terrorist attacks and embodies the swift reaction of the executive and legislative branches in the wake of the deadliest terrorist strike on American soil. Within weeks of the attacks, Congress passed and President George W. Bush signed the bill into law, giving law enforcement and intelligence authorities unprecedented domestic authority -- and the tools to wield that authority -- to thwart plots against the United States. "Surveillance of communications is another essential tool to pursue and stop terrorists," Bush said at the law's signing ceremony in Oct. 2001. "The existing law was written in the era of rotary telephones. This new law that I sign today will allow surveillance of all communications used by terrorists, including emails, the Internet, and cell phones." But it would end up doing much more -- more, even, than the law's major supporters and its primary architect on Capitol Hill, Wisconsin Republican Rep. Jim Sensenbrenner, ever imagined possible. So that part about cell phones. That's how the NSA started collecting phone records on millions of Americans? Yes, but the Patriot Act wasn't actually used for the justification for bulk metadata collection until 2006. That practice began secretly in 2001 after Bush used his executive authority to give the NSA the green light to begin sweeping phone and Internet records after 9/11. The Bush administration would eventually use the Patriot Act to justify its program -- enshrining it in law. Hold up. What the heck is this metadata, anyway? Metadata is all the information surrounding a call, including the caller's number, the receiver's number, the time and location of the call, and how long it lasted -- basically, everything except for the audio of the call itself. And the NSA collects the metadata of millions of Americans without those citizens' knowledge and without a warrant specifically targeting individuals suspected of wrongdoing. OK, but how much can the NSA actually learn without listening in to the call? The NSA can actually piece together quite a bit about a person by analyzing phone metadata --- information that a surveillance target's family might not even know. Repeated calls to a cardiologist could suggest a heart condition. Repeated late night calls between two employees could suggest a romantic relationship. "They can know, for example, whether an American called a psychiatrist three times in 36 hours, twice after midnight. That is a lot private information," explained Sen. Ron Wyden, D-Oregon, a leading supporter of NSA reforms. And

while NSA agents likely aren't spending their days poring over the metadata of Americans who aren't suspected of any terrorist activity, the agency does store the data for five years and retains easy access to the trove of information.¶ So what in the Patriot Act authorizes the NSA to rake in that information?¶ The government can petition the FISA court -- for a warrant to collect "any tangible things" to investigate terrorism or foreign spies.¶ If the government can credibly show that to the court's 11 judges, it gets a secret warrant that can force companies, such as Verizon, to hand over private information. And the recipient of the warrant is barred from discussing the warrant with anyone, due to national security concerns.¶ The Patriot Act stresses that the government can only request a warrant to obtain information that is "relevant to an ongoing investigation against international terrorism."¶ How is the data of millions of Americans "relevant" to terrorism investigations?¶ The Bush administration argued in 2006 that the metadata analysis program could only be successful if the government could collect and store the data of millions of Americans, even though it conceded "the vast majority of (data collected) will not be terrorist-related."¶ "Although admittedly a substantial portion of the telephony metadata that is collected would not relate to operatives of (redacted), the intelligence tool that the government hopes to use to find (redacted) communications -- metadata analysis -- requires collecting and storing large volumes of the metadata to enable later analysis. All of the metadata collected is thus relevant, because the success of this investigative tool depends on bulk collection," the administration argued.¶ That argument served as the justification for subsequent FISA court decisions approving warrants to collect customer data from various phone companies -- warrants that need to be renewed every 60 or 90 days.¶ But now Section 215 of the Patriot Act could be going away? And this program would change?¶ That's right. But lawmakers who want changes to the program still have a tough slog ahead of them.¶ Sensenbrenner, the lead author of the Patriot Act, was quick to condemn the FISA court's interpretation of the law once Snowden revealed the extent of the dragnet surveillance, calling the practice "based on a blatant misreading of the law."¶ He and Sen. Patrick Leahy, D-Vermont, have since led the charge to reform the Patriot Act and their efforts have gained steam in recent months, with the USA Freedom Act overwhelmingly passing the House earlier this month in a 338-88 vote.¶ The reform bill would keep the government from collecting telephone metadata of millions of Americans, instead requiring the NSA to get a warrant from the FISA court to collect data on a specific individual from telecommunications companies.¶ But the law is facing stiff opposition in the Senate from some of that chamber's most powerful Republicans, including Senate Majority Leader Mitch McConnell, R-Kentucky, and the chairman of the Senate Intelligence Committee, Sen. Richard Burr of North Carolina, who want to reauthorize the Patriot Act for five years without any reforms.¶ And if the Senate can't reach an agreement to extend the Patriot Act in some way, chunks of the law would sunset on June 1.¶ If the Senate doesn't get its act together, what happens?¶ Section 215, which authorizes the bulk metadata collection program, would sunset.¶ But two other sections of the Patriot Act would also expire: a so-called "lone wolf" provision and another section that allows roving wiretaps.¶ The first allows law enforcement to use the national security apparatus to go after suspected terrorists who may not be affiliated with a terrorist group, but share terrorist ideology and aims. That's a particular concern for law enforcement officials today as terrorist groups like ISIS are using social media to inspire individuals to carry out attacks in the U.S. and Europe.¶ The FBI would also lose the ability to

apply for new roving wiretaps to pursue suspected terrorists, a common procedure used in other criminal investigations that allows officials to wiretap additional phones linked to a suspect without requesting a new warrant.¶ Former FBI Assistant Director Tom Fuentes, a CNN analyst, said losing that authority would be a "severe" blow to counterterrorism efforts, keeping the FBI from collecting the information it needs in a timely manner.¶ But counterterrorism officials already conducting investigations wouldn't be completely hamstrung. A provision in the Patriot Act would allow officials to use these tools in investigations that were started before the June 1 sunset date.¶ Why are some lawmakers so opposed to reforming the Patriot Act?¶ For opponents of reform, it's all about national security.¶ They cite the growing terror threats the U.S. is facing, as ISIS continues to grow in Syria and Iraq and expands its reach online, inspiring attacks in Europe and the U.S.¶ To throw away a key tool at a time of such heightened concern would be foolish, opponents say.

Drone DA

1NC

Future drone production is on the brink now but set to increase

Holly 14 [writer for a political news agency “States restrict drone use because of privacy concerns” <http://investigatamidwest.org/2014/03/21/states-restrict-drone-use-because-of-privacy-concerns/>] (sakin)

Citing privacy concerns, **legislators** throughout the country **are** increasingly **passing laws to restrict** the use of **domestic drones** over private land. At least **nine states** have officially enacted some form of legislation that bans nonconsensual domestic drone use over private property, found an analysis by the American Civil Liberties Union, a network of more than 500,000 members who monitor First Amendment and privacy rights. “**We believe that we need a system of rules to ensure that we can enjoy the benefits of drones and technology without becoming a surveillance society** in which everyone’s movements are monitored, tracked, recorded and scrutinized by the authorities,” said Allie Bohm, an advocacy and policy strategist for the American Civil Liberties Union. “We believe that drones should be prohibited from indiscriminate mass surveillance.” In the states with drone-restriction policies in place, drone pilots surveying land and capturing images need to first gain consent from the owners of the land they are flying over. Likewise, law enforcement authorities need to first secure a warrant. Matt Waite holds a drone while giving a presentation on citizen journalism in Baltimore. Waite is a professor of journalism at the University of Nebraska who teaches a class on the use of drones in journalism. Matt Waite holds a drone while giving a presentation on citizen journalism in Baltimore. Waite is a professor of journalism at the University of Nebraska who teaches a class on the use of drones in journalism. This year, at least **34 additional states** have also introduced similar policies that aim to limit domestic drone use. And the moves are widely supported by the agriculture industry. “There is a private ownership of the land that’s important to maintain,” said R.J. Carney, director of congressional relations for the American Farm Bureau Federation. “It’s only with consent of the farmer that we would support the use of drones.” Florida, Idaho, Montana, Oregon, Tennessee, Virginia and North Carolina – a state where policymakers placed a minimum two-year moratorium on drone use – have all already passed drone legislation. Illinois and Texas, two of the top ag-producing states in the country, also recently passed legislation restricting drone use. In 2012, the Illinois agriculture industry sold more than \$17.1 billion in farm goods, according to preliminary 2012 Ag Census results. The Texas agriculture industry sold more than \$25.4 billion. Pending policies primed to include more ‘thoughtful’ regulation **When Congress reauthorized the Federal Aviation Administration’s budget in 2012, it did so with the stipulation that the administration would expand airspace for unmanned planes by Sept. 30, 2015.** “**We’re sort of at the brink right now,**” said Bohm. **When that time comes, unmanned aircraft will have access to the same airspace as piloted aircraft.** The University of Alaska, the State of Nevada, New York’s Griffiss International Airport, the North Dakota Department of Commerce, Texas A&M University in Corpus Christi and the State of Nevada have all been designated as test partners to see how the change will play out. “**We’re going to start seeing more and more drones in the air, particularly come 2015 once the FAA has to open their gates,**” Bohm said.

The aff creates a massive privacy movement that spills over onto other issues - Ryan et al '14, staff correspondent

The privacy movement kills any drone momentum – its seen as the most visible form of surveillance – Drone innovation is impossible

Crump 13 [Catherine Crump is a staff attorney with the ACLU's Speech, Privacy, and Technology Project and a nonresident fellow with the Stanford Center for Internet and Society "Why Americans Are Saying No to Domestic Drones"
http://www.slate.com/articles/technology/future_tense/2013/02/domestic_surveillance_drone_bans_are_sweeping_the_nation.html] (sakin)

In the past year, the American public has begun to pay more and more attention to the issue of domestic surveillance drones. And now, recent events suggest we might be seeing the emergence of a genuine national movement against the use of surveillance drones by law enforcement. With any luck, this may even set the stage for a wider dialogue about the increasingly intrusive technologies that are intended to catch crooks—but that all too often cast an overly broad net. Last week, after an especially raucous city council hearing, the Seattle police department terminated its drones program and agreed to return the purchased equipment to the manufacturer. This came just days after both houses of the Virginia state

legislature passed historic bills imposing a two-year moratorium on the use of drones by law enforcement and regulatory agencies in the state. In Florida, a potentially even more significant bill imposing a judicial warrant requirement on police use of drones continued to march toward passage. Similar legislation has been proposed in at least 13 other state legislatures around the country so far. Of all the threats to privacy that we face today, why have drones caught the attention of the American public to such a remarkable degree? One possibility is that there's something uniquely ominous about a robotic "eye in the sky." Many privacy invasions are abstract and invisible—data mining, for example, or the profiling of Internet users by online advertisers. Drones, on the other hand, are concrete and real, and the threat requires no explanation. But they are just the most visible example of a host of new surveillance technologies that have the potential to fundamentally alter the balance of power between individuals and the state. Physically tailing a suspect requires teams of police officers working 24/7, but now police can slap GPS devices on a suspect's car and then sit in the station house tracking his movements on a laptop. Now that the wholesale surveillance of American life is becoming cheap and easy, legal protections are all the more important. The drone issue has also gained momentum because the concern over it is bipartisan. While Democrats get most of the credit for pushing back on national surveillance programs, it was the Republican Party's 2012 platform that addressed domestic surveillance drones, stating that "we support pending legislation to prevent unwarranted or unreasonable governmental intrusion through the use of aerial surveillance." The ACLU of Virginia, for instance, teamed up with one of the state's most conservative lawmakers to introduce a drone regulation bill in the state House of Delegates, while its Senate companion bill was introduced by a progressive. Florida's drone regulation legislation is being almost entirely pushed by conservatives—and in most states, the legislative efforts we've seen so far have been conservative or bipartisan. Privacy issues are always less partisan than many other political questions, but the support for action on drones from both left and right has been remarkable. It's notable how different all of this is from the way surveillance technologies are normally adopted. There has actually been an opportunity for debate before drones have been widely deployed. We have the Federal Aviation Administration to thank for this state of affairs. At least for now, drones are largely banned by the FAA, which is concerned about the obvious safety issues: We can't have our skies filled with flying robots colliding with passenger aircraft or plummeting into people's houses. (This state of affairs will not last: Congress has ordered the FAA to integrate drones into the national airspace by 2015.) What we usually see happen with new law enforcement technologies is that agencies quickly and quietly snap them up, making their deployment a fait accompli before the public even learns of their existence, let alone has a chance to debate their privacy implications or democratically decide upon the correct balance between privacy and police power. At that point, taking privacy into account is an uphill battle because the tax dollars have already been spent and the technology integrated into the department's approach to crime fighting. With drones, on the other hand, because of the safety and regulatory issues they raise, we have a chance to do it right. The American public and our elected representatives can, for once, get ahead of the deployment curve—we can raise awareness, propose protections, and build support for them before the problems hit us in the face. If done right, this moment of hyperawareness about privacy could become a more permanent state of affairs: Ryan Calo of Stanford's Center for Internet and Society suggested in a December 2011 paper that because of their "disquieting" nature, drones

“could be just the visceral jolt society needs” to spark broader changes in how Americans conceptualize privacy problems. Ultimately, **the best solution on drones would be for Congress to pass strong, uniform rules protecting everyone across the nation and putting privacy concerns to rest.** For example, law enforcement agents should not make drones general tools of surveillance but should instead utilize them only where they have a specific reason to believe that use of one will turn up evidence of criminal activity. Ideally, those protections would become a model for other, perhaps less vivid but equally intrusive technologies such as cellphone location tracking. But unless and until Congress acts, state and local resolutions and rules are the best thing Americans can do to protect our privacy from the enormously invasive potential of domestic surveillance drones. **The upsurge in local activism around the country is just what’s needed to make this happen.**

That wrecks innovation – regulations make it not profitable for companies

Manjoo 2/4 [writer for the New York Times “Giving Drone Industry Leeway to Innovate” http://www.nytimes.com/2015/02/05/technology/personaltech/giving-the-drone-industry-the-leeway-to-innovate.html?_r=0] (sakin)

Commercial operators — people who are making money from their flights and therefore have an incentive to improve their training and the technology on their drones — are now barred from flying in most circumstances. And the Federal Aviation Administration is expected to release new draft rules in the next month that will allow for commercial drone operation in only a limited way. The rules are likely to prohibit drones from flying above 400 feet and require that they be used within sight of the operator. ¶ Untrained hobbyists like the one who crashed the drone in Washington, however, are allowed to fly their devices with relative freedom. ¶ For years, the drone industry has been calling on the Federal Aviation Administration to loosen rules on commercial unmanned flight. The White House crash is another in a string of public relations disasters that may hamper that effort. Drones have an image problem. In the popular imagination, unmanned flying robots portend an overhead invasion of privacy, a potential for novel and terrifying aerial attack and a dangerous cluttering of our skies. ¶ “Right now when you see a news story about an unmanned vehicle, it’s either a story about a hobbyist who did something crazy with his small toy, or you hear about a military strike in the Middle East,” said Jesse Kallman, the head of business development and regulatory affairs at Airware, a start-up that produces a kind of operating system for drones. ¶ But Mr. Kallman, like many in the industry, says that the perceptions have been shaped by a lack of obvious applications for drones, a lack that he blames in part on overly restrictive regulations. If the rules are loosened and commercial operations take flight, drone makers argue that perceptions will shift. ¶ That’s because enthusiasts see almost limitless potential for flying robots. When they fantasize about our drone-addled future, they picture not a single gadget, but a platform — a new class of general-purpose computer, as important as the PC or the smartphone, that may be put to use in a wide variety of ways. They talk about applications in construction, firefighting, monitoring and repairing infrastructure, agriculture, search and response, Internet and communications services, logistics and delivery, filmmaking and wildlife preservation, among other uses. ¶ But perhaps the most interesting applications for drones are the ones we can’t predict. **Imposing broad limitations on drone use now would be squashing a promising new area of innovation just as it’s getting started, and before we’ve seen many of the potential uses.** ¶ Continue

reading the main story ¶ “In the 1980s, the Internet was good for some specific military applications, but some of the most important things haven’t really come about until the last decade,” said Michael Perry, a spokesman for DJI, a Hong Kong-based drone maker whose Phantom drone was involved in the White House crash. He added, “Opening the technology to more people allows for the kind of innovation that nobody can predict.”

Strong drone innovation is necessary for a deterrence factor to prevent global conflicts

Zegart 3/18 [Ms. Zegart is a senior fellow at the Hoover Institution and co-director of Stanford University’s Center for International Security and Cooperation “The Coming Revolution of Drone Warfare” amy-zegart-the-coming-revolution-of-drone-warfare-1426720364] (sakin)

¶ Imagine an aircraft carrier—in the sky, not on sea. From its bay, it deploys swarms of armed drones that can fly, spy and kill, all guided by the touch of a computer keyboard thousands of miles away. This isn’t a scene from a science-fiction movie. It’s part of a recent proposal from the Defense Advanced Research Projects Agency, the Pentagon skunk works that brought us the Internet, videoconferencing and GPS. Now Darpa is soliciting ideas from companies on how to bring this technology to life. ¶ Equally important are the questions about how drones will be used strategically. Drones do not only offer new ways to kill. **They can prevent war.** The cumulative U.S. and Soviet nuclear stockpile peaked at 70,000 weapons in 1986. None of them were fired, but all kept the peace by threatening mutually assured destruction. ¶ Pentagon planners and defense intellectuals have spent decades analyzing the functions of nuclear weapons, but they have never considered seriously how drones could change the face of combat and coercion, whether by threat or with deterrence. Meanwhile, more than 20 nations, including China, are developing lethal drone technologies. In December, Iran said it was deploying an aerial drone replicated from Boeing ▲’s ScanEagle surveillance drone. But Iran’s version is fashioned to crash into designated targets, earning it the nickname “suicide drone.” ¶ Drones are going to revolutionize how nations and nonstate actors threaten the use of violence. First, they will make low-cost, high-credibility threats possible. Military planners have long assumed that high-cost actions risking blood, treasure and national reputation make the most credible threats. The classic example is U.S. Cold War “tripwire” forces in Germany. Risking 200,000 American lives signaled to the Soviets and to NATO allies that any Soviet invasion would kill many Americans, inevitably drawing the U.S. and its nuclear forces into war. Putting lives on the line proved that U.S. leaders meant it when they said the nuclear umbrella covered Europe. ¶ Lethal drones, by comparison, are low-cost weapons They are remotely piloted (U.S. drones in Afghanistan have been piloted from Nevada), so they pose no risk of a pilot being shot down over enemy airspace. Each MQ-9 Reaper, one of the mainstays of the U.S. unmanned arsenal, costs about \$14 million. By contrast, the Air Force’s newest manned aircraft, the F-35 Joint Strike Fighter, is expected to cost between \$148 million and \$337 million per jet. ¶ Boots on the ground aren’t cheap, either: According to the Center for Strategic and Budgetary Assessments, the estimated all-in cost of a single deployed service member in Afghanistan in 2014 was \$2.1 million. ¶ The political costs of using drones are much lower, too. President Obama’s lethal drone strikes in counterterrorism operations have been controversial. But a December Rasmussen poll found that 71% of the public still favors using them. Such low political risks could change the game. Effective threat

messaging used to mean taking actions that conveyed: “You know I mean business because I’ve put so much on the line.” A future effective threat could be: “You know I mean business because I can send swarms of cheap, lethal, stealthy drones at you all day long with no risk to me.”¶ Convincing the enemy that you have the domestic political support to do what you threaten is more important than ever because America’s wars since the 20th century have generally grown longer and more inconclusive. U.S. involvement in World War II lasted almost four years, and in Korea a full three years. Yet U.S. combat in Vietnam and the second Iraq war lasted nearly nine years, and the war in Afghanistan has lasted 13. When warfare was nasty, brutish and short, credible threats entailed convincing the enemy to “do this, or I’ll start shooting.” Today, the true test of political resolve is not initiating combat but sustaining it. Adversaries used to be sure that, over time, pressure would mount in the U.S. to bring troops home. The drones of future combat won’t have families or come back in coffins.¶ The current generation of drones also has capabilities we could not have imagined 20 years ago. Artificial intelligence and autonomous aerial refueling could remove human limitations even more, enabling drones to keep other drones flying and keep the pressure on for as long as victory takes.¶ Finally, lethal drones may make possible a new form of high-tech coercion: targeted hurting. Targeted terrorist-killing operations are designed to take an enemy off the battlefield. Targeted hurting could be designed to change any enemy’s behavior—by destroying selectively the family members, friends, associates, villages or capabilities that the enemy holds most dear.¶ Targeted hurting once was nearly impossible, because intelligence demands of precision targeting were too great, the lapse between identifying and hitting a target was too long, and the penetration of enemy territory required to succeed was too risky and difficult. It took 269 days to find Saddam Hussein in his spider hole even after U.S. forces invaded Iraq, and even though many of his countrymen wanted him caught. Now needle-in-haystack precision operations are growing far more feasible by the day. Drones already have the ability to hover over a target for up to 14 hours without being refueled, and to combine real-time imagery with real-time strike capabilities. ¶ As robotic warfare technologies proliferate and evolve, the U.S. is in a strategy race with other countries engaged in drone programs. If we do not develop innovative ideas about how these weapons can be used for coercion as well as **combat, others will.**¶ ¶

Uniqueness Wall

Drone support is on the brink – lobbies are pushing

Rogers 6-17 [AP “Industry group urges Congress to support expanded drone use”
<http://www.foxnews.com/tech/2015/06/17/industry-group-urges-congress-to-support-expanded-drone-use/>] (sakin)

A key drone industry group called on Congress to support expanded use of the controversial technology during testimony to the House Oversight and Government Reform Committee Wednesday.¶ The Association for Unmanned Vehicle Systems International (AUVSI) noted that the Federal Aviation Administration is working on finalizing rules for commercial and public drone use and is also granting permission for limited commercial use on a case-by-case basis. **“But more can and should be done,”** said AUVSI President Brian Wynne, in prepared testimony.¶ Wynne said that the upcoming FAA reauthorization bill should focus on two key areas – accelerating the safe commercial use of drones, also known as Unmanned Aerial Systems (UAS), and expanding research efforts. The FAA’s current authorization bill expires Sept. 30, 2015.¶ The FAA proposed rules in February that would severely restrict the use of commercial drones. The proposed rules would require operators to keep commercial drones within eyesight at all times, which significantly limits the distance they can fly.¶ Last month the FAA also unveiled its Pathfinder program, which will study how drones are used for newsgathering, as well as in the agriculture and transport industries.¶ “We need to permit expanded uses that pose no additional risk to the airspace system,” said Wynne, in his testimony. “Whether within the context of the rule, through the reauthorization or by other means, we need to allow for beyond-visual-line-of-sight, nighttime operations and operations over congested areas. Otherwise we risk stunting a still-nascent industry.”¶ AUVSI represents more than 7,500 members, including over 600 corporate members.¶ In his testimony, Wynne noted that drone technology is advancing rapidly thanks to collaboration between industry and government, but called for a flexible regulatory environment that can accommodate innovation. Regulations, he added, should focus on specific drone operations, as opposed to different drone technologies.

Drone Use will increase drastically but new legislation will limit its use

Solomon 13 [writer for National Security Zone “Uncertainties remain as FAA integrates drones into U.S. skies; number of drones may hit 30,000 by 2020”
<http://droneproject.nationalsecurityzone.org/uncertainties-remain-as-faa-integrates-drones-into-american-skies-josh-solomon/>](sakin)

WASHINGTON – Thousands of unmanned aircraft systems—commonly known as drones—could be buzzing around in U.S. airspace by 2015 because of a law passed last year, raising both safety and privacy concerns among some lawmakers and advocacy groups.¶ Already, drones are in use counting sea lions in Alaska, monitoring drug trafficking across our borders and conducting weather and environmental research. In fact, 327 drones to date are licensed by the Federal Aviation Administration to fly over U.S. soil.¶ **But the FAA expects that number to increase to 30,000 by 2020, fueling what could become a \$90 billion industry.**¶ The drones used domestically bear little resemblance to the war machines making headlines for their involvement overseas; the drones being flown in the U.S. often look more like toys, and none of

them carry weapons.¶ The 2012 law, called the FAA Modernization and Reform Act, contains a seven-page provision—known as the Drone Act—requiring the FAA to fully integrate unmanned aircraft into the National Airspace System by September 2015. Additionally, the Drone Act allows law enforcement agencies, including local police forces, to buy and use unmanned aircraft for evidence gathering and surveillance.¶ The FAA cannot regulate the use of model drones or airplanes by hobbyists as long as they operate within certain basic limitations. Crafts must weigh less than 55 pounds, cannot fly higher than 400 feet above the ground or interfere with manned airplane traffic and, if the craft is operated within five miles of an airport, the operator must contact airport personnel.¶ Transitioning drones into domestic airspace has raised both safety and privacy concerns. The unmanned vehicle industry, though, believes the benefits associated with civil drone use outweigh any associated concerns.¶ Earlier this month, a small drone was spotted 200 feet from a passenger airliner within airspace controlled by John F. Kennedy International Airport in New York City. This isolated incident may be the first of many, though, as 2020 approaches.¶ There are provisions in the Drone Act to protect manned aviation—airplanes and helicopters—from unmanned flight. But those provisions cannot prevent an inadvertent breach of controlled airspace. Also, as the drone population grows, so do the chances of a mid-air collision between two drones.¶ In addition to concern over drones entering closed airspace, some are worried unmanned aircraft could have their signals interfered with or fall victim to a “spoofing” attack.¶ University of Texas Professor Todd Humphreys and his team developed a software-based GPS transmitter designed to deceive—spoof—a drone.¶ He said sophisticated drones have two wireless communication linkages: the command and control link, which allows the operator to control the aircraft, and the GPS navigation link, which keeps the craft abreast of its own position. Spoofing is when a third party targets the GPS link, through which he could manipulate the drone.¶ Mario Mairena, spokesman for the Association for Unmanned Vehicle Systems International, which lobbies on behalf of the drone industry, said systems like SAASM—Selective Availability Anti-Spoofing Modules—already exist in military craft, and he expects that technology to transition to civilian drones in the coming years.¶ Drones also are susceptible to communications jamming, leaving the operator unable to control the aircraft. A craft with dual linkage would then go into “lost link protocol,” which would likely navigate the vehicle, using its remaining GPS connection, to a pre-designated landing spot. ¶ Despite the potential safety risks, the new technology has potential in a wide range of applications.¶ Mairena said UAS can provide assistance to first responders in search and rescue and during or after natural and man-made disasters, and they can also aid in scientific research. ¶ Unmanned aircraft can be equipped with infrared cameras, allowing responders to identify the heat signature of a body underneath a bank of snow on a mountain or under a pile of rubble in a disaster area. ¶ They can also be flown over land decimated by hurricanes or forest fires to help assess the damage, or through areas dangerous for humans such as a nuclear power plant immediately after a reactor leak or meltdown.¶ Researchers are also using drones. For example, University of Alaska Fairbanks utilizes them to monitor sea lions, because the animals retreat under water when approached by larger and louder manned craft.¶ Mairena also outlined potential commercial uses for unmanned aircraft. Farmers, he said, want to use UAS for crop dusting and disease detection, while oil and gas companies want to use UAS to inspect rigs and pipelines. Hollywood, too, wants to get its hands on unmanned aircraft to capture innovative camera shots and save money on manned aircraft costs.¶ A company called Darwin

Aerospace has even developed the Burrito Bomber, a drone equipped to carry and drop a parachute-wrapped burrito which it calls “truly the world’s first airborne Mexican food delivery service.” As drone technology becomes more popular, Mairena said he expects innovators will develop other practical applications for commercial integration.¶ Unmanned aircraft are already finding homes in local police departments and other law enforcement agencies. The specific provision in the Drone Act authorizing law enforcement and other government-funded entities to use UAS mandates aircraft must weigh 25 pounds or less, cannot be operated higher than 400 feet above the ground or near airports and must remain within naked eyesight of the operator. This portion of the law is contributing to much of the confusion surrounding domestic drone use, and is the reason behind much of the legislation proposed in state and federal governments to restrict the use of drones.¶ Right now, law enforcement can use drones to survey anything that is visible to the human eye without a warrant, said Amie Stepanovich, counsel at the Electronic Privacy Information Center. ¶ But drones can be equipped with penetrating technology like infrared thermal imaging cameras to uncover details that are not visible to the naked human eye. “It is physically impossible to hide from a drone within the typical home” if the drone is equipped properly, she said. At this point, with the technology being so new, Stepanovich said it is unclear whether such examinations will be considered “searches” under the Fourth Amendment, which would require law enforcement agencies to obtain a warrant before pursuing such an endeavor.¶ “There is currently no legislation that governs the collection or retention of information using drone technology,” she said. “Without comprehensive legislation or regulations to protect privacy, all individuals are at risk to having their rights to privacy violated by drone surveillance.”¶ Mairena disagreed. He said the industry believes the Fourth Amendment provides ample protection for citizens from invasions of privacy.¶ “We respect and support individuals’ rights to privacy and if anyone is misusing this technology, they should be punishable to the fullest extent of the law,” he said. “The Fourth Amendment of the U.S. Constitution has protected people from unreasonable searches and seizures for the past 225 years, and there’s no reason to think that the courts aren’t able to handle this new technology.”¶ Stepanovich, said, though, the “wait and see” approach to privacy is not sufficient. She cited the Electronic Communications Privacy Act of 1986, which regulated email privacy. “In no way can the ECPA be said to have hampered the Internet, but it did ensure that the new technology did not have a negative impact on individual privacy,” she said.¶ The concerns related to privacy go beyond just what drones can see, though. Because purchasing an unmanned aerial vehicle is much cheaper than buying a manned one—hundreds or thousands of dollars to buy as opposed to hundreds of thousands or millions of dollars—law enforcement can afford to have more of them in the sky.¶ American Civil Liberties Senior Policy Analyst Jay Stanley said that in American legal tradition, police don’t watch over citizens unless they have individualized suspicion a person is about to do something wrong. But, he said, drones could allow police to constantly monitor people tracking their movements and vehicles.¶ The unmanned vehicle lobby and the International Association of Chiefs of Police have both put forth guidelines for proper drone use. The lobby’s code of conduct includes one sentence addressing privacy that reads, “We will respect the privacy of individuals,” but provides no detail as to which uses do and do not violate an individual’s right to privacy.¶ Rep. Ted Poe, R-Texas, introduced the Preserving American Privacy Act last month that would ban all drone surveillance unless a warrant was first obtained, except during emergencies, if consent is given by the subject of the surveillance and

within 25 miles of the border. U.S. Customs and Border Patrol currently operates 10 Predator drones.¶ Virginia is considering a two-year moratorium on drone use. Thirty other states have introduced legislation to protect privacy and limit unmanned aircraft use.¶ Mairena said the privacy fears are overstated, noting that the only difference between unmanned and manned aircraft is the location of the pilot, of which the general public is much more accepting.¶ Humphreys, who calls himself a UAV proponent, said to ignore privacy concerns is bad for the industry. “My fear is that if we don’t proceed with due caution, we’re going to find ourselves confronted by a very angry public, both because of the privacy and the safety concerns,” he said.

Drone surveillance is set to increase

AP 5-22 [associated press “Justice Department issues policy on domestic drone use”

<http://www.aol.com/article/2015/05/22/justice-department-issues-policy-on-domestic-drone-use/21186497/>](sakin)

WASHINGTON (AP) — The Justice Department is acknowledging that the FBI, DEA and other federal law enforcement agencies are likely to make increasing use of unmanned aerial drones in the United States.¶ The department on Friday issued its first written guidelines for domestic drone use and emphasized the need to respect civil and constitutional rights.¶ The unmanned aircraft already have been used in kidnapping, drug and fugitive cases, as well as search and rescue operations, the department said. They also can be operated relatively cheaply.¶ The five-page policy document comes 19 months after the agency's inspector general recommended drone-specific policies that consider privacy rights. That report said that unmanned drones raised greater privacy concerns than pilot-operated aircraft because they can fly closer to homes and operate for days at a time.¶ The department said drones can't be used solely to monitor protests and other constitutionally protected activities.¶ Annual reviews will make sure the agency is complying with the new policy.

Drones Solve CT

Drones can resolve counter-terrorism

Shinkman 15 [Paul D. Shinkman is a national security reporter for U.S. News & World Report. June 18, 2015

<http://www.usnews.com/news/articles/2015/06/18/obama-cia-returning-to-controversial-drone-signature-strikes> "Obama, CIA Cornered Into Troubling 'Signature Strikes'" (Vaibhav)

The use of signature strikes returned to top headline space earlier this year, after Obama confirmed in April a U.S. aircraft had accidentally targeted and killed two hostages -- American Warren Weinstein and Giovanni Lo Porto, an Italian -- at a compound on the Afghanistan-Pakistan border. The president admitted the CIA had been tracking the compound and incorrectly determined the only occupants were enemy combatants. It launched the strike based on the "near certainties" protocols employed for U.S. counterterrorism strikes. Obama attributed the mistake to "the fog of war," adding, "in our fight against terrorists, specifically, mistakes and sometimes deadly mistakes can occur." The use of these controversial tactics is a result of the Obama administration's war policies, focused on bringing American ground forces home from protracted conflicts in Iraq and Afghanistan. Places like Libya, Syria and Yemen have become hotbeds for insurgent activity, but are also too dangerous for U.S. forces to operate in and provide a platform intelligence agents can use to gather information. The U.S. is then left to rely largely on 21st-century armed drone technology, born from the need to expand a watchful eye over the war in Afghanistan and steadily expanded during the George W. Bush and Obama administrations. The recent popularity of drone operations has put an incredible strain on the Air Force, largely responsible for operating the aircraft. When asked about death of al-Wahishi on Tuesday, Pentagon spokesman Army Col. Steve Warren declined to comment specifically. But the news, combined with the announcement the U.S. had also killed Mokhtar Belmokhtar in Libya this week, shows the effectiveness of U.S. counterterrorism efforts even without having to deploy troops to those countries, he said. "Even though we no longer have a presence in Yemen, no more boots on the ground, we don't have a presence in Libya, but we still have global reach," Warren said. "We still retain the ability to find, and kill terrorists wherever they are hiding in the world." Signature strikes have been an effective but imprecise tool used by U.S. intelligence and military units in the wars in Afghanistan and Iraq, and in the worldwide hunt for al-Qaida, to break terrorist networks' swift methods of moving operatives, particularly their top leaders. Retired Army Gen. Stanley McChrystal, the high profile former head of the military's shadowy Joint Special Operations Command, admitted after retiring in 2013 the appeal of the strikes and their inherent dangers.

Link - Privacy/Civil Rights

Privacy momentum specifically targets drones but the momentum is being controlled now

Delany 14 [International relations expert "Drone industry says it's being targeted by civil liberties groups" <http://innovationtrail.org/post/drone-industry-says-its-being-targeted-civil-liberties-groups>](Sakin)

¶ **The commercial drone industry says privacy advocates are unfairly targeting it when it comes to privacy and surveillance concerns.** ¶ The unmanned aerial systems industry wasn't even expecting to have to fight over privacy when it came to the integration of drones into the national airspace. ¶ "When the FAA bill passed, we had no idea privacy was going to be the issue de jour, of the day, for the next years to come," said Mario Mairena, who handles government relations for the Association of Unmanned Vehicle Systems International, a leading industry trade group. ¶ Mairena recently spoke to a gathering of companies involved in central New York's drone testing center, known as NUAIR. ¶ **AUVSI and Mairena have successfully lobbied against nearly two dozen congressional bills dealing with drones and privacy.** The Federal Aviation Administration has been tasked by Congress to develop regulations on commercial drones but privacy controls remain vague. ¶ **Mairena says civil liberties groups are trying to scare the public about drones' potential uses,** such as agriculture or search and rescue operations. ¶ "Any new technology could be misused," he told the room. "Where would be today, who'd of thunk it, 15 years ago we would have had to deal with anti-bully measures for uses on the internet." ¶ The American Civil Liberties Union and others have called for rules guiding the integration of drones, saying the cameras they're equipped with could be used for unwarranted surveillance and spying. Some states and communities have already banned drone use. ¶ Mairena says his industry does support enforcement of the Fourth Amendment, which protects against unlawful searches. ¶ "Our position is, we support Fourth Amendment rights, and if anyone is carelessly or recklessly utilizing UAS and your Fourth Amendment right has been violated, they should be held accountable and punishable to the fullest extent of the law," he said.

Domestic drone tests bring concerns about privacy violation

Wald '13, reporter

Matthew L., New York Times, http://www.nytimes.com/2013/12/31/us/politics/us-names-domestic-test-sites-for-drone-aircraft.html?_r=0, EC

WASHINGTON — The Federal Aviation Administration will authorize test sites for drone aircraft in upstate New York, New Jersey and at least eight other states, the agency said on Monday, preparing for a time when unmanned aircraft of various shapes and sizes cruise over the landscape.¶ The agency picked six institutions to operate test locations, which will explore how to set safety standards, train and certify ground-based pilots, ensure that the aircraft will operate safely even if radio links are lost and, most important, how to replace the traditional method for avoiding collisions. Integrating the aircraft into the nation's airspace, set by Congress for 2015, will be phased in gradually.¶ Already, federal investigators have linked one drone aircraft to a problem that would have been almost inconceivable if a pilot had been on board:

The engine failed, and no one noticed.¶The F.A.A. did not say precisely where the test flights would go, but it did say that selections were made with an eye toward diversity, including operations in areas of heavy air traffic, like the Northeast, and Nevada’s border with California.¶ While the public is mostly aware of drones like Predators, Global Hawks and other high-altitude, long-range planes operated by the government, Monday’s announcement covers commercial and private aircraft.¶ These include electric helicopters that a landlord could use to inspect a rooftop water tower; midget helicopters, which can fly close to power lines and are started by yanking a cord like the one on a chain saw; and Styrofoam planes that run on lighter fluid and can fly over fields to look for agricultural pests. Police and fire departments are among those eager to operate drones.¶ Competition to host the test sites was fierce, with state economic development agencies predicting the expansion of a major industry.¶ The six winners, chosen from a field of 25, included Griffiss International Airport, a former Air Force base near Rome, N.Y., which will fly some tests from Cape Cod in Massachusetts, and Virginia Tech, which will fly in Virginia and has an agreement with Rutgers University in New Jersey for testing there as well. Virginia Tech plans to conduct “failure mode” testing — finding out what happens if the aircraft’s control link is lost.¶ The other winners were the University of Alaska, which plans to test in Hawaii and Oregon as well as Alaska, the State of Nevada, the North Dakota Department of Commerce, and Texas A&M University Corpus Christi. Michael P. Huerta, the administrator of the F.A.A., said the sites provided diverse geography, climate and air traffic density.¶ Mr. Huerta said the choice of the six institutions marked a milestone for the aircraft, whose proponents prefer to call them “unmanned aerial systems.” But he said that while a 2012 law sets 2015 as the year by which they should be integrated into an airspace shared with conventional airplanes, “we would envision that that would be a staged process, as we learn more about what these aircraft are, and how they interact with other aircraft.”¶ The phase-in could be by type of drone or by type of airspace, or some other factor. The research will continue until 2017, the F.A.A. said. Flights are expected to begin within six months.¶ The basic concept of integrated airspace is that everything in the sky — manned or not — will use the Global Positioning System to determine its location, and will radio that information to the ground, where a computer will develop a whole picture and send that to all pilots. Sophisticated drones could use that data without human intervention to sense conflicts with other aircraft.¶ Mr. Huerta said that the agency had already issued the first commercial license for drone use: In Alaska it gave ConocoPhillips, the oil company, permission to use a ScanEagle off the Alaska coast.¶ The United States uses the ScanEagle as a spy plane; Iran claims to have captured one and copied its design.¶ The F.A.A. has put several privacy requirements in place for the test program. Site operators will be required to publish privacy policies, covering how they will use the data they gather and how long they will retain it, among other steps.¶ Many elected officials celebrated the selection of sites in their jurisdictions. Senator Heidi Heitkamp, a Democrat from North Dakota, said the selection of Grand Forks would help the drone industry grow and “help make sure it can become a key part of North Dakota’s economy.”¶ Some were less certain. “It’s good news and bad news,” said Luis R. Sepulveda, an assemblyman from the Bronx, who said that a bill he introduced this year to limit police use of drones would reach the Assembly floor in Albany in January or early February.¶ “There’s an opportunity for economic development of a new industry, with the potential to be a billion-dollar industry,” he said. “But we have some concerns about privacy. These are devices that can be disguised in such a way that you don’t

even know you're being recorded." ¶ A lawyer in New York who specializes in drones, Brendan Schulman, said the announcement was about a year behind schedule, meaning that integration into the air traffic system might also be delayed. ¶ "The future regulatory framework remains unknown and potentially could be quite burdensome," he said, although "the test site news is a glimmer of hope." ¶ Daniel R. Benson, a New Jersey state assemblyman, said: "You want to see the technology being tested. It's going to mean we're at the cutting edge and hopefully it will bring jobs in the future." ¶ But he added, "any new technology also brings new concerns."

The military tests drones domestically- but privacy activists are opposed

Lynch '12, Senior Staff Attorney with the Electronic Frontier Foundation

Jennifer, "Newly Released Drone Records Reveal Extensive Military Flights in US", <https://www.eff.org/deeplinks/2012/12/newly-released-drone-records-reveal-extensive-military-flights-us>

View EFF's new Map of Domestic Drone Authorizations in a larger window. ¶ Today EFF posted several thousand pages of new drone license records and a new map that tracks the location of drone flights across the United States. ¶ These records, received as a result of EFF's Freedom of Information Act (FOIA) lawsuit against the Federal Aviation Administration (FAA), come from state and local law enforcement agencies, universities and—for the first time—three branches of the U.S. military: the Air Force, Marine Corps, and DARPA (Defense Advanced Research Projects Agency). ¶ Military Drone Flights in the United States ¶ A160 Hummingbird Drone ¶ While the U.S. military doesn't need an FAA license to fly drones over its own military bases (these are considered "restricted airspace"), it does need a license to fly in the national airspace (which is almost everywhere else in the US). And, as we've learned from these records, the Air Force and Marine Corps regularly fly both large and small drones in the national airspace all around the country. This is problematic, given a recent New York Times report that the Air Force's drone operators sometimes practice surveillance missions by tracking civilian cars along the highway adjacent to the base. ¶ The records show that the Air Force has been testing out a bunch of different drone types, from the smaller, hand-launched Raven, Puma and Wasp drones designed by Aerovironment in Southern California, to the much larger Predator and Reaper drones responsible for civilian and foreign military deaths abroad. The Marine Corps is also testing drones, though it chose to redact so much of the text from its records that we still don't know much about its programs.

I/L Privacy Kills Innovation

Drone Paranoia block innovation

Basulto 14 [innovation writer for the Washington Post “The insidious effect of our paranoid drone culture” <http://www.washingtonpost.com/blogs/innovations/wp/2014/10/21/the-insidious-effect-of-paranoid-drone-culture/>] (sakin)

¶ The problem is, all this drone paranoia could have a chilling effect on innovation. Instead of devising new uses for drones, we’ll spend all our time devising anti-drone technology. We’ll be walking around in anti-drone camouflage, carrying around special personal drone detection systems and reaching for special devices that can disable the video cameras and infrared capabilities of drones. The more money that companies need to spend lobbying for drones, the less money they’ll have to pump into drone R&D. And that will be bad for innovation.¶ For now, the best way to address all the safety and privacy concerns Pentagon and Homeland Security account for most of the drones being flown today in the United is to have as much transparency as possible about who has drones and why. Since the States, it means that the greatest transparency has to start with the very people who probably want the least transparency possible when it comes to drones. That being said, there have been some encouraging signs. For example, organizations such as the Electronic Frontier Foundation (EFF) and Citizens for Responsibility and Ethics in Washington (CREW) have successfully forced the federal government to open up about its drone fleets. And now comes signs that the White House is about to sign an executive order forcing all federal agencies to detail how and why they are using drones.

Current FAA rules are sufficient for innovation – any new privacy momentum kills drones

Kaminski 2-25 [Margot E. Kaminski is an assistant professor of law at the Ohio State University Moritz College of Law and an affiliated fellow of the Yale Information Society Project. “The Rules of the Sky”

http://www.slate.com/articles/technology/future_tense/2015/02/faa_small_commercial_drone_rules_don_t_adequately_address_privacy_concerns.html]

The Federal Aviation Administration finally announced its proposed rules for small commercial drones (those fewer than 55 pounds) on Feb. 15. The proposed rules are considerably less stringent than expected. With the practical hurdles for commercial drone flight plummeting, it is time to turn our sights in earnest toward the privacy problem.¶ On Valentine’s Day 2012, the president signed the FAA Modernization and Reform Act, which, among other things, tasked the FAA with integrating small drones into the national airspace system. The FAA was supposed to have a final rule in place by August 2014 but was repeatedly described as lagging far behind. In November, several news outlets reported that the FAA had finally devised a set of rules for small drones. Those rules were sent to the White House for review. But the proposed rules were rumored to be strict, failing to distinguish between different sizes of drones under 55 pounds, and requiring operators to “have a license, and limit flights to daylight hours, below 400 feet and within sight of the person at the controls,” according to the Wall Street Journal.¶ The actual rules that came out this year—an almost perfect three years after the FAA was tasked with

addressing drones—are less stringent than expected and include room for at least one significant loophole for microdrones under 4.4 pounds. Yes, a drone will need to be flown within an operator’s eyesight and can’t climb above 500 feet. They cannot be flown over people. But the FAA has clarified that the license required for commercial small drone operations would not be a commercial pilot license, but a special “UAS operator certificate,” which will be far easier to obtain. (It will also be relatively affordable—the cost is anticipated to be less than \$300.) Small drones would not need to meet strict airworthiness standards, as feared. Moreover, the FAA has called for comments on the possibility of a “micro” UAS rule, for drones under 4.4 pounds, probably based on an industry proposal that such drones be treated with an even lighter regulatory hand. (Bad news for Amazon, though: Drones still can’t drop objects.)[¶]**All of this is probably good news for drone innovation,** although it could still take years before the rules will be finalized. (Anybody who wants to participate in rule formation by commenting should keep an eye on when the rules are formally published, which will start the clock ticking on the comment process.) In the meantime, most commercial drone use will remain banned. Until the rules are finalized, the FAA will continue to permit commercial drone flight only through its current relatively ad hoc process.[¶] But what about privacy? Drones—including small drones, and especially those driven by commercial motives to voraciously gather all kinds of information—can pose significant privacy threats. They see from new vantage points, they are far lower-cost than older aerial technologies, and they can move over boundaries that otherwise protect activity from sight. **These are only a few reasons why drones have been predicted to be a “privacy catalyst”—the drivers of robust discussions about the enactment of new privacy regulations.**[¶] The FAA has very little to say about privacy, which might not be surprising. It is primarily an agency concerned with aircraft safety. When the Electronic Privacy Information Center, a public interest group focused on privacy policy, petitioned the FAA in 2012 to address the threat from drones to privacy and civil liberties, the FAA responded that it “prioritizes its rulemaking projects based on issues that are crucial to the safety of the aviation community and the traveling public.” Similarly, in the required privacy impact assessment that accompanied the FAA’s draft drone rules, the FAA acknowledge privacy concerns over drone operations but pointed elsewhere for legal solutions.

Impact Module: Heg

Tons of other drone threats mean we're at the critical point

Rayne 4-30-15, Writer at American Thinker

Sierra, "The Future of Drone Warfare",

http://www.americanthinker.com/articles/2015/04/the_future_of_drone_warfare.html

According to a Teal Group report that Lerner cites, more than \$6 billion is spent each year on developing drone technology worldwide, a number that is expected to double over the next decade. Almost **90 percent** of this spending is expected to be on military applications. The RAND Corporation notes that 70 nations already have acquired drones, while 50 countries are developing them. Defense One noted predictions from some experts that "virtually every country on Earth will be able to build or acquire drones capable of firing missiles within the next ten years."¶ Analysis by IHS Inc. shows that the United States will likely remain the largest drone user for the foreseeable future. Currently, the U.S. constitutes nearly half of the global drone market, with the U.S. Air Force at half the American demand.¶ Prior to 2015, the U.S. exported armed drones only to the United Kingdom, with some other NATO countries receiving unarmed drones. Starting in February 2015, the Obama administration approved widespread drone exports with certain conditions. Each case will be assessed separately, and foreign military sales regulations will apply. Potential purchasers will need to commit to basic principles of use with respect to international law on military force and human rights, agree not to use them for unlawful domestic surveillance, and agree to potential end-use monitoring. Under the non-binding Missile Technology Control Regime (MTCR), Lerner points out that the U.S. has "committed to approaching requests for our armed drones with a 'strong presumption of denial' – meaning if a country comes to us asking to buy our drones, if they have a range of more than 300 km and can carry more than 500 kg, we force that country to make a strong case for why they should have these drones."¶ Lerner's research further highlights a Frost & Sullivan study showing that Israel is the largest drone exporter, sending about half its exports to Europe, about one-third to the Asia-Pacific, and a little over 10 percent to South America. Several European nations – such as the U.K. and France – are developing combat drones in collaborative networks to reduce their reliance on American and Israeli drones. South Korea and developing nations such as Colombia and India are also working on their own military drone capacity. Of course, China, Russia, Iran, and various non-state actors such as Hezb'allah and Hamas are also using and developing drone technology.¶ Among potential adversaries, China likely has the most advanced drone program. While not yet equal to the U.S. program, Lerner refers to a Project 2049 Institute report indicating that the Chinese have an "extensive design, [research and development], and production infrastructure spread across state-run industries and universities." China's drone programs started in the 1950s using downed Soviet drones that were reverse-engineered, but the real thrust of China's program began in the late 1990s and has been augmented by recent Chinese hacking efforts into the U.S. defense establishment.¶ As one might expect, Russia's drone programs took a major hit after the fall of the USSR, but serious efforts – helped by \$9 billion in funding – have been made since 2005 to restart the programs and catch up to the Americans. From interviewing other experts, Lerner learned that the Russian program went "dark" a few years ago and was probably taken over by Russian Army intelligence.

Lerner also notes that the Russians are reportedly working on a drone base just 400 miles from Alaska in order to provide better reconnaissance capacity to the Russian fleet in the northern Pacific. Iran's active drone program is working on long-range armed drones with potential capability to reach Israel. Iran claims to have captured and reverse-engineered U.S. drones, but Lerner says these claims warrant suspicion because of Iran's long history of related propaganda. In discussions with Lerner, Steve Zaloga from The Teal Group stated the following: Short term, the US probably does have a fair amount of concern about Iranian UAV [unmanned aerial vehicle] operation and use, and not because they are terribly sophisticated. I would describe it more as a nuisance than a serious threat, but the U.S. military is still concerned. Iranian UAVs will probably grow in complexity and sophistication, especially if Iran is able to tap into a significant exporter. So for example, if China decides to support Iran by permitting UAV sales, that could bring about a very, very big change. Among the non-state actors, Hezb'allah is the largest drone threat. The group reportedly has over 200 drones and has repeatedly violated Israeli airspace – including near Haifa and Dimona (where Israel is thought to house its nuclear weapons). Hamas also has drones and brought them into Israeli airspace from Gaza last year. Lerner points to a Lexington Institute article by Daniel Goure calling small drones "[t]he IEDs of the Next War":

Drones are necessary to maintain military dominance

Singer 2-23-15, Strategist for the New American Foundation

Peter Warren, "The future of war will be robotic",
<http://www.cnn.com/2015/02/23/opinion/singer-future-of-war-robotic/>

On the ground, the inventory numbers some 12,000, ranging from iRobot's PackBots, used to search for roadside bombs in Afghanistan, to the U.S. Marine Corps Warfighting Lab's tests with Qinetiq's Modular Advanced Armed Robotic System, a tracked robot that mounts cameras and a machine gun. This revolution is by no means just an American one. At least 87 other countries have used military robotics of some sort, ranging from the UK to China, which has an especially fast-growing drone fleet, as shown off at its recent arms trade show. A number of nonstate actors have added robots to their wares as well, including most recently both sides of the Syrian civil war, as well as ISIS. Both sides in the Ukraine conflict are also using them. These robots, though, are just the start. If this was 100 years ago, they would be the equivalent of the Bristol TB 8, the first bomber plane, or the Mark I, the first tank used in battle. A host of changes awaits us. Their size, shape and form will move in wild and, for many, quite scary new directions. A future Marine squad might not just have an armed robot on the ground -- the plan is that it will also have its own microdrone, such as the PD-100 Black Hornet. The size of a hummingbird, it weighs 18 grams, and will allow a Marine to safely peer around a corner or sneak up on a sniper waiting to ambush the squad from the window of a five-story building down the road. Or, overhead might be a Zephyr, a solar-powered drone with 74-foot wings, that could stay in the air for 11 days. Perhaps the biggest change that looms, however, is in the robots' intelligence and autonomy. The early Predator-class systems were "unmanned" only in that a human wasn't inside them. On the ground, human operators had to remotely instruct their every function and move. The current versions are now more automated, able to do things like take off and land on their own, fly to various mission waypoints on their own, and carry sensors that make sense of

what they are seeing for the humans.¶ This next, more autonomous stage is perhaps best illustrated by the debate in Congress last year over the Navy's Unmanned Carrier-Launched Airborne Surveillance and Strike program, UCLASS for short. Its progenitor, the Northrop X-47 test aircraft, has been able to perform one of the toughest human pilot tasks of all -- taking off from and landing on an aircraft carrier -- and is now being tested on functions like air-to-air refueling and partnering with manned planes. UCLASS is the next stage of a more advanced, jet-powered and stealthy system going operational.¶ But the main debate is not whether to deploy such drones as a regular part of a carrier's air wing, but how much of their role would be for reconnaissance -- or whether they would follow the natural evolution into a focus on bombing and strike missions, seeking to cause damage to any enemy they find, not just watching them. That is just what happened with those early manned airplanes a century ago.¶ Similarly, the British are testing an unmanned system called Taranis that is not just jet-powered and stealthy but also explores new target selection software.¶ We are not yet in the world of the Terminators or "The Matrix," where machines make their own decisions on when and where to go to war. Nor is the human role disappearing from war, or old technology going away. The current Iraq War 3.0 has all the players -- the U.S., ISIS, Iran, and Iraqi government forces -- using both drones and traditional boots on the ground.¶ But it is clear that something important is afoot in the discussion of humans, our technology and our wars. The human role has shifted from being "in the loop" of decision with our machines, making all the key calls to, as a U.S. Air Force report described it, "on the loop" of decision, where our role is more to manage than to direct the operations of robots. Cyberconflict is one area in which artificial intelligence and software algorithms increasingly make most of the decisions at digital speed.¶ The looming debate then is whether that human role will ever move ultimately "out of the loop." Many are deeply concerned by this prospect, arguing that it should be nipped in the bud, just as many wish H.G. Wells' concept of an "atomic bomb" had never been invented. They've started to organize to prevent research into autonomous armed robots and called for arms treaties banning the technology.¶ Whether that is possible remains to be seen, as both science and war have a long history of escaping their bounds. But one thing is clear: Like the present, the future of war will be robotic.

Impact Module: Agriculture

Drone surveillance is vital to sustaining long term agricultural resiliency

Best 13 [worker for the natural the natural resources defense council “The Surprising New Domestic Drone Market: Agriculture” <http://www.takepart.com/article/2013/04/02/drones-farm-surprising-new-market-unmanned-aircraft>] (sakin)

You’re probably already aware of the “coming of the drones.” While the U.S. government has had seemingly little compunction about unleashing a stealth fleet of unmanned aircraft in places like Iraq and Afghanistan, it’s been reluctant to allow similar winged bots to take to the skies here. And while much attention of late has been given to how law enforcement agencies might use drones to fight crime (or invade privacy, depending on your point of view), what’s surprising is that, in the drone industry, the real money isn’t on the cops—but the crops.¶“Agriculture is gonna be the big market,” Chris Mailey, a VP at the Association for Unmanned Vehicle Systems International, tells Wired.¶Even before the sequestration, the drone industry was preparing for stagnation in the military market, owing to the fact that the U.S. is finally winding down its wars overseas. Law enforcement on the homefront seemed like a natural market (and, in fact, some police drones are already hovering out there, like in Miami), but as Mailey argues in Wired, the market is fixed: there are 18,000 law enforcement agencies in the U.S., a sizeable portion of which are facing budget cuts of their own.¶So what about drones on the farm? Drone boosters (pause: with a phrase like that, it really does hit you that you’re living in the 21st century) enthuse about the range of cool things that drones can do that Old MacDonald could only ever dream about, like detecting fungal diseases in the field well before crops show signs of infection, and thus leading to earlier and more effective treatment.¶As Fast Company reports, a Canadian company called CropCam is hawking a GPS-controlled glider plane equipped with a camera that will snap geotagged hi-res images of fields, giving farmers a birds-eye view of which crops are healthy and which need some TLC. Farm drones could also allow for targeted spraying, especially for specialty crops that are either too difficult or too dangerous to spray with manned aircraft. Researchers at the University of California, Davis are experimenting with farm drones for spraying grapes in Napa Valley; over in Japan, where farm drones have been in use since 1990, 30 percent of the country’s rice paddies are sprayed using unmanned aircraft.

Impact Module: China

US drone deterrence is key to prevent a China Taiwan war, China is militarizing now.

Gertz 5-8-15, senior editor of the Washington Free Beacon

Bill, "China Preparing for Drone Warfare", <http://freebeacon.com/national-security/china-preparing-for-drone-warfare/>

China's military plans to produce nearly 42,000 land-based and sea-based unmanned weapons and sensor platforms as part of its continuing, large-scale military buildup, the Pentagon's annual report on the People's Liberation Army (PLA) disclosed Friday. ¶ China currently operates several armed and unarmed drone aircraft and is developing long-range range unmanned aerial vehicles (UAVs) for both intelligence gathering and bombing attacks. ¶ The acquisition and development of longer-range UAVs will increase China's ability to conduct long-range reconnaissance and strike operations," the report said. ¶ China's ability to use drones is increasing and the report said China "plans to produce upwards of 41,800 land- and sea-based unmanned systems, worth about \$10.5 billion, between 2014 and 2023." ¶ Four UAVs under development include the Xianglong, Yilong, Sky Saber, and Lijian, with the latter three drones configured to fire precision-strike weapons. ¶ "The Lijian, which first flew on Nov. 21, 2013, is China's first stealthy flying wing UAV," the report said. ¶ The drone buildup is part of what the Pentagon identified as a decades-long military buildup that last year produced new multi-warhead missiles and a large number of submarines and ships. ¶ PLA missile ranges ¶ Additionally, the Pentagon for the first time confirmed China's development of an ultra-high speed maneuvering strike vehicle as part of its growing strategic nuclear arsenal. ¶ **"China is working on a range of technologies to attempt to counter U.S. and other countries'** ballistic missile defense systems, including maneuverable reentry vehicles (MaRV), [multiple, independently targetable reentry vehicles], decoys, chaff, jamming, and thermal shielding," the report, made public Friday, states. ¶ "The United States and China acknowledge that the Chinese tested a hypersonic glide vehicle in 2014," the report noted. ¶ It was the first time the Pentagon confirmed the existence of what is known as the Wu-14 hypersonic glide vehicle, a strike weapon that travels at the edge of space at nearly 10 times the speed of sound. ¶ The Wu-14, designed to deliver nuclear weapons through U.S. missile defenses, was first disclosed by the Washington Free Beacon, which reported on three tests conducted in 2014. ¶ "Together with the increased mobility and survivability of the new generation of missiles, these technologies and training enhancements strengthen China's nuclear force and bolster its strategic strike capabilities," the report said. ¶ "China will likely continue to invest considerable resources to maintain a limited, but survivable, nuclear force to ensure the PLA can deliver a damaging responsive nuclear strike." ¶ Rick Fisher, a China military affairs analyst, said the report is the Pentagon's most detailed assessment in recent years. ¶ "By far it is the most detailed PLA report in terms of explaining near to medium term threat vectors but does not venture enough into the far term, the later 2020s and beyond," said Fisher, with the International Assessment and Strategy Center. ¶ The report also highlights the threat facing Taiwan. "It is a tragedy that the Obama administration does not pay attention to **these assessments when it continually denies**

Taiwan new weapons systems it requires to continue to deter China,” Fisher said.¶**The Chinese military, once a backward, ill-equipped force, is rapidly becoming a very sophisticated high-technology military organization that is focused on developing asymmetric warfare capabilities that will allow it to defeat the United States or other advanced militaries in a future conflict.**¶ The new capabilities include anti-satellite weapons, including a high-earth orbit missile capable of hitting strategic satellites as high as 22,000 miles in space, and cyber warfare capabilities.¶ But the major weapons systems that receive the most attention in Chinese defense spending, estimated by the Pentagon to be more than \$175 billion annually, are missiles.¶ China’s Second Artillery Corps, as its nuclear and conventional missile service is called, is building several new classes and upgrades of offensive missiles, including hypersonic vehicles.¶ **More than 1,200 short-range missiles are now deployed within range of Taiwan,** with which China has vowed to reunite, with force if necessary, since the island broke away at the end of the 1940s civil war against the Communists.¶ **“China is increasing the lethality of its conventional missile force by fielding a new ballistic missile, the CSS-11 (DF-16), which possesses a range of 800-1,000 km [500 to 620 miles],”** the report said.¶ **“The CSS-11, coupled with the already deployed conventional variant of the CSS-5 (DF-21) medium-range ballistic missile (MRBM), will improve China’s ability to strike not only Taiwan, but other regional targets.”**

Technological superiority is necessary to deter china

SCMB 14 [writer from reuters “China's military power an increasing threat to US, Pentagon official admits” <http://www.scmp.com/news/china/article/1416416/chinas-military-power-increasing-threat-us-pentagon-official-admits>] (sakin)

¶ **The US military’s technological superiority is increasingly challenged by China, and efforts to maintain an edge are complicated by shrinking defence budgets that have cut money for development,** the Pentagon’s top weapons buyer said on Tuesday.¶ Frank Kendall, **the deputy undersecretary of defence for acquisition and technology,** told lawmakers that the US military’s technological superiority is being “challenged in ways that I have not seen for decades, particularly in the Asia-Pacific region”, where China is pursuing a rapid modernisation program.¶ [China's] budget is far smaller than ours. But their personnel costs are also far smaller than ours.¶ Frank Kendall, undersecretary of defence, ¶ **“Technological superiority is not assured,”** Kendall told the Armed Services Committee in the House of Representatives. “This is not a future problem. This is a here-now problem.”¶ With China, Russia and other countries **rapidly modernising their militaries, Pentagon officials are voicing increasing concern about the possibility of losing the technological edge that has enabled the US military to dominate the battlefield over the past 25 years.**¶ US defence officials say they do not expect a conflict with China or Russia, but the chances are that **some of what they develop will be sold to other nations and the US military may eventually face those systems.**¶ Defence Secretary Chuck Hagel underscored the value of advanced research in a visit this month to Sandia National Laboratories in New Mexico, saying the **“technological edge that we’ve been able to maintain is critically important ... in the world that we’re in today with more complications, more combustibility”.**¶ Admiral Samuel Locklear, the head of US Pacific Command, told reporters in Washington recently that the military’s “relative dominance” had been diminishing after a period of unequalled superiority.¶ “That’s not something to be afraid of; it’s just to be pragmatic about,” Locklear said, adding that the military would have to think carefully about

which systems to develop in the future in order to maintain that edge.¶¶ Asked by a lawmaker how the technology race with China was going, Kendall indicated it was not positive, even though US defence spending is far greater than China's.¶¶ The base US defence budget will drop below US\$500 billion this year, while China's grew to US\$119 billion last year after another double-digit jump.¶¶ "Overall, China's military investments are increasing in double-digit numbers each year, about 10 per cent," Kendall said. "Their budget is far smaller than ours. But their personnel costs are also far smaller than ours."¶¶ Personnel costs make up roughly half of the US defence budget.¶¶ Kendall told lawmakers the Pentagon's ability to respond by developing new technologies was "severely limited by the current budget situation", with the department facing hundreds of billions in cuts to projected spending over the next decade.¶¶ Lawmakers voiced concern about not having known about Pentagon concerns earlier and asked Kendall when he first realised US technological superiority was being challenged.¶¶ "We've had a steady decline [in spending] over the last several years of cuts ... We've been pleading with you guys to come over and tell us the problem," congressman Randy Forbes of Virginia, a Republican, told Kendall.¶¶ Kendall said the issue became "a more visible concern" when the department conducted a strategic review after Congress approved the budget cuts in 2011.¶

---XT: Domestic Drones KEY

Domestic drones are key to military success- there's 64 known bases

Franceschi-Bicchierai '12, reporter

Lorenzo, "Revealed: 64 Drone Bases on American Soil", <http://www.wired.com/2012/06/64-drone-bases-on-us-soil/>

¶ WE LIKE TO think of the drone war as something far away, fought in the deserts of Yemen or the mountains of Afghanistan. But we now know it's closer than we thought. There are 64 drone bases on American soil. That includes 12 locations housing Predator and Reaper unmanned aerial vehicles, which can be armed.¶ Public Intelligence, a non-profit that advocates for free access to information, released a map of military UAV activities in the United States on Tuesday. Assembled from military sources — especially this little-known June 2011 Air Force presentation (.pdf) — it is arguably the most comprehensive map so far of the spread of the Pentagon's unmanned fleet. What exact missions are performed at those locations, however, is not clear. Some bases might be used as remote cockpits to control the robotic aircraft overseas, some for drone pilot training. Others may also serve as imagery analysis depots.¶ The medium-size Shadow is used in 22 bases, the smaller Raven in 20 and the miniature Wasp in 11. California and Texas lead the pack, with 10 and six sites, respectively, and there are also 22 planned locations for future bases. "It is very likely that there are more domestic drone activities not included in the map, but it is designed to provide an approximate overview of the widespread nature of Department of Defense activities throughout the US," Michael Haynes from Public Intelligence tells Danger Room.¶ The possibility of military drones (as well as those controlled by police departments and universities) flying over American skies have raised concerns among privacy activists. As the American Civil Liberties Union explained in its December 2011 report, the machines potentially could be used to spy on American citizens. The drones' presence in our skies "threatens to eradicate existing practical limits on aerial monitoring and allow for pervasive surveillance, police fishing expeditions, and abusive use of these tools in a way that could eventually eliminate the privacy Americans have traditionally enjoyed in their movements and activities."¶ As Danger Room reported last month, even military drones, which are prohibited from spying on Americans, may "accidentally" conduct such surveillance — and keep the data for months afterwards while they figure out what to do with it. The material they collect without a warrant, as scholar Steven Aftergood revealed, could then be used to open an investigation.

AT: FAA Regs

FAA regs were just good enough to spur drone innovation – innovation is still on the brink

McFarland 5-7 [editor for innovations and writer for the Washington Post “The FAA and the drone industry are turning over a new leaf”

<http://www.washingtonpost.com/blogs/innovations/wp/2015/05/07/the-faa-and-the-drone-industry-are-turning-over-a-new-leaf/>] (sakin)

The drone industry and the FAA haven’t always seen eye to eye, but both sides appear to be finding common ground and moving toward safely integrating drones into U.S. skies.¶ The FAA announced Wednesday that it would allow PrecisionHawk and BNSF Railway to test drone flights outside the line of sight of pilots. As part of this Pathfinder Program CNN will be allowed to test drones over cities. The FAA, which didn’t include outside of line-of-sight operations in its proposed rules this February, now appears fully committed to testing and determining if it can be done safely.¶ Relations between the sides had been strained previously, as the FAA missed deadlines for making commercial drone flights legal. Some drone advocates warned that the United States was being left behind as other nations moved quicker to provide rules for drones.¶ But now, Michael Drobac, executive director of the Small UAV Coalition, says that **a spirit of camaraderie and community has developed between U.S. regulators and the drone industry.**¶ “It’s a real triumph for technology, for consumers and for safety,” Drobac said. **“Now we’re seeing a certain degree of coordination of movement at the FAA with industry partnerships,** a kind of mindshare and a working relationship that is going to develop into something that will allow the U.S. to surge forward in grand fashion to take center stage and lead the world again.”¶ In his Wednesday speech, FAA administrator Michael Huerta said that data gathered at the trials could lead to FAA-approved operations in the next few years.¶ “The FAA for so long was asking industry to bring them solutions and I think that we’ve seen the fact that they are very responsive to that,” said Lisa Ellman, co-chair of McKenna Long & Aldridge’s unmanned aircraft systems group, who previously worked on drone policy at the U.S. Justice department.¶ Earlier this year the FAA streamlined the process for drone operators to apply for and receive an exemption to fly commercially. (Previously some exemption holders had grown frustrated with the time it took the FAA to approve flights, which hampered their ability to take on jobs.)¶ In January, PrecisionHawk presented Latas, its new air traffic management system, to the FAA as a solution for ensuring safe flights beyond line of sight. PrecisionHawk spokeswoman Lia Reich described that as building a trust that led its inclusion in the Pathfinder Program.¶ **“We still have a long ways to go in planning what this is going to look like,”** Reich said. **“But we’re ready to start right away, starting to feed data back to the FAA.”**

FBI/CIA Cooperation DA

1NC

FBI and CIA cooperation's ongoing and successful now

Hitz '13, Adjunct Professor, University of Virginia School of Law and Frank Batten School of Leadership and Public Policy

Frederick, "THE RISE OF THE SPY COMMANDO AND REORGANIZED OPERATIONAL CAPABILITIES", http://www.harvard-jlpp.com/wp-content/uploads/2013/10/35_1_245_Hitz.pdf

Ten years after September 11, there has not been an attack in the United States on a similar scale since that horrific day. We have experienced near misses, such as the failures of both the underwear bomber on Christmas Day, 2009 and the Times Square bomber in May 2010. We experienced the shootings of twelve soldiers by an Arab-American military psychiatrist at Fort Hood Army base in November 2009, although it is not clear that attack was terrorist-inspired. Nonetheless, there have not been any recurrences of terrorist killing in the United States on a mass scale. Why? A simple answer is that we are no longer the unaware, unprotected country we were in early September 2001. Airport security procedures are more elaborate, and the notion of "if you see something, say something" has become widespread. Nonetheless, it is important to ask if we have just been fortunate or if we are demonstrably better at international counterterrorism. Ten years after September 11, there are many new players in the world of U.S. counterterrorism. In addition to calling for the creation of a Director of National Intelligence⁹ and a National Counterterrorism Center,¹⁰ the 2004 9/11 Commission Report encouraged information sharing among government departments with access to intelligence on terrorism.¹¹ Indeed, the 9/11 Commission noted that the September 11 attacks were the product of a plot dreamed up in Hamburg, Afghanistan, and Madrid, within the operational jurisdiction of the CIA and the U.S. Department of State, but the action was destined to take place in the United States, where responsibility for stopping it fell largely to the FBI and local law enforcement.¹² In an age of instant communications, the CIA and FBI ought to be in constant contact about matters that relate to national security. But do the relevant elements of the U.S. Government regularly communicate with one another as the 9/11 Commission envisioned, or have bureaucratic setbacks like Wikileaks driven the intelligence community back to old information stovepiping habits? Thus, the events of September 11 led directly to the creation of the Department of Homeland Security, a gigantic agglomeration of domestic law enforcement, immigration, customs, and coastal protection authorities that did not include a domestic intelligence gathering entity separate from the FBI, like the UK's MI5.¹³ In addition, the United States has committed \$75 billion annually to counterterrorism,¹⁴ including the hiring of hosts of contractors holding an estimated 265,000 top secret clearances.¹⁵ What have we to show for this extraordinary expenditure of resources? With this background in mind, I turn to the role of the intelligence community, particularly the CIA. The CIA rebounded quickly after the September 11 debacle by inserting a team of civilian special operations case officers into northern Afghanistan three weeks later.¹⁶ Led by Gary Schroen, this six-man team helicoptered over the Hindu Kush Mountains from Uzbekistan to the Panjshir Valley¹⁷ where they linked up with members of the Northern Alliance to fight the Taliban who had been shielding Osama bin Laden.¹⁸ Schroen told this fascinating story in *First In*;¹⁹ Gary Berntsen continued it in his book *Jawbreaker*.²⁰ Moving

quickly, both Schroen's and Berntsen's teams used relationships built during the CIA-managed covert war against the Soviets from 1979–1991 and knowledge of regional languages²² to direct a second covert war, this time against the Taliban. Using SOFLAM²³ laser targeting mechanisms, the teams guided U.S. bombers against enemy troop concentrations.²⁴ The CIA exploited a vulnerability that helped drive the Taliban out of Kabul and Osama bin Laden to Tora Bora, where he might have been vulnerable to U.S. troops if they had been deployed on such a mission.²⁵ Although the CIA did not effectively warn President George W. Bush and his top policymakers before the September 11 attacks,²⁶ it picked itself up afterward by exploiting a long-standing CIA special operations capability—"spy commandos." By using these highly trained agents, the CIA was able to get "sneakers" on the ground in Afghanistan weeks before the U.S. military was able to do so.²⁷ It has continued to use spy commandos in Afghanistan since and recently enjoyed further success when they were teamed with U.S. Navy SEALs to bring down Osama bin Laden.²⁸ The CIA built a cadre of spy commandos consisting largely of experienced retired or detailed U.S. Special Forces personnel to work against the terrorist target in the Middle East.²⁹ These former soldiers receive CIA operations and reports training, while retaining their special forces operating skills which allow them to function in the outback where terrorists are active.³⁰ Because CIA officers will not encounter terrorists in official government offices or embassy cocktail parties but must confront them where they are attacking civilians,³¹ it seems to me that training and using spy commandos is an appropriate mission for our nation's clandestine service. The CIA also has experienced success in the decade since September 11 by combining accurate intelligence and American technology. The emergence of the Predator drone, initially deployed as a reconnaissance vehicle but now fitted with Hellfire missiles, helped coalition efforts immeasurably in finding, chasing down, and eliminating Taliban insurgents in the difficult terrain of Afghanistan and Pakistan.³² By some estimates, the CIA drone fleet has killed more than 1,500 suspected militants in Pakistan alone.³³ Not that the Predator has been an unmitigated success. Because of its futuristic and relentless non-humanity, the Predator drone has aroused strong opposition among ordinary citizens of Afghanistan and Pakistan, who deplore the collateral casualties that come with the drone's terrorist-killing accomplishments.³⁴

[INSERT MOMENTUM LINK]

That aff creates momentum from civil liberties groups that stops cooperation

Harris '5, Special Assistant to the President and Senior Director for African Affairs on the National Security Staff of the White House

Grant T., Yale Law and Policy Review, "The CIA Mandate and the War on Terror", <http://www.deckprism.net/news/Yale%20Law%20and%20Policy%20Review,%20CIA%20Mandate,%20Harris,%20G.pdf>

In the context of countering terrorism, there are "bright but dimming lines" between the FBI and CIA.¹²² The struggle against terrorism as well as other transnational threats has brought close cooperation between the CIA and the FBI (as well as other agencies), including combined centers designed to pool resources and enhance the agencies' effectiveness. In short, the fight against terrorism and other transnational threats has dawned an era of co-location, cooperation, and combined resources. In continuing this trend, the Intelligence Reform and

Terrorism Prevention Act of 2004 established a National Counterterrorism Center (NCTC),¹²³ a National Counter Proliferation Center,¹²⁴ and a Human Smuggling and Trafficking Center,¹²⁵ and also empowered the DNI to establish National Intelligence Centers.¹²⁶ The recent intelligence reform also calls for the establishment of a formal relationship between the intelligence community and the National Infrastructure Simulation and Analysis Center.¹²⁷ Co-location and/or close cooperation of CIA and FBI officials in joint centers on transnational threats raises statutory questions related to law enforcement activities because of the nexus between CIA intelligence and criminal prosecutions.¹²⁸ The Intelligence Reform and Terrorism Prevention Act of 2004 also supports an Information Sharing Environment (ISE) to promote the sharing of terrorism information throughout the Federal Government.¹²⁹ One of the policy goals of the ISE is to ensure the "maximum sharing of information among all relevant policy, law enforcement, diplomatic, and intelligence agencies . . . to improve effectiveness and to convert all information into intelligence that can be used to combat terrorist travel, migrant smuggling, and the trafficking of persons."¹³⁰ IRTPA § 7202 (to be codified at 8 U.S.C. § 1777).¹³¹ IRTPA § 1023 (to be codified at 50 U.S.C. § 404o.2).¹³² IRTPA § 8101.¹³³ The lateral sharing of information by the CIA to law enforcement agencies for use in criminal prosecutions "sounds a lot like law enforcement powers."¹³⁴ Telephone Interview with Jeffrey H. Smith, supra note 24.¹³⁵ IRTPA § 1016 (to be codified at 6 U.S.C. § 485). The legislative creation of an ISE continued previous initiatives to improve the sharing of such information between government agencies. See Exec. Order No. 13,356, 69 Fed. Reg. 53,599 (Aug. 27, 2004); Homeland Security Information Sharing Act, § 551, Yale Law & Policy Review Vol. 2:2, 2005, goals of the ISE is to "address and facilitate information sharing between and among departments and agencies of the intelligence community, the Department of Defense, the homeland security community and the law enforcement Community."¹³⁶ The security of sources and methods of intelligence is not mentioned as an explicit goal of the ISE, though the ISE's stated attributes are to include protections of privacy and civil liberties.¹³⁷ The linkage of intelligence and law enforcement was explicitly recognized by Congress in 1996 with a statutory addition to the National Security Act of 1947 directly pertaining to the collection of intelligence for law enforcement purposes.¹³⁸ The revision, codified in 50 U.S.C. § 403-5a, provides that "elements of the intelligence community may, upon the request of a United States law

enforcement agency, collect information outside the United States about individuals who are not United States persons." 133 Such information may be collected "notwithstanding that the law enforcement agency intends to use the information collected for purposes of a law enforcement investigation or counterintelligence investigation." 34 The Senate report noted that the "CIA and the [National Security Agency] currently interpret their legal authorities as permitting them to engage in intelligence collection only for a 'foreign intelligence' purpose" and noted the Aspin-Brown Commission's conclusion "that the Intelligence Community may be taking to[o] restrictive a view regarding whether intelligence assets can be tasked by law enforcement agencies to collect information overseas about non-United States persons." 135

The tearing down of "the wall" between intelligence and law enforcement in the wake of September 11 allows for much greater sharing of information between the two communities. 136 The Uniting and Strengthening America by Pub. L. 107-296, 116 Stat. 2135, tit. VIII, subtit. A (2002). 130. IRTPA § 1016 (to be codified at 6 U.S.C. § 485). 131. IRTPA §1016 (to be codified at 6 U.S.C. §485). 132. See Intelligence Authorization Act for Fiscal Year 1997, Pub. L. No. 104-293, § 814 (1996). 133. 50 U.S.C. § 403-5a(a) (West Supp. 2004). 134. 50 U.S.C § 403-5a(a) (West Supp. 2004). For background on how this statute might affect discovery requests of intelligence agency files during criminal prosecutions, see Fredman, *supra* note 9, at 364. 135 S. REP. No. 104-258, at 35 (1996), reprinted in 1996 U.S.C.A.N 3945, 3980. According to the Senate report, The law enforcement proviso of the National Security Act was intended to prohibit the CIA from infringing on the domestic jurisdiction of the FBI and from becoming a national secret police that might be directed against U.S citizens. These concerns are not present when the Intelligence Community collects against foreign persons outside the U.S. At the same time, the need to combat terrorism, drug trafficking and other transnational threats effectively requires that the capabilities of the Intelligence Community be harnessed to support law enforcement agencies as efficiently as possible. Id See also ASPIN-BROWN COMMISSION, PREPARING FOR THE 21 ST CENTURY: AN APPRAISAL OF U.S. INTELLIGENCE, REPORT OF THE COMMISSION ON THE ROLES AND CAPABILITIES OF THE UNITED STATES INTELLIGENCE COMMUNITY 41 (1996) [hereinafter ASPIN-BROWN COMMISSION]. 136 "The wall" refers to a set of barriers to coordination and information sharing between 552 Vol. 23:529, 2005 The CIA Mandate Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act (USA PATRIOT Act) amended the National Security Act to direct law enforcement agencies to disclose to the DCI (now the DNI) foreign intelligence acquired in the course of a criminal investigation pursuant to guidelines and with some possible exceptions. 37 Rule 6 of the Federal Rules of Criminal Procedure was amended to allow grand jury information involving foreign intelligence or counterintelligence to be shared with "any Federal law enforcement, intelligence, protective, immigration, national defense, or national security official in order to assist the official receiving the information in the performance of that official's duties." 138 The USA PATRIOT Act also made it lawful for foreign intelligence and counterintelligence to be shared more broadly among federal officials. 139 Additionally, the USA PATRIOT Act allows federal officers conducting electronic surveillance and physical searches under the Foreign Intelligence Surveillance Act (FISA) 140 greater consultation and coordination with federal law enforcement officers. 141 "The matters to be consulted upon must pertain to terrorist threats, but there is opportunity for definitional creep as the pressure for preventive action in this area of concern intensifies." 4 intelligence and law enforcement officials. See 9/11 COMMISSION

REPORT, supra note 15, at 78-80. "The wall" was extensively criticized after September 11 as having prevented necessary cooperation between intelligence and law enforcement. See, e.g., Testimony of Condoleezza Rice, Assistant to the President for National Security Affairs, Before the National Commission on Terrorist Attacks Upon the United States 9 (Apr. 8, 2004), at http://www.9-11commission.gov/archive/hearing9/9-11%20Commission%20-%20Hearing_2004-04-08.pdf (last visited Mar. 24, 2005), reprinted in THE 9/11 INVESTIGATIONS 215 (Steven Strasser ed., 2004) ("In hindsight, if anything might have helped stop 9/11, it would have been better information about threats inside the United States, something made very difficult by structural and legal impediments that prevented the collection and sharing of information by our law enforcement and intelligence agencies."). For background on some of the policy reasons that originally led to creation of "the wall," see generally Stewart A. Baker, Should Spies be Cops? 97 FOREIGN POL'Y 36 (Winter 1994-95). 137 Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act (USA PATRIOT Act) of 2001, Pub. L. No. 107-56, 115 Stat. 272, 388-89 (to be codified as amended in 50 U.S.C. § 403-5b(a)). The USA PATRIOT Act and the Homeland Security Act of 2002 also permit increased sharing of intercepted communications. See Homeland Security Act of 2002, Pub. L. No. 107-296, 116 Stat. 2135, 2257, § 896 (codified at 18 U.S.C. § 2517). 138. USA PATRIOT Act § 203(a) Rule 6 further allows the sharing of grand jury information involving "a threat of attack or other grave hostile acts of a foreign power or its agent, a threat of domestic or international sabotage or terrorism, or clandestine intelligence gathering activities by an intelligence service or network of a foreign power or by its agent." FED. R. CRIM. P. 6(e)(3)(D). 139. USA PATRIOT Act § 203(d) (codified as amended at 50 U.S.C. § 403-5d (West Supp. 2003)). As passed in the USA PATRIOT Act, this provision is due to sunset on December 31, 2005. USA PATRIOT Act § 224. The Homeland Security Act extended the reach of that provision to allow information obtained as part of a criminal investigation to be more easily shared with federal, state, local, and foreign government officials. Homeland Security Act of 2002 § 897 (codified at 50 U.S.C. § 403-5d (West Supp. 2003)). 140. Foreign Intelligence Surveillance Act of 1978, Pub. L. No. 95-511, 92 Stat. 1783 (codified as amended at 50 U.S.C. § 1801 et seq. (West Supp. 2003)). 141. USA PATRIOT Act § 504 (codified as amended at 18 U.S.C. §§ 1806, 1825 (West Supp. 2003)). 142. Hitz, supra note 62, at 773. 143. 553 Yale Law & Policy Review 252, 205. The law enforcement prohibition in the National Security Act may make part of the destruction of "the wall" somewhat theoretical, despite the expansion of coordination and information sharing between the FBI and CIA. According to Stewart Baker, former General Counsel at the National Security Agency, the CIA's dependence on law enforcement agencies for domestic activities "may still be having an effect on what information they routinely get access to, although that seems to be a controversial question because any suggestion that there is still a 'wall' is not considered politically correct." 143. Baker is "not totally convinced" that "the wall" is gone because it is difficult if not impossible to work hand-in-glove with law enforcement without getting into some issues that touch on law enforcement areas and would therefore be prohibited by the National Security Act." 4 Nevertheless, the changes wrought by the USA PATRIOT Act and subsequent legislation have received harsh criticism from civil liberties groups and others who believe the USA PATRIOT Act "puts the Central Intelligence Agency back in the business of spying on Americans" 145 and that abuses will result. 146

FBI/CIA cooperation is critical to continued CT

Dinshaw 6-13-15, Reporter

Fram, "Animosity between CIA and FBI before 9/11 debilitated spies: newly declassified documents", <http://www.nationalobserver.com/2015/06/13/news/animosity-between-cia-and-fbi-911-debilitated-spies-newly-declassified-documents>

According to a trove of documents declassified by the CIA on June 12, al-Qa'ida's operational activity in the United States and Canada was greater than previously thought leading up to the 9/11 attacks on the World Trade Center and the Pentagon, with Tenet's leadership blamed for much bad judgement.¶ The CIA report details how tension between the CIA and FBI hindered counter-terrorism investigations, and how intelligence agencies repeatedly failed to put future 9/11 hijackers on a watch list.¶ It describes an often-vicious conflict between George Tenet's CIA and the FBI before 9/11, as well as the spy agency's difficulties in gathering Human Intelligence (HUMINT) and mounting a covert strike to capture or kill bin Laden, after his organization bombed US embassies in East Africa and attacked the USS Cole in 2000.¶ "The key pre-9/11 CIA-FBI relationship with respect to al-Qa'ida, that between UBL (Usama Bin Laden) station and the FBI's New York Field Office (the Bureau's office of origin or office with responsibility for al-Qa'ida), was troubled at best and dysfunctional at worst," states the documents.¶ One CIA member told the investigating team that an FBI representative from the Bureau's New York Field Office was there to spy on behalf of his chief, who did not trust the UBL station.¶ The FBI representative, in turn, told investigators that he was mistrusted as New York's 'spy' and felt like an outcast, saying: "...many of his supervisors and peers did, in fact, characterize him that way."¶ Many of those interviewed said that the worst animosity occurred in a crucial period between 1997 and 1999, after which attempts were made to mend fences, with little success.¶ The report notes that the CIA's UBL station had a smoother relationship with FBI Headquarters' counter-terrorism office, but those interviewed said that supposedly monthly meetings were erratic at best.¶ Nonetheless, the UBL station and FBI counter-terrorism heads established a good working relationship.¶ Lack of cooperation despite stepping up effort to investigate bin Laden.¶ But on Dec. 24 1998, then-CIA chief George Tenet called in a memo for "a new phase in our effort against bin Laden," urging that efforts against al-Qa'ida's chief be stepped up dramatically.¶ "We need an integrated plan which captures these elements and others which may be appropriate. This plan must be fully co-ordinated with the FBI," said Tenet in his memo.¶ But co-operation between the CIA and other agencies remained inadequate. On at least three occasions from January 2000 – August 2001, agencies "failed to recommend future 9/11 hijackers Nawaf al-Hazmi and Khalid al-Mihdhar for watchlisting."¶ "...the Director of Central Intelligence (DCI) acknowledged in his testimony that [the] CIA was not sufficiently focused on advising the State Department to watchlist all terrorist operatives, attributing this to uneven practices, bad training, and a lack of redundancy," the report states.

Terrorism causes nuclear war

Kroenig '12, Council on Foreign Relations Stanton Nuclear Security Fellow and Georgetown University assistant professor of government

Matthew, "The History of Proliferation Optimism: Does It Have A Future?",
<http://www.npolicy.org/article.php?aid=1182&tid=30>

Nuclear terrorism. The spread of nuclear weapons also increases the risk of nuclear terrorism.[58] It used to be said that "terrorists want a lot of people watching, not a lot of people dead," but the terrorist attacks of September 11, 2001 changed expert perceptions of the terrorist threat.[59] September 11th demonstrated that Al Qaeda and other modern terrorist groups are interested in imposing massive casualties and there are few better ways of killing large numbers of civilians than detonating a nuclear weapon in a major metropolitan area. And, while September 11th was one of the greatest tragedies in American history, it would have been much worse had Osama Bin Laden been able to acquire nuclear weapons. Osama Bin Laden declared it a "religious duty" for Al Qaeda to acquire nuclear weapons and radical clerics have issued fatwas declaring it permissible to use nuclear weapons in Jihad against the West.[60] Unlike states, which can be deterred, there is little doubt that if terrorists acquired nuclear weapons, they would use them. Indeed, in recent years, many U.S. politicians and security analysts have agreed that nuclear terrorism poses the greatest threat to U.S. national security.[61] Wanting nuclear weapons and actually possessing them, however, are two different things and many analysts have pointed out the tremendous hurdles that terrorists would have to overcome in order to acquire nuclear weapons.[62] Nevertheless, as nuclear weapons spread, the possibility that they will eventually fall into terrorist hands increases. States could intentionally transfer nuclear weapons, or the fissile material required to build them, to terrorist groups. There are good reasons why a state might be reluctant to transfer nuclear weapons to terrorists, but, as nuclear weapons spread, the possibility that a leader might someday purposely arm a terrorist group with nuclear weapons increases. Some fear, for example, that Iran, with its close ties to Hamas and Hezbollah, might be at a heightened risk of transferring nuclear weapons to terrorists. Moreover, even if no state would ever intentionally transfer nuclear capabilities to terrorists, a new nuclear state, with underdeveloped security procedures, might be vulnerable to theft, allowing terrorist groups or corrupt or ideologically-motivated insiders to transfer dangerous material to terrorists. There is evidence, for example, that representatives from Pakistan's atomic energy establishment met with Al Qaeda members to discuss a possible nuclear deal.[63] Finally, a nuclear-armed state could collapse, resulting in a breakdown of law and order and a loose nuclear weapons problem. U.S. officials are currently very concerned about what would happen with Pakistan's nuclear weapons if the government were to fall. As nuclear weapons spread, this problem is only further amplified. Iran is a country with a history of revolutions and a government with a tenuous hold on power. The regime change that Washing has long dreamed about in Tehran could actually become a nightmare if Iran had nuclear weapons and a break down in authority forced us to worry about the fate of Iran's nuclear arsenal.

Cooperation Now/Essential

FBI and CIA cross-agency cooperation is essential

Jackson et al '9, American lawyer and the Chief United States district judge on the United States District Court for the Middle District of Louisiana

Brian Anthony, "The Challenge of Domestic Intelligence in a Free Society: A Multidisciplinary Look at the Creation of a U.S. Domestic Counterterrorism Intelligence Agency",
https://books.google.com/books?id=1MYQCCfuv4QC&dq=%22domestic+surveillance%22+%22interagency+cooperation%22&source=gbs_navlinks_s

As time has passed, the cast of agencies involved in domestic intelligence activities has grown, and therefore, coordination among these agencies has grown increasingly complicated. The events of 9/11 highlighted interagency-coordination problems, and once again, calls for reorganization arose. "The establishment of the Department of Homeland Security promises to further complicate both the delineation of responsibilities and coordination across agencies." The coordination of domestic intelligence activities is particularly complex because such activities overlap with the responsibilities of so many agencies. The military and CIA have gradually been restricted to foreign intelligence activities, while the FBI has taken on the primary role in domestic intelligence activities. However, there must be coordination and information exchange among these agencies because threats have become increasingly transnational in nature. In addition to these historical interagency-coordination problems, the events of 9/11 also led to increasing calls to separate law enforcement and intelligence activities. Since the late 1950s, the FBI increasingly took on surveillance activities until the Church Committee reforms in the 1970s put additional oversight and accountability mechanisms in place. With the events of 9/11, the FBI has once again been asked to take on increased surveillance responsibilities, and some have questioned whether law enforcement and intelligence activities can be conflated in a single organization because of the risk that such activities will come into conflict with one another. Thus, domestic surveillance efforts in the United States have historically been extremely complex because they require coordination across various government agencies, coordination across international and domestic activities, and melding of various organizational cultures. The nation has always struggled with the delineation of responsibilities across agencies and how to streamline the domestic intelligence enterprise. "The calls for reorganization since the 9/11 attacks are merely the latest episode in a cyclical reevaluation of the organizational structure of the country's domestic surveillance activities."

Interagency cooperation is crucial to domestic intelligence

Rosenbach and Peritz '9, Executive Director of the Belfer Center for Science and International Affairs at the Harvard Kennedy School and Associate at the Belfer Center for Science and International Affairs at the Harvard Kennedy School of Government

Eric and Aki, "Confrontation or Collaboration? Congress and the Intelligence Community",
<http://belfercenter.ksg.harvard.edu/files/IC-book-finalasof12JUNE.pdf>

Domestic Intelligence. Unlike many nations, the United States does not have a dedicated organization focused on domestic intelligence collection. Although the Federal Bureau of Investigation (FBI) is the principal domestic intelligence agency, the Central Intelligence Agency (CIA) and Department of Defense (DoD) also play limited domestic intelligence roles. In response to criticism following the attacks of 9/11, the FBI began reforms to increase their collection and analysis of domestic intelligence, especially in regards to terrorism. Nonetheless, critics contend that FBI intelligence collection continues to play a secondary role to the FBI's primary mission, federal law enforcement. This memo provides new members of Congress with an overview of U.S. domestic intelligence and the issues most relevant to the 111th Congress. Domestic Intelligence before September 11, 2001. Since its creation in 1908, the FBI has been responsible for both domestic intelligence and law enforcement. From the 1930s through 1960s, the FBI focused on cases of espionage and foreign subversion. The Church Committee investigation of intelligence abuses in the 1970s disclosed a series of FBI—along with CIA and NSA—violations of Americans' civil liberties. Congress passed a series of reform laws in the late 1970s, including the Foreign Intelligence Surveillance Act (FISA), to prevent future abuses. In the wake of the intelligence scandals of the 1970s, concern about the potential for intelligence agencies to inappropriately collect information that could be used to prosecute citizens prevailed. This concern eventually morphed into a mistaken belief that intelligence officials could not legally share information with FBI criminal investigators. The resulting "wall" of bureaucratic obstacles virtually halted the flow of intelligence information provided to domestic law enforcement agencies. The 9/11 Commission highlighted this shortcoming as a major impediment to national security. Post-9/11 Domestic Intelligence Paradigm. The attacks of 9/11 resulted in major organizational and functional changes within the Intelligence Community and dramatically shifted FBI priorities from traditional criminal matters to international counterterrorism threats and intelligence gathering. After much debate, the 9/11 Commission recommended against creating a dedicated domestic intelligence agency, and instead recommended that the FBI expand and improve its intelligence capabilities. In order to improve its domestic intelligence capacity, the FBI pursued the following initiatives: Joint Terrorism Task Forces (JTTFs): The JTTFs are multi-agency task forces located in more than 100 locations nationwide. JTTFs bring local, state, and federal law enforcement and intelligence agencies together to share information and conduct operations to prevent terrorist operations. Prior to September 11, 2001, the United States had 35 JTTFs. Shortly after the attacks, the FBI Director instructed all FBI field offices to establish formal terrorism task forces. Personnel: The FBI hired hundreds of counterterrorism analysts and linguists, and re-tasked more than 700 personnel from criminal investigations to counterterrorism and counterintelligence duties. National Security Branch: The Bureau merged its intelligence, counterintelligence, and counterterrorism divisions into a unified "National Security Service" in 2005. Field Intelligence Groups (FIGs): FIGs are composed of Special Agents, Intelligence Analysts, and other FBI specialists in each of the FBI's 56 field offices. They are designed to integrate the "intelligence cycle" into FBI field operations and manage the Field Office Intelligence Program in coordination with the Directorate of Intelligence at FBI Headquarters. Domain Management Initiative: In November 2005, the FBI launched the Domain Management Initiative to focus attention on national

security threats within each field offices "geographic domain." The goal of program is to develop a comprehensive understanding of the threats relevant to each field office's region.

---Other Agencies

And there's tons of other agencies involved

Rosenbach and Peritz '9, Executive Director of the Belfer Center for Science and International Affairs at the Harvard Kennedy School and Associate at the Belfer Center for Science and International Affairs at the Harvard Kennedy School of Government

Eric and Aki, "Confrontation or Collaboration? Congress and the Intelligence Community", <http://belfercenter.ksg.harvard.edu/files/IC-book-finalasof12JUNE.pdf>

Although the FBI is the lead agency for domestic intelligence, many other organizations within the government contribute to the collection, processing and analysis of domestic intelligence. The Department of Homeland Security (DHS), The Office of Intelligence and Analysis, located in the Department of Homeland Security, employs over 500 staff responsible for sifting through, analyzing, packaging, and disseminating intelligence based on information collected by DHS component agencies. I&A also integrates with the broader intelligence community and uses DHS links to state, local, and private sector partners to share information about potential threats. The National Counterterrorism Center Since 2005, FBI intelligence experts have been co-located at the National Counterterrorism Center (NCTC) with colleagues from across the Intelligence Community to assess and analyze terrorism threats. Department of Defense The Defense Department established the Counter Intelligence Field Activity (CIFA) in 2002 to counter threats to U.S. military installations and detect espionage against the Pentagon. CIFA had both intelligence and law enforcement functions. After a short and controversial existence in which several of its key programs were "disestablished", Secretary Gates merged CIFA into the Defense Counterintelligence and Human Intelligence Center at the Defense Intelligence Agency (DIA). Domestic Intelligence The Belfer Center for Science and International Affairs | The Harvard Kennedy School 47 Outstanding Issues in Domestic Intelligence Despite the reforms outlined above, improving the nation's domestic intelligence capability will remain an important issue for the 111th Congress. Federal Bureau of Investigation (FBI) As a lead domestic intelligence agency, the FBI continues to improve counterterrorism initiatives, intelligence sharing and capabilities. The 111th Congress will likely need to assess these and other reform issues that have expanded the mission of the FBI.

Link- Generic Surveillance

Interagency surveillance sharing is a target for civil liberties advocates

Barrett 3-10-15, Staff Writer

Devlin, "CIA Aided Program to Spy on U.S. Cellphones", <http://www.wsj.com/articles/cia-gave-justice-department-secret-phone-scanning-technology-1426009924>

WASHINGTON—The Central Intelligence Agency played a crucial role in helping the Justice Department develop technology that scans data from thousands of U.S. cellphones at a time, part of a secret high-tech alliance between the spy agency and domestic law enforcement, according to people familiar with the work.¶ The CIA and the U.S. Marshals Service, an agency of the Justice Department, developed technology to locate specific cellphones in the U.S. through an airborne device that mimics a cellphone tower, these people said.¶ Today, the Justice Department program, whose existence was reported by The Wall Street Journal last year, is used to hunt criminal suspects. The same technology is used to track terror suspects and intelligence targets overseas, the people said.¶ The CIA and the U.S. Marshals developed technology that would trick phones into revealing their registration data. WSJ's Devlin Barrett discusses his exclusive story. Photo: Getty¶ The program operates specially equipped planes that fly from five U.S. cities, with a flying range covering most of the U.S. population. Planes are equipped with devices—some past versions were dubbed "dirtboxes" by law-enforcement officials—that trick cellphones into reporting their unique registration information.¶ The surveillance system briefly identifies large numbers of cellphones belonging to citizens unrelated to the search. The practice can also briefly interfere with the ability to make calls, these people said.¶ Some law-enforcement officials are concerned the aerial surveillance of cellphone signals inappropriately mixes traditional police work with the tactics and technology of overseas spy work that is constrained by fewer rules. Civil-liberties groups say the technique amounts to a digital dragnet of innocent Americans' phones.¶ The CIA has a long-standing prohibition that bars it from conducting most types of domestic operations, and officials at both the CIA and the Justice Department said they didn't violate those rules.¶ The cooperation began a decade ago, when the CIA arranged for the Marshals Service to receive more than \$1 million in gear to conduct such surveillance, said people familiar with the program. More than \$100 million went into research and development of the devices.¶ For years, the U.S. Marshals' Technical Operations Group worked with the CIA's Office of Technical Collection to develop the technology. In the early days it was the CIA that provided the most resources, said the people familiar with the matter.¶ The CIA gave the Marshals Service the ability to conduct what officials called "silent stimulation" of cellphones. By using a device that mimics a cell tower, all phones in its range are compelled to send identifying information. When the device finds a target phone in that sea of information, the plane circles overhead until the device can locate it to within about 3 yards.¶ Some versions of the technology also can be used to intercept signals from phones, these people said. U.S. military and intelligence agencies have used the technology in Afghanistan, Iraq, and elsewhere to hunt terrorists, and map the use of cellphones in such places, according to people familiar with the work.¶ The cooperation between technical experts at the CIA and the Marshals Service, which law-enforcement officials have described as a "marriage," represents one way criminal investigators are increasingly relying on U.S.

intelligence agencies for operational support and technical assistance in the wake of the Sept. 11, 2001, attacks. Many Justice Department officials view the joint effort with the CIA as having made valuable contributions to both domestic and overseas operations.¶ A CIA spokesman declined to comment on whether the CIA or any other agency uses the devices. Some technologies developed by the agency “have been lawfully and responsibly shared with other U.S. government agencies,” the spokesman said. “How those agencies use that technology is determined by the legal authorities that govern the operations of those individual organizations—not CIA.” He also said the relationship between the Marshals Service and CIA tech experts couldn’t be characterized as a marriage.¶ The Justice Department, which oversees the Marshals Service, would neither confirm nor deny the existence of such technology, saying that doing so would tip off criminals.¶ A Justice Department spokesman said Marshals Service techniques are “carried out consistent with federal law, and are subject to court approval.” The agency doesn’t conduct “domestic surveillance, intelligence gathering, or any type of bulk data collection,” the spokesman said, adding that it doesn’t gather any intelligence on behalf of U.S. spy agencies.¶ To civil libertarians, the close involvement of America’s premier international spy agency with a domestic law-enforcement arm shows how military and espionage techniques are now being used on U.S. citizens.¶ “There’s a lot of privacy concerns in something this widespread, and those concerns only increase if we have an intelligence agency coordinating with them,” said Andrew Crocker of the Electronic Frontier Foundation, which has filed a lawsuit seeking more details about the program and its origins.

It’s the privacy advocates’ next goal- concerns about illegitimate data collection prove

Michael, “Ex-CIA, NSA Chief Defends U.S. Intelligence Gathering”,
http://www.washdiplomat.com/index.php?option=com_content&view=article&id=9543:ex-cia-nsa-chief-defends-us-intelligence-gathering&catid=1506:august-2013&Itemid=535

The effects are already being felt. In a speech in mid-August, President Obama addressed public concern over the NSA's surveillance activities. While he made no assurances that the surveillance would stop, he did concede the public should be better informed about it and suggested some modest changes, including greater transparency and a review of the section of the Patriot Act dealing with phone records.¶ He also said the Foreign Intelligence Surveillance Act (FISA) might need to be altered. The law established a secret court to grant warrants for foreign surveillance, similar to a judge who considers police search warrants. Critics of the court say it's little more than rubberstamp, citing the fact that last year, it didn't reject a single one of the more 1,850 applications that the government submitted.¶ Obama suggested creating an independent attorney to challenge government prosecutors in the court — an idea long embraced by FISA critics, including Democratic Sens. Tom Udall of New Mexico and Ron Wyden of Oregon.¶ In late July, Wyden and Udall introduced two bills to level the FISA playing field: The FISA Court Reform Act of 2013 would create a special advocate in the court to argue on behalf of American civil liberties. The second bill, the FISA Judge Selection Reform Act, would reform how judges are appointed to the court to ensure that it is geographically and ideologically diverse (the current court is overwhelmingly stacked with conservatives).¶ Hayden scoffed at the

proposals.¶ "Let me tell you something really weird about the FISA court — we actually go to a court," he said. "No other Western democracy goes to a court to conduct foreign intelligence. People say, 'I don't like it — it's a secret court.' Well, that was the deal! You can't have a court, which I repeat is weird, for foreign intelligence without it being secret. You want an advocate? Does poor Tony Soprano [the fictional mobster in the HBO television series] have an advocate when the FBI goes to a court to get a warrant for that poor besieged citizen of New Jersey?"¶ Asked if he thinks there should be any reforms to the FISA court, Hayden was unequivocally opposed — then softened his stance slightly.¶ "No, of course I don't," he said. "Now, would I give? Sure, if it's the cost of doing business. You want a full-time public defender down there? Go ahead, be my guest. But don't get in the way and don't slow this stuff down. It's probably going to be a little more tedious and it will slow it down. You'll be more confident about what we're doing. You're going to be a little less safe, but you'll be more comfortable. That's the tradeoff."¶ But civil liberty advocates say that tradeoff is a false one. Unlike in the immediate post-9/11 landscape, when privacy concerns took a backseat to security, a growing number of Americans are uncomfortable with the thought of the NSA potentially sifting through the calls they make or websites they visit — especially without hard evidence that such domestic spying has thwarted any actual attacks.¶ That the NSA taps into Internet servers to monitor foreign communications hasn't sparked a major backlash domestically. Obama has made no secret of the fact that the U.S., like all governments, snoops on other countries. Speaking to The Diplomat about the NSA spy scandal for an article in the August issue, Hayden himself joked that "yes, indeed, the United States does conduct espionage," noting that "the Fourth Amendment that protects American privacy isn't an international treaty and therefore doesn't innately protect the privacy of non-Americans."¶ But Americans are increasingly worried about their privacy, as a steady drip of leaks this summer exposed the surprising extent of the NSA's reach into their personal lives. In addition to collecting and storing the phone records of millions of Americans, the NSA also reportedly scours the emails and text messages that travel in and out of the country for links to suspected terrorists abroad.¶ "While it has long been known that the agency conducts extensive computer searches of data it vacuums up overseas, that it is systematically searching — without warrants — through the contents of Americans' communications that cross the border reveals more about the scale of its secret operations," wrote Charlie Savage of the New York Times, detailing how Americans' electronic communications can be swept up in the NSA dragnet if, for example, they mention a foreign target or keyword.¶ And an Aug. 15 report in the Washington Post, based on Snowden's leaks, shows that the NSA broke its own privacy rules thousands of times each year since Congress gave the agency broader surveillance powers in 2008, gathering unauthorized information on Americans, often while not disclosing the violations to Congress or the FISA court.¶ Further piling on the revelations, the Wall Street Journal reported that the NSA has built a network that taps into roughly 75 percent of all U.S. Internet traffic in its hunt for foreign intelligence.¶ Also in August, Reuters detailed how the DEA's super-secret Special Operations Division uses vast troves of data on foreigners collected by the NSA, CIA, FBI and other intelligence agencies to target American citizens for ordinary drug crimes. Law enforcement agencies are taught to conceal these sources of information by creating something called a "parallel construction," or a manufactured trail of evidence (like saying the investigation began with a traffic violation instead of a tip). It's a common tactic used by police enforcement to protect informants, but the problem, critics say, is that the origin of

the case is untraceable by defendants, or even prosecutors and judges.¶ Asked about reports that the NSA is sharing data with the DEA for domestic drug prosecutions, Hayden asserted that NSA is collecting its evidence legally. As for what the DEA is doing with it, he declined to comment.¶ "I will make no case with regard to how DEA does or doesn't use the information," Hayden told The Diplomat. "All I can tell you is what we have is legitimately collected foreign intelligence."¶ Hayden did say that drugs are part of the foreign intelligence matrix. "I had a counter-narcotics center at the CIA and at the NSA, and so we all recognize that it is a legitimate foreign intelligence activity. We also know it has a tremendous law enforcement nexus. We would go out there and collect legitimate foreign intelligence. Now, how that is shared within the government becomes, frankly, a pretty complicated question because it's easier to get running room to collect foreign intelligence than it is for a law enforcement agency to get running room to gather data," he said.¶ "Honest men may differ about the reconstruction [of case history]," Hayden continued. "I'm not a lawyer, but I have read that it is not uncommon in a variety of cases when you want to protect a sensitive source, like a snitch. I'll let that be fought out in the courts, but that should not affect your judgment about collecting legitimate intelligence."¶ But Hayden's critics say a good deal of the intelligence gathered by the U.S. government in the wake of 9/11 was gained through illegitimate means. Hayden, though, was unapologetic about the use of waterboarding — an interrogation tactic that simulates drowning — after the Sept. 11 terrorist attacks. The strategy was widely condemned as torture and President Obama banned the practice in 2009. While Hayden conceded the controversial nature of the tactic, he also claimed it **worked.**

Link- Ambiguity

Ambiguity in CIA power caused by new statutory provisions causes decreased CT

Harris '5, Special Assistant to the President and Senior Director for African Affairs on the National Security Staff of the White House

Grant T., Yale Law and Policy Review, "The CIA Mandate and the War on Terror",
<http://www.deckprism.net/news/Yale%20Law%20and%20Policy%20Review,%20CIA%20Mandate,%20Harris,%20G.pdf>

Terrorism is a national security threat that has united the nation and could create the same climate of tolerance of abuse that prevailed during the Cold War.⁸⁷ The U.S. government is now singularly focused on domestic security and the present day fight against terrorism is portrayed as and perceived by policymakers to be an all-out, multi-front struggle that "knows no borders." This struggle is, as the title of this Note suggests, commonly thought of and described as a "war." In today's fight against terror, ambiguous prohibitions on CIA activity could facilitate future civil liberties abuses.¹⁸⁸ In terms of the limits on CIA authority, the legal restraints are the same as before September 11, but they "may have been reinterpreted."¹⁸⁹ On the other extreme, ambiguity in the boundaries of the law enforcement prohibition could hamper the U.S. response to terrorism and other transboundary national security threats by deterring cooperation between law enforcement and intelligence. According to the 1C2 1 Commission, one of the results of the intelligence scandals of the 1970s "was that the two communities tended to further distance themselves from one another over concern about further inadvertent missteps."¹⁹⁰ Likewise, the Aspin-Brown Commission concluded that "some clarification of existing law would be helpful" in fostering improved cooperation between intelligence and law enforcement agencies because the "[f]lack of clear legal authorities has resulted in confusion inside individual intelligence agencies, between different intelligence agencies, and within the law enforcement community-regarding what activities intelligence agencies can conduct to support law enforcement."¹⁹¹ These concerns are all the more pressing when viewed in light of jurisdictional questions and definitional problems caused by the nature of.¹⁸⁶ See supra Section II.D.¹⁸⁷ In discussing such disturbing hypotheticals, Judge Prettyman's remarks in the context of the Fourth Amendment appear particularly apposite: "[w]e are dealing with doctrines and not with presumable taste and sense of individual officials. Maybe none of these examples would ever occur But the question before us is not whether they would happen but whether they legally could." *District of Columbia v Little*, 178 F.2d 13, 18-19 (D.C. Cir. 1949), *aff'd on other grounds*, 339 U.S. 1 (1950)¹⁸⁸. The Church Committee noted this natural tendency of domestic intelligence collection "In time of crisis, the Government will exercise its power to conduct domestic intelligence activities to the fullest extent, The distinction between legal dissent and criminal conduct is easily forgotten "² CHURCH COMMITTEE, supra note 5 1, at 289. As an illustration of the dangers of ambiguous statutory language, recall the Church Committee's finding that the CIA "interpreted the internal security prohibition narrowly to exclude investigations of domestic activities of American groups for the purpose of determining foreign associations." ¹ CHURCH COMMITTEE, supra note 40, at 138. See supra note 66 and accompanying text, Similar issues can present

themselves in investigating and ascertaining intelligence on domestic groups suspected of foreign terrorist connections. Indeed, an important facet of the struggle against terrorism is ferreting out front organizations for terrorist groups (such as certain ostensibly charitable organizations) operating in the United States.¹⁸⁹ Telephone Interview with Stewart A. Baker, supra note 143.¹⁹⁰ IC21 STAFF STUDY, supra note 150, at 272.¹⁹¹ ASPtN-BROWN CoMMISSION, supra note 135, at 41.⁵⁶³ Yale Law & Policy Review Vo.2:2,05, terrorism and other international threats.^{9 2}

Impact Module- US Russia War

And it spills over to military readiness

AllGov no date

“Counterintelligence Field Activity”, <http://www.allgov.com/departments/department-of-defense/counterintelligence-field-activity?agencyid=7158>

As a result of these events, the Department of Defense established the Defense Counterintelligence Board to better counteract spying attempts against the US military. In 2001 the Deputy Assistant Secretary of Defense for Intelligence and Security created the Joint Counterintelligence Assessment Group (JCAG) with a “mandate for creative experimentation.” The JCAG became the immediate precursor to CIFA.¶¶ Concurrently, senior Defense officials were working with counterparts in the CIA, FBI, the National Security Council and the Senate Select Committee on Intelligence to broaden interagency cooperation across the entire national security apparatus. The resulting blueprint was called CI-21, brought to life by a Presidential Decision Directive, “Counterintelligence for the 21st Century,” in January 2001, one of the last acts of President Bill Clinton. The intent behind CI-21 was to bring the Defense and national security communities into an era of interagency cooperation and to foster a commonality of purpose in the realm of counterintelligence. CI-21 envisioned several new structures, notably a National Counterintelligence Executive, to bring the various elements into close coordination.¶¶ Following the 9/11 terrorist attacks, the Bush administration redirected federal resources and personnel to focus on the country’s Global War on Terrorism (GWOT) campaign and to better protect homeland security. This included the establishment of the Northern Command, a new military organization charged with protecting the United States from attack. Defense Secretary Donald Rumsfeld led the effort to create Northern Command as well as the establishment of the Counterintelligence Field Activity (CIFA) through Department of Defense Directive 5105.67 (PDF) in February 2002.

Russia’s ramping up militarization- only military readiness and continued surveillance solve

Russia’s military occupation and absorption of Crimea shattered the two decades of post–Cold War peace in Europe. Twenty-two years after the collapse of the Soviet Union, Russia is rebuilding its military strength and is once again rising in regional influence. In the military, economic, and political spheres, Russia is preparing to project its power across Eastern Europe, the Caucasus, Central Asia, and the North Pacific. Most notably, Russia is also beginning to bolster its geopolitical presence and military might by expanding the Collective Security Treaty Organization. Russia’s resurgent assertiveness presents challenges for the U.S. and Western allies. It is vital that the Obama Administration increase intelligence gathering on Russian military modernization and strategic and tactical goals, programs, and plans. It is also crucial that U.S. military modernization continue—and that defense spending remain at 4 percent of gross domestic product.¶ Twenty-two years after the collapse of the Soviet Union, Russia is rebuilding its strength and is once again rising in regional influence. In the military, economic, and political spheres, Russia is preparing to project its power across Eastern Europe, Central Asia, and the North Pacific. It is strengthening relationships in the Middle East, especially with

Iran and Syria, but also with Egypt. Most notably, Russia is also beginning to bolster its geopolitical presence and military might by expanding the Collective Security Treaty Organization (CSTO)—its regional military bloc[1] for arms sales and military cooperation.¶The U.S. political and military leadership should be mindful of Russia’s return as an important actor in international relations. Russia will increasingly affect its neighbors in Eastern and Central Europe, in the South Caucasus, and in Central Asia, and will do its best to project power into the Mediterranean and the Middle East.¶ Following the principles articulated in its new military and foreign policy doctrines and redefining the core of Russia’s military and diplomatic strategy, Russia emphasizes its international indispensability, upholding its sovereignty, asserting claims to protect co-ethnics and Russian-speakers along its borders; and, going beyond the inviolability of its boundaries, Moscow is asserting claims to protect co-ethnics and Russian-speakers beyond its borders.[2] This assertiveness, when turning into outright aggression, presents challenges for the U.S.¶ The most important step that the Obama Administration can take in light of Russia’s growing military power is to increase intelligence gathering on Russian military modernization and strategic and tactical goals, programs, and plans. The Administration should also pay closer attention to the dynamics of Russian technical–military cooperation with other countries (arms and military-technology sales); maintain the U.S. military budget at 4 percent of gross domestic product (GDP); continue U.S. military modernization, including the nuclear arsenal and missile defense; and expand military cooperation with NATO allies and partners, especially those in the former Soviet Union.

Extinction

Bostrom 2, Professor, Faculty of Philosophy, Oxford University

Nick, “Existential Risks: Analyzing Human Extinction Scenarios and Related Hazards”,
<http://www.nickbostrom.com/existential/risks.html>

The US and Russia still have huge stockpiles of nuclear weapons. But would an all-out nuclear war really exterminate humankind? Note that: (i) For there to be an existential risk it suffices that we can’t be sure that it wouldn’t. (ii) The climatic effects of a large nuclear war are not well known (there is the possibility of a nuclear winter). (iii) Future arms races between other nations cannot be ruled out and these could lead to even greater arsenals than those present at the height of the Cold War. The world’s supply of plutonium has been increasing steadily to about two thousand tons, some ten times as much as remains tied up in warheads ([9], p. 26). (iv) Even if some humans survive the short-term effects of a nuclear war, it could lead to the collapse of civilization. A human race living under stone-age conditions may or may not be more resilient to extinction than other animal species.

Impact Module- Jihad

Domestic intelligence is the main defense against threats from jihadists

Lewis '6, Center for Strategic and International Studies

James A., "Combating Terrorism: Lessons Learned from London Testimony before the House Government Reform Subcommittee on National Security, Emerging Threats and International Relations", <http://csis.org/files/media/csis/congress/ts060919jimlewis.pdf>

Second, many countries have refocused the work of their intelligence and security services to meet the threat posed by jihad. The work of these services, particularly in domestic intelligence activities, is the main defense against terror attacks. Domestic intelligence – the collection of information within a nation's borders for security purposes, often involving clandestine method, and including collection on citizens who have not violated any law – is a central element of counter-terrorism. The ability to identify and disrupt terrorist plans before they get to the airport or train station is the key to countering attacks, not more screening at airports or harbors. Third, the arrests also show that international cooperation – in the London case, between the UK, Pakistan and the U.S. - is much better than it was five years ago. A national counter-terror effort will not by itself prevent attacks by a jihad that spreads across the Middle East, Europe and Asia. Building this cooperation has been one of the unspoken successes in response to terrorism, but sustaining this cooperation in the face of the growing hostility to the U.S. found in Europe and the rest of the world will be a major challenge for the United States. This combination of network surveillance, domestic intelligence, and international cooperation is what thwarted the plan to blow up twelve airliners over the Atlantic. This success is encouraging CSIS – 9/19/06 2 and points to the ingredients of a defense that can frustrate the attacks of global jihad. Britain's success in stopping the airline plot has also led to renewed calls for an American MI5 (the former name of Britain's Security Service). The desire for an American MI5 has appeared regularly since the 9/11 attacks. The Report of the Commission on Iraqi WMD came closest to such a recommendation when it called on the president to establish a National Security Service. This recommendation led President Bush to direct the FBI, using existing authorities and resources, to merge its counter-terror and counterintelligence division into a new National Security Branch.

That causes nuclear terror

Beinart '8, associate professor of journalism and political science at the City University of New York

Peter, "The Good Fight: Why Liberals, and Only Liberals, Can Win the War on Terror", <https://books.google.com/books?id=o0HB4CoL8X0C&pg=PR13&lpg=PR13&dq=APPLYING+THAT+TRADITION+today+is+not+easy.+Cold+war+liberals+developed+their+narrative+of+national+greatness+in+the+shadow+of+a+totalitarian+%C2%B6+superpower.+Today,+the+United+States+faces+no+such+unified+threat.&source=bl&ots=QkLb1QxUNB&sig=8AMcL782L6FAT5CdIEgUairPAZ0&hl=en&sa=X&ei=tcyaVbu4A4H2yQTEEnYqQBQ&ved=0CB8Q6AEwAA#v=onepage&q=APPLYING%20THAT%20TRADITION%20today%20is%20not%20easy.%20Cold%20war%20liberals%20developed%20their%20narrative%20of%20national%20greatness%20in%20the%20shadow%20of>

%20a%20totalitarian%20%20C2%B6%20superpower.%20Today%20the%20United%20States%20faces%20no%20such%20unified%20threat.&f=false

APPLYING THAT TRADITION today is not easy. Cold war liberals developed their narrative of national greatness in the shadow of a totalitarian ¶ superpower. Today, the United States faces no such unified threat. Rather, it faces a web of dangers—from disease to environmental degradation to weapons of mass destruction—all fueled by globalization, which leaves America increasingly vulnerable to pathologies bred in distant corners of the world. And at the center of this nexus sits jihadist terrorism, a new totalitarian movement that lacks state power but harnesses the power of globalization instead. ¶ Recognizing that the United States again faces a totalitarian foe does not provide simple policy prescriptions, because today's totalitarianism takes such radically different form. But it reminds us of something more basic, that liberalism does not find its enemies only on the right—a lesson sometimes forgotten in the age of George W. Bush. ¶ Indeed, it is because liberals so despise this president that they increasingly reject his trademark phrase, the “war on terror.” Were this just a semantic dispute, it would hardly matter; better alternatives to war on terror abound. But the rejection signifies something deeper: a turn away from the very idea that anti-totalitarianism should sit at the heart of the liberal project. For too many liberals today, George W. Bush's war on terror is the only one they can imagine. This alienation may be understandable, but that does not make it any less disastrous, for it is liberalism's principles—even more than George W. Bush's—that jihadism threatens. If today's liberals cannot rouse as much passion for fighting a movement that flings acid at unveiled women as they do for taking back the Senate in 2006, they have strayed far from liberalism's best traditions. And if they believe it is only George W. Bush who threatens America's freedoms, they should ponder what will happen if the United States is hit with a nuclear or contagious biological attack. No matter who is president, Republican or Democrat, the reaction will make John Ashcroft look like the head of the ACLU.

Impact Module- Laundry List

Interagency cooperation is key to solving Iraq, prolif, climate change, pandemics, and military readiness

Tama '5, Assistant Professor at the School of International Service at American University

Jordan, "Intelligence Reform: Progress, Remaining Deficiencies, and Next Steps",
http://www.princeton.edu/~ppns/papers/intel_reform.pdf

No aspect of the U.S. foreign policy infrastructure has received more attention since 9/11 than intelligence -- and rightfully so.¹ As former 9/11 Commission Vice Chairman Lee Hamilton has stated: "The single most important tool that we have in preventing terrorist attacks is intelligence."² In addition to its central role in combating terrorism, good intelligence is essential to defeat the insurgency in Iraq, stem the proliferation of weapons of mass destruction (WMD), shape smart policies toward the Muslim world, plan for the rise of emerging states such as China and India, and understand the security and economic implications of global dangers such as climate change and highly infectious diseases.¹ Yet the track record of the U.S. intelligence community (IC) includes both notable successes and serious failures. The IC excelled at monitoring the Soviet Union's military capabilities; has frequently provided critical information to American military commanders during wartime; and has helped to capture or kill hundreds of jihadist and insurgent leaders in Afghanistan, Iraq, and elsewhere. But the IC did not forecast India's 1998 nuclear tests or the 9/11 terrorist attacks, inaccurately assessed Iraq's WMD capabilities before the war, and today knows disturbing little about Iran's or North Korea's nuclear programs. It may not be fair, with the benefit of hindsight, to expect the IC to have gotten all of these issues right. But for roughly \$44 billion a year, Americans naturally expect more.³ The 9/11 and Iraqi WMD failures have led to hundreds of proposals for intelligence reform from blue-ribbon commissions, congressional inquiries, and individual experts.¹ They have also led to the adoption of the most far-reaching IC reforms since the passage of the National Security Act in 1947. These adopted reforms include the establishment of the position of Director of National Intelligence (DNI), the creation of the National Counter Terrorism Center (NCTC) and National Counter Proliferation Center (NCPC), the formation of an intelligence-oriented National Security Service in the Federal Bureau of Investigation (FBI), and the breaking down of many walls preventing cooperation and information sharing among the IC's 15 federal agencies.⁴

Prolif leads to extinction

Kroenig '12, Council on Foreign Relations Stanton Nuclear Security Fellow and Georgetown University assistant professor of government

Matthew, "The History of Proliferation Optimism: Does It Have A Future?",
<http://www.npolicy.org/article.php?aid=1182&tid=30>

The spread of nuclear weapons poses a number of severe threats to international peace and U.S. national security including: nuclear war, nuclear terrorism, emboldened nuclear powers, constrained freedom of action, weakened alliances, and further nuclear proliferation. This section explores each of these threats in turn.¶¶ Nuclear War. The greatest threat posed by the spread of nuclear weapons is nuclear war. The more states in possession of nuclear weapons, the greater the probability that somewhere, someday, there is a catastrophic nuclear war. A nuclear exchange between the two superpowers during the Cold War could have arguably resulted in human extinction and a nuclear exchange between states with smaller nuclear arsenals, such as India and Pakistan, could still result in millions of deaths and casualties, billions of dollars of economic devastation, environmental degradation, and a parade of other horrors.¶¶ To date, nuclear weapons have only been used in warfare once. In 1945, the United States used one nuclear weapon each on Hiroshima and Nagasaki, bringing World War II to a close. Many analysts point to sixty-five-plus-year tradition of nuclear non-use as evidence that nuclear weapons are unusable, but it would be naïve to think that nuclear weapons will never be used again. After all, analysts in the 1990s argued that worldwide economic downturns like the great depression were a thing of the past, only to be surprised by the dot-com bubble bursting in the later 1990s and the Great Recession of the late Naughts.[53] This author, for one, would be surprised if nuclear weapons are not used in my lifetime.¶¶ Before reaching a state of MAD, new nuclear states go through a transition period in which they lack a secure-second strike capability. In this context, one or both states might believe that it has an incentive to use nuclear weapons first. For example, if Iran acquires nuclear weapons neither Iran, nor its nuclear-armed rival, Israel, will have a secure, second-strike capability. Even though it is believed to have a large arsenal, given its small size and lack of strategic depth, Israel might not be confident that it could absorb a nuclear strike and respond with a devastating counterstrike. Similarly, Iran might eventually be able to build a large and survivable nuclear arsenal, but, when it first crosses the nuclear threshold, Tehran will have a small and vulnerable nuclear force.¶¶ In these pre-MAD situations, there are at least three ways that nuclear war could occur. First, the state with the nuclear advantage might believe it has a splendid first strike capability. In a crisis, Israel might, therefore, decide to launch a preemptive nuclear strike to disarm Iran's nuclear capabilities and eliminate the threat of nuclear war against Israel. Indeed, this incentive might be further increased by Israel's aggressive strategic culture that emphasizes preemptive action. Second, the state with a small and vulnerable nuclear arsenal, in this case Iran, might feel use 'em or loose 'em pressures. That is, if Tehran believes that Israel might launch a preemptive strike, Iran might decide to strike first rather than risk having its entire nuclear arsenal destroyed. Third, as Thomas Schelling has argued, nuclear war could result due to the reciprocal fear of surprise attack.[54] If there are advantages to striking first, one state might start a

nuclear war in the belief that war is inevitable and that it would be better to go first than to go second. In a future Israeli-Iranian crisis, for example, Israel and Iran might both prefer to avoid a nuclear war, but decide to strike first rather than suffer a devastating first attack from an opponent. ¶ Even in a world of MAD, there is a risk of nuclear war. Rational deterrence theory assumes nuclear-armed states are governed by rational leaders that would not intentionally launch a suicidal nuclear war. This assumption appears to have applied to past and current nuclear powers, but there is no guarantee that it will continue to hold in the future. For example, Iran's theocratic government, despite its inflammatory rhetoric, has followed a fairly pragmatic foreign policy since 1979, but it contains leaders who genuinely hold millenarian religious worldviews who could one day ascend to power and have their finger on the nuclear trigger. We cannot rule out the possibility that, as nuclear weapons continue to spread, one leader will choose to launch a nuclear war, knowing full well that it could result in self-destruction. ¶ One does not need to resort to irrationality, however, to imagine a nuclear war under MAD. Nuclear weapons may deter leaders from intentionally launching full-scale wars, but they do not mean the end of international politics. As was discussed above, nuclear-armed states still have conflicts of interest and leaders still seek to coerce nuclear-armed adversaries. This leads to the credibility problem that is at the heart of modern deterrence theory: how can you threaten to launch a suicidal nuclear war? Deterrence theorists have devised at least two answers to this question. First, as stated above, leaders can choose to launch a limited nuclear war. [55] This strategy might be especially attractive to states in a position of conventional military inferiority that might have an incentive to escalate a crisis quickly. During the Cold War, the United States was willing to use nuclear weapons first to stop a Soviet invasion of Western Europe given NATO's conventional inferiority in continental Europe. As Russia's conventional military power has deteriorated since the end of the Cold War, Moscow has come to rely more heavily on nuclear use in its strategic doctrine. Indeed, Russian strategy calls for the use of nuclear weapons early in a conflict (something that most Western strategists would consider to be escalatory) as a way to de-escalate a crisis. Similarly, Pakistan's military plans for nuclear use in the event of an invasion from conventionally stronger India. And finally, Chinese generals openly talk about the possibility of nuclear use against a U.S. superpower in a possible East Asia contingency. ¶ Second, as was also discussed above leaders can make a "threat that leaves something to chance." [56] They can initiate a nuclear crisis. By playing these risky games of nuclear brinkmanship, states can increase the risk of nuclear war in an attempt to force a less resolved adversary to back down. Historical crises have not resulted in nuclear war, but many of them, including the 1962 Cuban Missile Crisis, have come close. And scholars have documented historical incidents when accidents could have led to war. [57] When we think about future nuclear crisis dyads, such as India and Pakistan and Iran and Israel, there are fewer sources of stability that existed during the Cold War, meaning that there is a very real risk that a future Middle East crisis could result in a devastating nuclear exchange.

Terror DA

Uniqueness

General

Authoritarian regimes make domestic terror uniquely likely, surveillance is the most effective way of preventing it

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Broad surveillance of communications is the least intrusive and most effective method for discovering terrorist and espionage activity. Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity, often in cooperation with other countries, including the United States.

Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. Given resurgent authoritarianism and continuing jihad, the new context for the surveillance debate is that the likelihood of attack is increasing. Any legislative change should be viewed through this lens.

The terrorist threat is *increasing* and *global*- continued response is key

PTI 4-14-15, The Economic Times

"Treat terrorism as sensitively as nuclear proliferation: Narendra Modi",

http://articles.economictimes.indiatimes.com/2015-04-14/news/61142201_1_prime-minister-narendra-modi-comprehensive-global-strategy-comprehensive-convention

BERLIN: Asking the international community to treat terrorism as "sensitively" as nuclear proliferation, Prime Minister Narendra Modi today said the world should collectively put pressure on countries which provide shelter to terrorists, in an apparent reference to Pakistan.[¶] The Prime Minister also made a strong pitch for the conclusion of the long-pending Comprehensive Convention on International Terrorism (CCIT) at the UN this year which marks the 70th anniversary of the global body. The objective of the CCIT is to strengthen cooperation to combat international terrorism.[¶] Addressing a joint press conference with German Chancellor Angela Merkel here after their talks during which they discussed the menace of terrorism, Modi described it as the "biggest threat to humanity" and said all those believing in humanity should speak in one voice and intensify collective efforts to tackle it.[¶] "Terrorism is a challenge to the whole world...This issue should be dealt with as sensitively as nuclear proliferation," the Prime Minister said.[¶] He further added that "We need to work on how we can stop sources from where the weapons are supplied. How we can put pressure on the countries where governments provide shelter to terrorists...We need to isolate such countries and governments," he said.[¶] Modi's remarks came four days after a Pakistan court released LeT operations commander and the 2008 Mumbai attack mastermind Zaki-ur-Rehman Lakhvi, which evoked a sharp reaction and concern from several countries including the US, France and Israel.[¶] Strongly protesting Lakhvi's release, India said it "eroded" the value of Pakistan's commitment to tackle terror.[¶] In his initial remarks at the press interaction, Modi said, "The spread of terrorism is growing and its

character is changing. The threat is coming close to us across every region of the world. We need a comprehensive global strategy to deal with this global challenge, in which India and Germany can work together."¶ German Chancellor Merkel also said the two countries have agreed to fight against terrorism collectively, describing it as a global challenge.¶ Equally, in the coming days, maritime cyber and space security would be a matter of concern to everyone and the two countries should increase the cooperation in this area as well, Modi said.¶ He also talked about instability and violence in West Asia, saying it "affects the security of our citizens at home".

ISIS Uniqueness

Current surveillance keeps the ISIS threat under control- but a continued push is key (for impacts based on ISIS)

Rostoum 2-3-15, leading energy expert and geopolitical specialist with degrees from Harvard and Stanford

Elly, “U.S.-Led Coalition Counterterrorist Strategy Against ISIS Going Forward”,
<http://foreignpolicyblogs.com/2015/02/03/us-led-coalition-counterterrorist-strategy-against-isis-going-forward/>

Since June 2014, the Islamic State of Iraq and Syria (ISIS) has managed to gain control of a population of around 8 million people in parts of Iraq and Syria. That’s roughly the equivalent of the population of Switzerland. The group has dominated news headlines and TV coverage around the world thanks to its barbaric and graphic executions and beheading videos. ISIS’ tactics have helped catalyze the global community’s revulsion against the militant jihadist organization, and has partly been the reason the world has been so successful in organizing such a broad-based coalition.¶ In September 2014, U.S. President Barack Obama summed up the world’s response to the ISIS threat: “Our objective is clear. We will degrade, and ultimately destroy, ISIL through a comprehensive and sustained counterterrorism strategy.” Since then, the United States has provided advisers to the Iraqi military in its fight with ISIS and has bombed the organization’s positions extensively, killing more than 6,000 ISIS terrorists since the start of the campaign. The prospect that the United States might need to expand its involvement in the region remains, however, including on the ground troop deployment — a highly contentious issue at home.¶ It’s important to note that the current geopolitical strategy in the Middle East focuses on counterterrorism — which is an attempt to address a symptom of the dynamics of the current conflicts in the region, not the actual problems. The current counterterrorist strategy does not address nor does it hone in the appropriate measures and responses to the civil war in Syria, or the deteriorating security situation in Iraq.¶ According to U.S. intelligence estimates, ISIS currently has a core force of 9,000 to 18,000 fighters. A key aim of the U.S.-led coalition’s counterintelligence strategy has been to undermine ISIS’s core manpower. The weakness of such strategy lies on ISIS’s ability to raise its manpower by tapping into other militant groups to bulk up its force, which underscores ISIS’s focus on recruitment. In October 2014, U.S. officials estimated that there were approximately 1000 recruits joining ISIS per month from overseas.¶ Underlining the importance of that steady flow of ISIS recruits, since the Syrian war began over three years ago, more than 19,000 foreign fighters from 90 different countries have traveled to Syria and Iraq. This points to a serious vulnerability in the coalition’s counterterrorism strategy. If the coalition’s campaign is killing around 1,200 ISIS fighters a month and yet ISIS continues to recruit an estimated 1,000 fighters from overseas a month, the campaign against ISIS will be of limited success.¶ The longer the group remains active, the farther the reach of its militant, barbaric ideology. In fact, ISIS’s influence keeps growing around the world, which has helped “internationalize” the fight as ‘affiliate’ organizations carry out attacks in the name of ISIS — including in Libya, Egypt and Afghanistan. This “internationalization” poses an important problem for the coalition, who has focused on ISIS targets in Syria and Iraq.¶ Seven months into the fight, key questions remain for the coalition: How is ISIS doing as it confronts

the U.S.-led military campaign against it in both Iraq and Syria? Should the United States and its coalition get more actively involved on the front lines of the fight in Syria? And should we push for greater American involvement in Iraq?¶ On the ground, ISIS has continued its attacks in northern Iraq, particularly in Kirkuk, the largely Kurdish city and a key oil production stronghold. ISIS attacks in Iraq are strategic and are partly meant to draw Kurdish fighters away from Mosul, its key base in Iraq. ISIS has controlled Mosul, Iraq's second largest city, since June, but Kurdish forces have closed in around it. The Kurdish authorities have also cut a key supply line to ISIS in Mosul and have taken back an estimated 300 square miles of land around the city.¶ The situation in Syria is not as promising. At least one-third of the country remains under ISIS's control in spite of the coalition's airstrikes. The U.S.-led airstrikes are proving successful — albeit at a slower pace as hoped. Recently, ISIS lost control of Kobani, a small town on the Syrian-Turkish border where many of the U.S.-led airstrikes have been concentrated.¶ The most effective strategy against ISIS is to cripple the organization in Iraq. Continued precision airstrikes in Kirkuk and Mosul will inevitably eliminate ISIS' core manpower. An effective urban warfare campaign will simultaneously be needed to prevent cells from growing. To do so, the Iraqi army and Kurdish forces will ultimately need a greater number of U.S. and coalition advisors to successfully execute and defeat ISIS.¶ From Afghanistan to Libya, ISIS' reach, especially in historically al Qaeda-dominated regions, will have the benefit of causing infighting amongst these terrorist organizations. ISIS' recent move into Yemen is significant for the group as al Qaeda has maintained a presence there for more than a decade. The infighting amongst al Qaeda and ISIS has the benefit of weakening both and offering the U.S. and its coalition with an opportunity to eliminate the threat at the source.

A2 Yemen N/U

There's still success

Connor 3-26-15, fellow for HuffPost Media

Jackson, "MSNBC's Mika Brzezinski Hounds Josh Earnest: 'Is Yemen Still A Success Story?'" , http://www.huffingtonpost.com/2015/03/26/msnbc-josh-earnest-yemen-still-a-success-story_n_6947314.html

Last September, during a speech outlining his plan to fight back the Islamic State, President Barack Obama told Americans to look at Yemen as a shining example of how U.S. counter-terrorism can triumph.¶ "This strategy of taking out terrorists who threaten us, while supporting partners on the front lines, is one that we have successfully pursued in Yemen and Somalia for years," he said.¶ Now, some six months later, the Yemeni government has all but collapsed, with Houthi rebels forcing President Abdu Rabbu Mansour Hadi to allegedly flee the country by boat for Djibouti. On Wednesday night, Saudi Arabia began airstrikes on the Houthis, and Yemen seems poised to descend into a period of total chaos.¶ Still, during a panel discussion on MSNBC's "Morning Joe" Thursday, White House press secretary Josh Earnest was unwilling to walk back the Obama administration's victorious language.¶ Co-host Mika Brzezinski led the charge, grilling Earnest about the crisis.¶ "Josh, I'll put you on the spot here," she began. "Is Yemen still a success story? Can you say that?"¶ "The measure of the U.S. policy should not be graded against the success or the stability of the Yemeni government, that's a separate enterprise," Earnest responded after skirting the question a number of times. "The goal of U.S. policy toward Yemen has never been to try to build a Jeffersonian democracy there. The goal of U.S. policy in Yemen is to make sure that Yemen cannot be a safe haven that extremists can use to attack the west and to attack the United States."¶ Though Earnest conceded that the White House would "prefer a situation where there is a stable government" in Yemen, he ultimately maintained that the U.S. is still able to gather intelligence within the country and launch successful strikes against extremists when necessary.

A2 CT Fails

Counter terrorism efforts are successful now- there is a correlation and causation with a decrease in terror and these efforts

Dilanian 15 [July 3, 2015 AP Intelligence Writer<http://www.vnews.com/news/nation/world/17592169-95/us-counterterrorism-policy-faces-mounting-skepticism> "U.S. Counterterrorism Policy Faces Mounting Skepticism"] (Vaibhav)

"U.S. counterterrorism policy has caused some intense backlash and has had a lot of unintended consequences," said Rosa Brooks, a former Obama administration Pentagon official. Current officials dispute the criticism, but they declined to make anyone available to speak on the record. The administration's position is that the failure of al-Qaida or the Islamic State to launch a coordinated attack on the U.S. homeland is the best evidence that the strategy is working. Timothy Hoyt, a professor of counterterrorism studies at the Naval War College, agreed. Terrorist attacks against the U.S. and its allies have been far less lethal than past campaigns in Britain by the Irish Republican Army, he said, "which suggests that some elements of our counterterrorism strategy are working."

Links

Link- Surveillance

The DA has an invisible risk, every form of data collection is useful because they give fragments to prevent attacks

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, "Underestimating Risk in the Surveillance Debate,"

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success. Success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture.

In practice, analysts must simultaneously explore many possible scenarios. A collection program contributes by not only what it reveals, but also what it lets us reject as false. The Patriot Act Section 215 domestic bulk telephony metadata program provided information that allowed analysts to rule out some scenarios and suspects. The consensus view from interviews with current and former intelligence officials is that while metadata collection is useful, it is the least useful of the collection programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215, but this would not come without an increase in risk. Restricting metadata collection will make it harder to identify attacks and increase the time it takes to do this.

Every instance of surveillance is a necessity

Jessica **Zuckerman 13**, policy analyst at the Heritage Foundation, et al, 7/22/13, "60 Terrorist Plots Since 9/11: Continued Lessons in Domestic Counterterrorism,"

<http://www.heritage.org/research/reports/2013/07/60-terrorist-plots-since-911-continued-lessons-in-domestic-counterterrorism>

Maintain essential counterterrorism tools. Support for important investigative tools such as the PATRIOT Act is essential to maintaining the security of the U.S. and combating terrorist threats. Key provisions within the act, such as the roving surveillance authority and business records provision, have proved essential for thwarting terror plots, yet they require frequent reauthorization. In order to ensure that law enforcement and intelligence authorities have the essential counterterrorism tools they need, Congress should seek permanent authorization of the three sun setting provisions within the PATRIOT Act.[208] Furthermore, legitimate government surveillance programs are also a vital component of U.S. national security, and should be allowed to continue. Indeed, in testimony before the house, General Keith Alexander, the director of the National Security Agency (NSA), revealed that more than 50 incidents of potential terrorism at home and abroad were stopped by the set of NSA surveillance programs that have recently come under scrutiny. That said, the need for effective counterterrorism operations does not relieve the government of its obligation to follow the law and respect

individual privacy and liberty. In the American system, the government must do both equally well.

Surveillance is key to preventing violence before it happens- here's an example
Inserra and Walters 4-8-15, Policy Analyst, Homeland Security and Cybersecurity, and Research Assistant

David and Riley, "65th Islamist Terrorist Plot or Attack Since 9/11: Persistent Terrorism Requires Constant Vigilance", <http://www.heritage.org/research/reports/2015/04/65th-islamist-terrorist-plot-or-attack-since-911-persistent-terrorism-requires-constant-vigilance>

Terrorist Plot Details, U.S. citizens Noelle "Najma Samaa" Velentzas and Asia "Murdiyyah" Siddiqui were arrested for willfully conspiring to use a weapon of mass destruction in the United States.[2] Using the Internet and relevant books, the two roommates researched and obtained the items needed to create an explosive device made from propane tanks. Velentzas noted several weeks ago that there are more "opportunities of pleasing Allah" in the United States, implying that she intended to launch an attack on U.S. soil rather than going to fight overseas.[3] An investigation revealed that both defendants took to Islamist ideology several years ago. Velentzas admired Osama bin Laden and his mentor Abdullah Azzam and had been obsessed with pressure-cooker bombs since the 2013 Boston Marathon bombings. She also considered herself a citizen of the Islamic State (ISIS). Siddiqui showed an interest in Islamist ideology even earlier. In 2006, she became close to a prominent figure in the al-Qaeda in the Arabian Peninsula terrorist group, Samir Khan, who died in 2011. In 2009, she wrote a poem for a magazine called Jihad Recollections and called for readers to engage in violent jihad. In 2010, she sent a letter of support to Mohamed Mohamud, who was arrested for attempting to detonate a car bomb in Portland, Oregon.[4] Through an undercover agent, the FBI began tracking both Velentzas and Siddiqui in July 2014. About that time, the two women showed an increased interest in learning how to construct and detonate explosive devices within the United States. Velentzas and Siddiqui read about how to make homemade grenades, pipe bombs, and pressure-cooker bombs and on electrical currents and chemistry. Velentzas showed a growing interest in attacking police, military, and other government targets, and discussed how she and Siddiqui could defend themselves with concealed knives or with stolen weapons in the event they were arrested.[5] Ultimately, the FBI acted because Velentzas and Siddiqui had not only acquired the materials necessary to build a bomb, including multiple propane canisters, but Siddiqui had indicated a desire to proceed with independent planning and plots. With the potential for a bomb to be built, the undercover agent unable to track the progress of the work, and Siddiqui and Velentzas's clear desire to attack the U.S., the FBI arrested them before harm could come to the public.[6] Terrorism on the Rise, Of the 65 Islamist terrorist plots or attacks since 9/11, this marks the 54th homegrown terrorist plot, as both individuals were U.S. citizens who were radicalized in the U.S. This case is also the third terror plot in less than three months, indicating an uptick in Islamist terrorism. This may be due to the success of terrorist campaigns by ISIS and other terrorist organizations inspiring individuals to radicalize and act on those extremist beliefs.[7] The past three terrorist plots have all expressed at least some, if not direct, allegiance to ISIS and a desire to help ISIS by attacking targets here in the U.S. With the trend of homegrown terrorism continuing to grow and the recent increase in terrorist plots, both here in

the U.S. and across the West, the U.S. must redouble its efforts.¶ Specifically, the U.S. should:¶ Maintain essential counterterrorism tools. Support for important investigative tools is essential to maintaining the security of the U.S. and combating terrorist threats. Legitimate government surveillance programs are also a vital component of U.S. national security and should be allowed to continue. The need for effective counterterrorism operations, however, does not relieve the government of its obligation to follow the law and respect individual privacy and liberty. In the American system, the government must do both equally well.¶ Emphasize community outreach. Federal grant funds should be used to create robust community outreach capabilities in higher-risk urban areas. Importantly, these funds must not be used for political pork or so broadly used that they are no longer targeted at those communities at greatest risk. Such capabilities are key to building trust in local communities, and if the United States is to be successful in thwarting lone-wolf terrorist attacks, it must put effective community outreach operations at the tip of the spear.¶ Develop a comprehensive counterterrorism strategy. Since the inspirational source of domestic radicalization and terrorism often lies overseas, battling violent Islamist extremism abroad must be addressed in concert with the challenges presented by the terrorism at home. To this end, Congress should ensure that the Administration has a comprehensive strategy for addressing violent Islamist extremism both at home and abroad. This includes working with allies to strengthen intelligence sharing and collaborative counterterrorism efforts.

Link- Deterrence

Even if the data seems useless, its necessary to deter terrorists from planning an attack in the first place

Kroneg and Pavel 12 [Kroenig is an Assistant Professor of Government at Georgetown University and a Stanton Nuclear Security Fellow at the Council on Foreign Relations. Barry Pavel is Director of the Atlantic Council's International Security Program "How to deter terrorism"]

Given the value that terrorists place on operational success, states can deter terrorism by convincing terrorists that operations are likely to fail. For this reason, **simple homeland security measures can deter terrorist attacks.** Improving **domestic intelligence and hardening key targets** are strong deterrents to attack. Indeed, we know of many cases in which terrorists were deterred from carrying out an attack by the fear of failure. For example, an al-Qaeda affiliate planned to attack a U.S. military base in Turkey in late 2003, but the United States improved its defenses at the site during the planning stages, and the terrorists called off the attack.²² It is, of course, impossible to protect every conceivable target, and terrorists will often re-focus away from hardened targets toward softer ones. This fact can be an asset as well as a liability in the war on terror, however. It is, after all, the counterterrorists' choice about which targets should be defended and at what cost. **Deploying effective homeland security measures may, for example, be targeted to specifically help deter WMD terrorism.** In order to successfully conduct a WMD attack, terrorists would have to complete a number of difficult steps. **Measures that the United States takes to reduce the probability that a WMD terror attack will succeed should have a deterrent effect.** For example, **as the United States improves its radiation detection capabilities at border crossings, the probability that a terrorist smuggling nuclear material across the border will be captured and the radioactive material confiscated increases.** Given the value that terrorists might place on scarce and strategically important nuclear material, **they may prefer not to even attempt to bring it into the United States, given a sufficiently high risk of losing it.** A critic might counter that the United States is already improving homeland security and that this is being done for defensive, not deterrent purposes. This critique, however, glosses over one of the most important questions of U.S. counterterrorism policy: should homeland security measures be intended primarily as a deterrent or as a defense? We argue that homeland security policy should be designed primarily as a deterrent. **The objective of homeland security should not be to fend off an endless number and methods of terrorist attacks.** In fact, if it gets to the point that U.S. forces have to thwart an attack at the last moment, homeland security has failed. Rather, **the United States should aim to deter terrorism.** **Washington should send the message that we are ready and that it is not in terrorists' best interests to attempt an attack.** The point of building concrete barriers around the Washington Monument is not to have terrorists smash explosive-laden trucks into the barricades day after day. Rather, the hope is that terrorists will see the defenses and decide not to attack in the first place. This insight has important implications for the way we structure homeland security. First, homeland security should not be designed primarily as a defense. **We cannot hope to thwart every kind of conceivable attack.** Rather the goal should be to raise the perceived probability that an operation will be thwarted to convince terrorists that they should not attempt an attack in the first place. For this goal, **a perfect defense is overkill** (and

unachievable in any event). Homeland security can rely more heavily on measures such as randomized screening and periodic surges in security levels at key sites. Such measures keep terrorists off guard, are less costly than a watertight defense, and if designed well, are sufficient for deterring terrorist attacks.

A2 Only Suspected Terrorists

“Suspected terror monitoring” is ineffective because it doesn’t stop the unknown terrorist

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, “Underestimating Risk in the Surveillance Debate,”

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

The echoes of September 11 have faded and the fear of attack has diminished. We are reluctant to accept terrorism as a facet of our daily lives, but major attacks—roughly one a year in the last five years—are regularly planned against U.S. targets, particularly passenger aircraft and cities. America’s failures in the Middle East have spawned new, aggressive terrorist groups. These groups include radicalized recruits from the West—one estimate puts the number at over 3,000—who will return home embittered and hardened by combat. Particularly in Europe, the next few years will see an influx of jihadis joining the existing population of homegrown radicals, but the United States itself remains a target.

America’s size and population make it is easy to disappear into the seams of this sprawling society. Government surveillance is, with one exception and contrary to cinematic fantasy, limited and disconnected. That exception is communications surveillance, which provides the best and perhaps the only national-level solution to find and prevent attacks against Americans and their allies. Some of the suggestions for alternative approaches to surveillance, such as the recommendation that NSA only track “known or suspected terrorists,” reflect both deep ignorance and wishful thinking. It is the unknown terrorist who will inflict the greatest harm.

A2 Useless Data

No such thing as useless data – it stops us from going after false leads

James Andrew **Lewis 14**, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies, December 2014, “Underestimating Risk in the Surveillance Debate,”

http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects.

This makes the critique of the 215 program like a critique of airbags in a car—you own a car for years, the airbags never deploy, so therefore they are useless and can be removed. The weakness in this argument is that discarding airbags would increase risk. How much risk would increase and whether other considerations outweigh this increased risk are fundamental problems for assessing surveillance programs. With the Section 215 program, Americans gave up a portion of their privacy in exchange for decreased risk. Eliminating 215 collection is like subtracting a few of the random pieces of the jigsaw puzzle. It decreases the chances that the analysts will be able to deduce what is actually going on and may increase the time it takes to do this. That means there is an increase in the risk of a successful attack. How much of an increase in risk is difficult to determine, but this is crucial for assessing the value of domestic surveillance programs.

If the risk of attack is increasing, it is not the right time to change the measures the United States has put in place to deter another 9/11. If risk is decreasing, surveillance programs can be safely reduced or eliminated. A more complicated analysis would ask if the United States went too far after 9/11 and the measures it put in place can be reduced to a reasonable level without increasing risk. Unfortunately, precise metrics on risk and effectiveness do not exist, and we are left with the conflicting opinions of intelligence officials and civil libertarians as to what makes effective intelligence or counterterrorism programs. There are biases on both sides, with intelligence officials usually preferring more information to less and civil libertarians can be prone to wishful thinking about terrorism and opponent intentions.¹³

Interviews with current and former intelligence officials give us some guidance in deciding this. The consensus among these individuals is that 215 is useful in preventing attacks, but the least useful of the programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215 before any others, but ending 215 would not come without some increase in risk.

A2 Link Turn- Data Overload

New data programs solve info overload

Lavenda 3-21-15, Technology strategist

David, "How Smartphone Metadata Can Help Prevent Information Overload",
<http://www.cmswire.com/cms/mobile-enterprise/how-smartphone-metadata-can-help-prevent-information-overload-024591.php?pageNum=2>

Where to Next? Where No Man Has Gone Before, The rapid deployment of sensor-rich smart mobile devices, coupled with the proliferation of distributed, heterogeneous cloud services provides a fertile ground for almost limitless opportunities to define contexts that could pinpoint and surface the information you need "right here, right now." Validation of this trend was provided by Microsoft's recent announcement of the Office Graph. Microsoft's Office Graph uses "signals from email, social conversations, documents, sites, instant messages, meetings and more to map the relationships between the people and things that make your business go." Apps that can tap into the intelligence of Office Graph and related sources, might finally be able to crack the information overload problem. The Internet of Things is ultimately the top level of sophistication available for context-aware situations. Specifically, when devices will be able to communicate amongst themselves, the sky is literally the limit about what is possible. The opportunities to reduce information overload afforded by the coupling of sensors, context and machine-machine interactions will be covered in a future article.

Data tagging and organization do too

Harari 6-23-15, Thompson Reuters

Ofer, "Big Data Intelligent Tagging: Bringing Order to Information Overload",
<http://tabbforum.com/opinions/big-data-intelligent-tagging-bringing-order-to-information-overload>

Data has long been the driving force in financial services, and it continues to play an important role powering everything from governments to healthcare. In this era of Big Data, the ongoing flow of information can be overwhelming or distracting. But when used intelligently, today's open data economy can drive informed, strategic decisions and give a financial service firm an edge in the marketplace. Structured, machine-readable and intelligent information is essential in an evolving landscape in which there are more than three billion online users globally, generating millions of text documents daily. For example, satellite images now offer incredible detail about the state of crops in various parts of the world. Machines can sort through corporate SEC filings faster than any human. Bricks-and-mortar retailers can track the number of people going into stores, how long they spent there and what they walked out with – while online rivals such as Amazon know what people searched for and can make a good guess about what they might order and when. News is now disseminated on social sites such as Twitter faster than through traditional news agencies – and it comes in greater quantity than ever before. [Related: "In-House Alpha: Mining the Unstructured Data Within"] But the abundance of data is only the beginning – firms still face the crucial task of making sense of it all and deriving tangible benefits from it. In a vast digital world, how can a company get to the heart of

what is needed and make valuable connections between people, subjects, places and more? For Big Data to be useful, our clients must connect the dots, find what is relevant and leave the rest behind – in other words, separate the wheat from the chaff. Thomson Reuters Intelligent Tagging, powered by Calais, has been used for the past six years inside Thomson Reuters to effectively mine content, help analysts collect and curate information, and make content searchable in our flagship products such as Eikon, WestlawNext and more. We are now making this exact same service available to our clients as well, providing technology and business professionals access to the automatic generation of rich, semantic metadata and providing a way to link, tag and find relationships within content to increase its value and gain competitive advantage. But Intelligent Tagging also goes far beyond classic entity identification. It uses Natural Language Processing (NLP), text analytics and data mining technologies to derive meaning from all that unstructured information – including research reports, news articles and blog posts. It then connects extracted entities to Thomson Reuters “core entity masters,” which provide even more information and connections to leverage for search and analytics. Thomson Reuters internal Content Marketplace defines a global information model across the organization where each content set is managed centrally with keeping “one version of the truth” and with ontology and linkages to other content sets (like Organization Authority, People Authority, Industries, Deals and more). Thomson Reuters Intelligent Tagging is the glue that links any unstructured content, using metadata, to the relevant authorities (e.g., a News story that mentions a merger deal will be linked to the latest Deals tear sheet and the data on those companies in the Organization Authority). Our unified approach provides a comprehensive and unique perspective that cuts through the clutter and makes relevant connections. It helps clients standardize data definitions, share information across the enterprise and leverage knowledge hidden in the daily deluge of information as well as in data stores. This allows end users, such as analysts, managers, advisors or anyone seeking information, to move from long, challenging data searches, to gaining the insight and advantage that provide a competitive edge. Intelligent Tagging: As Simple as Child’s Play. With this service available now to our clients, data can be easily searched for meaningful, usable information that can help the business be more competitive. 1. Tagging. Using NLP, machine learning and other methods, Thomson Reuters Intelligent Tagging analyzes any kind of documents and finds the entities and events within it. This automatically adds rich, semantic, machine-readable metadata to the client’s content that is connected to the highly curated data of Thomson Reuters. 2. Intelligence. The tags are delivered to the client’s platforms and incorporated into applications for search, analytics, alerts, news aggregation and other use cases. 3. Linkages. Linkages to Thomson Reuters authorities with up-to-date metadata are available at any point in time. As a news and information company, Thomson Reuters has been amassing a host of data for years, giving us unparalleled ability to make the connections we’re now sharing through Intelligent Tagging. Our own teams rely on this proprietary service as an essential building block for developing new products and services. As the marketplace moves faster and grows more competitive, the relevance of intelligent information is becoming increasingly clear. With Intelligent Tagging, the ability to sort through the universe of information to find the news item, document or dataset that could put you ahead of the competition has become “child’s play.” Data About Data. Metadata is “data about data.” For example, a book’s title and author is metadata. In information systems, a tag is a non-hierarchical keyword or term assigned to a piece of

information (such as an Internet bookmark, digital image, or computer file). This kind of metadata helps describe an item and allows it to be found again by browsing or searching. By tagging, clients can start to create an organized, linked metadata store that can be constantly updated and searched for intelligent insight. For example, by tagging entities in a given article and then connecting those entities to Thomson Reuters' rich metadata, a user would have access to a wealth of information, such as:

- ¶ Entities: Examples are companies, people, places and products.
- ¶ Relationships: John Doe works for Acme Corp., which is a pharma company in Dallas.
- ¶ Facts: John Doe is a 42-year-old, male CFO.
- ¶ Events: Jane Doe was appointed a board member of Acme Corp.
- ¶ Topics: Story is about M&As in the pharma industry.

Turns Case

Rollback

DA turns case- surveillance is replaced with increased and more intrusive agents- these are expensive and don't solve the DA because they're not effective

Lewis '14, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies

James Andrew, "Underestimating Risk in the Surveillance Debate", http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf, Broad surveillance of communications is the **least** intrusive method and **most effective** means for discovering terrorist activity. The alternatives to mass surveillance are straightforward. Countries can replace communications surveillance by increasing the number of security service personnel responsible for monitoring terrorism or they can decrease surveillance and accept some increase in the level of risk of a successful attack. The dilemma with choosing this course of action is that the number of agents required to replace communications surveillance is expensive and **overtly intrusive** in a way the communications surveillance is not. Hundreds of thousands of additional agents would be required to provide national coverage, may lack sufficient global reach to detect activity being planned or undertaken outside U.S. territory, and the creation of such a large force risks creating a much greater chilling effect on liberties.

Impact Work

Impact Framing

Frame your decision through the unknowability of the risk of the DA- the fact we don't know exactly when the next attack will happen means you err on the side of caution

Lewis '14, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies

James Andrew, "Underestimating Risk in the Surveillance Debate", http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf, Assertions that a collection program contributes nothing because it has not singlehandedly prevented an attack, reflect an ill-informed understanding of how the United States conducts collection and analysis to prevent harmful acts against itself and its allies. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success (nor is technology consistently infallible). Intelligence is a team sport. Perfect knowledge does not exist and success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. Analysts assemble this mosaic from many different sources and based on experience and intuition. Luck is still more important than anyone would like and the alternative to luck is acquiring more information. This ability to blend different sources of intelligence has improved U.S. intelligence capabilities and gives us an advantage over some opponents. Portrayals of spying in popular culture focus on a central narrative, essential for storytelling but deeply misleading. In practice, there can be many possible narratives that analysts must explore simultaneously. An analyst might decide, for example, to see if there is additional confirming information that points to which explanation deserves further investigation. Often, the contribution from collection programs comes not from what they tell us, but what they let us reject as false. In the case of the 215 program, its utility was in being able to provide information that allowed analysts to rule out some theories and suspects. This allows analysts to focus on other, more likely, scenarios. In one instance, an attack is detected and stopped before it could be executed. U.S. forces operating in Iraq discover a bomb-making factory. Biometric data found in this factory is correlated with data from other bombings to provide partial identification for several individuals who may be bomb-makers, none of whom are present in Iraq. In looking for these individuals, the United States receives information from another intelligence service that one of the bombers might be living in a neighboring Middle Eastern country. Using communications intercepts, the United States determines that the individual is working on a powerful new weapon. The United States is able to combine the communications intercept from the known bomb maker with information from other sources—battlefield data, information obtained by U.S. agents, collateral information from other nations' intelligence services—and use this to identify others in the bomber's network, understand the plans for bombing, and identify the bomber's target, a major city in the United States. This effort takes place over months and involves multiple intelligence, law enforcement, and military agencies, with more than a dozen individuals from these agencies collaborating to build up a picture of the bomb-maker and his planned attack. When the bomb-maker leaves the Middle East to carry out his attack, he is

prevented from entering the United States. An analogy for how this works would be to take a 1,000-piece jigsaw puzzle, randomly select 200 pieces, and provide them to a team of analysts who, using incomplete data, must guess what the entire picture looks like. The likelihood of their success is determined by how much information they receive, how much time they have, and by experience and luck. Their guess can be tested by using a range of collection programs, including communications surveillance programs like the 215 metadata program. What is left out of this picture (and from most fictional portrayals of intelligence analysis) is the number of false leads the analysts must pursue, the number of dead ends they must walk down, and the tools they use to decide that something is a false lead or dead end. Police officers are familiar with how many leads in an investigation must be eliminated through legwork and query before an accurate picture emerges. Most leads are wrong, and much of the work is a process of elimination that eventually focuses in on the most probable threat. If real intelligence work were a film, it would be mostly boring. Where the metadata program contributes is in eliminating possible leads and suspects. This makes the critique of the 215 program like a critique of airbags in a car—you own a car for years, the airbags never deploy, so therefore they are useless and can be removed. The weakness in this argument is that discarding airbags would increase risk. How much risk would increase and whether other considerations outweigh this increased risk are fundamental problems for assessing surveillance programs. With the Section 215 program, Americans gave up a portion of their privacy in exchange for decreased risk. Eliminating 215 collection is like subtracting a few of the random pieces of the jigsaw puzzle. It decreases the chances that the analysts will be able to deduce what is actually going on and may increase the time it takes to do this. That means there is an increase in the risk of a successful attack. How much of an increase in risk is difficult to determine, but this is crucial for assessing the value of domestic surveillance programs. If the risk of attack is increasing, it is not the right time to change the measures the United States has put in place to deter another 9/11. If risk is decreasing, surveillance programs can be safely reduced or eliminated. A more complicated analysis would ask if the United States went too far after 9/11 and the measures it put in place can be reduced to a reasonable level without increasing risk. Unfortunately, precise metrics on risk and effectiveness do not exist, and we are left with the conflicting opinions of intelligence officials and civil libertarians as to what makes effective intelligence or counterterrorism programs. There are biases on both sides, with intelligence officials usually preferring more information to less and civil libertarians can be prone to wishful thinking about terrorism and opponent intentions.¹³ Interviews with current and former intelligence officials give us some guidance in deciding this. The consensus among these individuals is that 215 is useful in preventing attacks, but the least useful of the programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215 before any others, but ending 215 would not come without some increase in risk.

A2 No Terror Threat

Terrorism is feasible and likely- its only a question of prevention by surveillance

Lewis '14, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies

James Andrew, "Underestimating Risk in the Surveillance Debate",
http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Americans are reluctant to accept terrorism is part of their daily lives, but attacks have been planned or attempted against American targets (usually airliners or urban areas) almost every year since 9/11. Europe faces even greater risk, given the thousands of European Union citizens who will return hardened and radicalized from fighting in Syria and Iraq. The threat of attack is easy to exaggerate, but that does not mean it is nonexistent. Australia's then-attorney general said in August 2013 that communications surveillance had stopped four "mass casualty events" since 2008. The constant planning and preparation for attack by terrorist groups is not apparent to the public. The dilemma in assessing risk is that it is discontinuous. There can be long periods with no noticeable activity, only to have the apparent calm explode. The debate over how to reform communications surveillance has discounted this risk. Communications surveillance is an essential law enforcement and intelligence tool. There is no replacement for it. Some suggestions for alternative approaches to surveillance, such as the idea that the National Security Agency (NSA) only track known or suspected terrorists, reflect wishful thinking, as it is the unknown terrorist who will inflict the greatest harm.

View the debate through the lens of the increasing invisible threat of terror

Lewis '14, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies

James Andrew, "Underestimating Risk in the Surveillance Debate",
http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Risk Is Not Going Away. Broad surveillance of communications is the least intrusive and most effective method for discovering terrorist and espionage activity. Many countries have expanded surveillance programs since the 9/11 attacks to detect and prevent terrorist activity, often in cooperation with other countries, including the United States. Precise metrics on risk and effectiveness do not exist for surveillance, and we are left with conflicting opinions from intelligence officials and civil libertarians as to what makes counterterrorism successful. Given resurgent authoritarianism and continuing jihad, the new context for the surveillance debate is that the likelihood of attack is increasing. Any legislative change should be viewed through this lens.

The terror threat exists- the secretary of defense agrees

IBD 15 [June 23, 2015 <http://news.investors.com/ibd-editorials/062315-758709-diminishing-us-power-has-elevated-our-terror-threat-level.htm> "Despite Obama's Claim, Our Terror Threat Level Is High"] (Vaibhav)

Homeland Security: The president repeatedly claims we're safer than ever. The chairman of the House Intelligence Committee just warned of the opposite. Apparently we have difficulty tracking U.S.-based

terrorist cells. The attitude of the Obama administration toward terrorism is summed up by the National Terrorism Advisory System page on the Homeland Security website. "There are no current alerts," it reports. And "there are no expired alerts." Nearby is the question, "Was this page helpful?" The answer is no. The five post-9/11 color-coded terrorism alert levels, abandoned in 2011, were lampooned by comedians for being vague and based on hidden criteria. With the threat level never dropping below "elevated" (yellow), down to "guarded" (blue) or "low" (green), the public was ignoring it, it was said. But now, in its place, is a National Terrorism Advisory System that never issues alerts. In fact, over nearly six and a half years, President Obama has not once, under either the old or new system, issued an alert. Last August he promised **"things are much less dangerous now than they were 20 years ago, 25 years ago, or 30 years ago."** **That contradicted his own Joint Chiefs chairman, secretary of defense, and even his then-Attorney General Eric Holder,** who called potential undetectable explosives smuggled in from Syria the most frightening thing he had seen while in office. Enter House Intelligence Committee Chairman Devin Nunes, R-Calif., who told CBS' "Face the Nation" on Sunday that **"we face the highest threat level we have ever faced in this country today . . . including after 9/11."** Because of obstacles such as encrypted Internet chat rooms, **"we are having a tough time tracking terrorist cells,"** according to Nunes. And **"the flow of fighters"** from Western nations who have been radicalized into the Islamic State, but **"who have now come out"** and may seek to commit terrorist attacks back home, is another reason the threat is greater than ever. Nunes noted that the FBI has **"cases open in 50 states."** Then there is civil war in Yemen, with the AQAP branch of al-Qaida "everywhere," according to Nunes. Last September, outlining his noncombat approach against the Islamic State, Obama cited his Yemen policy as the model. Eleven days later, Iranian-backed Houthi rebels toppled the U.S.-backed government. Obama is poised to make a nuclear deal with those same Iranians, lifting sanctions and handing Tehran tens of billions in cash to terrorize even more and gain regional dominance — all before getting nuclear weapons, which will launch an atomic arms race in the Mideast. Russia's new aggressiveness counters Obama's claims that the Cold War is ancient history. Iran, the Islamic State and other terrorists are actually, while lacking Moscow's massive nuclear arsenal, a greater threat because of the theocratic-based, self-destructive irrationality and instability underlying their motivations. The Soviets, after all, never murdered thousands of Americans on their own soil. Far less powerful Islamist fanatics did. **Under the old color-coded system, today's level of alert would be "severe" (red).**

A2 Metadata Not Key

Successful surveillance requires data from *tons of sources*- restriction decreases early *detection and prevention*

Lewis '14, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies

James Andrew, "Underestimating Risk in the Surveillance Debate",
http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

Espionage and Counterterrorism, NSA carried out two kinds of signals intelligence programs: bulk surveillance to support counterterrorism and collection to support U.S. national security interests. The debate over surveillance unhelpfully conflated the two programs. Domestic bulk collection for counterterrorism is politically problematic, but assertions that a collection program is useless because it has not by itself prevented an attack reflect unfamiliarity with intelligence. Intelligence does not work as it is portrayed in films—solitary agents do not make startling discoveries that lead to dramatic, last-minute success. Success is the product of the efforts of teams of dedicated individuals from many agencies, using many tools and techniques, working together to assemble fragments of data from many sources into a coherent picture. In practice, analysts must simultaneously explore many possible scenarios. A collection program contributes by not only what it reveals, but also what it lets us reject as false. The Patriot Act Section 215 domestic bulk telephony metadata program provided information that allowed analysts to rule out some scenarios and suspects. The consensus view from interviews with current and former intelligence officials is that while metadata collection is useful, it is the least useful of the collection programs available to the intelligence community. If there was one surveillance program they had to give up, it would be 215, but this would not come without an increase in risk. Restricting metadata collection will make it harder to identify attacks and increase the time it takes to do this.

Splintering Trick

Framing issue- these terrorists don't have to work together- one independent attack is enough to cause our impact

Lewis '14, senior fellow and director of the Strategic Technologies Program at the Center for Strategic and International Studies

James Andrew, "Underestimating Risk in the Surveillance Debate",
http://csis.org/files/publication/141209_Lewis_UnderestimatingRisk_Web.pdf

There is general agreement that as terrorists splinter into regional groups, the risk of attack increases. Certainly, the threat to Europe from militants returning from Syria points to increased risk for U.S. allies. The messy U.S. withdrawal from Iraq and (soon) Afghanistan contributes to an increase in risk.²⁴ European authorities have increased surveillance and arrests of suspected militants as the Syrian conflict lures hundreds of Europeans. Spanish counterterrorism police say they have broken up more terrorist cells than in any other European country in the last three years.²⁵ The chairman of the House Select Committee on Intelligence, who is better placed than most members of Congress to assess risk, said in June 2014 that the level of terrorist activity was higher than he had ever seen it.²⁶ If the United States overreacted in response to September 11, it now risks overreacting to the leaks with potentially fatal consequences. A simple assessment of the risk of attack by jihadis would take into account a resurgent Taliban, the power of Islamist groups in North Africa, the continued existence of Shabaab in Somalia, and the appearance of a powerful new force, the Islamic State in Iraq and Syria (ISIS). Al Qaeda, previously the leading threat, has splintered into independent groups that make it a less coordinated force but more difficult target. On the positive side, the United States, working with allies and friends, appears to have contained or eliminated jihadi groups in Southeast Asia. Many of these groups seek to use adherents in Europe and the United States for manpower and funding. A Florida teenager was a suicide bomber in Syria and Al Shabaab has in the past drawn upon the Somali.²⁴ Jon Swaine, "NYPD terror chief: New Yorkers among American Islamists in Middle East," The Guardian, June 20, 2014, <http://www.theguardian.com/world/2014/jun/20/nypd-terror-chief-new-yorkers-american-islamists-middle-east>.²⁵ Carlotta Gall, "Spanish Police Target Cells Recruiting War Volunteers," New York Times, June 16, 2014, <http://www.nytimes.com/2014/06/17/world/europe/spanish-police-target-cells-recruiting-war-volunteers-for-insurgenciesfrom-western-africa-syria-iraq.html?ref=todayspaper>.²⁶ Representative Michael Rogers, first panel, "Ethos and Profession of Intelligence," Georgetown University, Washington, DC, June 12, 2014, <http://www.georgetown.edu/news/cia-conference-2014.html>.²⁰ | Underestimating Risk in the Surveillance Debate, population in the United States. Hamas and Hezbollah have achieved quasi-statehood status, and Hamas has supporters in the United States. Iran, which supports the two groups, has advanced capabilities to launch attacks and routinely attacked U.S. forces in Iraq. The United Kingdom faces problems from several hundred potential terrorists within its large Pakistani population, and there are potential attackers in other Western European nations, including Germany, Spain, and the Scandinavian countries. France, with its large Muslim population, faces the most serious challenge and is experiencing a wave of troubling anti-Semitic attacks that suggest both popular support for extremism and a decline in control by security

forces.¶ The chief difference between now and the situation before 9/11 is that all of these countries have put in place, much more robust surveillance systems, nationally and in cooperation with others, including the United States,¶ to detect and prevent potential attacks. Another difference is that the failure of U.S. efforts in Iraq and,¶ Afghanistan and the opportunities created by the Arab Spring have opened a new “front” for jihadi groups that,¶ makes their primary focus regional. Western targets still remain of interest, but are more likely to face attacks,¶ from domestic sympathizers. This could change if the well-resourced ISIS is frustrated in its efforts to establish,¶ a new Caliphate and turns its focus to the West. In addition, the al Qaeda affiliate in Yemen (al Qaeda in the,¶ Arabian Peninsula) continues to regularly plan attacks against U.S. targets.¶ 27¶ The incidence of attacks in the United States or Europe is very low, but we do not have good data on the number,¶ of planned attacks that did not come to fruition. This includes not just attacks that were detected and stopped,¶ but also attacks where the jihadis were discouraged and did not initiate an operation or press an attack to its,¶ conclusion because of operational difficulties. These attacks are the threat that mass surveillance was created to,¶ prevent. The needed reduction in public anti-terror measures without increasing the chances of successful attack,¶ is contingent upon maintaining the capability provided by communications surveillance to detect, predict, and,¶ prevent attacks. Our opponents have not given up; neither should we.

Impact Module- Prolif (Good for Current UQ)

Specifically, Al Qaeda causes nuclear prolif- *splintering* means they're uniquely difficult to target

Mowatt-Larssen '10, senior fellow at the Harvard Kennedy School's Belfer Center for Science and International Affairs

Rolf, "Bulletin of the Atomic Scientists: Nightmares of nuclear terrorism",

<http://belfercenter.ksg.harvard.edu/files/Atomic%20Bulletin%20March%20April%202010.pdf>

That might have been true at the time, but on 9/11, Al Qaeda rewrote the terrorist playbook by executing mass casualty attacks against strategic U.S. targets. In essence, these attacks ended one era and ushered in a new one. It is an age in which a few terrorists hold the means to alter the course of history with a single blow. Having set a standard that dares to change the world, it is likely only a matter of time before 9/11 is eclipsed by an even more devastating event. So why has it not happened yet? For starters, having pulled off such a complex and successful operation as 9/11, Osama bin Laden may find it problematic to settle on anything lesser—or riskier—that might damage his movement's almost mythological standing in the annals of terrorist lore. W Bulletin of the Atomic Scientists | WWW.THEBULLETIN.ORG March/april 2010 38 Al Qaeda is a conservative, risk-averse organization. The group's leadership apparently recognizes that it is better to not attack at all, than to do so in a way that falls short of the lofty goals they have set for themselves. And for now at least, the Al Qaeda leadership may have few credible options for making good on threats to disrupt the global economy and to convince their adversaries that they are fighting a war that cannot be won. A further—and highly unsettling—explanation of Al Qaeda's extraordinary patience is that group members think time is on their side. They probably believe they have drawn the United States into a deepening commitment to fight a protracted insurgency in Afghanistan. Moreover, Saddam Hussein was deposed, opening up long-term possibilities for an Islamic theocracy in Iraq. Gen. Pervez Musharraf is out of power in Pakistan, and the domestic instability there is growing every day. These developments create opportunities to change the global status quo. In other words, Al Qaeda may be waiting for a perfect storm in the alignment of targets, opportunity, and timing to launch another game-changing attack. If they do so, it will certainly be based on a calculation that the moment is ripe to try to force Washington's hand in ways that favor Al Qaeda's long-term goals. In this light, the group's long-held intent and persistent efforts to acquire nuclear and biological weapons represent a unique means of potentially fulfilling its wildest hopes and aspirations. As bin Laden declared in 1998, it is his duty to obtain WMD. He apparently understood at this early juncture that using such weapons might become necessary at some stage of his confrontation with the United States and its allies. With this in mind, Al Qaeda feverishly pursued nuclear and biological weapons capabilities before 9/11. These efforts were managed by the group's most senior leadership, with a sense of purpose and urgency that suggests it was important to make progress on possessing WMD prior to its 2001 attack on the United States. Yet in spite of bin Laden's declaration and Al Qaeda's subsequent efforts to acquire nuclear and biological weapons, the threat is not widely being treated as a clear-and-present danger that requires an urgent response. Nuclear terrorism detractors point out that the threat has been hyped. Unfortunately, it is true that some have used the WMD threat to

incite fear and to justify extreme tactics to combat terrorism. Skeptics argue that there were no WMD in Iraq, so why should people believe intelligence that terrorists are seriously trying to acquire them? Plus, if terrorists have such a weapon, why haven't they used it? They also argue that it is impossible for men in caves to acquire and detonate a nuclear bomb. They acknowledge some nuclear material may be missing from global stocks, but they exude confidence that it is surely not available in sufficient quantities to constitute a real threat, and that in any case, it is preposterous to believe that primitive, unsophisticated terrorists might be able to construct a bomb capable of producing a nuclear yield. Let us hope the skeptics are right, because in terms of organizing the international community to confront the threat posed by large-scale WMD terrorism, not much has been accomplished. Intelligence and law enforcement agencies, in the United States and abroad, have been slow to dedicate resources and leadership to the problem. For example, there is a widespread assumption that terrorists will employ small-scale, crude forms of chemical, biological, and radiological weapons because they are easier to acquire and use. But the weight of the evidence suggests the opposite is true—i.e., terrorists choose weapons best suited for the targets they intend to strike. The history of Al Qaeda strikes against the United States bears this out. The group historically has utilized a remarkably diverse arsenal of weapons in its attacks against the United States: The embassy bombings in Kenya and Tanzania were ground attacks; the U.S.S. Cole bombing was a sea attack; and the World Trade Center and Pentagon bombings were air attacks. It chose the desired weapons based on operational considerations, most notably a weapon's capacity to destroy the intended target. Another dangerous bias in assessing the threat is the belief that once terrorists obtain a nuclear bomb, they will use it. Thus, the following argument is proffered: Since Al Qaeda has yet to use a nuclear weapon, it does not possess one. This might comfort the doubters, but terrorists may not agree that it is difficult to stash a nuclear or biological weapon in a safe place for future use, without fear of discovery. After all, it has proved exceedingly difficult to find bin Laden and his lieutenant Ayman al-Zawahiri, and we have a pretty good idea of where they might be hiding. Plus, nothing in Al Qaeda's behavior suggests that its leaders follow predictable patterns concerning the means and timing of attacks. But accepting that nuclear terrorism can happen does not mean that it is inevitable. The odds are stacked against a terrorist successfully acquiring a nuclear bomb. That said, in a twenty-first century world of rare and unpredictable events, prudent risk management must prioritize threats based on both the probability of an event and its potential consequences. Accordingly, terrorists must be denied any possibility, however remote it might seem, from ever succeeding in their quest to launch a nuclear or large-scale biological attack on any city. Better still, if we can anticipate how a nuclear terrorist threat might unfold, it stands to reason that we might be able to prevent such an attack from happening. The following scenarios are the nuclear nightmares that keep me up at night.

---A2 Nuke Prolif Impossible

Here's a few scenarios

1. Pakistan can lose control of its bomb

Mowatt-Larssen '10, senior fellow at the Harvard Kennedy School's Belfer Center for Science and International Affairs

Rolf, "Bulletin of the Atomic Scientists: Nightmares of nuclear terrorism",
<http://belfercenter.ksg.harvard.edu/files/Atomic%20Bulletin%20March%20April%202010.pdf>

Pakistan loses control of its Bomb. Allegations that the threat posed by Pakistani "loose nukes" has been hyped and that the Pakistani military has everything under control may sound soothing, but they obscure the fact that South Asia is replete with violent extremists. Mix in a rapidly expanding arsenal of nuclear weapons and growing domestic instability, and there is a greater possibility of a nuclear meltdown in Pakistan than anywhere else in the world. It is a good thing then that the Pakistani military approaches nuclear security with great professionalism, for Pakistan has **fewer margins for error** than any other nuclear state. For comparison's sake, in the United States, it was widely recognized that significant nuclear security upgrades had to be made after 9/11. Specific attention was given to the possibility that terrorists could gain access to a nuclear weapons-related facility, particularly with the assistance of insiders working at the facility. Accordingly, large increases in funding were allocated to assure a much higher U.S. nuclear security standard, including an increased emphasis on intelligence and counterintelligence programs. Nonetheless, in recent years, there have been appalling lapses in controls over nuclear weapons and the compromise of nuclear weapons-related information—e.g., a U.S. Air Force B-52 mistakenly and unknowingly flew six nucleartipped cruise missiles across the country (from North Dakota to Louisiana) in August 2007. With this in mind, U.S. concerns about Pakistani vulnerabilities should not be interpreted as finger-pointing or meddling; it obviously can happen in the United States as well. Some broader trends in Pakistan, however, elevate the risks of compromised nuclear security. The burgeoning Pakistani nuclear arsenal. A growing domestic nuclear program means more nuclear activity taking place in more places—necessitating more materials, weapons, facilities, transportation, and storage. In short, there are now more places where something can go wrong. Increased extremism. Growing levels of extremism means higher numbers of potential insiders in the nuclear establishment, willing to work with outsiders to provide access to facilities and exfiltrate nuclear-related materials and weapons. Recent warnings by the Taliban and Al Qaeda that Washington will seize Pakistan's nuclear weapons amount to a clever recruiting pitch to insiders to collaborate with extremists. In an attempt to stoke such groundless

Bulletin of the Atomic Scientists | WWW.THEBULLETIN.ORG March/april 2010 41

The following argument is proffered: Since Al Qaeda has yet to use a nuclear weapon, it does not possess one. This might comfort the doubters, but terrorists may not agree that it is difficult to stash a nuclear or biological weapon in a safe place for future use, without fear of discovery. fears, A. Q. Khan, the father of the Pakistani nuclear program, and Bashiruddin Mahmood, the radical CEO of Khan's rogue nuclear supplier network, both recently called upon Pakistan to expand its arsenal of nuclear weapons, implying that they guarantee sovereignty and assure Islamabad's standing as a leading Islamic nation. The perilous military-civilian

relationship. Although Pakistan's nuclear National Command Authority is controlled by the military, the Pakistani constitution delegates certain nuclear weapon responsibilities to the civilian government. This creates the potential for a military-civilian standoff over nuclear assets during a crisis, especially in the event that extremist elements assume power. Moreover, there are no guarantees of how the military and government would react to all contingencies they may encounter in a rapidly unfolding crisis. For instance, how would they respond to a breakdown in internal communication, or with the outside world? Unconfirmed news reports of a seizure of nuclear weapons in transit? A takeover of a facility by a rogue military unit? Taliban penetration of a nuclear weapons storage site? More importantly, how would India interpret and react to such developments? Along these lines: Are current communication mechanisms between Islamabad, New Delhi, and Washington robust enough to be reliable during a crisis? At least in Pakistan, the risks are well-known and extra precautions are being taken to avert nuclear compromise. That is not the case for the next scenario.

2. North Korea sells them the bomb

Mowatt-Larssen '10, senior fellow at the Harvard Kennedy School's Belfer Center for Science and International Affairs

Rolf, "Bulletin of the Atomic Scientists: Nightmares of nuclear terrorism",
<http://belfercenter.ksg.harvard.edu/files/Atomic%20Bulletin%20March%20April%202010.pdf>

North Korea sells the Bomb. The discovery of Syria's Al Kibar reactor, believed to be built with North Korean assistance, was a wake-up call that Pyongyang does not possess strong self-imposed constraints on transferring nuclear technologies to other parties—a sobering, if unsurprising, reality. After all, North Korea routinely prints counterfeit U.S. currency, traffics narcotics, and starves its own people. So it is not unexpected that it would provide nuclear-related technologies for profit. If anything, North Korea's erratic and irresponsible behavior makes it a leading potential source—on a witting or unwitting basis—for terrorist acquisition of nuclear-related technologies and materials. The extraordinary level of secrecy in handling intelligence concerning the North Korean-Syrian project at Al Kibar helped ensure that knowledge of its existence did not leak before Israel could effectively neutralize the reactor militarily in September. Bulletin of the Atomic Scientists | WWW.THEBULLETIN.ORG March/april 2010 42, 2007. Unfortunately, secrecy also restricted the international community's ability to run down all leads on the reactor before the North Koreans discovered that it had been compromised. So an opportunity was lost to begin an early examination of active proliferation pathways flowing from Pyongyang. Nonetheless, there are three broad implications of North Korean-Syrian nuclear cooperation that should be assessed urgently. The viability of the nonproliferation regime. To date, the regimes of Kim Jong-il and Bashar al-Assad have suffered no consequences for conspiring to develop a nuclear weapons capability, casting doubts on the viability of the Nuclear Non-Proliferation Treaty and the credibility of the global nuclear order. In fact, U.S. dialogue with Syria improved after the Israeli raid. And the countries participating in the Six-Party Talks with North Korea (the United States, Russia, China, South Korea, and Japan) continue to cajole Pyongyang back to the negotiating table to make new concessions in exchange for more promises the North will not keep. Basically, Al Kibar obliterated all of the red lines thought to exist in terms of nuclear deterrence, accountability,

and responsibility, setting a precedent that it is okay to clandestinely provide nuclear-related technologies to other states. An “A. Q. Kim” network? Since Kim Jong-il came close to providing Syria with the building blocks for a nuclear weapon, how confident can the international community be that there is not a long-running “A. Q. Kim” network in North Korea that is analogous to the Khan nuclear supplier network in Pakistan? Clearly, the chapter of proliferation history that suggests Khan was a historical anomaly may need to be rewritten. But what will it say? Today, there is fresh information and new leads that must be explored to determine the full extent of North Korea’s proliferation activity.

3. They have the means and motives

Mowatt-Larsen ’10, senior fellow at the Harvard Kennedy School’s Belfer Center for Science and International Affairs

Rolf, “Bulletin of the Atomic Scientists: Nightmares of nuclear terrorism”,
<http://belfercenter.ksg.harvard.edu/files/Atomic%20Bulletin%20March%20April%202010.pdf>

Sabotage. Terrorists could attack a nuclear facility in hopes of causing a large release of radioactivity—similar to how they used airplanes on 9/11 as an inscrutable weapon. There is evidence that Al Qaeda’s leadership considered such a possibility before 9/11, when their operatives reportedly conducted some light casing of U.S. nuclear reactor facilities. But thanks to enhanced security and reinforced defenses at U.S. nuclear sites, the available intelligence seems to indicate that Al Qaeda has concluded that it is too difficult to either (a) crash a plane into a nuclear facility or (b) use a team to penetrate a nuclear facility to gain access to nuclear weapons and materials. Purchase. After the Cold War ended, the former Soviet Union was an attractive place to shop for nuclear components. In fact, there are credible reports that Ayman al-Zawahiri visited Russia in the mid-1990s. However, al-Zawahiri’s announcement in 2001 that Al Qaeda had obtained nuclear devices in the former Soviet Union does not ring true. If the terrorist organization had purchased such weapons, why announce it to the world? Of course, there is a possibility that Al Qaeda’s nuclear materials are being held in storage or have not reached their final destination yet. But no credible reporting has surfaced that Russian/Soviet nuclear weapons have been lost, much less that they have found their way into terrorist hands. (Reports of Russian “loose nukes” appear to have been greatly exaggerated.) Construct. Counting assembled nuclear weapons is far easier than accounting for nuclear material in bulk form. Al Qaeda’s experience on the nuclear black market has taught its planners that their best chance at some sort of nuclear or radiological attack is to construct an improvised nuclear device comprised of illegally purchased weapons-usable material—i.e., the direct pathway of finding a “loose nuke” or “suitcase nuke” is riddled with scam artists and intelligence services dangling their wares to terrorists in hopes of landing big fish. So while building a bomb is surely not the preferred course of action, it might be the only realistic pathway for sub-state actors who cannot develop the infrastructure necessary to enrich fissile material. To realistically do so would involve recruiting malicious insiders at nuclear facilities who are in a position to smuggle fissile material from their workplace and patiently combing the nuclear black market for similar material. It also requires enlisting specialists to build a device, rig the explosives, and assemble the pieces, all in complete secrecy. Finally, a suicide bomber is needed to transport the bomb

to the intended target. Even if they succeeded in avoiding discovery throughout the planning stages, a terrorist would never know for certain whether his device would reach a nuclear yield or whether he had a viable bomb until he tried to detonate it. Al Qaeda must understand that the odds are long of conducting a successful nuclear attack. Yet, it is determined to try. And regrettably, time favors intent; if terrorists get something wrong the first time, they can continue to try until they succeed. More likely, however, their plans will be exposed somewhere during the planning stage: Stolen or smuggled fissile material might be interdicted at a port or border crossing equipped with state-of-the-art sensors; a suspicious neighbor might report the curious activities of a rogue scientist from a state weapons program; or an alert analyst might flag the intercept of an unusual container, shipment, or consignment of goods that did not fit the usual patterns. Somehow, though, a clue is likely to emerge that will present an opportunity to disrupt an Al Qaeda nuclear plot—probably when, and where, it is least expected. In this regard, terrorist use of WMD presents a litmus test of the current state of global counterterrorism response. It is an apt challenge. The prospect of an Al Qaeda nuclear bomb stretches the mind to its limits, as such an attack entails almost unimaginable consequences. As such, it is essential to develop a robust, highly Bulletin of the Atomic Scientists | WWW.THEBULLETIN.ORG March/april 2010 45 Rolf Mowatt-Larssen, “Nightmares of nuclear terrorism,” Bulletin of the Atomic Scientists, March/April 2010, vol. 66, no. 2, pp. 37–45. DOI: 10.2968/066002005 Copyright © 2010 Bulletin of the Atomic Scientists. All Rights Reserved. creative capability to identify pathways terrorists might take to obtain a bomb in order to interdict plots before they reach fruition—and to do so quickly. In planning for success, one thing is certain: If we cannot imagine a nuclear catastrophe, we will surely fail to prevent it from happening.

---A2 Intel Not Key

And intelligence is *uniquely* key in our scenario

Mowatt-Larssen '10, senior fellow at the Harvard Kennedy School's Belfer Center for Science and International Affairs

Rolf, "Bulletin of the Atomic Scientists: Nightmares of nuclear terrorism",
<http://belfercenter.ksg.harvard.edu/files/Atomic%20Bulletin%20March%20April%202010.pdf>

Al Qaeda acquires the Bomb. It is difficult to objectively assess the feasibility of nuclear terrorism without being suspected of hyping and overdramatizing the threat. It is also hard to set aside the Bulletin of the Atomic Scientists | WWW.THEBULLETIN.ORG March/april 2010 43 fear in contemplating nuclear catastrophe. That said, it is necessary to approach the task with an optimistic mind-set. Methodically sifting through all of the threat's variables can systematically lower the risks—an approach that requires collection and analysis of each potential terrorist nuclear plot pathway, attack indicator, and choke point. Such a dynamic modus operandi can serve as the basis for undertaking anticipatory action that will identify actionable leads, compromise terrorist planning, and neutralize an impending attack. The chances of identifying indicators of a nuclear terrorism plot are highest in the earliest stages of planning. Over time, the likelihood of interdiction decreases. With this in mind, a premium must be paid to penetrate terrorist leadership, facilitation, and support networks during a plot's most formative stages. Here is how it can be done: Finely tuned terrorist communication intercepts must be used to generate actionable leads. Satellite surveillance and state-of-the-art sensors also must be widely employed to enhance quick detection of nuclear material. And every tool of intelligence tradecraft needs to be focused on finding a logistical and support footprint no larger than that of Mohammed Atta's limited 9/11 plot. Fortunately, the challenges faced by terrorists who want to acquire a nuclear weapon are no less formidable than for the global intelligence agencies that are trying to stop them. In fact, by my count, there are only three pathways to a terrorist nuclear attack.

Circumvention/Solvency

Offense

The executive branch will privatize surveillance functions to escape curtailment by statute or litigation

Jon D. **Michaels 8**, Acting Professor, UCLA School of Law, August 2008, "ARTICLE: All the President's Spies: Private-Public Intelligence Partnerships in the War on Terror," California Law Review, 96 Calif. L. Rev. 901

The "War on Terror" has dramatically increased the nation's need for intelligence, and the federal government is increasingly relying, as it does in so many other contexts, on private actors to deliver that information. While private-public collaboration in intelligence gathering is not new, what is novel today - and what drives this inquiry - is that some of these collaborations are orchestrated around handshakes rather than legal formalities, such as search warrants, and may be arranged this way to evade oversight and, at times, to defy the law.ⁿ¹ Unable to target or repel terrorists using conventional military tactics and munitions alone, the United States is acutely aware that today's pivotal battlefield is an informational one. Teams of U.S. intelligence agents, acting as eavesdroppers, infiltrators, interrogators, and data-miners, must race against the clock to anticipate terrorists' actions, frustrate their missions, and dismantle their infrastructure. ⁿ¹ Because the U.S. government does not know the who, [*902] what, where, and when of the next terrorist strike, but recognizes that the plot might be hatched on domestic soil, its first step must be to cast a wide net to gather all sorts of data points, ⁿ² any one of which might be the clue that leads intelligence agents to prevent another September 11-like catastrophe. ⁿ³ In this regard, there is no better ally than the private sector. Its comparative advantage over the government in acquiring vast amounts of potentially useful data is a function both of industry's unparalleled access to the American public's intimate affairs - access given by all those who rely on businesses to facilitate their personal, social, and economic transactions - and of regulatory asymmetries insofar as private organizations can at times obtain and share information more easily and under fewer legal restrictions than the government can when it collects similar information on its own. ⁿ⁴ [*903] Seeking to bridge the private sector's data-gathering capabilities and the nation's need for homeland security is an Executive with a voracious appetite for intelligence and correspondingly little patience for anything that might interfere with its efforts to neutralize the terrorist threat. The Executive is institutionally predisposed to act decisively and unilaterally during times of national crisis, even if it means bypassing legal restrictions, skirting congressional and judicial oversight, and encroaching on civil liberties. ⁿ⁵ As Justice Souter remarked in Hamdi v. Rumsfeld: ⁿ¹ deciding ... on what is a reasonable degree of guaranteed liberty whether in peace or war (or some condition in between) is not well entrusted to the Executive Branch of Government, whose particular responsibility is to maintain security. For reasons of inescapable human nature, the branch of the Government asked to counter a serious threat is not the branch on which to rest the Nation's entire reliance in striking the balance between the will to win and the cost in liberty on the way to victory; the responsibility for security will naturally amplify the claim that security legitimately raises. ⁿ⁶ Unilateral executive policymaking of this sort has figured prominently in post-September 11 national-security policies and is reflected in the United States' approach to military detainees, interrogation tactics, battlefield contractors, and, of course, intelligence operations. ⁿ⁷ [*904] Although the Bush Administration's intelligence policy has garnered no shortage of interest and criticism, much of the focus has been on what seems to be the Administration's own willingness to defy applicable law, and not on the particular role that corporations play in facilitating these operations. ⁿ⁸ To date, the Executive's apparent practice of identifying and then courting private actors, persuading, coaxing, and sometimes deceiving them to enter into "informal" intelligence-gathering partnerships that often are inscrutable to Congress and the courts, has gone largely unexamined by policymakers and scholars alike. These "handshake agreements," ⁿ⁹ which spawned the now-notorious National Security Agency (NSA) warrantless eavesdropping and call-data programs, as well as a range of lesser-known collaborations with the likes of FedEx and Western Union, have enabled the Executive to operate outside of the congressionally imposed framework of court orders and subpoenas, and also outside of the ambit of inter-branch oversight. In the process, these informal collaborations may unduly threaten privacy rights.

separation of powers, the rule of law, and the legitimacy and vitality of bypassed government institutions. In addition, these private-public partnerships may undermine the integrity of the marketplace and weaken consumer trust in key industries.[¶] Transcending these particular concerns are questions of national security accountabilityⁿ¹⁰ - how "privatization," in the guise of informal intelligence agreements with corporations, can help the Executive direct broad swaths of intelligence policy without having to seek ex ante authorization or submit to meaningful oversight. This evasion leaves Congress and the courts ill-equipped to weigh in on important policy considerations regarding the proper scope and calibration of counterterrorism and homeland security operations, not to mention ill-equipped to intervene to remedy individual instances or patterns of injustice. Whether intentional or not, working around the legislative and judicial branches through shadowy collaborations is especially troubling given that many of today's surveillance programs rely on brand-new technologies and cut more broadly and deeply into the domestic fabric than ever before. Thus, [*905] the need for careful consideration by the full range of government actors, especially those further removed from the immediate responsibility of hunting terrorists, is particularly acute. Greater scrutiny is essential both to ensure fidelity to existing laws and to determine whether new, informal surveillance and data-mining practices operating in the interstices of the extant legal framework warrant legislative or administrative responses to fill in those regulatory gaps. In other words, with respect to initiatives that are not currently regulated (and not readily observable), these lawmakers, regulators, and judges need accurate information to determine whether, normatively speaking, the unregulated terrain is in fact underregulated.ⁿ¹¹

Private-sector surveillance tanks consumer confidence in the economy

Jon D. **Michaels 8**, Acting Professor, UCLA School of Law, August 2008, "ARTICLE: All the President's Spies: Private-Public Intelligence Partnerships in the War on Terror," California Law Review, 96 Calif. L. Rev. 901

Even if a given informal partnership is not aimed at defying governing legal requirements, a range of harms may still follow from the ostensibly lawful decision to proceed by handshake. For instance, left to their own devices, both corporations and intelligence agencies may systematically undervalue the social costs associated with the commodity being traded (i.e., private information) - and thus traffic in an inordinately high amount of citizens' personal information.ⁿ¹⁶¹ As in the case of industrial regulation of pollution, the possibility of exposing or misusing individuals' personal data is not fully internalized by the parties to the given transaction. Therefore, irrespective of what value society as a whole would assign to the personal information in question,ⁿ¹⁶² the parties to the transaction peg it comparatively lower.ⁿ¹⁶³ In other words, without the government having to resort to legal process (e.g., by obtaining ex ante authorization and compelling corporate cooperation,ⁿ¹⁶⁴) the [*938] "informal market" may transfer more information with fewer safeguards than is socially optimal, or even necessary.ⁿ¹⁶⁵ If, on the other hand, the Executive and the corporations were required to internalize these social costs (say, if a robust oversight regime existed or if private rights of action were readily enforceable),ⁿ¹⁶⁶ it is likely that the parties would have a greater incentive to reduce instances of over-trafficking in the information and thus better abide by whatever agreed-upon privacy protections were in place. This result would be similar to how corporations respond when forced by outside interests to come to terms with an environmental externality.ⁿ¹⁶⁷¶ Second, under any of the possible arrangements agreed to voluntarily or via legal compulsion, if word gets out that such partnerships exist for the purpose of domestic-intelligence gathering, there could be a chilling effect. Some individuals would be less candid on the telephone and over email (especially when voicing political dissent), and expressive activities would [*939] suffer.ⁿ¹⁶⁸ Certainly, if such a chilling effect occurred, it would set in no matter what type of private-public intelligence-gathering partnership was reported by the press; but, if the arrangement were described as having been regulated pursuant to the dictates of the law, individuals could take some solace in the fact that the partnership's activities were accountable and being monitored for a requisite showing of cause.ⁿ¹⁶⁹ They might also find some comfort in the fact that the firms were evidently protective of their customers, giving out information only upon pains of legal compulsion.¶ By contrast, when a legally

informal relationship is exposed by the media, a consumer could reasonably fear that intelligence-gathering intrusions lack meaningful limits. Consider a counterfactual about New York's Container Inspection Program, which involves police officers conducting random searches of subway passengers in an effort to locate or deter concealed explosives. n170 While many passengers may find the random search itself to be bothersome and intrusive, they at least know that as a matter of unambiguous law the agents are forbidden from looking through reading materials or collecting personally identifying information about those searched. n171 If suddenly, however, it came to light that the police had mini-hand scanners and, notwithstanding the clear limitations on their discretion, were secretly cataloging personal information and triangulating it with time/location of people's travel and reading habits, it may well be the case that, on the margins, people may choose to take the bus (at least when they are carrying particularly personal materials). Thus, informality, and the corresponding uncertainty that [*940] attaches, may excessively chill expression or limit freedoms. n172¶ Third, and building on the previous point, evidence that any private-public surveillance program operated without complying with the relevant regulatory requirements is likely to engender distrust of private industry writ large. Individuals confronted with the realities of legally informal relationships have no reason to believe that journalists or government watchdogs have smoked out all of the possible collaborations of that kind. Instead, people have cause for suspecting that if such partnerships exist in realms A and B, the government might just as likely be doing something improper in realms C and D, too. n173 These worries are only compounded when revelation of such partnerships, including the infamous NSA warrantless eavesdropping program, prompts an unrepentant President to insist that Congress grant retroactive legal immunity to the private parties involved. n174

tremendous gamble.

Iran deal will survive but veto override is possible—Obama's sales pitch is key **Liptak**, White House producer for CNN, **7/14/2015**

(Kevin, "Now that he has a deal with Iran, Obama must face Congress,"
<http://www.cnn.com/2015/07/14/politics/iran-nuclear-deal-congress-obama-block/>)

With a historic deal meant to curb Iran's nuclear ambitions in place, President Barack Obama has ticked off another legacy-making item on his checklist -- as long as Congress doesn't get in his way.¶ Early Tuesday, Obama launched a sales pitch to lawmakers who remain deeply skeptical of the nuclear deal. But while Congress retains the ability to nullify Obama's accord with Tehran, the high bar for action on Capitol Hill -- including building veto-proof majorities in just over two months -- will make it difficult for opponents to block the President.¶ In its most simplistic form, the deal means that in exchange for limits on its nuclear activities, Iran would get relief from sanctions while being allowed to continue its atomic program for peaceful purposes. Many of the more technical points of the deal weren't available Tuesday morning, and specifics could prove to be red flags for skeptical members of Congress, many of whom said they were still reviewing the specifics of the plan.¶ Congress has 60 days to review the deal, and if it opposes it can pass a resolution of disapproval to block its implementation. The administration now has five days to certify the agreement and formally present the deal to Capitol Hill. The clock on that 60 day period will not start until the official document is delivered to Capitol Hill.¶ The Republican controlled House has the votes to pass a resolution, but in the Senate Republicans would need to attract support from a half a dozen Democrats.¶ Because President Obama has already pledged to veto any bill to block the deal GOP leaders would need to convince enough Democrats to join with them to override his veto -- a heavy lift. How the public views the deal will be critical, as Members of Congress will be back home for several weeks this summer before any vote.¶ While Obama on Tuesday said he welcomed a "robust" debate over the deal's merits, he issued a warning to lawmakers considering blocking the agreement, bluntly threatening to veto any measure that would prevent the deal from going into effect.¶ "Precisely because the stakes are so high, this is not the time for politics," he said in an address from the White House. "Tough talk from Washington does not solve problems. Hard nosed diplomacy, leadership that has united the world's major powers, offers a more effective way of verifying Iran is not pursuing a nuclear weapon."¶ Like the completion earlier this month of a diplomatic renewal with Cuba, the deal with Iran provides Obama a tentative foreign policy achievement in the final year-and-a-half of his presidency. Both are built on the premise of engaging traditional U.S. foes, a vow Obama made at the very beginning of his presidency when he declared to hostile nations the United States would "extend a hand if you are willing to unclench your fist."¶ The deal -- which was finalized after almost two years of talks -- provides vindication for an administration that's sought to emphasize diplomacy over military force.¶ "This deal demonstrates that American diplomacy can bring about real and meaningful change," Obama said Tuesday, adding later that the deal "offers an opportunity to move in a new direction."¶ But even Obama himself has admitted there are risks inherent in striking an accord with a sworn U.S. enemy. Lawmakers, many deeply wary of those risks, now have 60 days to digest the provisions included in the deal with Iran, a two-month review period Congress insisted upon as the negotiations unfolded.¶ Obama was initially resistant to any congressional review of the Iran pact. But faced with overwhelming support among lawmakers for some kind of evaluation period, the White House ultimately conceded that Congress could be able to review the final deal before it takes full effect.¶ It won't be easy for Congress to inflict damage on the agreement. They must act quickly -- and the two-month period in which they can scuttle the plan includes a month-long August recess, and only a handful of working days.¶ Foreign Relations Committee Chairman Bob Corker told reporters Monday he expects to start hearings sometime shortly after the 60-day clock begins -- which will come sometime in the next five days, after the Director of National Intelligence completes a number of certifications to Congress about the deal, including that it meets U.S. non-proliferation objectives and does not jeopardize U.S. national security.¶ Corker said he wants first to ensure senators have ample time to read the agreement and its classified annexes so they are "well versed" before

hearing from the administration and any outside experts he plans to call to testify.¶ Corker said he would like to complete hearings before the August recess -- which begins Aug. 7 -- so lawmakers have the recess to consider their positions. Under this scenario, up or down votes on the deal itself would not happen until mid-September, he said.¶ In the House, a similar process and timeframe is also expected.¶ Within the 60-day span, opponents of the measure must rally votes to either enact new sanctions against Iran, or to disallow Obama from easing sanctions as part of the deal, measures the President would veto.¶ Overriding the veto in Congress would require a two-thirds majority -- meaning in the Senate, Obama must only secure a minimum of 34 votes in order for his deal to take effect. Additional time beyond the 60-day review period is included for Obama to veto any legislation, and for Congress to muster support for an override.¶ If lawmakers fail to pass any new restrictions during the review period -- which ends in mid-September -- the deal will go into place, and sanctions will be lifted in Iran.¶ But among **deeply skeptical senators**, who worry about Iran's support for terror groups and incarceration of Americans, **even 34 Democratic votes** in support of Obama **aren't necessarily assured**.¶ "Over this August recess there's going to be **fast-and-furious lobbying**, and **we don't know whether there will be 34 votes**," said former Democratic Rep. Jane Harman, who now heads the Woodrow Wilson International Center for Scholars.

Veto override collapses the deal—escalates to middle east war

Cirincione, president of the Ploughshares Fund, **7/9/2015**

(Joe, "What You Need to Know About the Coming Deal With Iran,"

http://www.huffingtonpost.com/joe-cirincione/what-you-need-to-know-abo_b_7763516.html)

If Iran wants to build a nuclear weapon and the deal doesn't happen, is there any way to stop them? Does anyone really expect the U.S. to start a war with Iran by bombing their nuclear installations?¶ That's why this diplomatic deal is so promising. It's not without risk, and there are going to be problems with it, but it is far better than all the alternatives.¶ If the deal falls apart, especially if the U.S. is seen as the reason it falls apart - **if Congress kills this deal** - the sanctions regime will more or less collapse. Other countries aren't going to follow our lead. It doesn't matter if the Senate passes new sanctions. The other negotiating powers aren't going to go along with it.¶ This does not just mean Russia and China. It is also Japan and South Korea and Europe; the people who buy Iran's oil. And that means that Iran's economy will start to recover. The inspections regimes that are in place will end. The restraints on Iran's program will end. They will start installing thousands more centrifuges, enriching thousands of pounds of uranium and getting closer and closer to a bomb.¶ Whether they cross that line or not, they will clearly have the ability to build a weapon in a very short amount of time. That **increases the risk of military action**.¶ If Israel attacks Iran, if we strike Iran, it won't be a neat, little overnight strike, or two or three days of strikes. This will be weeks of bombardment against their hardened nuclear facilities, their air defenses, their ports and airfields. It will kill thousands of Iranians. It will be the beginning of a major war with Iran.¶ Former Secretary of Defense Robert Gates says

that "if you think the war in Iraq was hard, an attack on Iran would, in my opinion, be a catastrophe." That is what we would be looking at; a major new war in the Middle East. That would be a disaster for the U.S., for Israel, and for the entire region.

Goes nuclear

James A. **Russell**, Senior Lecturer, National Security Affairs, Naval Postgraduate School, **2009**

"Strategic Stability Reconsidered: Prospects for Escalation and Nuclear War in the Middle East"
IFRI, Proliferation Papers, #26, http://www.ifri.org/downloads/PP26_Russell_2009.pdf

Strategic stability in the region is thus undermined by various factors: (1) asymmetric interests in the bargaining framework that can introduce unpredictable behavior from actors; (2) **the presence of non-state actors that introduce unpredictability into relationships between the antagonists**; (3) **incompatible assumptions about the structure of the deterrent relationship that makes the bargaining framework strategically unstable**; (4) **perceptions by Israel and the United States that its window of opportunity for military action is closing, which could prompt a preventive attack**; (5) the prospect that Iran's response to pre-emptive attacks could involve unconventional weapons, which could prompt escalation by Israel and/or the United States; (6) **the lack of a communications framework to build trust and cooperation among framework participants**. These systemic weaknesses in the coercive bargaining framework all suggest that escalation by any the parties could happen either on purpose or as a result of miscalculation or the pressures of wartime circumstance. Given these factors, **it is disturbingly easy to imagine scenarios under which a conflict could quickly escalate in which the regional antagonists would consider the use of chemical, biological, or nuclear weapons. It would be a mistake to believe the nuclear taboo can somehow magically keep nuclear weapons from being used in the context of an unstable strategic framework.** **Systemic asymmetries** between actors in fact **suggest** a certain increase in **the probability of war** – a war in which escalation could happen quickly and from a variety of participants. **Once such a war starts, events would likely develop a momentum all their own** and decision-making would consequently be shaped in unpredictable ways. The international community must take this possibility seriously, and muster every tool at its disposal to prevent **such an outcome**, which **would be an unprecedented disaster for the peoples of the region, with substantial risk for the entire world.**

UQ

AT: UQ Overwhelms

Extend Liptak—August recess means that Obama has to counter intense lobbying—even if it looks overwhelmingly certain now that doesn't assume future lobbying—it increases the vulnerability of the deal.

Republicans have override *within their reach*—Democrats willing to desert Obama

NPR 7/14/2015

("Congress Sharpens Knives For Iran Deal," <https://hereandnow.wbur.org/2015/07/14/iran-deal-cory-gardner>)

In announcing the nuclear deal with Iran today, President Obama vowed to veto any measure that critics in Congress pass in order to stop the deal. Republicans who control the Senate will have to win over more than a dozen Democrats in order to do so, and at least 14 Senate Democrats have signaled a willingness to oppose the deal.

This morning, Colorado Sen. Cory Gardner was one of the Republicans leading the charge against the deal, tweeting "This deal would make Iran a globally-approved nuclear threshold state. It would put Israel in severe danger."

Even if they win that--Bipartisan support key to long-term deal effectiveness

De Luce, chief national security correspondent for Foreign Policy, **7/5/2015**

(Dan, "Even if Obama Wins an Iran Nuclear Deal in Vienna, Can He Sell It at Home?," <http://foreignpolicy.com/2015/07/05/even-if-obama-wins-an-iran-nuclear-deal-in-vienna-can-he-sell-it-at-home/>)

¶ In raw political terms, the Obama administration believes it has already prevailed on the issue after defeating a bid by Republican lawmakers in April to block a deal. ¶ If an accord is clinched by Tuesday, Congress will have 30 days to review the agreement. But if the Republican majority votes against the accord, Obama can veto any proposal to ditch the agreement. And there is little prospect of Republicans managing to attract enough Democrats to back a two-thirds majority needed to override a presidential veto. ¶

Although a short-term political victory seems assured, even supporters of a nuclear agreement worry that the absence of any bipartisan consensus could create risks down the road — particularly if a

Republican president is elected to succeed Obama in 2016. ¶ ¶ Ian Goldenberg, a former Pentagon and State Department official in the Obama administration, said the White House has successfully made a case for the deal so far, with polls showing solid support among American voters for nuclear diplomacy. ¶ ¶ But he said more should have been done from the outset to build up support among members of Congress. ¶ "I think they could have been better in the last few years in reaching out to [Capitol] Hill and building a better relationship with the Hill," said Goldenberg, now a senior fellow at the Center for a New American Security. ¶ By the time Netanyahu addressed a joint session of Congress in March to warn against what he called a "bad deal" being negotiated with Iran, the battle lines in Congress were already drawn. The time to win over skeptics or undecided lawmakers had passed. ¶ ¶ In such a fraught, partisan climate, a small group of scientists with expertise in nuclear weapons find themselves in high demand and at the center of the debate. The technical specialists, some of them former U.N. arms inspectors and scholars in the field of nuclear proliferation, bring instant credibility to discussions about uranium enrichment and the time it could take Iran to build a nuclear weapon. ¶ ¶ Both sides have tried to recruit these experts as "validators" to reinforce their public arguments for or against a potential deal. But some of the scientists have rejected overtures from the administration or from opponents of the talks, insisting on maintaining their independence. ¶ ¶ David Albright, a physicist who leads the Institute for

Science and International Security and who has been tracking Iran's nuclear program for years, said he has been unfairly labeled by the administration as an opponent of an accord. He complained that a "war room" mentality has taken hold inside the White House and warned against taking a black-and-white view of the tentative deal emerging from the talks in Vienna. ¶ "I'm very frustrated," Albright said. "I'm seen as a hardliner or a critic or a skeptic." ¶ The details of the nuclear talks are complicated and intricately intertwined, touching on plutonium metallurgy, inspection procedures, the history of nonproliferation efforts, international finance, and the physics of nuclear weapons. ¶ But the political debate is usually presented as a stark choice, between war and peace, or victory and surrender. ¶ Experts such as Albright resent the up-or-down terms of the political war over the nuclear talks, and say the heated rhetoric makes it difficult to offer sober assessments or to discuss the facts. ¶ He called the atmosphere around the debate "corrosive," as it cuts off the possibility of coming up with constructive solutions for curtailing Iran's nuclear work. ¶ "In the end, this fight isn't healthy. The deal is going to have some strengths and weaknesses; you need to have ways to deal with the weaknesses," Albright said. ¶ The lack of a consensus across party lines could have damaging consequences, he said. ¶ "You need a real heavy commitment ... for implementing this deal. You don't want to have a situation where one [side] is looking for opportunities to undercut the other." ¶ But one former Obama administration official said no amount of engagement with Congress will ever win over entrenched opponents of a deal in Republican ranks. ¶ "When have you last seen a bipartisan consensus on anything?" said the former official, who spoke on condition of anonymity. ¶ "I would not fault the administration's communications strategy for a lack of a bipartisan consensus," the official said. ¶ Advocates of the diplomatic effort with Iran believe Obama is poised to strike a historic breakthrough, but worry that bitter opposition on the political right could produce problems over time. ¶ "The question will become: Can you start to actually build a bipartisan consensus around this ... so that the deal can live beyond the Obama administration — if there's a Republican president," Goldenberg said. ¶ Arms control agreements and other international accords can begin to unravel if a new administration sees it as a low priority or if Congress looks for ways to weaken them, he said. ¶ "There is a big question — whether through neglect that, over time, [the deal] dies," he said. "That's a real danger. That has happened before."

Stops future sanctions and certification

Zengerle, writer for Reuters, **7/14/2015**

(Patricia, "Iran deal faces fight in U.S. Congress, but will likely survive," <http://in.reuters.com/article/2015/07/14/iran-nuclear-congress-process-idINL2NOZSOAW20150714>)

The nuclear deal between world powers and Iran starts a new phase of intense negotiation - this time between the Obama administration and the U.S. Congress, where some Republicans have long been working to sink an agreement. ¶ Any effort in Congress to overturn the deal would face an uphill fight. Republicans have majorities in both the House of Representatives and Senate, but they would need the support of dozens of President Barack Obama's fellow Democrats to sustain a "resolution of disapproval" that could cripple a deal. ¶ The chances of that happening are slim. A resolution of disapproval would need only the support of the Republican majority to pass the House, but would require the votes of at least six Democrats to get the 60 to advance in the Senate. The chances of mustering enough votes to then overrule a near-certain Obama veto are slimmer still. ¶ The second-ranking Democrat in the House, Steny Hoyer, said after the deal was announced: "It is now up to members of Congress to work carefully through every detail, particularly given Iran's likelihood to exploit any ambiguity or loophole to its benefit and to the detriment of the security of America, Israel, and our allies in Europe and the Gulf." ¶ Senate Democrats have stood firm to date against Republican-led efforts to interfere with the talks, which included Iran and the United States, Britain, China, France, Germany and Russia. ¶ In the House, more than 150 Democrats, including party leader Nancy Pelosi, signed a

letter in May strongly supporting the nuclear negotiations.¶ "I understand the heavy lift that's involved," Tennessee Republican Senator Bob Corker, chairman of the Senate Foreign Relations Committee, told reporters when asked about the chances of passing a "resolution of disapproval."¶ Obama in May signed a law, authored by Corker, giving Congress the right to review the agreement and potentially sink it by passing a disapproval resolution that would eliminate the president's ability to waive sanctions passed by Congress.¶ Easing sanctions is an integral part of the deal, under which Iran will curtail its nuclear program.¶ Under the Iran Review Act, lawmakers have 60 days to review the agreement and decide whether to seek a resolution of disapproval. During that period, plus an additional 22 days in which Obama could veto a resolution and Congress could try to override it, Obama cannot waive the congressional sanctions.¶ A veto override would require a two-thirds majority in both houses - or 13 Democrats along with all 54 Republicans in the Senate, and 43 Democrats plus as all 236 House Republicans.¶ Party leaders have said there is no guarantee that every Republican would back a disapproval resolution.¶ Sanctions passed by Congress account for the overwhelming majority of those imposed by the United States. U.S. sanctions are especially important to the international sanctions regime because of the country's influence on global trade and banking.¶ "CONGRESS GAVE AWAY ITS POWER"¶ The congressionally mandated sanctions can be temporarily waived by the president for national security reasons, which he would do under the deal with Iran. That waiver ability stays in place unless Congress is able not just to pass a disapproval resolution, but override Obama's expected veto of it.¶ "Congress gave away its power by granting national security waivers with all of these sanctions," Corker said.¶ Congressional leaders said they plan to begin briefings and hearings on the Iran deal as soon as they receive the agreement, with an eye toward deciding on a course of action this month, before lawmakers leave for summer recess.¶ Obama administration officials, including the president himself, have reached out to members of Congress, holding hundreds of meetings and hearings and making telephone calls in the past four months. Those efforts are expected to intensify now with a deal.¶ Acknowledging the difficulty of passing a disapproval resolution, some lawmakers suggest that Congress would do better to consider, and then reject, a "resolution of approval."¶ Defeating such a resolution by a large margin would not affect the sanctions regime, but would send a strong message that the United States is not united behind a "bad" Iran pact and was prepared to act if Iran made moves toward building a bomb, they said.¶ Lawmakers from both parties acknowledged that the debate will not end with the review period this year. Some Republicans have discussed passing legislation to impose more sanctions over Iran's human rights record or for supporting terrorism.¶ The Iran Review Act requires the president, Obama and his successor after the 2016 election, to regularly certify that Tehran is adhering to terms of a deal. There is no guarantee a Republican president, in particular, would do so. Several of the GOP White House hopefuls have already said they are skeptical about the deal.

Doesn't overwhelm—Obama lobbying and vote counts

Times of Israel 7/21 (Times of Israel; July 21 2015; Israeli newspaper focusing on middle eastern politics; "White House set to lobby House Democrats on Iran deal";

jskullz

Three senior Obama administration officials will speak to House Democrats this week in an effort to secure their support for the nuclear agreement with Iran and head off attempts to scuttle the deal. ¶ Get The Times of Israel's Daily Edition by email, and never miss our top stories Free Sign up! ¶ Minority Leader Nancy Pelosi (D-Calif.) invited Secretary of State John Kerry, Secretary of Energy Ernest Moniz and Treasury Secretary Jack Lew to hold two briefings for Democrats Wednesday and Thursday. Kerry and Moniz both led the American side in lengthy negotiations between the P5+1 — a coalition of world powers comprising the US, Britain, Russia, China, France and Germany — and Iran. ¶ Lew will be leading the move to lift US sanctions against Iran if the agreement goes ahead as planned. ¶ The briefings will be classified. ¶ Pelosi has declared her support for the agreement, which faces stiff criticism both domestically and internationally, and will encourage fellow Democrats to back it. ¶ “As you may be aware, I believe that this agreement is a major accomplishment. I am pleased that the response thus far from House Democrats has been so positive,” she wrote to lawmakers on Monday. ¶ If Republicans in Congress decide to move ahead with legislation aimed to kill the agreement, they will require the support of House Democrats to overcome the presidential veto that Obama has already guaranteed he will employ in such a scenario. ¶ Obama said last week that that he hoped Congress’s upcoming decision on the agreement would be “based on the facts — not on politics, not on posturing, not on the fact that this is a deal I bring upon us as opposed to a Republican president, not based on lobbying but based on the interest of the United States of America.” ¶ House Minority Leader Nancy Pelosi speaks with reporters on Capitol Hill in Washington, Friday, December 5, 2014 (Photo credit: J. Scott Applewhite/AP) ¶ House Minority Leader Nancy Pelosi speaks with reporters on Capitol Hill in Washington, Friday, December 5, 2014 (Photo credit: J. Scott Applewhite/AP) ¶ There are 46 Democrats in the Senate, but the administration is likely more concerned with 27 of them. Based on statements made immediately following the deal’s release, Washington insider site The Hill last week counted only five senators – Democrats Dick Durbin, Dianne Feinstein, Martin Heinrich, Jack Reed and presidential candidate Bernie Sanders – who are currently definite “yes” votes for the administration. ¶ Another 13 Democrats are seen as leaning toward supporting the administration’s position – but the intentions of the remaining 27 Democrats and one Independent remain unclear. Some, like Senator Robert Menendez, may lean toward rejecting the agreement, but almost all of the yet-undecideds have emphasized that they are still waiting to learn more about the deal. Reports over the weekend said that up to 15 Democratic senators have expressed skepticism over the terms of the deal.

Deal will come down to the wire—PC key to counter republican push

Lillis 7/19 (Mike Lillis; July 19 2015; healthcare and politics reporter for the Hill; Iran deal tests Dems' loyalty to Obama; The Hill; <http://thehill.com/policy/international/248371-iran-nuclear-deal-tests-democrat-loyalty-to-obama>) jskullz

President Obama's nuclear agreement with Iran is the latest test of the Democrats' loyalty toward their ally in the White House. ¶ Coming off a contentious trade debate that highlighted Democratic divisions and infuriated Obama’s liberal base, even the Democrats most critical of the Iran deal are walking a fine line. ¶ ADVERTISEMENT ¶ Sen. Bob Menendez (D-N.J.), for instance, has emerged as the leading Democratic critic in the upper chamber, warning that the agreement “legitimizes” Iran’s nuclear program and sets the stage for Iran to reap billions of dollars in financial relief it could use to bolster its stock of conventional weapons. ¶ But Menendez has stopped short of

saying he'll join Republicans in a vote to disapprove the deal, saying he wants first to examine the agreement more closely, both on the Foreign Relations panel and in briefings with administration officials. ¶ "It's premature for some people to say they're definitely against it and for others to say they're definitely for it," he said. "Let's have the vetting." ¶ The issue is tough for Democrats, because it represents Obama's top foreign policy goal in his second term but is strongly opposed by Israel's government. ¶ The Republicans' near-unanimous objections have further complicated the politics, because even Democrats wary of the deal might not want a role in helping the GOP kill it. ¶ Rep. Brad Sherman (D-Calif.) is concerned that the deal sets the stage for Iran to have nuclear weapons capabilities a decade from now but hasn't signed on to the Republicans' disapproval push. ¶ He says he'd surely vote against a motion of approval if it were to hit the floor, but he remains undecided on the more likely consideration of both a disapproval measure and a vote to override Obama's promised veto of that disapproval. ¶ "It's different," Sherman said. ¶ "A motion of approval would, I think, morally bind this country to accept this deal not only short-term but long-term, and long-term it becomes unenforceable," he explained. "A resolution of disapproval, if it overrides a veto — and those are two separate votes — would create a short-term crisis in our policy toward Iran, with the executive branch pushing in one direction, the congressional branch pushing in the other direction, Europe going in a third direction and [it] might deprive us of the short-term benefits of the agreement — the stockpiles and the centrifuge mothballing." ¶ Republicans are not so indecisive. They wasted no time slamming the agreement with warnings that it will launch a Middle Eastern nuclear arms race while threatening the security of the United States and its allies, particularly Israel. ¶ On Friday, House Republicans introduced their disapproval resolution, backed by more than 170 GOP lawmakers, which is expected to get a vote in September. ¶ "This agreement fails on every level to ensure Iran never acquires a nuclear weapons capability," Rep. Peter Roskam (R-Ill.), the head of the House Republican Israel Caucus and lead sponsor of the resolution, said in a statement. "The unprecedented outpouring of support for this resolution proves that Congress will not rubber-stamp a deal that severely threatens the United States and our allies by paving Iran's path to a bomb." ¶ Still, the reluctance of the Democratic critics to endorse the resolution highlights the tough road ahead for the GOP. ¶ In the Senate, Majority Leader Mitch McConnell (R-Ky.) will need Democratic backers to reach the 60 votes required to defeat a filibuster. And while the House Republicans are expected to pass the disapproval measure through the lower chamber, they'll face a steep climb winning over the Democratic votes needed to override Obama's promised veto. ¶ Liberal Democrats, who make up a majority of the Caucus, are already lining up in favor of the agreement. And House Minority Leader Nancy Pelosi (D-Calif.) threw her considerable influence behind the deal Thursday, when she delivered her enthusiastic stamp of approval. ¶ "[It's] a good product — not only better than the status quo, not only the best possible option, but a strong, effective ... proposal for keeping the peace and stopping the proliferation of weapons of mass destruction," she said. ¶ Pelosi said she's "not exactly lobbying" her troops behind the deal but "made it very clear to them my own standing on this issue and why I think this is a good agreement." ¶ Rep. Steve Israel (N.Y.), yet another Democrat who's voicing strong reservations with the deal but hasn't committed a vote either way, said it's "too early to say" if Obama would have the Democratic support to sustain a veto of the GOP's disapproval measure. ¶ "My sense is, based on my conversations with my colleagues on both sides of the aisle, it's going to be very close in both the House and the Senate," he told CNN Wednesday. "I believe in both chambers it's going to come right on the cusp." ¶ Obama has shown signs that he's taken a lesson from the trade debate — when many Democrats felt excluded — and is leaving nothing to chance. He sent Vice President Biden to Capitol Hill twice this week to meet privately with House and Senate Democrats to explain the deal and address lawmaker concerns. ¶ There are early signals that the strategy is paying dividends. ¶ "You make friends before you need them. I think the administration is doing it very wisely," Rep. Bill Pascrell (D-N.J.) said after meeting with Biden. "I disagreed with them on trade. On this, I think they're heading in the right direction."

PC Key—review time, Israeli and Saudi lobbying, republicans

Goodman and Leverett 7/13 (Amy Goodman and Flynt Leverett; Amy Goodman is the host of the Democracy Now! War and Peace Report, Leverett is a professor of International Affairs at Penn State. He served for over a decade in the U.S. government as a senior analyst at the CIA, Middle East specialist for the State Department, and as senior director for Middle East affairs at the National Security Council; "With Historic Iran Nuclear Deal Expected, Can President Obama Sell It to Congress and the Public?"; Democracy Now!;

http://www.democracynow.org/2015/7/13/as_historic_iran_nuclear_deal_nears) jskullz

FLYNT LEVERETT: Yes. Both houses of Congress will have 60 days to review the agreement once it's finalized. I think it is quite possible, if not likely, that a simple majority of members in each

house will vote a so-called resolution of disapproval in regard to the agreement. At that point, President Obama has said that he would veto those resolutions of disapproval. And at this point, the White House seems pretty confident that they have the votes, at least in the Senate, and perhaps in the House, as well, to sustain President Obama's veto. So, they are confident that if you can get to an agreement here in Vienna, that it will ultimately get through the congressional review process and will go into effect.¶¶ But obviously, during the next—you know, the 60 days following a conclusion of an agreement, the Israelis, the Saudis, their friends and allies in the American political system, others who don't want to see this agreement go forward are going to be working very hard, trying to turn public opinion against the deal and trying to build congressional support to maximize the vote against the deal.¶¶ Public opinion polls would show that Americans are open to supporting this deal, but one of the things I really worry about is that President Obama himself has not really made the strategic case for why doing this deal and for why building a different kind of relationship with Iran is so strongly in America's interest. He either talks about this as a kind of narrow arms control agreement, but Iran is still this very bad actor, or he talks about it in terms of it being an opportunity for Iran to rejoin the international community, as he puts it. This is not the way to sell this deal to Americans. Americans understand that what the United States has been doing in the Middle East for the last decade and a half has actually been profoundly against American interests. It's also been very damaging to Middle Easterners. But it has been profoundly damaging to America's position in this critical part of the world and globally. President Obama has a chance here to begin to turn that around and put U.S. policy toward the Middle East on a more different and more productive trajectory, but he is going to have to make the strategic case—¶¶ AMY GOODMAN: Flynt Leverett, we're going to have to—¶¶ FLYNT LEVERETT: —spend the political capital necessary to make the strategic case.

Iran deal will pass, but Democrats still unsure - Obama PC is key to convincing them

Lillis 7/19 (<http://thehill.com/policy/international/248371-iran-nuclear-deal-tests-democrat-loyalty-to-obama>, Iran deal tests Dems' loyalty to Obama, Mike Lillis, staff writer for the Hill, 7/19/2015)

President Obama's nuclear agreement with Iran is the latest test of the Democrats' loyalty toward their ally in the White House. Coming off a contentious trade debate that highlighted Democratic divisions and infuriated Obama's liberal base, even the Democrats most critical of the Iran deal are walking a fine line. Sen. Bob Menendez (D-N.J.), for instance, has emerged as the leading Democratic critic in the upper chamber, warning that the agreement "legitimizes" Iran's nuclear program and sets the stage for Iran to reap billions of dollars in financial relief it could use to bolster its stock of conventional weapons. But Menendez has stopped short of saying he'll join Republicans in a vote to disapprove the deal, saying he wants first to examine the agreement more closely, both on the Foreign Relations panel and in briefings with administration officials. "It's premature for some people to say they're definitely against it and for others to say they're definitely for it," he said. "Let's have the vetting." The issue is tough for Democrats, because it represents Obama's top foreign policy goal in his second term but is

strongly opposed by Israel's government. The Republicans' near-unanimous objections have further complicated the politics, because even Democrats wary of the deal might not want a role in helping the GOP kill it. Rep. Brad Sherman (D-Calif.) is concerned that the deal sets the stage for Iran to have nuclear weapons capabilities a decade from now but hasn't signed on to the Republicans' disapproval push. He says he'd surely vote against a motion of approval if it were to hit the floor, but he remains undecided on the more likely consideration of both a disapproval measure and a vote to override Obama's promised veto of that disapproval. "It's different," Sherman said. "A motion of approval would, I think, morally bind this country to accept this deal not only short-term but long-term, and long-term it becomes unenforceable," he explained. "A resolution of disapproval, if it overrides a veto — and those are two separate votes — would create a short-term crisis in our policy toward Iran, with the executive branch pushing in one direction, the congressional branch pushing in the other direction, Europe going in a third direction and [it] might deprive us of the short-term benefits of the agreement — the stockpiles and the centrifuge mothballing." Republicans are not so indecisive. They wasted no time slamming the agreement with warnings that it will launch a Middle Eastern nuclear arms race while threatening the security of the United States and its allies, particularly Israel. On Friday, House Republicans introduced their disapproval resolution, backed by more than 170 GOP lawmakers, which is expected to get a vote in September. "This agreement fails on every level to ensure Iran never acquires a nuclear weapons capability," Rep. Peter Roskam (R-Ill.), the head of the House Republican Israel Caucus and lead sponsor of the resolution, said in a statement. "The unprecedented outpouring of support for this resolution proves that Congress will not rubber-stamp a deal that severely threatens the United States and our allies by paving Iran's path to a bomb." Still, the reluctance of the Democratic critics to endorse the resolution highlights the tough road ahead for the GOP. In the Senate, Majority Leader Mitch McConnell (R-Ky.) will need Democratic backers to reach the 60 votes required to defeat a filibuster. And while the House Republicans are expected to pass the disapproval measure through the lower chamber, they'll face a steep climb winning over the Democratic votes needed to override Obama's promised veto. Liberal Democrats, who make up a majority of the Caucus, are already lining up in favor of the agreement. And House Minority Leader Nancy Pelosi (D-Calif.) threw her considerable influence behind the deal Thursday, when she delivered her enthusiastic stamp of approval. "[It's] a good product — not only better than the status quo, not only the best possible option, but a strong, effective ... proposal for keeping the peace and stopping the proliferation of weapons of mass destruction," she said. Pelosi said she's "not exactly lobbying" her troops behind the deal but "made it very clear to them my own standing on this issue and why I think this is a good agreement." Rep. Steve Israel (N.Y.), yet another Democrat who's voicing strong reservations with the deal but hasn't committed a vote either way, said it's "too early to say" if Obama would have the Democratic support to sustain a veto of the GOP's disapproval measure. "My sense is, based on my conversations with my colleagues on both sides of the aisle, it's going to be very close in both the House and the Senate," he told CNN Wednesday. "I believe in both chambers it's going to come right on the cusp." Obama has shown signs that he's taken a lesson from the trade debate — when many Democrats felt excluded — and is leaving nothing to chance. He sent Vice President Biden to Capitol Hill twice this week to meet privately with House and Senate Democrats to explain the deal and address lawmaker concerns. There are early signals that the strategy is paying dividends. "You make friends before you need them. I

think the administration is doing it very wisely,” Rep. Bill Pascrell (D-N.J.) said after meeting with Biden. “I disagreed with them on trade. On this, I think they're heading in the right direction.” Biden, for one, expressed confidence that the accord will survive the congressional gauntlet. “I think we're going to be OK,” he said as he left the House meeting.

Veto override possible

Page 6/25 (Susan Page; June 25th 2005; journalist for USA Today; “Corker: 'Strong possibility' Congress would block 'bad' Iran deal”; USA Today; <http://www.usatoday.com/story/news/politics/2015/06/25/capital-download-bob-corker-iran/29276369/>) jskullz

WASHINGTON — Senate Foreign Relations Chairman Bob Corker warned the White House on Thursday there is a "strong possibility" enough congressional Democrats would join Republicans to block a nuclear deal with Iran if they believe it makes too many concessions to Tehran.¶ In an interview with Capital Download, Corker expressed skepticism about President Obama's willingness to walk away from a "bad deal," as he has pledged to do, and about the president's resolve to launch military action against Iran if necessary to destroy its nuclear capabilities.¶ The strong words from the moderate Tennessee Republican came as negotiators in Vienna face a deadline of next Tuesday to reach a deal.¶ Corker said they should take more time if it's needed.¶ "We all want a strong agreement, but we're going to have to live with it for a long time, so if it takes another month, two months, three months, we're better off where we are with the interim agreement than we are with a bad agreement," he told USA TODAY's weekly newsmaker series.

Will Pass

Extend Liptak—Deal will pass now but August recess means that Obama has to counter intense lobbying

Iran deal will pass, although Congress can still kill it – PC needed to make sure it won't get overridden.

Prokop 7/14 (How Congress could kill the Iran deal, and why it probably won't, <http://www.vox.com/2015/7/14/8959807/iran-deal-congress>, Andrew Prokop, politics Staff Writer for Vox)

Republicans in Congress will get a chance to kill President Obama's new nuclear deal with Iran. But they'd have to win over a sizable chunk of Democrats to do it. The deal doesn't need to be affirmatively approved by Congress. But a law passed earlier this year allows Congress to vote to disapprove it and therefore block the relief of sanctions on Iran that's crucial to it. However, this resolution of disapproval would need to be passed by both the House and Senate over President Obama's veto. Assuming every Republican in the House and Senate votes to disapprove the deal, 13 Senate Democrats and 44 House Democrats would have to join them to kill Obama's veto. (If a vacant House seat is filled by a Republican by the time of the vote, only 43 House Democrats would be needed.) That would be over a fifth of the Democratic delegation in each chamber. Given that Obama made the deal and Hillary Clinton is praising it, defections like these seem unlikely unless key party leaders, like Sen. Chuck Schumer and House Minority Whip Steny Hoyer, come out against it. How the congressional review process works At the start of this year, Congress had no clear way to review the deal with Iran that Obama's team was hoping to strike. Both Democrats and Republicans were unhappy about this, and so after some debate, the bipartisan Iran Nuclear Agreement Review Act of 2015 was passed and signed by Obama. The new law says that once the administration submits this deal to Congress, Obama can't waive sanctions on Iran for 60 days so Congress can have time to review the agreement. However, the burden is then on Congress to disapprove the deal. If Congress takes no action, the lifting of sanctions will go into effect. Furthermore, a mere majority vote to kill the deal isn't enough. To go into effect and block Obama from lifting the sanctions permanently, Congress's resolution of disapproval would have to overcome Obama's promised veto. For that, the GOP would need two-thirds of both the House and Senate — 290 votes in the lower chamber, plus 67 in the upper one. In the House, there are currently 246 sitting Republicans — so if every one of them opposed the deal, the remaining 44 votes would have to come from Democrats. The vacant seat of former Rep. Aaron Schock (R-IL) will be filled in a September 10 special election, and Republican Darin LaHood is expected to win it. So if he's seated in time for the vote, only 43 Democrats would need to disapprove the deal. In addition to that, the Senate would have to vote to override a veto too. In the Senate, there are 54 sitting Republicans, meaning that 13 Democrats would have to join them. The politics of the Iran deal on the Hill What this means in practice, though, is that a vote will take place. And that will be an uncomfortable vote for many Democrats. Some may be genuinely skeptical of the deal, and others may be caught between their desire to support the president and their desire to have good relations with hawkish pro-Israel groups like AIPAC (which released a "deeply concerned" statement about the deal Tuesday morning). But AIPAC has had less clout among Democrats recently. Last year, the Daily

Beast's Eli Lake reported on how, in somewhat of a precursor to this fight, AIPAC "helped turn what was a bipartisan effort to keep Iran in check into just another political squabble," when its effort to get Congress to further toughen sanctions on the country failed. Plus, in addition to President Obama, Hillary Clinton — one of the more hawkish leaders in the party — is praising the deal. That means that Democrats who defect would be going against both the current president and his potential successor. So, barring a true outpouring of anti-deal opinion and pressure from constituents over the summer, not too many Democrats are likely to defect unless they have cover from some respected figures in the party. Those could include Sen. Chuck Schumer (D-NY) and House Minority Leader Steny Hoyer, who have hawkish foreign policy leanings and have tended to be strong allies of pro-Israel groups. Indeed, earlier this year, it was Schumer whose intervention was key in passing the law that gave Congress this review power in the first place, and he is Senate Democrats' choice to replace Harry Reid as their leader after he retires. So for signs of whether Congress will kill the deal, look to Schumer and Hoyer.

Iran deal will pass – but Obama needs his PC to keep Schumer and Dems on his side

Feehery 7/14 (<http://blogs.wsj.com/washwire/2015/07/14/republicans-oppose-the-iran-deal-but-can-they-override-a-veto/>, Republicans Oppose the Iran Deal—but Can They Override a Veto?, John Feehery, policy analyst for Christian Science Monitor and writer for Wall Street Journal, 7/14/2015)

It's easy for Republicans to oppose this nuclear deal with Iran. They don't trust President Barack Obama, they don't like John Kerry, and they love Benjamin Netanyahu. The question is: Can they override a presidential veto of a resolution of disapproval? Congress can pass either a resolution of approval or disapproval regarding the agreement. A two-thirds vote in both chambers is needed to assert congressional dominance over the president, and to reach that threshold, Republicans will most likely need the support of the incoming Democratic leader of the Senate, Chuck Schumer. Senate Majority Leader Mitch McConnell will need Mr. Schumer, all of the other Jewish Democrats in the Senate, and three other Democrats to join him in overcoming the veto that President Obama promised Tuesday in the face of congressional opposition. Sen. Robert Menendez is a likely suspect; Bill Nelson and Kirsten Gillibrand are also strong possibilities. In the House, getting enough votes would be an even tougher slog. Iran is the one issue that unifies House Republicans. Indeed, when Speaker John Boehner invited the Israeli prime minister to address a joint session of Congress, it sent his stock sky-high among his most recalcitrant conservative colleagues. But the odds of getting enough bipartisan support for an override are dicey at best. There are 247 Republicans in the House. They need 290 members to override a veto, which means they would need 43 Democrats to abandon Mr. Obama. It's hard to see where they get that many votes. There are 18 Jewish Democrats in the House, and many of them will probably stick with the president. Neither the black caucus nor the Hispanic caucus is likely to abandon Mr. Obama, and it is highly unlikely that House Democratic leader Nancy Pelosi will either. If Congress can't disapprove of the deal, it becomes fodder for the 2016 presidential campaign. Hillary Clinton has already signaled her support. Sen. Bernie Sanders applauded this "victory for diplomacy." Joe Biden obviously has to support it. Among Republican presidential candidates, the general consensus is that the deal stinks. The question is how colorful their rhetoric will be to capture the support of big donors who also oppose the

agreement. (Expect rhetoric along the lines of: Is this merely the worst deal in history or will it likely bring on the apocalypse?) The president and his secretary of state finally have the deal they have worked so hard to make. Can they keep it? Time will tell.

Iran deal has controversy in Congress but will likely pass as long as Obama has PC

Zengerle 7/14 (Iran deal faces fight in U.S. Congress but will likely survive, <http://www.reuters.com/article/2015/07/14/us-iran-nuclear-congress-process-idUSKCN0PO1HJ20150714>, Patricia Zengerle, Congressional Correspondent and Staff Writer for Reuters, July 14, 2015)

The nuclear deal between world powers and Iran starts a new phase of intense negotiation - this time between the Obama administration and the U.S. Congress, where some Republicans have long been working to sink an agreement. Any effort in Congress to overturn the deal will face an uphill fight. Republicans have majorities in both the House of Representatives and Senate, but they would need the support of dozens of President Barack Obama's fellow Democrats to sustain a "resolution of disapproval" that could cripple a deal. The odds of that are slim. A resolution of disapproval would need only the Republican majority to pass the House, but would require at least six Democrats to get the 60 votes needed to advance in the Senate. The chances of mustering enough support to then overrule an Obama veto are slimmer still. Obama vowed on Tuesday that he would veto any bill Congress passed that would prevent implementation of the Iran agreement. Nancy Pelosi, who leads the Democrats in the House, praised Obama in a statement. "I commend the president for his strength throughout the historic negotiations that have led to this point," she said, promising Congress would "closely review" the agreement. Senate Democrats have stood firm so far against Republican-led efforts to interfere with the talks between Iran, the United States and five other world powers. Some expressed skepticism about the deal, but others said they expected to vote for it. Senator Dianne Feinstein, a veteran Democrat who is the ranking member of the Senate Intelligence Committee, said she would support the deal. "This is a strong agreement that meets our national security needs and I believe will stand the test of time," she said in a statement. In the House, more than 150 Democrats, including Pelosi, signed a letter in May that strongly supported the negotiations. "I understand the heavy lift that's involved," Tennessee Republican Senator Bob Corker, chairman of the Senate Foreign Relations Committee, told reporters when asked about the chances of passing a "resolution of disapproval". Corker said the Foreign Relations committee would review the deal closely but added he would begin "from a place of deep skepticism" about whether the agreement meets the goal of preventing Iran from obtaining a nuclear weapon. RELATED COVERAGE › White House says it will take a couple of days to get Iran deal to Congress Other leading Republicans went much further in their criticism. House Speaker John Boehner promised a fight. "Instead of stopping the spread of nuclear weapons in the Middle East, this deal is likely to fuel a nuclear arms race around the world," Boehner said in a statement. Obama in May signed a law, authored by Corker, giving Congress the right to review the agreement and potentially sink it by passing a disapproval resolution that would eliminate the president's ability to waive sanctions passed by Congress. Easing sanctions is an integral part of the deal, under which Iran will curtail its nuclear program. 60 DAYS Under the Iran Review Act, lawmakers have 60 days to review the agreement and decide how to respond, once they receive the agreement

and supporting documentation. During that period, plus 22 more days in which Obama could veto a resolution and Congress could try to override it, Obama cannot waive the congressional sanctions. A veto override would require a two-thirds majority in both houses, or 13 Democrats along with all 54 Republicans in the Senate, and 43 Democrats plus all 236 House Republicans. Sanctions passed by Congress account for the overwhelming majority of those imposed by the United States. U.S. sanctions are central to the international regime because of the country's influence on global trade and banking. Congressional briefings on the Iran deal have already begun. Vice President Joe Biden was to meet with House Democrats on Wednesday morning to discuss Iran, and Obama and other administration officials called several lawmakers on Tuesday. RELATED COVERAGE › U.S. Senate leader: If Iran deal rejected, would be 'hard' to override veto Acknowledging the difficulty of passing a disapproval resolution, some lawmakers suggested Congress should consider, and then reject, a "resolution of approval." Defeating such a resolution by a large margin would not affect the sanctions regime, but it would send a strong message that the United States is not united behind a "bad" pact and was prepared to act if Iran moved toward building a bomb, they said. Corker told Reuters in an interview that congressional leaders would decide whether to pursue a resolution of approval or disapproval in the coming weeks. But neither the full House nor Senate is expected to vote on any measure before September, after lawmakers' August recess. Steny Hoyer, the number-two Democrat in the House, dismissed concerns that the delay would leave Democrats vulnerable to a summer of attacks from Republicans that they will be voting "for Iran" if they back Obama. "I'm not sure that it's politically disadvantageous to members," he told reporters. "I think the American public may well agree with the president on this." Both parties acknowledged that the debate will not end this year. Some lawmakers have discussed imposing more sanctions over Iran's human rights record or for supporting terrorism. The Iran Review Act requires the president to regularly certify that Tehran is adhering to terms of a deal. There is no guarantee the next president would do so. Most Republican 2016 White House hopefuls said they do not support the deal.

Will pass – can't override veto

Davis 7/14/15 (Susan, writer at USA Today, "Congress Unlikely to block Iran deal", <http://www.usatoday.com/story/news/politics/2015/07/14/congress-iran-deal/30125885/>)/BW

Congressional skeptics of the Iran nuclear deal said lawmakers would thoroughly vet the agreement, but Congress is unlikely to find a veto-proof majority necessary to block the deal. "I want to read the agreement in detail and fully understand it, but I begin from a place of deep skepticism that the deal actually meets the goal of preventing Iran from obtaining a nuclear weapon," said Senate Foreign Relations Chairman Bob Corker, R-Tenn. Iran, world powers reach landmark nuclear agreement "In the coming days, Congress will need to scrutinize this deal and answer whether implementing the agreement is worth dismantling our painstakingly-constructed sanctions regime that took more than a decade to establish," Corker added. The Tennessee senator led the effort to pass a law earlier this year that gave Congress an enhanced oversight role in the event a deal was reached. The law provides a 60-day review period after lawmakers receive the terms of the agreement to hold hearings and examine the fine print. Congress can then vote on a resolution that approves or disapproves of the deal, or they can do nothing at all. Corker told reporters Tuesday that hearings will take place prior to the August recess and a vote would happen in September. If Congress were to pass a resolution seeking to block the deal, President Obama said Tuesday he would veto it. Opponents would then need a veto-proof, two-thirds majority in both chambers to override — a scenario that seems unlikely today as top Democrats issued early statements of support.

Deal necessary to prevent nuclear annihilation—get the foot in the door for future reforms

Cirincione, president of the Ploughshares Fund, **7/9/2015**

(Joe, "What You Need to Know About the Coming Deal With Iran,"

http://www.huffingtonpost.com/joe-cirincione/what-you-need-to-know-abo_b_7763516.html)

What about Iran's support for terrorism, human rights record, it's recognition of Israel? Is that in any way part of these negotiations?¶ These are deeply troubling aspects of Iran's regional behavior. This is not a pleasant regime. Iran executes about a thousand people a year, more than any other country in the world. They support Hamas and Hezbollah, who are foes of our ally, Israel. We disapprove of a lot of Iran's behavior in the region, but that's not what this negotiation is about.¶ As I wrote earlier this year, "Iran's deplorable record is not a reason to walk away. It is the very reason we must hammer out an iron-clad agreement to ensure Iran cannot get its hands on a nuclear bomb."¶ We negotiate with untrustworthy or "evil" governments all of the time. One of the greatest achievements of the 20th century was our ability to work with the Soviet Union, a country that Reagan called an "evil empire," to avoid nuclear annihilation. That moniker was well deserved. Stalin's purges murdered millions of Russians. Political opponents were rounded up, given show trials and executed. They were sent to gulags where they were worked to death or simply disappeared. His successors supported scores of groups fighting against America and our allies.¶ But cooperation with the Soviets not only prevented a nuclear war, it also led to a series of security, economic and political agreements that helped stabilize the world and led to the gradual demise of the Soviet empire.¶ When Nixon toasted Mao in Beijing in 1972, the Chinese Communist Party was arming the North Vietnamese, who had killed over 2,000 American soldiers in Vietnam the previous year. But the relationship they brokered shifted global relations and resulted in dramatic changes in China that have made better lives for hundreds of millions of Chinese.¶ Negotiating with corrupt, brutal and often despicable governments is necessary to prevent even greater evils. This time, we are doing it to make sure that a dangerous regime does not get the bomb. Certainly that is an endeavor that is worth our effort.¶ If we try to load every single one of our concerns into this negotiation, we will break the table. You can't possibly resolve all those issues at once, so we are taking care of the most threatening, which is the nuclear program. As bad as Iran's behavior is, it might be worse if they actually got a nuclear weapon. And then we'll see if this opens up new channels of communication, and avenues for addressing these other issues.¶ If there is a good deal, or a good enough deal, over time that will have some kind of moderating influence on the Iranian government, on its behavior in its neighborhood and also on domestic issues as well?¶ I do think that, and I'm informed by human rights activists and civic activists inside Iran.¶ Research conducted by experts from the International Campaign for Human Rights in Iran, has shown that Iranians themselves believe that a nuclear agreement between Iran and world powers will lead to internal political and cultural reforms in Iran. A recent report shows that "sixty-one percent [of Iranians] believe a deal would enable political and cultural reforms, as a politically strengthened Rouhani administration could now turn its focus to such issues."¶ The Executive

Director of the Campaign, Hadi Ghaemi, believes that the nuclear agreement will "will have the potential to validate voices of moderation and embolden those who have called for a loosening of the political and cultural environment in Iran." Indeed, the Campaign asserts that, "every poll undertaken has confirmed Iranian society's strong support for the nuclear negotiations, and the resounding electoral win of the centrist Hassan Rouhani reflects society's desire for greater political and social freedoms."¶ Activists inside Iran see it as a beginning. As a way to empower Rouhani, who campaigned not just on economic stimulation, but on opening up freedoms for the Iranian people, and establishing a more moderate government. They think this will empower him and could be the opening that they're looking for.¶ That's why you saw these massive crowds greet even the interim agreement in April. Foreign Minister Zarif was mobbed on the way home from the airport not because they reached some complicated agreement on inspections and the nuclear program, but because they see this as a ray of hope, the beginning of change in the regime. Whether that will happen, we don't know. That will require a lot of struggle. But yes, I think this deal could be the beginning of big change inside Iran, and in Iran's relationship with us and its neighbors, including Israel.¶ Are the U.S. and its negotiating partners hypocrites in these negotiations? In that all of them possess nuclear weapons, and no one has called Israel on their nuclear arsenal?¶ This is a point the Iranians make quite often. The five permanent members of the Security Council all have nuclear weapons. The U.S. and Russia have thousands of nuclear weapons, about ninety six percent of all the weapons in the world. So this is a point.¶ Israel has somewhere around one hundred weapons in an undeclared arsenal. This is also a point.¶ But there are other means of addressing these arsenals, in the United Nations and in the Nonproliferation Treaty process, but we're not talking about those now, we're talking about the Iranian program. The Iranians swore when they signed the Nonproliferation Treaty, that they would not undertake nuclear weapons research. We caught them building secret facilities, in violation of the treaty. That's why sanctions were imposed, that's why we are talking about it now.¶ Is it an hypocrisy problem? Do we have a problem, as long as we are maintaining thousands of weapons and telling Iran they can't have one? Yes, but the legal and diplomatic arguments outweigh that at this point, and they're on our side. We are going to stop this program -- and that may create the diplomatic and political space for us to further reduce our own obsolete nuclear arsenal.

Israel Strike Impact

Israel strikes cause extinction

Masko, 2/9/12

[Dave Masko is an Air Force News veteran who's filed stories from Washington, D.C., the Middle East, the Balkans and Europe. These days, he's a freelance writer based in Florence, Oregon. Masko's articles have appeared in European Stars and Stripes, The Washington Post, Rolling Stone and other publications. From 1977-1999 he was a reporter for the Defense Department, <http://www.huliq.com/10282/iran-nuclear-ambitions-alarming-israel-brink-war-say-experts>]

There's always been the danger of something "going nuclear" in our fragile world where countries such as Iran and Israel seem to like rattling sabers at each other was once viewed as "same old, same old," by political science experts when referring to these countries threats of war remaining the same. However, it's not same old, same old, when President Obama told NBC News in a TV interview Feb. 5 that while he does not think Israel has decided whether to attack Iran, the United States is "going to be sure that we work in lockstep as we proceed to try to solve this... hopefully diplomatically." Thus, if Israel does attack Iran's nuclear facilities and war breaks out, "even a small-scale, regional nuclear war could produce as many direct fatalities as all of World War II and disrupt the global climate for a decade or more, with environmental effects that could be devastating for everyone on Earth, university researchers have found," stated a report on the University of California Los Angeles website aasc.ucla.edu; while pointing to "a team of scientists" at Rutgers, the State University of New Jersey; the University of Colorado at Boulder and UCLA who've researched the implications of such an attack. What's at stake for the world? Overall, the stakes could not be any greater for a world that fears war after more than 20 years of sabre rattling by Israel over Iran's nuclear ambitions. In turn, President Obama and other world leaders seem very concerned that it's not if but when "an Israeli military attack on the Islamic Republic of Iran" will leave in its wake a new war in the Middle East, with more terrorism worldwide laced with even broader economic woes at a time when many countries are already at a breaking point. Moreover, the top U.S. intelligence official told Congress Jan. 31 – in an annual report about threats facing the nation – that "Iran's leaders seem prepared to attack U.S. interests overseas, particularly if they feel threatened by possible U.S. action." Jim Clapper, director of National Intelligence, also told the Senate Intelligence Committee Jan. 31 in an MSNBC TV report that America "now faces many interconnected enemies, including terrorists, criminals and foreign powers, who may try to strike via nuclear weapons or cyberspace, with the movement's Yemeni offshoot and 'lone wolf' terror attacks posing key threats." Middle East nuclear confrontation feared "While a regional nuclear confrontation – such as the one feared between Iran and Israel – among emerging third-world nuclear powers might be geographically constrained," report this noted team of U.S. scientists, "the environmental impacts could be worldwide." Thus, even the great Atlantic Ocean – that sits between the U.S. and the Middle East – would not buffer the "fallout" that will be in the "global atmosphere" impacting an already fragile world climate situation. While these conclusions of dark days ahead for the world if the so-called "nuclear genie gets out of the bottle" -- by U.S. scientists during a meeting of the American Geophysical Union – was back in 2006, the UCLA website that presented these nuclear war fears, has updated such conclusions about a clear and present danger of possible nuclear confrontation if Israel attacks Iran, and as of Feb. 9, 2012, the news from Israel is not good at all, state experts.

Prolif Module

Proliferation is an existential threat—Iran deal is necessary to generate modeling and political will

Plame Wilson 15 (Valerie Plame Wilson; May 13 2015; former CIA covert nonproliferation officer; Looking Forward, Nuclear Proliferation Is Still Greatest Existential Threat We Face; Huffington Post; http://www.huffingtonpost.com/valerie-plame-wilson/nuclear-proliferation-existential-threat_b_7118460.html) jskullz

As a former covert CIA operative, specializing in counter-proliferation, I still believe that the spread of nuclear weapons and the risk of their use is the greatest existential threat we face. Twenty-six years after the end of the Cold War, the world still has more than 15,000 nuclear weapons. Whatever other issues people care about -- poverty, the environment, inequality and so many others -- if we don't get this one right, and soon, nothing else will matter. We are at a crossroads on this issue and the decisions we make over the next 10 years will set us on a course either toward the elimination of all nuclear weapons or toward expanding arsenals and proliferation. There are some disturbing trends. All of the nuclear countries are investing heavily, or planning to do so, in modernizing their forces and/or expanding their arsenals. President Obama is proposing a massive overhaul of the U.S. nuclear arsenal that the Congressional Budget Office (CBO) estimates will cost \$1 trillion over the next 30 years. Russia has already begun a major upgrade of its arsenal. China is ramping up each leg of its nuclear triad, India is close to having a full nuclear triad with the addition of a nuclear submarine to its forces, and North Korea continues to develop its nuclear capability. Perhaps most worrisome is Pakistan, which has the fastest-growing nuclear arsenal and is plagued by persistent political instability and extremist elements. In addition to developing new types of weapons, nuclear weapons countries also appear to be taking steps toward establishing the dangerous nuclear high-alert posture that the United States and Soviet Union adopted during the Cold War (and still maintain) -- shortening the decision time for launch and increasing the risk that nuclear weapons will be used in conflict, by accident or through unauthorized launch. Longstanding regional conflicts involving nuclear-armed countries remain unresolved and tensions high, including on the South Asian Peninsula, the Korean Peninsula and the Middle East. Relations between Russia and the West have spiraled dangerously downward; Russia has even threatened to use nuclear force to defend its annexation of Crimea. Meanwhile, terrorists are working to get their hands on the bomb. This danger has risen as states have failed and ungoverned zones have spread, especially in the Middle East and Africa. In the last two decades there have been dozens of incidents of nuclear explosive materials being lost or stolen. The so-called "Islamic State" group has already seized low-grade nuclear material from a facility in Mosul. These are very difficult challenges. But there are also significant factors that could provide opportunities for progress. A final agreement with Iran would verifiably prevent it from developing a nuclear bomb. It would negate a long-standing leading argument of opponents to Global Zero -- that Iran and countries like it would never agree to forgo nuclear weapons. And it provides a model -- multilateral negotiations and intrusive verification -- for pursuing global reductions in nuclear arsenals.

Iran deal failure is a disaster—causes regional instability, nuclear proliferation, and escalation

Kaye 7/7 (Dalia Dassa Kaye; July 7th 2015; Director, Center for Middle East Public Policy; Senior Political Scientist, PhD in political science; "The Middle East After Vienna"; Foreign Affairs; <https://www.foreignaffairs.com/articles/iran/2015-07-07/middle-east-after-vienna>) jskullz

The first and most dangerous scenario is that Tehran could break out of the interim nuclear agreement, the Joint Plan of Action, which has essentially frozen Iran's nuclear program for nearly two years. With no promise of lasting and more significant sanctions relief, Iran may decide to resume its nuclear enrichment program at levels that reduce the time it would need to weaponize its nuclear program. Iran could still remain in the Nuclear Non Proliferation Treaty and come dangerously close to developing the capabilities to quickly break out if there is no international agreement placing further restrictions and inspections on its activities. To make matters worse, unless it is clear that Iran is at fault for the breakdown in nuclear talks, the current broad international support for sanctions against Iran could weaken. U.S. sanctions against Iran have proven effective because of the backing they have garnered among key oil-importing countries such as China, India, South Korea, and Japan. International sanctions have, by some estimates, cut Iran's oil exports by more than half in recent years, costing Iran up to \$40 billion in revenue annually. Continued unilateral American sanctions and secondary U.S. sanctions on countries and institutions doing business with Iran following the breakdown of a deal would likely continue to keep U.S. and European companies away from Iran. But other key international powers, and even some in Europe, may tire of self-imposed restrictions, especially if Iran appeared to have negotiated in good faith. So, Iran could find itself less isolated over time, especially if Congress rejected the deal, leaving the United States to blame for the failure. Indeed, this is the worst-of-both-worlds outcome—few constraints on Iran's nuclear program and dissipating international pressure on Iran. ¶ A return to military escalation with Iran is also more likely in a no-deal Middle East. Iranian hardliners' arguments that the West was never really interested in a deal with Iran will appear vindicated, undermining the leverage and influence of more pragmatic Iranian factions who were associated with the failed negotiations. This could lead to an expansion of Iran's already destabilizing regional activism, particularly in Iraq, Syria, and in its relationship with Hezbollah. Israel and Hezbollah are not currently interested in another conflict, but at some point in time Hezbollah may perceive attacking Israel as a useful distraction from its losses in Syria. Military escalation between Israel and Hezbollah with Iranian-supplied missiles, could happen quickly. Hezbollah attacks on Sunni insurgent groups fighting the Assad regime close to Israel's border could also mistakenly hit an Israeli target, leading Israel to retaliate. Israel would be more concerned about maintaining its deterrence posture in a regional context where Iran's nuclear program was unchecked, leading to harsh retaliation against any missile strike that could also quickly escalate into a broader conflict. ¶ And of course, Israeli leaders are likely to return to open threats about military options against Iran's nuclear facilities should Iran resume its enrichment program to levels that bring it closer to a weapons capability that crosses Israeli red lines. Pressures on neighboring states to consider nuclear programs of their own would also likely increase, even if concerns about the intentions and ability of neighboring countries like Saudi Arabia to pursue nuclear weapons capability are largely overblown.

Economy Module

Iran deal leads to an increase in US business – banking sector

Rosenfeld, Ward and Brennen 7/14/14 (Everett, Marguerite and Morgan, writers for CNBC, "Iran deal: Corporate winners from the nuclear agreement", <http://www.cnbc.com/2015/07/14/iran-deal-corporate-winners-from-the-nuclear-agreement.html>)/BW

Iran and six world powers reached an agreement on Tuesday to lift sanctions against the Islamic Republic, and while U.S. and Iranian leaders have heralded the deal as a victory, the real winners could be corporations across the globe. Iran holds the world's fourth-largest proved crude reserves and the second-largest natural gas reserves, according to the U.S. Energy Information Administration, so energy firms will be some of the clear beneficiaries of the deal. Most of those gains may not go to American companies, however, as they weigh the political costs of doing business with Tehran—especially considering the skepticism from Congress, according to Alireza Nader, senior international policy analyst at the Rand Corp. "Most likely European and Asian energy companies will see an increase in business—so companies like Total and Shell," Nader said. "For American energy companies, it's going to be tougher for them to go back in Iran." A view of a petrochemical complex in Assaluyeh on Iran's Persian Gulf coast. Morteza Nikoubazl | Reuters A view of a petrochemical complex in Assaluyeh on Iran's Persian Gulf coast. Other parts of the energy industry are also likely to benefit, including tankers and oilfield services, experts told CNBC. Citi Research analyst Chris Wetherbee said the opening of Iran is a "net positive" for international tanker firms, because Iran's aging fleet won't be able to compete, and more energy supplies will be on the market. Companies like Scorpio Tankers and Navios Maritime Acquisition saw their stocks rise Tuesday. In a note published by Barron's, Simon Wong of investment firm Gabelli wrote that an agreement would "open investment opportunities in the country's oil and gas sector." That would likely benefit oilfield service firms like Schlumberger, Weatherford International and Halliburton. Earlier this year, Schlumberger pleaded guilty to violating U.S. sanctions related to Iran, agreeing to a three-year period without any operations in Iran. A spokeswoman told CNBC that the company was not in a position to comment on Tuesday's deal. While the energy industry may be the most obvious beneficiary of an Iran deal, banks will also stand to benefit, experts told CNBC. "All of the major banking institutions in the industrial world will try to finance and facilitate increased trade with Iran," Christopher Whalen, senior managing director at Kroll Bond Rating Agency, told CNBC. "It's a big country, (and) they are very Western-focused. Iranians are consumers of everything. You can anticipate anything from industrial equipment to consumer products will definitely be bought, and will definitely be financed." As for which U.S. banks stand to benefit, Whalen said the gains will be concentrated among some of the top financial institutions—Citibank, JPMorgan, Goldman Sachs and Morgan Stanley. Those banks, he said, will likely work to facilitate the shipment of goods and services to Iran, taking on a trade finance function, and supporting project finance. They may also reach out to Iranian banks about sovereign business, Whalen added. But American banks aren't the only ones that stand to benefit from a reduction of Iranian sanctions, Whalen said, explaining that they'll compete against European and Asian banks for the business. If sanctions on Iran's use of SWIFT (the financial messaging system that transmits and tracks international transactions) are lifted, then new financial sector opportunities could also open, experts said. "The SWIFT

sanctions are more important at this point than any other type of sanctions because it affects all manner of industry and agriculture," Djavad Salehi-Isfahani, an economist at Virginia Tech, told CNBC earlier this year. Telecommunications firms may also be early winners, Blaise Misztal, director of national security at the Bipartisan Policy Center, said. Other industries could also benefit from the Iran deal. PSA Peugeot Citroen told Reuters that it's in advanced talks on an Iranian car-making venture with Iran Khodro and expects rapid progress. The political deal struck in Vienna "should clear the way for significant progress in our discussions," Peugeot's Africa and Middle East chief, Jean-Christophe Quemard, said in an emailed statement Tuesday. General Electric, which does business in Iran through its health-care division, could also consider expanding in the country. "We look forward to reviewing the details of the agreement reached and will watch the regulatory landscape that may unfold," the company said in a statement.

Prices Module

Deal collapses oil prices

Randle 7/11 (Jim Randle; July 11th 2015; Journalist for voice of America, citing Gary Hufbauer, scholar at the Peterson institute for international relations; “Analyst: Ending Iran Sanctions Could Push Down Oil Prices”; Voice of America; <http://www.voanews.com/content/analyst-ending-iran-sanctions-could-push-down-oil-prices/2857710.html>) jskullz

One economic expert said the end of sanctions could bolster growth in some of Iran’s neighbors and push global oil prices down further. Peterson Institute for International Relations scholar Gary Hufbauer said ending sanctions could cut oil prices from their current \$50 a barrel range to around \$35 per barrel. Crude prices Hufbauer said after sanctions, Iran could boost production by half a million barrels a day in a few months, and the additional supply could put downward pressure on crude prices worldwide. While that would not be a large percentage of the approximately 90 million barrels of oil a day consumed by the global economy, Hufbauer said the market is oversupplied right now and is sensitive to additional supplies. But U.S. Treasury Secretary Jacob Lew said it is a “myth” that Iran’s economy would “instantly recover” because sanctions have pushed it into a “deep hole.” Lew said sanctions have cost Iran “over \$160 billion” in oil revenue since 2012. The gross domestic product shrank 9 percent in the two years ending in March 2014, and is “15 to 20 percent smaller” than it would have been otherwise. Lew said Iran needs “half a trillion dollars” in domestic investment. The U.S. Congressional Research Service said sanctions cut Iran’s oil exports by half, and falling oil prices cut revenue in half again. Value of currency The economic problems caused the value of the Iran’s currency, the rial, to fall about 56 percent on unofficial markets, and inflation is estimated to have hit 50 percent at one point. The departure of a number of foreign oil firms has reduced Iran’s access to the technology needed to update its oil industry, crimping the long-term outlook for the sector. Sanctions also hurt efforts to modernize Iran’s non-oil industrial sector by blocking access to imported parts and materials.

AT: Deal Bad Top Shelf

Deal resolves the reasons for aggression—creates a more moderate Iran

Traub 7/21 (James Traub; July 21, 2015; fellow of the Center on International Cooperation; The Nuke Deal to End the Revolution; Foreign Policy; <http://foreignpolicy.com/2015/07/21/the-iran-nuke-deal-to-end-the-revolution-obama-policy/>) jskullz

¶ That level of alarmism is ludicrous, even by Netanyahu's standards, both because Iran's military capacities are very modest and because its ambitions are regional, not global. Nevertheless, Iran represents a special kind of danger to the world because, like revolutionary France, if not like Nazi Germany, it seeks to expand its area of control not simply as a matter of state interest but of ideological conviction. Iran is a revolutionary force bent on upending a regional status quo. And while France exhausted itself through perpetual warfare, ultimately discrediting the principles of the revolution, Iran's leaders have largely fought through proxies, preserving their standing, as well as the nation's power. Indeed, the very fact that Supreme Leader Ali Khamenei has given his blessing to the nuclear deal is a sign of the suppleness that has preserved the revolution after more than 35 years. ¶ The regime is unlikely to destroy itself, and the Iraq War should have cured even the most reckless soul of the belief that outside forces can institute regime change without cataclysmic results. The question then is, what actions by outsiders — if any — are most likely to reduce the potency of Iran's revolutionary ideology and thus curb its adventurous foreign policy? How, that is, can Iran come to resemble other ambitious-but-responsible emerging powers, like India or Turkey? ¶ Could the nuclear deal itself begin to bring that about? In conversations I had starting in the summer of 2009, officials in President Barack Obama's administration expressed the very guarded hope that a new, more respectful approach to Iran might ultimately lead to just such an outcome. Now that Obama has gained the nuclear deal he sought, he is careful to say, as he did to the New York Times' Thomas Friedman, that he has no expectations of a kinder, gentler Iran. The president has learned quite a few painful lessons over the years about the intransigence of America's rivals (think of Russia in Ukraine or China in the South China Sea). What's more, he knows very well that both Netanyahu and many of his Persian Gulf allies regard his Iran policy as recklessly naive. There's no reason to compound the problem by putting forward overly optimistic scenarios. ¶ There are, in fact, few grounds for optimism. As many commentators have noted, some portion of the \$100 billion to \$150 billion in bank funds to be unfrozen as sanctions are lifted will almost certainly go to the Iran's Revolutionary Guard or Hezbollah. Even absent that windfall, so long as Iran's Sunni adversaries, above all the Saudis, remain obsessed with countering Teheran's influence, both real and imagined, Iran can be counted on to support Shiite groups in Iraq, Lebanon, Yemen, and Syria. ¶ In the short run, therefore, the nuclear deal is likelier to make matters worse rather than better, and the president may spend more of his remaining time in office countering Iran's aggressive moves than he will summoning its better angels, as the New York Times' editorial page recently urged him to do. ¶ But what about the long run? What about changes, not in the behavior of the regime but in its ideological foundations — and thus in the balance of power between state and society? Is it reasonable to think that the nuclear deal might help tip Iran toward moderation? I think it is, and I imagine that Obama thinks so too, even if you won't catch him saying so. ¶ Revolutions need adversaries. The best argument for ending the decades-long sanctions on Cuba was that inveterate American enmity had offered

the Castros the perfect pretext for preserving their autocratic rule. Normalizing relations would unleash forces that would undermine the legitimacy of the communist regime and strengthen liberal forces. That process has only just begun, but it holds out far more promise of turning Cuba into a country that respects the international order than did the policy of endless antagonism. Iran, like Cuba, has used virulent anti-Americanism to preserve its grip over an increasingly restless citizenry.¶¶ The mullahs can still muster crowds to shout “Death to America,” but they aren’t as large as they once were. Unlike Cuba, Iran has a robust and growing middle class that is desperate to travel to and trade with the West. That class elected the moderate Hassan Rouhani as president in 2013. And it is this aspirational class that will ultimately be the agent of social transformation in Iran.¶¶ Of course, there are arguments on the other side. Cuba is dead broke and needs the lifeline from the West, whereas the nuclear deal is about to loose a cataract of revenue on Iran. If the United States really wants to tip the balance between the theological state and an increasingly aspirational Iranian society, therefore, Washington should keep tightening the screws of sanctions until the citizens rise up against their rulers — as then-President Ronald Reagan did by raising the ante of military spending until the Soviets bankrupted themselves. Nevertheless, that seems less likely to dislodge the mullahs from power than the dynamic of economic freedom.¶¶ Revolutionary societies don’t last forever; they are eventually undone by their own contradictions. Mao gives way to Deng; Andropov to Gorbachev and then to Yeltsin (and then, alas, to Putin). Sometimes the United States confronts such regimes, sometimes it contains them, and sometimes it tries to furnish an exit ramp. Until now, Washington has focused its policy toward Iran on the first two of those options. Now it is trying the third. It’s a gamble. It is, however, vastly preferable to the alternatives.

AT: Deal Bad

Deal prevents nuke—all paths prevented and sanctions easy to reinstate

Lewis 7/14 (Jeffery Lewis; July 14 2015; director of the East Asia Nonproliferation Program at the James Martin Center for Nonproliferation Studies; “**It’s a Damn Good Deal**”; Foreign Policy; <http://foreignpolicy.com/2015/07/14/its-a-damn-good-deal-iran-nuclear-agreement-joint-comprehensive-plan-of-action/>) jskullz

The reduction in centrifuges remains substantial — the limits are the same as those reported when the framework was announced. Moreover, little worries I had, like whether Iran would agree to remove piping and other infrastructure along with the centrifuges themselves, were resolved favorably.¶ The Vienna Plan also provides a path to resolve the outstanding issues with the International Atomic Energy Agency regarding Iran’s past covert nuclear weapons program (known delicately as “possible military dimensions”) and provides a public description of something U.S. officials had only described in private — a R&D schedule that limits Iran’s development of new centrifuges over the next eight to 10 years.¶ And, if like me you think “breakout,” or the time it would take to turn nuclear material into one bomb, is a dumb measure, the agreement also has lots of provisions to deal with “sneak-out,” or an attempt to get a bomb covertly. These provisions include granting inspectors access to military sites and monitoring of centrifuge workshops and uranium mines. But this shouldn’t be a surprise: It was in the bag in Lausanne.¶ It is worth looking at this chart issued by the Supreme Leader’s office showing all his “red lines” in the talks. It turns out the Iranians gave in on several of them and found rather creative solutions to a few others. You can make your own list, but I think they compromised on (1, 3, 5, 7, 8, and 9): [img removed]¶ What had to be resolved in Vienna was the tricky issue of sanctions. It was always clear that there would have to be an implementation period so that Iran could say sanctions came off “immediately” while the United States could claim the opposite.¶ One of the amazing things is how many of the pearl-clutching stories about how the agreement was going off the rails turned out to be nonsense. Most of these were written by the New York Times’ David E. Sanger, and they won’t age well: see 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10.¶ One story said the administration was going to back off what looked like a hard cap on how much enriched uranium Iran could have at any one time. I called it the Great LEU Panic of June 2015. Sure enough, Iran is limited to “300 kg of up to 3.67% enriched UF₆ (or the equivalent in different chemical forms).” The rest of Iran’s stockpile must be sold or diluted. I told you so.¶ The real issues in Vienna were how to re-impose sanctions if the deal collapsed, as well whether to lift the United Nations’ arms embargo and the sanctions on Iran’s missile programs.¶ The mechanism to re-impose sanctions — called “snapback” by people who don’t wear baseball caps — is pretty clever. Any of the parties can raise an issue within a Joint Commission created to administer the agreement. If the party is unsatisfied, it then can notify the U.N. Security Council. The Security Council has 30 days to act — and if it does nothing, the sanctions are automatically re-imposed. That gives the United States and other parties the ability to blow up the deal and return to sanctions regime with no chance for Russia or China to veto.¶ The arms embargo and missile sanctions were trickier. The Iranians argued that those were only imposed as punishment for nuclear activities — and that they should come off as part of any deal. It’s a fair point, but rather too lawyerly for the situation. Iran’s missile program was part of the possible military dimensions to its nuclear program. And Iran is also engaged in several proxy wars in Middle East at the moment. One of the main reasons for being concerned about Iran’s past nuclear weapons work is how aggressive a nuclear-armed Iran might become. It should have been obvious to anyone in Tehran that the United States wasn’t going to agree to a flood of new arms and missile technologies.¶ The compromise, again, was obvious. U.N. sanctions will come off over time — reportedly five years in the case of the arms embargo and eight years in terms of the missile program — but national and other international restrictions stay. President Barack Obama will not waive U.S. sanctions for missile proliferation, terrorism, and human rights. Moreover, Iran remains outside the Missile Technology Control Regime, the cartel of suppliers that controls missile technologies. As a practical matter, Iran’s missile suppliers are still limited to North Korea — something already prohibited by sanctions — and entities already sanctions-busting.¶ That said, it probably makes sense to think about a follow-on agreement limiting Iran’s development of ballistic and cruise missiles as well as how to deal with a deteriorating regional security situation that has many U.S. allies understandably nervous. If Obama ignores these concerns, he will be handing his

opponents back at home an issue that they will only too happily use to club him over the head. ¶ Remember how House Republicans have repeatedly voted to repeal, defund, or deform the Affordable Care Act? Fought all the way to the Supreme Court, twice? ¶ The fight over the Iran deal is going to make the Obamacare battles look like two preppies slap-fighting over a cucumber sandwich. ¶ Congress now has 60 days to review the deal and pass a resolution of disapproval that would remove the president's authority to waive sanctions on Iran. Obama has said he will veto such a measure, if his opponents can find the votes, which will give Congress another, shorter period to attempt to override the veto. ¶ Even if the deal survives the congressional review period, you can expect a lot of leaks. ¶ Much of the arguments in Washington to date have focused on making the process look disorganized or chaotic. At one point, Sanger moaned on Twitter that Mozart wrote Symphony No. 36 in less time than diplomats have been in Vienna for the last round of talks. Fellow nuke wonk Alicia Dressman noted, more than a little sarcastically, that she was going to miss his "poignant observations quarantined from relevance." ¶ Good news, Alicia! He's not going away. The leaks are going to shift to how Iran is doing this or that. You kids may not remember this, but more than 20 years ago the Clinton administration — yes, Hillary's husband was president back then — struck a similar deal with North Korea to freeze its plutonium production infrastructure. Immediately the leaks began: North Korea is cheating! (North Korea probably was cheating, by the way, but just not in the ways alleged by opponents. That's another problem with the Beltway noise-machine.) ¶ The low point was when satellite images showed a large, underground facility under construction near a place called Kumchang-ri. Someone at the Defense Intelligence Agency decided it was a covert underground nuclear reactor — based mostly on the military unit responsible for digging. No one else thought it was a reactor because, well, it was just a hole in the ground. Not surprisingly, this got leaked to the New York Times, which ran the headline: "North Korea Site an A-Bomb Plant, U.S. Agencies Say." (Guess who the author was?) ¶ Never mind that it wasn't true. One agency, singular, said that; the others were unconvinced. But when something is on page A1 of the New York Times, it becomes true. The United States negotiated access to the site, which turned out to be empty. The site was "unsuitable" for a nuclear reactor and "not well designed" for a reprocessing facility. It was kind of a mini-Iraq, but where we had the good sense not to invade. ¶ I've told this story over at 38North, but the point is that the Clinton administration realized too late that they needed to reinforce the 1994 Agreed Framework with other deals, starting with North Korea's ballistic missile program. It makes sense to start thinking now about regional security issues, including Iran's missile program, once this deal comes under monthly attack. ¶ It is possible that the Iranians will cheat. It is also possible that they will insist on tendentious readings of certain provisions. And, although I hate to break it to you, we might not be perfect ourselves. One of my favorite passages in the agreement is an oblique acknowledgement by the Iranians that there is no telling what sort of stunt Sen. Tom Cotton and his friends might pull. (Paragraph 26. Check it out.) Even two committed parties may find that they disagree about how to implement an agreement. That's normal. ¶ But there will also be a cottage industry in Washington, D.C., for the next decade dedicated to manufacturing one crisis after another to try to derail this agreement. We've already seen a series of press conferences by the National Council for Resistance in Iran, a.k.a. the MEK, making one allegation or another. I had to debunk one about a secret centrifuge plant that NCRI claimed was churning out LEU from the basement of the site printing national ID cards.

Deal ensures no nuke—the alternative is war

Jaffe 7/15 (Greg Jaffe; July 15 2015; Military expert for the Washington Post, citing Barack Obama, president of the United States; Obama says only alternative to a nuclear deal with Iran is war; Washington Post; http://www.washingtonpost.com/politics/obamas-defense-of-the-iran-deal-comes-with-a-tough-love-message/2015/07/15/a7614b4a-2b04-11e5-bd33-395c05608059_story.html) jskullz

President Obama's defense of the complex and painstakingly negotiated nuclear deal that his administration reached with Iran boiled down to a simple, if controversial, contention: The only real alternative to the deal was war. ¶ Obama returned to that conclusion repeatedly Wednesday at a news conference that stretched for more than one hour. ¶ "Without a deal," he said in his opening statement, "we risk even more war in the Middle East." ¶ A few minutes later, in response to a reporter's question, Obama dismissed concerns that the House and Senate might vote down the deal, forcing him to use his presidential veto. Wouldn't a rejection of the deal by lawmakers make him question its wisdom? ¶ "Either the issue of Iran obtaining a nuclear weapon is resolved diplomatically through a negotiation or it's resolved through force, through war," Obama countered. "Those are — those are the options." ¶ What about those who argued that Obama should have employed more diplomatic, economic or military leverage to get a "better deal" from the intransigent Iranians? ¶ "What does that mean?" Obama asked rhetorically. "If the alternative is that we should bring Iran to heel through military force, then those critics should say so. And that will be an honest debate." ¶ The president's news conference in the White House's East Room came a day after his negotiators concluded contentious marathon talks with Iran. The deal they reached to limit Iran's nuclear enrichment program — more than six years in the making — was swiftly condemned by virtually every major

Republican presidential candidate. ¶ A spokesman for House Speaker John A. Boehner (R-Ohio) said Wednesday that Obama, in defending the deal, had shown himself to be “hopelessly disconnected from reality.” Israeli Prime Minister Benjamin Netanyahu, addressing his country’s parliament a few hours before Obama spoke, left open the possibility of military action against Iran. ¶ “We will reserve our right to defend ourselves against all of our enemies,” Netanyahu said. “We have strength, and it is great and mighty.” ¶ The president responded with a defense of the nuclear agreement that was equal parts pugilistic and legalistic. Obama was briefed on the progress of the negotiations with Iran as often as twice a day and had amassed a detailed knowledge of the 109-page agreement and the additional 47 pages of annexes. He drew on that knowledge the way an experienced courtroom lawyer might rely on case-law expertise to answer criticisms that the deal didn’t last long enough; that it wouldn’t prevent the Iranians from covertly producing a nuclear weapon; that it still allowed the Iranians some nuclear enrichment capacity and therefore didn’t go far enough. He seemed eager to address every question. ¶ “Have we exhausted [all the] Iran questions here?” Obama said at one point. “I am really enjoying this Iran debate. . . . Go ahead. Go ahead.” ¶ President Obama took questions on the deal with Iran in the East Room of the White House on July 15. Here are key moments from that speech. (AP) ¶ A few minutes later, Obama picked up a piece of paper from the lectern in front of him, eager to keep talking about the deal. “Okay,” he said. “I made some notes about many of the arguments — the other arguments that I’ve heard here.” ¶ Obama’s defense of the deal wasn’t designed to win over dug-in critics, whom he dismissed as illogical and unrealistic. His audience was an American public worried about the threat posed by a nuclear-armed Iran but also exhausted by more than 14 years of war in Iraq and Afghanistan. ¶ Obama has speculated in recent weeks that the nuclear deal could empower moderates in Iran who are eager for better relations with the rest of the world. “What I’d say to them is this offers a historic opportunity,” he told the New York Times in an interview Tuesday. ¶ Such hopeful talk was largely absent Wednesday from Obama’s news conference, which focused on the dangers posed by Iran and the need to prevent the country from acquiring a nuclear weapon. “This has been a Democratic priority, this has been a Republican priority, this has been Prime -Minister Netanyahu’s priority,” Obama said. ¶ Obama hit on almost all the major criticisms of the deal during the news conference. ¶ Republicans have criticized the deal for allowing Iran as many as 24 days before it grants inspectors access to military sites that could house covert programs. The delay could give Iran enough time to conceal illegal activity, critics said. Obama dismissed the charges as unrealistic and not grounded in science. ¶ “This is not something you hide in a closet,” Obama said of the centrifuges and other sensitive equipment needed to make weapons-grade uranium. “This is not something you put on a dolly and kind of wheel off somewhere.” ¶ Even if the Iranians had moved nuclear material from the site, Obama said, inspectors would find it. “Your high school physics will remind us that leaves a trace,” he said. “And so we’ll know, in fact, there was a violation of the agreement.” ¶ Other critics have charged that the deal would pave Iran’s path to a bomb by lifting some of the most onerous restrictions on its nuclear energy program after 10 years. ¶ “That’s a good one,” Obama said. ¶ He countered that the inspections would still be in place 20 years from now. So, too, would Iran’s Non-Proliferation Treaty commitments. Iran would be about one year away from developing enough fuel for a nuclear bomb — a longer time frame than its current two to three months.

Deal key to prevent “sneak-out”

Acton 7/16 (James M. Acton; July 16 2015; Co-director of the Nuclear Policy Program at the Carnegie Endowment for International Peace; Iran Ain’t Gonna Sneak Out Under This Deal; Foreign Policy; <http://carnegieendowment.org/2015/07/16/iran-ain-t-gonna-sneak-out-under-this-deal/idh7>) jskullz

Nonetheless, where verification is concerned, the details do matter and we really should be debating the finer points of the Iran deal’s verification provisions. (See: Annex I, Sections L, M, N, O, P, Q, and R — yes, it’s that detailed.) In assessing whether these arrangements are “good enough,” the best place to start is with the following question: If Iran decides to cheat, how would it go about doing so? ¶ Iran’s leadership would have three options and, in deciding between them, it would presumably choose the pathway that maximized its chances of success. ¶ First, Iran could overtly renounce all its nonproliferation commitments chuck out international inspectors, and build the bomb loudly and proudly. The Nuclear Nonproliferation Treaty contains a clause that allows states to withdraw under “extraordinary” circumstances and, even though JPCOA doesn’t have any such provision, there can be no certainty that Iran won’t abrogate it anyway. No verification system can prevent this scenario, but what almost certainly can deter it is the threat of American weaponry hitting Iran before Ayatollah Khamenei can say “death to.” ¶ The second, more likely scenario would be for Iran to use its declared nuclear materials and facilities for bomb-building: the much-discussed “breakout scenario.” Many of the Iran deal’s limits are intended to make breakout much more time consuming than it would currently be — and that’s a

good thing. Ultimately, however, breakout still isn't all that likely. Declared facilities are subject to International Atomic Energy Agency (IAEA) monitoring and . As a result, Iran understands it would almost certainly be caught quickly if it attempted breakout. ¶ Iran's third option would be to build a secret parallel nuclear program dedicated to military purposes — sneak-out. Detecting small clandestine enrichment plants is difficult and Tehran might view sneak-out as its most attractive option. Indeed, Iran has tried to sneak-out before. Repeatedly, It failed to declare three out of the four facilities in which it has enriched uranium (the Kalaye Electric Factory, the Fordow Fuel Enrichment Plant near Qom, and the Pilot Fuel Enrichment Plant at Natanz) in accordance with IAEA rules. ¶ “Anytime, anywhere” access is often advocated as the solution to detecting secret facilities — in fact, Secretary of Energy Ernest Moniz, an MIT physicist and one of the U.S. negotiators, said back in April that the United States expected it. The Iran deal doesn't provide for it, however, as critics, including Sen. Tom Cotton, have noted (rather gleefully, at that). ¶ So, what access provisions does the deal contain? ¶ It does allow the IAEA to go anywhere — including military sites — if there is evidence of undeclared facilities hosting nuclear activities. But, if Iran declined to grant access, a complicated dispute resolution negotiation process would ensue under which Iran would have to negotiate first with the IAEA and then with the Joint Commission created to oversee implementation of the deal. This process could take up to 24 days. (on day 25, if Iran still refused access, it would be in non-compliance with the agreement and sanctions could be re-introduced.) ¶ Fortunately for the JCPOA, the refrain of an “anytime, anywhere” access may make for a great soundbite, but its utility is overstated by Cotton and other critics of the agreement. An access delay — even one of 24 days — wouldn't make any material difference to the IAEA's ability to detect undeclared nuclear activities. ¶ When IAEA inspectors search for undeclared nuclear activities they look for tiny traces of nuclear material on surfaces. Fortunately for them, nuclear material lingers. And, modern detection technology is so amazingly effective that miniscule traces of nuclear material can be detected years after nuclear activities took place. Countries have tried to sanitize facilities completely to remove every last trace of nuclear material. Iran did so at the Kalaye Electric Factory after its secret nuclear program was revealed in 2002. Syria tried the same thing in 2007 after Israel bombed its plutonium production reactor at Al Kibar. In both cases, the IAEA still managed to detect nuclear material. Those findings were critical to persuading the organization's governing body to make a formal finding of non-compliance against both Iran and Syria. ¶ Perhaps Iran has learned from its past mistakes and could do a better job of cleaning up nuclear material in the future and keeping its program secret. But, what's clear is that perfect cleanup — if it were possible — would take many months. After just 24 days, the IAEA would have little difficulty detecting the residue from undeclared nuclear activities. ¶ So, here's the bottom line: The Iran deal doesn't provide for anytime, anywhere access, but it does facilitate timely access anywhere — and that's what's needed for effective verification. ¶ But wait, as they say on QVC, there's more! ¶ Not only is anytime, anywhere access not necessary, it's also not sufficient. In other words, its inclusion might have placated (a few) critics, but would not be enough, by itself, for effective verification. After all, it would be physically impossible for the IAEA to inspect every building where Iran could conceivably be hiding clandestine nuclear activities. ¶ What the IAEA actually needs is some preliminary evidence about where a secret nuclear facility might be lurking. The much-discussed but little-understood Additional Protocol was developed precisely for that purpose and the JCPOA obliges Iran to accept it, first voluntarily and subsequently on a legally binding basis. But, the JCPOA goes beyond the Additional Protocol in two innovative and important ways. ¶ First, IAEA monitoring will be extended to declared yellowcake (the precursor material to the feedstock for enrichment) and to declared centrifuge components. This measure will deter Iran from diverting this material and equipment to a secret program. Iran could, of course, try to acquire yellowcake or centrifuge components secretly instead — but doing so would create more opportunities for detection. ¶ Second, the deal also creates a “Procurement Working Group” to oversee the import of all equipment and material that either is used or could be used for nuclear purposes. The intelligence communities of the United States and its friends spend considerable resources monitoring Iranian imports. If they discover that Iran has obtained any items that should have been declared but weren't, they will have acquired clear evidence of secret nuclear activities in Iran. They could hand this evidence to the IAEA, which could conduct inspections to investigate further. ¶ All in all, therefore, the JCPOA provides for some impressive verification provisions to guard against sneak-out. That said, no one should be under any illusions. Detecting small, undeclared centrifuge plants is difficult and there is no guarantee of success. But, perfection is not the right metric against which to assess a nonproliferation agreement. The real question is whether sneak-out is more likely with a deal or without one. And here the

answer is clear: sneak-out would be much more likely without a deal, because the IAEA's powers to detect clandestine facilities would be much more limited.

Iran deal does not lead to proliferation

Pashakhanlou 7/14/15 (Arash Heydarian, Postdoctoral Teaching Fellow in Politics & International Relations at University of Bath, "Beyond the Iran deal: nuclear proliferation is a myth", <http://theconversation.com/beyond-the-iran-deal-nuclear-proliferation-is-a-myth-42441//BW>)

After nearly two years of incremental and painstaking negotiations, a full deal on Iran's nuclear programme has at last been struck. In a feat of diplomacy and patience, Iran and the P5+1 – the US, the UK, France, Germany, Russia and China – have managed to construct a deal that limits Iran's nuclear activity and the sanctions imposed on it. Early reactions deemed this a "new chapter of hope" in more ways than one; not just a victory for diplomacy, but a major victory in the efforts against nuclear weapons proliferation. This is somewhat misguided. In reality, however, even a nuclear-armed Iran would not have meant that a nuclear weapons proliferation among states was underway. Proliferation, after all, means rapid spread. And whereas nuclear weapons have proliferated "vertically", with existing nuclear states adding to their existing nuclear arsenals, there has not been a "horizontal" nuclear weapons proliferation – that is, a fast spread of these weapons to new nations. On the contrary, nuclear weapons have spread slowly across the world, even though academics, politicians and the media frequently discuss horizontal nuclear weapons proliferation as if it was a matter of fact. Currently, there are only nine states in the world with nuclear weapons among the UN's 193 members: the US (since 1945), Russia (since 1949), the UK (since 1952), France (since 1960), China (since 1964), India (since 1974), Israel (since 1979, unofficial), Pakistan (since 1998) and North Korea (since 2006). Other countries have dropped off the list. South Africa joined the nuclear club in the 1980s, but dismantled its weapons in the early 1990s. Belarus, Kazakhstan and Ukraine inherited nuclear weapons from the Soviet Union when they became independent states after the Cold War, but they transferred their nuclear arsenal to Russia in the 1990s. In other words, only a handful of countries in Europe, Asia and North America possess these weapons, while Africa, Australasia and Latin America are devoid of nuclear weapons states. In fact, the number of nuclear weapons states has actually decreased ever since the 1990s. And even though the Pakistani nuclear weapons scientist Abdul Qadeer Khan confirmed the existence of a global nuclear black market which purportedly provided nuclear technology, expertise, and designs to various countries, including Libya, no horizontal nuclear weapons proliferation has taken place. Libya eventually voluntarily renounced its secret nuclear weapons efforts in December 2003. Argentina, Brazil, South Korea, and Taiwan have also shelved their nuclear weapons programs. As of now, there are 31 countries with nuclear power plant units in operation; countries such as Australia, Canada, and Japan are widely believed to have the technological sophistication to become nuclear weapons states in relatively short amount of time should they want to – but they have not pursued that path. In other words, even though there have been opportunities for nuclear weapons proliferation across a range of new states, such a development has not materialised. All of the available evidence thus unanimously suggests that no horizontal nuclear weapons proliferation has taken place throughout the 70 years that these weapons have existed. Claims to the contrary lack basis, whether they are made for political or economic reasons, sheer

ignorance, or for any other purposes. Horizontal nuclear weapons proliferation is a bogeyman that does not exist. If we are to devise sound strategies and policies regarding nuclear weapons we have to ground them in existing reality. Recognising that there is no horizontal nuclear weapons proliferation is a good place to start.

AT: Israel Strike

No Israeli strike—if Bibi was serious he'd had bombed Iranian facilities more than a decade ago

Keck 15 (Zachary Keck; Feb. 9 2015; managing editor of The National Interest.; "5 Resasons Israel Won't Attack Iran"; National Interest; <http://nationalinterest.org/commentary/five-reasons-israel-wont-attack-iran-9469?page=2>) jskullz

1. You Snooze, You Lose¶ First, if Israel was going to strike Iran's nuclear facilities, it would have done so a long time ago. Since getting caught off-guard at the beginning of the Yom Kippur War in 1973, Israel has generally acted proactively to thwart security threats. On no issue has this been truer than with nuclear-weapon programs. For example, Israel bombed Saddam Hussein's program when it consisted of just a single nuclear reactor. According to ABC News, Israel struck Syria's lone nuclear reactor just months after discovering it. The IAEA had been completely in the dark about the reactor, and took years to confirm the building was in fact housing one.¶ Contrast this with Israel's policy toward Iran's nuclear program. The uranium-enrichment facility in Natanz and the heavy-water reactor at Arak first became public knowledge in 2002. For more than a decade now, Tel Aviv has watched as the program has expanded into two fully operational nuclear facilities, a budding nuclear-research reactor, and countless other well-protected and -dispersed sites. Furthermore, America's extreme reluctance to initiate strikes on Iran was made clear to Israel at least as far back as 2008. It would be completely at odds with how Israel operates for it to standby until the last minute when faced with what it views as an existential threat.¶

AT: NPT Turn

No NPT breakdown—secondary agreements, lack of capacity, and no interest

Esfiandary and Tabatabai 4/28 (Dina Esfiandary and Ariane Tabatabai; Dina Esfiandary is a McArthur Fellow in the Centre for Science and Security Studies at King's College London. Ariane Tabatabai is a visiting assistant professor in the Security Studies Program at the Georgetown University School of Foreign Service and a columnist for The Bulletin of the Atomic Scientists; "Why an Iran deal won't lead to nuclear proliferation"; Washington Post; www.washingtonpost.com/blogs/monkey-cage/wp/2015/04/28/why-an-iran-deal-wont-lead-to-nuclear-proliferation/) jskullz

First, the entire region, except for nuclear-armed Israel, is party to the NPT. This means that they've already legally given up the nuclear weapon option. Moreover, nuclear weapon states can't legally provide them nuclear weapons either. Second, many countries have safeguards agreements and some, the additional protocol, in place. This means that their programs are under close International Atomic Energy Agency (IAEA) scrutiny. ¶ ¶ None of these states have expressed an interest in reprocessing, which closes the plutonium path to the bomb. Some have even foregone enrichment, which blocks the uranium path to the bomb. That's the case for the UAE. But some states, such as Saudi Arabia and Turkey, want to reserve "the right" to enrich. Riyadh went further and stated it wanted whatever Iran got out of the negotiations, including enrichment. ¶ ¶ Saudi Arabia, Turkey, Egypt, Jordan and the UAE are all dependent on foreign suppliers and expertise for their programs. They lack the human capacity for the programs. Foreign involvement makes it difficult, though not impossible, to covertly develop a nuclear weapon. This means that suppliers also need to do their due diligence and ensure that buyers use their equipment for purely peaceful purposes.

AT: Bomb Good

Iran bomb increases risk of nuclear miscalc

Dokos 12 (Thanos Dokos; Sep 2012; Director-General of the Hellenic Foundation for European & Foreign Policy (ELIAMEP); Why Kenneth Waltz is Both Right & Wrong About the 'Iranian Bomb'; ELIAMP; <http://www.isn.ethz.ch/Digital-Library/Publications/Detail/?id=153731>) jskullz

At the heart of the views of the Waltz school is a simple extrapolation from the non-use of nuclear weapons in the U.S.-Soviet context to the future non-use of those weapons in other regions. This analogy overlooks the unique combination of circumstances that has helped to ensure nuclear peace over the past decades. The non-use of nuclear weapons has rested upon particular geopolitical and technical factors: cautious leadership (despite the harsh rhetoric of both sides); the fact that neither national survival nor territorial integrity was immediately at stake and that neither power has ever been at war with the other; the lack of common borders, thereby lessening flash points for conflict and impeding escalation; and adequate technical means to prevent accidental detonation and the unauthorized use of nuclear weapons. Without these features, mere fear of nuclear destruction, though itself quite important, might not have sufficed. For example, the probability of the use of nuclear weapons as a result of miscalculation or loss of control during a crisis cannot be easily dismissed. The lack of secure second-strike forces and reliable C4I systems in most new nuclear weapon states and the adoption of launch-on-warning (LOW) postures as a consequence, could result to strategic instability and could increase the probability of the use of nuclear weapons due to miscalculation. And however small the risk of each individual scenario may be, one should also consider the cumulative risk of all the possible dangers arising from additional nuclear proliferation. The prospect of a nuclear "accident" or miscalculation would, therefore, be much higher in a proliferated world, as tensions between India and Pakistan have demonstrated in the past. The Middle East is probably a different case, mainly because Israel and Iran are not geographically contiguous states, nor do they constitute an existential threat for the other side (although many Israelis would take issue with that statement). Waltz also argues that "Israel's regional nuclear monopoly has long fueled instability in the Middle East. It is Israel's nuclear arsenal, not Iran's desire for one, that has contributed most to the current crisis. Power, after all, begs to be balanced. What is surprising about the Israeli case is that it has taken so long for a potential balanced to emerge." He also suggests that "Current tensions are best viewed not as the early stages of a relatively recent Iranian nuclear crisis but rather as the final stages of a decades-long Middle East nuclear crisis that will only end when a balance of military power is restored." This is a rather surprising statement. Israeli policies and actions, especially in connection with the Palestinian problem, often have had destabilizing consequences for the region, but its "nuclear behavior" can hardly be described as irresponsible or destabilizing (this doesn't imply, of course, that efforts for a NWFZ in the Middle East should be abandoned). As a result, the only full-fledged effort to acquire nuclear weapons by a Middle Eastern state was motivated by Saddam's regional ambitions, not concern about Israel's nuclear arsenal. Similarly, Tehran's current security policies, including its strong interest in the development of a nuclear weapon capability and its regional aspirations, antedate the Islamic revolution and are rooted in Persian nationalism and the country's historical sense of regional leadership, not Israel's nuclear capability. Iran's nuclear programme is also motivated, among other, by some legitimate security concerns, including the experience of its war with Iraq, when Iraq used chemical weapons on a large scale against Iran with the international community protesting very weakly, and fears about regime survival. Post 9/11, influential groups inside Iran were concerned that the U.S. intended to change its regime by force. Indeed, it is possible that the Iranian leadership reached the conclusion that if a regime was considered by the U.S. as a member of the 'Axis of Evil' and did not possess a nuclear capability, a fate similar to Saddam Hussein's could be expected, whereas if the country did have a nuclear weapon capability, like North Korea, it stood a reasonable chance of getting financial support and even regime survival guarantees from the US and the international community. Finally, one should also consider Iranian leadership's distrust towards the West, mainly as a result of a sense of humiliation caused by a long colonial experience. At the same time it is probably true that since late 2003, with the U.S. entangled in an Iraqi (and increasingly an Afghan) quagmire, draining American resources and reducing its influence in the region and worldwide and in view of the domestic situation in Lebanon and Palestine, a permissive regional environment for spoiling

strategies and the lack of a functioning regional security architecture in the Gulf region, the Iranian leadership saw a window of opportunity to increase the country's geopolitical weight and establish Iran as a pivotal regional power. It is possible that the acquisition of a nuclear weapon capability may increase not only Iran's self-confidence, but also its propensity for brinkmanship and risk-taking. Iranian official rhetoric, often bombastic in style, will not help in this context. At the global level, there is little doubt that further proliferation would make the strategic chessboard more complex whilst at the same time multiplying risks and complicating strategic decision-making. There is also growing concern that the open nuclearization of Iran could also, in combination with other negative developments, deal a serious –even deadly– blow to the NPT regime. Although one can speculate whether Iran's nuclearization will be the 'hair that broke the camel's back', Christoph Bertram rightly points out that 'anyone seeing in an Iranian bomb a key factor which might prompt Saudi Arabia, Egypt or other countries to obtain one as well needs to explain why for 40 years the Israeli bomb has not had that effect.' Waltz agrees that "If an atomic Israel did not trigger an arms race then, there is no reason a nuclear Iran should now" (a rather controversial statement in view of his conviction that the real cause of the Middle Eastern crisis has been the Israeli nuclear monopoly).

Iran nuke causes runaway prolif and nuclear war

Lindsay and Takeyh 10 (James M. Lindsay and Ray Takeyh; Lindsay is Senior Vice President, Director of Studies, and Maurice R. Greenberg Chair at the Council on Foreign Relations, Takeyh is a Middle East scholar, former United States Department of State official, and a Senior Fellow at the Council on Foreign Relations; *After Iran Gets the Bomb*; Foreign Affairs; <https://www.foreignaffairs.com/articles/persian-gulf/2010-02-22/after-iran-gets-bomb>) jskullz

Containing a nuclear Iran would not be easy. It would require considerable diplomatic skill and political will on the part of the United States. And it could fail. A nuclear Iran may choose to flex its muscles and test U.S. resolve. Even under the best circumstances, the opaque nature of decision-making in Tehran could complicate Washington's efforts to deter it. Thus, it would be far preferable if Iran stopped -- or were stopped -- before it became a nuclear power. Current efforts to limit Iran's nuclear program must be pursued with vigor. Economic pressure on Tehran must be maintained. Military options to prevent Iran from going nuclear must not be taken off the table. But these steps may not be enough. If Iran's recalcitrant mullahs cross the nuclear threshold, the challenge for the United States will be to make sure that an abhorrent outcome does not become a catastrophic one. This will require understanding how a nuclear Iran is likely to behave, how its neighbors are likely to respond, and what Washington can do to shape the perceptions and actions of all these players. **MESSIANIC AND PRAGMATIC** Iran is a peculiarity: it is a modern-day theocracy that pursues revolutionary ideals while safeguarding its practical interests. After three decades of experimentation, Iran has not outgrown its ideological compunctions. The founder of the Islamic Republic, Ayatollah Ruhollah Khomeini, bequeathed to his successors a clerical cosmology that divides the world between oppressors and oppressed and invests Iran with the mission of redeeming the Middle East for the forces of righteousness. But the political imperative of staying in power has pulled Iran's leaders in a different direction, too: they have had to manage Iran's economy, meet the demands of the country's growing population, and advance Iran's interests in a turbulent region. The clerical rulers have been forced to strike agreements with their rivals and their enemies, occasionally softening the hard edges of their creed. The task of governing has required them to make concessions to often unpalatable realities and has sapped their revolutionary energies. Often, the clash of ideology and pragmatism has put Iran in the paradoxical position of having to secure its objectives within a regional order that it has pledged to undermine. To satisfy their revolutionary impulses, Iran's leaders have turned anti-Americanism and a strident opposition to Israel into pillars of the state. Tehran supports extremist groups, such as Hamas, Hezbollah, and the Islamist militias opposing U.S. forces in Iraq. The mullahs have sporadically attempted to subvert the U.S.-allied sheikdoms of the Persian Gulf. But the regime has survived because its rulers have recognized the limits of their power and have thus mixed revolutionary agitation with pragmatic adjustment. Although it has denounced the United States as the Great Satan and called for Israel's obliteration, Iran has avoided direct military confrontation with either state. It has vociferously defended

the Palestinians, but it has stood by as the Russians have slaughtered Chechens and the Chinese have suppressed Muslim Uighurs. Ideological purity, it seems, has been less important than seeking diplomatic cover from Russia and commercial activity with China. Despite their Islamist compulsions, the mullahs like power too much to be martyrs.¶ Iran's nuclear program has emerged not just as an important aspect of the country's foreign relations but increasingly as a defining element of its national identity. And the reasons for pursuing the program have changed as it has matured. During the presidencies of Hashemi Rafsanjani and Muhammad Khatami, nuclear weapons were seen as tools of deterrence against the United States and Saddam Hussein's regime, among others. The more conservative current ruling elite, including President Mahmoud Ahmadinejad and the Revolutionary Guards, sees them as a critical means of ensuring Iran's preeminence in the region. A powerful Iran, in other words, requires a robust and extensive nuclear infrastructure. And this may be all the more the case now that Iran is engulfed in the worst domestic turmoil it has known in years: these days, the regime seems to be viewing its quest for nuclear self-sufficiency as a way to revive its own political fortunes.¶ Going nuclear would empower Iran, but far less than Tehran hopes. Iran's entry into the nuclear club would initially put Tehran in a euphoric mood and likely encourage it to be more aggressive. The mullahs would feel themselves to be in possession of a strategic weapon that would enhance Iran's clout in the region. They might feel less restrained in instigating Shiite uprisings against the Arab sheikdoms in the Persian Gulf. But any efforts to destabilize their Sunni neighbors would meet the same unsuccessful fate as have similar campaigns in the past. Iran's revolutionary message has traditionally appealed to only a narrow segment of Shiites in the Persian Gulf. Sporadic demonstrations in Bahrain and Saudi Arabia have not sought to emulate Iran's revolution; rather, they have been an outlet for Shiites to express their economic and political disenfranchisement.¶ A nuclear Iran might also be tempted to challenge its neighbors in the Persian Gulf to reduce their oil production and limit the presence of U.S. troops on their territories. However, obtaining nuclear weapons is unlikely to help Iran achieve these aims, because nuclear weapons, by definition, are such a narrow category of arms that they can accomplish only a limited set of objectives. They do offer a deterrent capability: unlike Saddam's Iraq, a nuclear Iran would not be invaded, and its leaders would not be deposed. But regime security and power projection are two very different propositions. It is difficult to imagine Sunni regimes yielding to a resurgent Shiite state, nuclear or not; more likely, the Persian Gulf states would take even more refuge under the U.S. security umbrella. Paradoxically, a weapon that was designed to ensure Iran's regional preeminence could further alienate it from its neighbors and prolong indefinitely the presence of U.S. troops on its periphery. In other words, nuclear empowerment could well thwart Iran's hegemonic ambitions. Like other nuclear aspirants before them, the guardians of the theocracy might discover that nuclear bombs are simply not good for diplomatic leverage or strategic aggrandizement.¶ Likewise, although the protection of a nuclear Iran might allow Hamas, Hezbollah, and other militant groups in the Middle East to become both more strident in their demands and bolder in their actions, Israel's nuclear arsenal and considerable conventional military power, as well as the United States' support for Israel, would keep those actors in check. To be sure, Tehran will rattle its sabers and pledge its solidarity with Hamas and Hezbollah, but it will not risk a nuclear confrontation with Israel to assist these groups' activities. Hamas and Hezbollah learned from their recent confrontations with Israel that waging war against the Jewish state is a lonely struggle.¶ The prospect that Iran might transfer a crude nuclear device to its terrorist protégés is another danger, but it, too, is unlikely. Such a move would place Tehran squarely in the cross hairs of the United States and Israel. Despite its messianic pretensions, Iran has observed clear limits when supporting militias and terrorist organizations in the Middle East. Iran has not provided Hezbollah with chemical or biological weapons or Iraqi militias with the means to shoot down U.S. aircraft. Iran's rulers understand that such provocative actions could imperil their rule by inviting retaliation. On the other hand, by coupling strident rhetoric with only limited support in practice, the clerical establishment is able to at once garner popular acclaim for defying the West and oppose the United States and Israel without exposing itself to severe retribution. A nuclear Iran would likely act no differently, at least given the possibility of robust U.S. retaliation. Nor is it likely that Iran would become the new Pakistan, selling nuclear fuel and materials to other states. The prospects of additional sanctions and a military confrontation with the United States are likely to deter Iran from acting impetuously.¶ A nuclear Iran would undeniably pose new dangers in the Middle East, especially at first, when it would likely be at its most reckless. It might thrash about the Middle East, as it tried to press the presumed advantages of its newfound capability, and it might test the United States' limits. But the mullahs will find it difficult to translate Iran's nuclear status into a tangible political advantage. And if Washington makes clear that rash actions on their part will come at a high cost, they will be far less likely to take any.¶

THE RIPPLES IN THE REGION¶ In assessing the consequences of Iran's nuclearization, it is important to consider not only how Iran is likely to act but also how other states will react to this outcome -- and what the United States could do to influence their responses. Iran's nuclearization would not reduce Washington to passively observing events in the region. Washington would retain considerable ability to shape what Iran's neighbors do and do not do.¶ The nightmare scenario that could be unleashed by Iran's nuclearization is easy to sketch. Israel would go on a hair-trigger alert -- ready to launch a nuclear weapon at a moment's notice -- putting both countries minutes away from annihilation. Egypt, Saudi Arabia, and Turkey would scramble to join the nuclear club. The Nonproliferation Treaty (NPT) would collapse, unleashing a wave of nuclear proliferation around the globe.

No override now but GOP looking to poach democrats

Logiurato 7/14 (Brett Logiurato; July 14th 2015; Politics editor at Business Insider; “Here's how Congress could kill the Iran deal”; Business Insider; <http://www.businessinsider.com/how-congress-can-veto-iran-deal-2015-7>) jskullz

While even opponents of the deal concede the odds are long, there's at least a small chance that Congress could torpedo the deal.¶ “The American people are going to repudiate this and I believe Congress will kill the deal,” said Sen. Tom Cotton (R-Arkansas), one of the more hawkish members of the Senate on foreign policy.¶ Here's a brief overview of what happens next:¶ Once Congress receives the details of the deal, it will have 60 days to debate and vote on it, according to the terms of the law Obama signed in May. A GOP congressional aide told Business Insider that it has not yet received the details.¶ If Congress sends a joint resolution of disapproval to Obama (meaning both chambers of Congress disapprove of the deal), it would trigger a new timeline. He would have 12 days to veto the resolution. That's likely, considering his promise Tuesday morning to veto anything that would hamper the deal's implementation.¶ Following an Obama veto, Congress would have 10 days to vote to override his veto, which would require a two-thirds majority of both chambers of Congress.¶ If both chambers vote to override, it would prevent Obama from suspending sanctions on Iran related to its nuclear program.¶ Simple math, then, is in favor of the Iran deal moving along through Congress unscathed. ¶ Nevertheless, the deal has not only become just about universally unpopular among Republican members of Congress. It's also opposed by a chunk of Democrats normally aligned with Obama on both domestic and foreign-policy matters.¶ Sen. Chuck Schumer (D-New York), the third-ranking Democrat in the Senate and the incoming Democratic leader after Sen. Harry Reid's retirement next year, said he'd be going through the deal with a "fine-toothed comb" before deciding whether or not to support it. Rep. Eliot Engel (D-New York), the top Democrat on the House Committee on Foreign Affairs, said likewise that he'd have to go through the details — but added that he's been "troubled" by the negotiations.¶ Many congressional observers consider it likely that Congress will pass an initial resolution of disapproval. Thereafter, it will again become another question of math.¶ “The rhetoric and behavior from Iran's ayatollahs has been so provocative in recent months that Congress is surprisingly united in its opposition to the nuclear deal that was announced this morning,” said Greg Valliere, the chief political strategist at Potomac Research Group.¶ Furious lobbying against the deal, from pro-Israeli groups in particular, will begin immediately as a 60-day review period starts. There's little doubt that both houses will pass a resolution of disapproval, which will prompt a veto from President Obama. Then the real drama will begin.¶ A veto override would require at least 13 Democrats in the Senate and 44 in the House to break with their party and president — if all Republicans are united in their opposition.¶ There were 20 Democratic co-sponsors of the legislation that eventually gave Congress a say in the negotiations. Some congressional GOP aides believe at least 13 of those Democrats and an Sen. Angus King (I-Maine), an independent who caucuses with Democrats, are swayable. ¶ GOP leaders aren't convinced they'll get the veto override — but they do plan to force a sustained drumbeat leading up to the first vote in September.¶

PC key to deal legitimacy—too much conflict kills it

Weisman and Davis 7/14 (Jonathan Weisman and Julie Hirschfeld Davis; July 14, 2015; Journalists for the New York Times; “Congress to Start Review of Iran Nuclear Deal”; New York Times; http://www.nytimes.com/2015/07/15/world/middleeast/congress-iran-nuclear-deal.html?_r=0) jskullz

But even potential supporters say the spectacle of a majority of Congress rejecting such a delicate international accord could do real damage. ¶ “If I were in their shoes and I was responsible for this, I would want to win over a majority of the American people and convince them the deal is in their interest,” said Senator Chris Coons, Democrat of Delaware and a member of the Senate Foreign Relations Committee. “Who wants their legacy to be a deal that is barely approved by the narrowest of margins and is opposed by the majority of Congress? That would indicate a depth of division that would put the whole venture into question.”

PC key to keep Schumer—Key to democratic unity

Rogers 7/9 (Alex Rogers; July 9th 2015; Congressional reporter for National Journal; “The Democrat Who Could Swing the Iran Deal”; Defense One; <http://www.defenseone.com/politics/2015/07/democrat-who-could-swing-iran-deal/117442/>) jskullz

“Senator Schumer is a passionate, engaged advocate on the concerns of America and America’s security, and he’s been a strong and persistent voice in the Democratic caucus about making sure that we only support a deal that is a strong and enforceable deal,” Coons said. ¶ ¶ Having Schumer—one of the most vociferous Democratic critics of the Iran talks—on the administration’s side would be a huge get for President Obama. While he worked to alter the nuclear-deal-review bill to bring along more Democrats and supported delaying a vote on a bill that could increase sanctions due to the administration’s concerns, Schumer also ultimately backed both bills over the White House’s objections. ¶ ¶ Dylan Williams, the vice president of government affairs at the left-leaning J Street advocacy group, said supporters of the deal were encouraged by a June 3 speech by Schumer to Orthodox Union activists. “The overall reaction to the speech among those who saw it was that he was making a case that a deal which may not be perfect might be preferable to the alternatives,” Williams said. ¶ ¶ Williams believes that Schumer’s embrace of the final accord “would send a very strong signal that there would be overwhelming, near-unanimous Democratic support in the Senate for a deal.” Only if the administration suffered an unexpected major loss of support—over two-thirds of members—could Congress endanger a final deal by voting to keep sanctions. ¶ ¶ But Republicans point to Schumer’s history as a fierce Israel ally—and his self-described identity as a shomer, or guardian of Israel—and hope to pry the Senate Democrats’ main message man from his party. At least three conservative outside groups released videos last month urging viewers to call Schumer’s office and ask him to reject a deal they too deemed weak.’

Deal will pass but Obama still needs PC to get moderate Dems on board – lobbying now

Lee et al 7/15/15 (CAROL E. LEE, COLLEEN MCCAIN NELSON and KRISTINA PETERSON, Writers for the Wall Street Journal, “Obama Girds for Battle With Congress on Iran Deal”, <http://www.wsj.com/articles/obama-girds-for-battle-with-congress-on-iran-deal-1437005023>)/BW

President Barack Obama delivered an unusually animated and sometimes combative defense of the Iran nuclear deal the day after it was reached, girding for a complicated political challenge likely to force him to use his veto to save his crowning foreign-policy achievement. Lawmakers have 60 days to review the agreement and an option to vote on approving or disapproving it, with opposition to the deal widespread among Republicans who control both houses of Congress. If they vote it down, the deal’s survival will hinge on Mr. Obama’s ability to secure enough support from his own Democratic Party to prevent a two-thirds majority in each chamber from overriding his promised veto. Mr. Obama, in a 67-minute news conference at the White House, accused opponents—from Israeli leader Benjamin Netanyahu to Republican lawmakers—of pushing political talking points to simply discredit the accord as a bad deal. “For all the objections of Prime Minister Netanyahu or, for that matter, some of the Republican leadership that’s already spoken, none of them have presented to me or the American people a better alternative,” Mr. Obama said. “Either the issue of Iran obtaining a nuclear weapon is resolved diplomatically through a negotiation or it’s resolved through force, through war,” he added. “Those are the options.” The president’s aggressive defense of the deal drew quick pushback from Republicans in Congress, where the criticism has largely been twofold: that the agreement won’t stop Iran from acquiring a nuclear weapon and that it doesn’t address broader concerns about Tehran’s behavior in the region. Rep. Lee Zeldin (R., N.Y.) disputed the president’s assertion that this is a choice between the accord or war. “Here’s an alternative other than war: A better deal,” Mr. Zeldin said. “For the security of America and the stability of the Middle East, we must pursue a better direction immediately.” Sen. Marco Rubio, a Florida Republican and 2016 presidential candidate, started an online petition opposing the deal, and the powerful pro-Israel lobby Aipac is calling on lawmakers to vote against it. At the same time, J Street, a liberal pro-Israel group, said Wednesday it will launch a multimillion-dollar effort, including ads in print and broadcast media, to lobby lawmakers to support the deal. The agreement reached Tuesday in Vienna puts strict limits on Iran’s nuclear program for the next decade that are designed to keep Tehran from being at least 12 months away from amassing enough nuclear fuel for a bomb. In exchange, the U.S., the European Union and the United Nations will lift economic sanctions on Iran. Mr. Obama said he is “not betting on the Republican Party rallying around this agreement,” and Vice President Joe Biden met with Democrats on Capitol Hill. Mr. Biden told Democratic lawmakers he was initially skeptical of the deal but is now convinced the agreement, while not perfect, is worth supporting, according to participants. But even some Democrats expressed concerns about the deal, particularly on the inspections provisions and the decision to lift United Nations embargoes on arms and ballistic missile sales to Iran. “For most members, including myself, it comes down to verification,” said Rep. Ron Kind of Wisconsin, chairman of the New Democrat Coalition, a group of centrist House Democrats. “It comes down to access to the sites, making sure they’re not impeded in any way, that we’ve got unlimited access to where we need to go to make sure Iran is living up to their agreement.” The White House’s effort to preserve the deal depends on cohesion among Democrats in the House and persuading wavering Democratic senators to stick with the president. That is because it became clear in the hours after the agreement’s unveiling that few, if any, Republicans were likely to support it. For Mr. Obama, the next best option would be for Democrats to block the Republican-controlled Congress from passing a resolution of disapproval. Such a resolution would likely prompt the agreement’s collapse if Congress could override a veto from Mr. Obama.

Obama needs political capital to pass the Iran deal

WERNER 7/8/15 (Erica, writer at The Associated Press, “Obama presses Senate Democrats to withhold judgment on Iran”, http://www.philly.com/philly/news/politics/20150708_ap_b1b9c2e2baa6436fb31d29e234afcd66.html)/BW

A top focus was Iran, according to several lawmakers. Prospects are uncertain for the Obama administration to complete a deal, but if the accord isn’t sent to Congress by Thursday, its

month-long review period would be doubled to 60 days. Obama has expended significant political capital on finalizing an agreement to keep Iran from going nuclear, prompting Republicans to accuse him of making too many concessions and even some Democrats to express deep ambivalence. "He wanted to make it perfectly clear that he is in no rush to an agreement and that he will walk away from the table if there is no good deal to be reached and that there isn't a deal yet and so all of these reports about what is in a deal are premature," said Sen. Chris Murphy, D-Conn. Participants said that after Obama's opening remarks, the reception with senators and Cabinet members turned into an unusually friendly and free-flowing question and answer session ranging from climate change, to politics, to the church shooting in Charleston, S.C., to the budget, to rare diseases, to health care in the wake of the Supreme Court decision upholding Obama's health care law.

Deal will pass but its contentious

Domm 7/13 (Patti Domm; July 13, 2015; CNBC Executive news editor; "Iran deal would face tough battle in Congress"; CNBC <http://www.cnbc.com/2015/07/13/iran-deal-would-face-tough-battle-in-congress.html>) jskullz

¶ Any Iran nuclear deal is going to face a tough, and possibly lengthy, battle in Washington that could delay the arrival of Iranian crude onto the market. ¶ ¶ Iran was reportedly close to a deal Monday that could end its nuclear program and remove the economic sanctions against the country. The U.S. and five other nations have been in tense negotiations with Iran for months, and diplomatic sources were quoted as saying an agreement could be announced Tuesday. ¶ ¶ "For anyone that thinks that Iranian oil will be on the market by the end of the year, it's not a sure thing, because of Congress," said Greg Valliere, chief political strategist at Potomac Research. ¶ ¶ "The Iranian behavior and rhetoric have been so provocative, that there's a decent chance Congress could kill this thing," Valliere said. ¶ ¶ Read More Iran diplomats: Nuclear deal likely Monday into Tuesday: Sources ¶ ¶ While President Barack Obama would override any congressional motion of disapproval, Valliere said Congress would attempt to overturn the veto. "That's going to be a close call," he said. ¶ ¶ Analysts said the details of the deal will be important. The agreement was expected to impose strict verifiable limits on Iran's nuclear program to prevent it from advancing to weapons development. ¶ ¶ Dan Clifton, head of policy research at Strategas, agrees Congress will attempt to roadblock the deal but he expects it ultimately to be approved. ¶ ¶ Congress has 60 days to review the agreement but in several weeks it will go on recess until September, delaying the process. That could also potentially give opponents more time to galvanize their case, Clifton said. ¶ ¶

It's a clash of epic proportions

Lewis 7/14 (Jeffery Lewis; July 14 2015; director of the East Asia Nonproliferation Program at the James Martin Center for Nonproliferation Studies; "It's a Damn Good Deal"; Foreign Policy; <http://foreignpolicy.com/2015/07/14/its-a-damn-good-deal-iran-nuclear-agreement-joint-comprehensive-plan-of-action/>) jskullz

Remember how House Republicans have repeatedly voted to repeal, defund, or deform the Affordable Care Act? Fought all the way to the Supreme Court, twice? ¶ ¶ The fight over the Iran deal is going to make the Obamacare battles look like **two preppies slap-fighting over a cucumber sandwich.**

Will pass but it will be an epic fight

Atkins 7/13 (Kimberly Atkins; July 13, 2015; Journalist for the Boston Herald; "Atkins: Battle brewing in D.C. over possible Iran deal"; Boston Herald; http://www.bostonherald.com/news_opinion/columnists/kimberly_atkins/2015/07/atkins_battle_brewing_in_dc_over_possible_iran_deal) jskullz

WASHINGTON — GOP lawmakers yesterday **vowed to kill** what appeared to be an imminent Iran nuke deal, in a preview of **the epic battle brewing** on Capitol Hill — but making good on their promise could prove even tougher than the long-running negotiations with Tehran. Senate Majority Leader Mitch McConnell said any deal would be “a very hard sell for the administration” once it lands in Congress, where lawmakers will get 60 days to review the measure before approving it or passing a resolution of disapproval. In actuality, it’s McConnell who will have the toughest sell trying to stop whatever deal Secretary of State John Kerry and the team of allied negotiators reach with Iranian officials. A resolution of disapproval will require 67 Senate votes to override President Obama’s veto. That means **McConnell and other Republicans will have to woo at least 13 Democrats to their side.** That’s a tall order indeed, especially for a Congress with a history of showing more bark than bite when it comes to the Obama administration’s foreign policy moves. Just last month, despite bipartisan calls for Obama to seek congressional approval for the military strikes against ISIS in Iraq and Syria that were already underway, a measure formally authorizing military force fizzled on the Hill despite efforts of a few lawmakers, including Bay State Rep. Jim McGovern, to force a vote. Details of the deal to roll back Iran’s nuclear program and stop it from developing nuclear weapons in exchange for the lifting of sanctions were still being worked out in the early hours today. Of special interest will be the frequency of access international inspectors will have to Iranian nuclear sites and the timing of sanctions relief. Alireza Miryousefi, spokesman for Iran’s Ministry of Foreign Affairs, said the agreement was a 100-page document. But lawmakers yesterday began blasting the measure even as final sticking points were being ironed out. “Whatever deal comes out of this weekend is going to be dangerous for the United States and dangerous for the world,” Sen. Tom Cotton (R-Ark.) said on CBS’s “Face the Nation,” sentiments echoed by McConnell and other GOP lawmakers and Republican presidential candidates. They join critics from abroad, led by Israeli Prime Minister Benjamin Netanyahu, who has steadfastly asserted that a deal puts Israel in imminent danger of attack. In a tweet he called Iran “just like ISIS, but much bigger.” But **when a deal is struck, the hardest part will be over for Obama and Kerry, each seeking to shore up their foreign policy legacies.** And the tough part for McConnell and the rest of the GOP leadership will have just begun.

Deal requires huge amounts of political capital—congressional outrage

Pace 7/14 (Julie Pace; July 14, 2015; Staff Writer for the Associated press; Obama warns Congress not to stand in way of Iran deal; Associated Press via Philly; http://www.philly.com/philly/news/politics/20150714_ap_765c36dd4a1a4ebeaff0c7c6b0294250.html#IXQSzjtWULw2M80A.99) jskullz

For Obama, the accord marks the fulfillment of one of his top foreign policy goals and will be cast by the White House as a validation of the president's focus on seeking resolutions through diplomacy. The president staked enormous political capital on the diplomatic pursuit with Iran, deeply straining relations with Israel and sparking outrage from some congressional lawmakers. It will likely be well after Obama has left the White House before it is known whether the deal succeeds in preventing Iran from building a bomb. Critics say Iran cannot be trusted even with the lower levels of nuclear technology it will be allowed to retain under the terms of the agreement. With the deal between the world powers now finalized, Congress has 60 days to

assess the accord and decide whether to pursue legislation imposing new sanctions on Iran or prevent Obama from suspending existing ones. Obama called congressional leaders Monday night to alert them that a deal was at hand.

It'll be close—PC necessary to keep democrats in line—small margin

Espo 7/14 (David Espo; July 14, 2015; AP special correspondent; "Veto struggle with Congress possible over Iran nuclear deal"; WRAL; <http://www.wral.com/veto-struggle-with-congress-possible-over-iran-nuclear-deal/14772930/>) jskullz

WASHINGTON — The Republican-controlled Congress can't block the complex nuclear agreement the Obama administration announced with Iran on Tuesday, but a veto struggle is a near certainty as lawmakers try to undermine the deal by insisting that numerous sanctions remain in place.¶ A law that President Barack Obama signed earlier this year gives him five days to submit the agreement to Congress for review. It also provides for a condensed, 60-day period for Congress to hold hearings and consider legislation that would bar him from lifting sanctions that lawmakers have enacted in recent years.¶ Republicans and Democrats both noted the measure would be subject to a 60-vote requirement in the Senate. The GOP holds 54 seats, meaning party leaders would need the votes of at least six Democrats to pass the legislation, technically known as a resolution of disapproval.¶ Obama has already said he'll veto any legislation to leave sanctions in place. A two-thirds majority in each house would be required to override him. As an example, that means the administration would be assured of prevailing if it could hold the votes of 34 Democrats in the Senate.¶ A close vote on overriding a veto is likely, and Obama's hopes would rest in part on the views of Democrats with close ties to Israel, which vehemently opposes the lifting of any sanctions. Among them is Sen. Charles Schumer of New York, a member of the leadership, who issued a non-committal statement saying he would "carefully study the agreement before making an informed decision."

Obama political capital key to prevent additional sanctions from the GOP

Welsh 7/6/15 (Teresa, writer at US News, "Iran Nuclear Deal Close, But Not Assured", [//BW](http://www.usnews.com/news/articles/2015/07/06/iran-nuclear-deal-close-but-not-assured)

Diplomats in Vienna have one more day to negotiate a deal on Iran's nuclear program before another deadline expires Tuesday, with both sides saying they have not yet reached consensus on critical remaining issues. Iranian Foreign Minister Javad Zarif said Monday negotiators "are trying and working hard" but that differences remain, while Secretary of State John Kerry said Sunday that progress had been made but negotiations "could go either way." Secretary of State John Kerry and Iranian Foreign Minister Javad Zarif arrive to deliver a statement at the Swiss Federal Institute of Technology in Lausanne, Switzerland on April 2, 2015. "We are not yet where we need to be on several of the most difficult issues," said Kerry, who stayed in Vienna over the weekend even as other ministers traveled home. "If hard choices get made in the next couple of days and made quickly, we could get an agreement this week. But if they are not

made, we will not." Diplomats from China, France, Germany, Russia and the United Kingdom are working along with the U.S. to reach an agreement with Iran on that country's nuclear program. The Americans in particular are eager to reach an agreement this week because Congress must receive a copy of the deal by July 9 to ensure a 30-day review period. If lawmakers see the agreement after that date, the review period will expand to 60 days. That provision is the result of a bill sponsored by Sen. Bob Corker, R-Tenn., chairman of the Foreign Relations Committee. Corker said Sunday he was concerned that the Iran negotiations had gone from an effort to dismantle the Iranian nuclear program to "managing proliferation." Corker and other critics say the Obama administration has given in to too many Iranian demands and that the administration wants a deal so badly it will agree to a bad one. While Tuesday's deadline is self-imposed, not reaching a deal would be a loss for both President Barack Obama and Kerry, who have placed immense political capital on the success of the negotiations. The talks could continue beyond the deadline, but Republicans who have held off on votes to impose additional sanctions on Iran would likely move on such legislation. And, even if Obama could successfully dispatch such a bill with his presidential veto, it would almost certainly be enough to doom the fragile process.

Iran deal will be close- Obama pushing is key

Roberts 7/14/15 (Dan Roberts, covers politics and U.S. national affairs for the guardian, "Iran Nuclear Deal: What will the US do now?" <http://www.theguardian.com/world/2015/jul/14/iran-nuclear-deal-what-will-the-us-do-now>, 7/14/15)

In theory, Towards the end of the 60-day review period, both the House and Senate will probably vote on a resolution of approval or disapproval. The exact mechanism is unclear, but this is likely to require a simple majority in both chambers to pass – ie 51 of the 100 senators and 218 of the 435 representatives. Since many Republicans are opposed to the deal and currently command a majority in both House and Senate, it is quite possible that a joint disapproval resolution would pass. The catch is that the president can veto any attempt to make such a resolution enforceable – and on Tuesday in his statement on the deal he vowed to do so. To override a presidential veto requires a second vote to be passed with a two-thirds majority in both chambers: a high hurdle that would have to include at least 42 Democrats in the House and a dozen Democratic senators – probably more, if some Republicans chose to back the administration. In other words, Obama can stick to his deal as long as he persuades at least one-third of one chamber of Congress to vote with him over the course of the four votes. Conversely, his opponents have to persuade a significant number of Democrats to stand up against their president on the most important foreign policy question of his administration – four times in a row.

Dems key to resolution of disapproval and overriding Obama's potential veto

Zengerle 7/14/15 (Patricia Zengerle, Congressional Correspondent for Reuters.com, "Iran Deal faces fight in U.S. Congress, but will likely survive," <http://in.reuters.com/article/2015/07/14/iran-nuclear-congress-process-idINL2N0ZS0AW20150714>, 7/14/15)

The nuclear deal between world powers and Iran starts a new phase of intense negotiation - this time between the Obama administration and the U.S. Congress, where some Republicans have long been working to sink an agreement. Any effort in Congress to overturn the deal would face an uphill fight. Republicans have majorities in both the House of Representatives and Senate, but they would need the support of dozens of President Barack Obama's fellow Democrats to sustain a "resolution of disapproval" that could

cripple a deal. The chances of that happening are slim. A resolution of disapproval would need only the support of the Republican majority to pass the House, but would require the votes of at least six Democrats to get the 60 to advance in the Senate. The chances of mustering enough votes to then overrule a near-certain Obama veto are slimmer still. The second-ranking Democrat in the House, Steny Hoyer, said after the deal was announced: "It is now up to members of Congress to work carefully through every detail, particularly given Iran's likelihood to exploit any ambiguity or loophole to its benefit and to the detriment of the security of America, Israel, and our allies in Europe and the Gulf." Senate Democrats have stood firm to date against Republican-led efforts to interfere with the talks, which included Iran and the United States, Britain, China, France, Germany and Russia. In the House, more than 150 Democrats, including party leader Nancy Pelosi, signed a letter in May strongly supporting the nuclear negotiations. "I understand the heavy lift that's involved," Tennessee Republican Senator Bob Corker, chairman of the Senate Foreign Relations Committee, told reporters when asked about the chances of passing a "resolution of disapproval."

Iran deal will pass, but it will be close – PC key

Heller and Chiacu 7/19/15 (Gernot and Doina, writers for Reuters, "Obama sends Iran deal to wary Congress, Israel urges rejection", [//BW">http://www.reuters.com/article/2015/07/19/us-iran-nuclear-idUSKCN0PT0I520150719">//BW](http://www.reuters.com/article/2015/07/19/us-iran-nuclear-idUSKCN0PT0I520150719))

President Barack Obama's administration sent a nuclear agreement with Tehran to Congress on Sunday and Israeli Prime Minister Benjamin Netanyahu urged U.S. lawmakers to reject a deal he said would only feed an "Iranian terror machine". In a first concrete sign of European determination to quickly rebuild economic and political ties with Iran after a 12-year standoff, German Economy Minister Sigmar Gabriel arrived in Tehran with an economic delegation. Other European powers were expected to follow. Obama has promised to exercise his veto if Congress rejects the deal, which curbs Iran's nuclear program while allowing an easing of economic sanctions. Overriding it would require a two-thirds majority of both the House of Representatives and Senate, so the administration is working to win over enough of Obama's fellow Democrats to offset strong Republican opposition. In an unusual move, Obama took three Democratic congressman golfing with him: Joe Courtney of Connecticut, Ed Perlmutter of Colorado and John Yarmuth of Kentucky. The president more often taps aides and friends for weekend golfing. "I think the right thing to do is merely not to go ahead with this deal," Netanyahu said on CBS's "Face the Nation" as he continued a string of U.S. media interviews denouncing the deal reached on Tuesday between Iran and six major powers. "There are many things to be done to stop Iran's aggression and this deal is not one of them," he said.

PC key to passing the deal – deal is the only way to top middle eastern proliferation

Al Jazeera 7/15/15 (street creds, "Obama urges passage of Iran nuclear deal in US Congress", [//BW">http://www.aljazeera.com/news/2015/07/obama-urges-passage-iran-nuclear-deal-congress-150715174444041.html">//BW](http://www.aljazeera.com/news/2015/07/obama-urges-passage-iran-nuclear-deal-congress-150715174444041.html))

US President Barack Obama has urged the opposition-led Congress to support the nuclear deal with Iran, calling the agreement "a powerful display of leadership and diplomacy" by Washington DC. In a press conference on Wednesday, Obama said that the deal achieved the goal of cutting off "every single path" Iran has to a nuclear bomb. "I can say with confidence, that Iran will not be in a position to develop a nuclear bomb," he said. "Based on the facts, the majority of Congress should approve it." Both the House of Representatives and the Senate branches of Congress in the US are controlled by the opposition Republican Party. Earlier this year, lawmakers passed a resolution giving them authority to review the deal within the next 60 days. Obama has been holding an intense public lobbying campaign to convince Congress to approve the deal. He has also threatened to veto any measure against the Iran deal. He said that

in the absence of a deal, the international economic sanctions that brought Iran to the negotiating table will unravel, and the world community will be unable to put the sanctions regime together. "Without a deal, we risk even more war in the Middle East, and other countries in the Middle East would feel compelled to develop their own nuclear weapons," Obama said, adding that such a chain of events would risk a nuclear arms race "in the most dangerous region in the world." Obama however ruled out the re-establishment of a formal diplomatic relationship with Iran similar to Cuba in the near future. Later, the White House published a readout of a phone call between Obama and Russian President Vladimir Putin, in which the US president thanked his counterpart for supporting the deal. "The President thanked President Putin for Russia's important role in achieving this milestone, the culmination of nearly 20 months of intense negotiations," the statement said.

Holding off on sanctions key—causes deal collapse and backlash

Toosi 6/15 (Nahal Toosi; foreign affairs correspondent at POLITICO; "'Great unwinding' of sanctions on Iran poses risks"; Politico; <http://www.politico.com/story/2015/06/obama-iran-nuclear-deal-sanctions-119011.html#ixzz3fapIH0Ay>) jskullz

Removing sanctions too quickly would give Iran sudden access to cash that some fear it will use to fund nefarious activity. With an accord due by June 30, however, others warn of a different threat: If Iran doesn't feel relief from sanctions fast enough, it could lose its incentive to stick to the agreement. ¶ With an accord due by June 30, however, others warn of a different threat: If Iran doesn't feel relief from sanctions fast enough, it could lose its incentive to stick to the agreement. ¶ "People think that there's going to be a windfall, a profit for Iran," said Elizabeth Rosenberg, a former senior adviser on sanctions at the Treasury Department. "The truth is, there's actually a number of reasons why it won't be fast and it won't be easy." ¶ The deal is expected to suspend a slew of nuclear-related international sanctions if Iran severely curbs its atomic program, allowing Tehran to access what's believed to be more than \$100 billion in frozen foreign exchange reserves. The Obama administration insists sanctions will be rolled back in phases based on Iran meeting certain benchmarks, and that they will be snapped back in place if Iran violates the deal. But some Iranian officials have indicated they expect many of the main sanctions to be lifted immediately once a deal is reached. ¶ House Majority Leader Kevin McCarthy of Calif., left, walks with Rep. Darrell Issa, R-Calif., toward the House Chamber on Capitol Hill in Washington, Friday, June 12, 2015. Earlier, President Barack Obama made an 11th-hour appeal to dubious Democrats on Friday in a tense run-up to a House showdown on legislation to strengthen his hand in global trade talks. (AP Photo/Pablo Martinez Monsivais) ¶ Also on POLITICO ¶ Obama's trade plan in critical condition ¶ JAKE SHERMAN ¶ The "great unwinding," as some call the removal of sanctions, is no simple task. ¶ ¶ The U.S. alone has over the past few decades placed numerous sanctions on Iran, some through congressional action and others via the executive branch. In more recent years, amid growing international concern about its nuclear program, Iran also has faced sanctions from several other countries as well as through the United Nations and the European Union. ¶ The combined pressure of the international sanctions program cratered Iran's economy, spurring severe inflation that climbed

above 40 percent in 2013, leading its currency to plummet in value — and ultimately helping bring the Islamist-led country to the negotiating table.¶¶ Under the deal, sanctions that target Iran’s sponsorship of terrorism, ballistic missile program and human rights abuses are expected to stay in place, while those related to its nuclear program will be waived. Sanctions that have targeted Iran for multiple reasons, including its nuclear initiatives, may be more challenging to pick apart.¶¶ Iran already is courting international businesses, and many have expressed interest in investing in the Islamic republic, or, in some cases, returning there. The country has a well-educated population of 81 million — about the same as Germany reports. Its vast oil-and-gas reserves make it a prize for energy firms, but the technology, automobile and construction industries, among others, also are appealing.¶¶ Still, the long-term prognosis for the nuclear deal is uncertain. If a Republican wins the White House in 2016, the U.S. commitment to the deal could flag. Corruption also is rampant in Iran, where the state controls much of the economy.¶¶ For those reasons and more, most U.S. firms will likely continue to avoid the Middle Eastern nation altogether, analysts said, while businesses based elsewhere will tread cautiously, knowing they risk their relationship with the United States (and massive fines) if they run afoul of what will still remain a complex sanctions architecture.¶¶ The reluctance could stunt a hoped-for economic rebound in Iran. “What that may do is cause frustration in Iran, which will then undermine the deal and reduce their incentive to adhere to the deal,” Rosenberg said.¶ UNITED STATES - DECEMBER 15: Senate Minority Leader Mitch McConnell, R-Ky., left, talks with Sen. Charles Schumer, D-N.Y., outside of the Senate chamber after a roll call vote on the motion to proceed to the New START Treaty. (Photo By Tom Williams/Roll Call)¶¶ Also on POLITICO¶ Can Schumer and McConnell just get along?¶¶ MANU RAJU¶¶ A slow recovery also could strengthen Tehran hard-liners set against compromising the country’s nuclear program — which Iran has always insisted is peaceful — and disillusion an Iranian public constantly bombarded with anti-U.S. propaganda. Although Iran has received some relief from sanctions under an interim deal struck to keep it at the negotiating table, Iranians expect significantly more of an economic boost once a formal accord is reached.¶

I/L—Unity

Democratic unity key—plan wedges Obama and rest of democrats

Allen 7/14 (Johnathan Allen; July 14 2015; Chief political correspondent at Vox; "Obama's Iran deal is making Democrats in Congress very nervous"; Vox; <http://www.vox.com/2015/7/14/8963101/obama-iran-deal-democrats>) jskullz

The Iran nuclear deal may be good policy — and a legacy builder for President Barack Obama — but it also creates a tougher political environment for Democrats running for president and Congress in 2016. "Overall, this is a deal that will probably come at a price on the campaign trail," said Princeton University political science professor Julian Zelizer, who has written about the short-term political pain of past treaties. "Republicans will play to the fears among voters, including Democrats, that this is too risky." The best proof of the thorny politics: Obama already has vowed to veto planned legislation blocking the deal. That means he will rely on just one-third of either the House or Senate voting with him to save it. He needs a majority of Democrats but only a minority of either chamber. That paradigm — Republicans uniformly opposed and Democrats divided — will make the agreement a tougher sell to the broader public than if it had bipartisan majority support or even full backing from Obama's Democrats. "The easier vote for most us will be no," said one House Democrat who is inclined to back the president. Members don't tend to lose their seats for voting against the president when his position ends up winning, the lawmaker explained. On the other side, it's easy for Republican candidates to be against Obama and his foreign policy — it plays well with their base — and they were vocal in their criticism of the deal even before they'd had a chance to read all the details. Wisconsin Gov. Scott Walker flicked at how the GOP will go after Democrats on the deal. "President Obama has abandoned the bipartisan principles that have guided our nonproliferation policy and kept the world safe from nuclear danger for decades," Walker said in a statement. "Instead of making the world safer, this deal will likely lead to a nuclear arms race in the world's most dangerous region." The larger issue here is that in the waning light of his presidency, Obama is increasingly making policy in areas that divide Democrats — from trade to the Iran deal — and they are concerned that his political incentives no longer match theirs. They know that Obama, who refers to the last two years of his presidency as the "fourth quarter," is running a two-minute drill to secure as much of his legacy as possible before he leaves office. And those goals may not always serve their political futures. Why this is so difficult for Democrats From the White House's perspective — and that of many Democrats — the deal with Iran is far preferable to leaving in place a sanctions regime that doesn't actually stop Tehran from developing a nuclear weapon or going to war with Iran. Under the pact, Iran would give up its nuclear weapons program in exchange for the lifting of certain economic sanctions, which would make it less of a nuclear threat and more stable. The key is whether the inspections and enforcement provisions of the deal can be implemented effectively and whether Iran's loss of nuclear capability is verifiable. And therein lies the rub for Democrats on the ballot in 2016. The deal won't be consecrated for months. Republicans charge that it's not airtight — that Obama is putting his faith in the trustworthiness of the Iranian regime. The truth is that the next election is too soon to judge whether Iran is complying with its end of the bargain, which leaves Democrats open to Republican attacks that the deal is a disaster. It will be hard for Democratic candidates to prove a negative. One House Democrat who is generally supportive of the president — and open to

the deal — expressed hope Tuesday that the Senate would sustain an Obama veto of legislation blocking the deal so that House Democrats wouldn't have to vote on it at all. It's easier for Obama to round up 34 senators than 146 House Democrats, the lawmaker argued — even though conventional wisdom holds that the opposite is true.¶ Obama's interests and those of fellow Democrats are diverging in the "fourth quarter"¶ There was a time, earlier in his administration, when fellow Democrats would have walked the plank for Obama without letting their political concerns slow them down. Those days are over.¶ "It is not unusual as a president comes to the last months of his administration, particularly if it's his second term, that members of his party become a little less willing to follow the president's lead," former Sen. Bob Graham, a Florida Democrat and onetime chairman of the Senate Intelligence Committee, said.¶ Obama's incentives are necessarily different from those of his Democratic allies in Congress. While he's focused on policy and legacy, they are focused on policy and winning reelection. Increasingly, Obama has used tools that don't require full Democratic support to implement policy — such as executive actions and the Iran deal. Still, Democrats know they will be held accountable for his actions, particularly if they can't show that they opposed him on a specific issue.¶ Jim Manley, a former aide to the late Sen. Ted Kennedy and Minority Leader Harry Reid, said the dynamics of a congressional disapproval vote — which would set up the veto and the one-third threshold necessary to sustain it — give the president an advantage.¶ "I think in the end, the president will have enough Democrats with him to sustain a veto," Manley said. "For many Democrats, the politics of this are so tricky they will be forced to vote against their president."

Deal is 50-50 now, Dems are key to ensuring passage

Werner 7/8/15 (Erica Werner, congressional reporter for the Associated Press, "President tells them he will walk away if a good deal isn't there," <http://www.slttrib.com/home/2710403-155/obama-presses-senate-democrats-to-withhold>, 7/8/15)

Washington • President Barack Obama downplayed chances for an Iran nuclear deal in a closed-door meeting with Senate Democrats, participants said Wednesday, while asking them to withhold judgment until any deal is complete. Obama also insisted that he won't sign a weak deal — a message that won praise from senators who joined the president for wine and appetizers in the White House State Dining Room on Tuesday evening. "He was urging that we wait to see the actual terms of an agreement if there is one and to have confidence that he would not sign a deal he viewed as flawed," said Sen. Chris Coons, D-Del. Coons added that Obama said it was uncertain whether the Iranians would go along with some of the tougher conditions and that a deal is "at best a 50-50 proposition."

Dem base key—rest of congress too polarized

Weisman and Davis 7/14 (Jonathan Weisman and Julie Hirschfeld Davis; July 14, 2015; Journalists for the New York Times; “Congress to Start Review of Iran Nuclear Deal”; New York Times; http://www.nytimes.com/2015/07/15/world/middleeast/congress-iran-nuclear-deal.html?_r=0) jskullz

[ed royce is a republican representative from California; benjamin cardin is head democate on the senate foreign relations committee]

“There are people who have already made up their minds, no question about that, and I think that’s unfortunate,” Mr. Cardin said. “But at this point, a majority of Congress believes we have to objectively review what’s in the agreement before we decide what course we’re going to take.”¶ Mr. Cardin said the Iran review, while proceeding in Congress initially over the White House’s objections, probably played to the West’s advantage. Under the terms of the law that established the review, Congress has 30 days to examine the agreement before sanctions can be lifted on Iran. But because Congress will be in its August recess when that review period ends, the deal effectively has an additional month of public scrutiny before Congress can decide its actions.¶ Mr. Cardin said the Iranians thought they could force negotiators to accept terms more favorable to Tehran to avoid that extra 30-day period. But American negotiators in the end let that deadline slip.¶ “Iran thought they’d blink at the last minute, and they didn’t,” he said.¶ White House officials must now decide whether the president should try to win over a majority of Congress, including hostile Republicans, or focus on shoring up a Democratic base to sustain a veto. Mr. Royce said he thought the strategy to protect the veto was already in play.¶ “I don’t see them convincing skeptical Democrats this is a good agreement. I see them pressuring Democrats to go along,” he said.

Senate Dems key to Iran deal

Hughes and Peterson 7/16/15 (Siobhan Hughes and Kristina Peterson, reports for the wall street journal both cover congressional issues, “Senate Democrats Key to Iran Deal,” <http://www.wsj.com/articles/senate-democrats-key-to-iran-deal-1437092680>, 7/16/15)

WASHINGTON—President Barack Obama’s efforts to cement the nuclear deal with Iran hinge on support from a majority of senators in his party, many of whom face competing political pressures as they weigh an agreement that could reshape the U.S. relationship with the Middle East. Sen. Chuck Schumer of New York, the chamber’s Democratic leader-in-waiting, is perhaps the most closely watched, because of his influence in the broader caucus. The top Democrat on the Senate Foreign Relations Committee, Ben Cardin of Maryland, is pivotal because he is a point person for the party on foreign policy, as is Sen. Chris Coons (D., Del.), whose views are being solicited by others in the caucus. So far, few of the Democrats have shown their hand as they assess the deal, its likely impact on the Mideast—and on their own political futures. Even Minority Leader Harry Reid (D., Nev.), who isn’t running for re-election and is often a reliable Obama ally, is a question mark. Republicans have almost universally promised to fight the agreement, which would stand as a cornerstone of Mr. Obama’s foreign-policy legacy. That leaves Senate Democrats as the key line of defense for the White House, because Republicans need 60 votes to reject the deal and they control only 54 seats. In other words, one of Mr. Obama’s best bets for avoiding a congressional resolution of disapproval of the Iran pact would be getting 41 of the 46 senators in the Democratic caucus to support a filibuster of it, thus depriving Republicans of the 60 votes they need to advance the measure. Mr. Obama has threatened a veto of any such resolution, which would then force Republicans to assemble 67 votes for an override. The lobbying has already begun. Vice President Joe Biden on Thursday met with Democrats on the Senate Foreign Relations Committee in a bid to help Senate Democrats get comfortable with it. An early problem cropped up when lawmakers raised questions about

why the Obama administration would head to the United Nations on Monday for an expected vote on lifting U.N. sanctions that are separate from American-imposed sanctions. Some lawmakers viewed such a move as an affront to Congress, which will have 60 days to review the deal and which is protective of its prerogatives. They feel their imposition of sanctions several years ago made possible this week's diplomatic agreement. "We are deeply concerned that your administration plans to enable the United Nations Security Council to vote on the agreement before the United States Congress can do the same," Senate Foreign Relations Committee Chairman Bob Corker (R., Tenn.) and Mr. Cardin wrote in a letter Thursday to Mr. Obama. "We urge you to postpone the vote at the United Nations until after Congress considers this agreement." House Minority Leader Nancy Pelosi (D., Calif.), who has a strong record of keeping her caucus in line, was optimistic House Democrats would largely hang together with the administration. But because the GOP-controlled House is expected to have the votes to initially reject the Iran deal, Democratic cohesion is more important in the Senate, where the party has more sway. Democrats are caught between competing forces, a situation aggravated by 2016 politics. Liberals view the pact as preferable to the risk of war with Iran, which the Obama administration has painted as the stark alternative. On the other side, pro-Israel constituents—some of whom are big campaign donors—worry that lifting sanctions will make Israel vulnerable and leave Iran flush with cash to support terrorist activities. Mr. Schumer embodies the pressures in his party. He said Thursday he hadn't made a decision, but in January showed a willingness to buck the White House by siding with Republicans in the Banking Committee in favor of a bill to toughen sanctions on Iran if a deal wasn't reached by the end of June. The White House had said the bill could undermine the talks. Two other Democrats seen as crucial, Mr. Cardin and Mr. Coons, have also times been willing to go their own way. Last month, Mr. Cardin voted against a fast-track trade bill pushed by the White House even though he had earlier supported it. "I am in the process of reviewing it," Mr. Cardin said of the Iran pact. "We have lots of questions—we do—and I'm going to take advantage of getting the answers to those questions." Sen. Jon Tester (D., Mont.) said his primary concern with the deal is oversight, to ensure that Iran can't cheat. "There aren't a lot of other options out there, other than boots on the ground," he said. Mr. Tester's position is being watched closely because as chairman of the Democratic Senatorial Campaign Committee he must make calculations about how his voting record will affect fundraising. Sen. Michael Bennet (D., Colo.), a former DSCC chair who is up for re-election in 2016, also has special political considerations. The White House faces additional uncertainty with lawmakers such as Sens. Kirsten Gillibrand of New York, Cory Booker and Bob Menendez of New Jersey and Bill Nelson of Florida, who face pressure because of large Jewish populations in their states. The tone from the New Jersey Democrats hasn't been not promising for the White House. "I'm concerned that the deal ultimately legitimizes Iran as a threshold-nuclear state," Mr. Menendez said in a statement this week. "The bottom line is: The deal doesn't end Iran's nuclear program—it preserves it." Mr. Booker said in a statement that "the most important question...is whether it will credibly prevent Iran from obtaining a nuclear weapon, now and into the future." Liberals like Sen. Brian Schatz (D., Hawaii) were more supportive of the Obama administration. "The more I learn about it, the more inclined I am to support it. The harder you scratch, in terms of the opposition, the more it becomes clear that they have no alternative," Mr. Schatz said. Some centrists, while still weighing the decision, were going through a similar thought process. "I'm skeptical, but I'm also going to very closely examine the alternatives," said Sen. Claire McCaskill (D., Mo.). Ms. McCaskill said she worried that if the U.S. rejected the deal, the international sanctions regime could collapse. "What does the world look like with no more sanctions on Iran except us? Does that mean their race to a nuclear weapon is on steroids at that point? I'm trying to weigh not just what's in this deal and whether or not it's verifiable, but what are we left with if we turn this deal down," she said.

Senate Dems key to Iran deal

Hughes and Peterson 7/16/15 (Siobhan Hughes and Kristina Peterson, reports for the wall street journal both cover congressional issues, "Senate Democrats Key to Iran Deal," <http://www.wsj.com/articles/senate-democrats-key-to-iran-deal-1437092680>, 7/16/15)

WASHINGTON—President Barack Obama's efforts to cement the nuclear deal with Iran hinge on support from a majority of senators in his party, many of whom face competing political pressures as they weigh an agreement that could reshape the U.S. relationship with the Middle East. Sen. Chuck Schumer of New York, the chamber's Democratic leader-in-waiting, is perhaps the most closely watched, because of his influence in the broader caucus. Yes deal block

Deal block possible

Raju and Everett 7/14 (Manu Raju and Burgess Everett; July 14 2015; Political correspondents for Politico; “Key Democrats skeptical of Iran deal”; Politico; <http://www.politico.com/story/2015/07/key-democrats-skeptical-of-iran-deal-120123.html>)
jskullz

But with Republicans almost universally opposed to the deal, a chunk of Democratic defections could put a real scare into the centerpiece of the president’s foreign policy legacy. And if public opposition mounts, Congress could pursue other avenues to rein in the president — either through appropriations legislation or passing further sanctionsx.

AT: Next Prez

Impossible for next president to kill the Iran Deal

Tabin 7/17 (<http://www.thedailybeast.com/articles/2015/07/17/a-gop-president-won-t-stop-the-iran-deal.html>, John Tabin, staff writer for the Daily Beast, A GOP President Won't Stop the Iran Deal)

A number of Republican candidates and office holders say they can sink the nuke deal with Iran. In reality, they probably can't. No matter how what happens with the 2016 elections, the chances of the GOP blowing up the nuclear deal with Iran are extraordinarily slim. First off, it's not a treaty, so it doesn't need the approval of two-thirds of the Republican-controlled Senate. For a while this year, the Obama administration seemed to think they could cut Congress out of the process entirely, presumably using the executive waiver powers built into most of the relevant sanctions legislation; Obama initially threatened to veto Senator Bob Corker's bill to give Congress a vote on the deal. The veto threat was withdrawn, and Corker's bill passed both houses of Congress with near-unanimous support (only the very hawkish Republican Tom Cotton voted no), because the process it establishes is heavily weighted toward approving the deal. If Congress does nothing (or if action gets bottled up in committee), the deal is approved by default. If a resolution of approval fails, it's a symbolic rebuke with no legal force. And if a resolution of disapproval passes, it needs veto-proof support to actually block U.S. participation in the deal. That means the president would need to lose 13 Democrats in the Senate and 45 Democrats in the House (more if there are Republican defections in the other direction). That will, at the very least, be difficult. Before the deal, some Democrats cited a letter put out by the Washington Institute for Near East Policy, signed by a bipartisan group that includes five former Obama advisers, that laid out guidelines for an acceptable deal. The deal that's been struck clearly doesn't meet that bar; to take just one example, the letter demands that weapons inspectors "must have timely and effective access to any sites in Iran they need to visit in order to verify Iran's compliance with the agreement." The deal makes it possible for Iran to delay inspections for up to 24 days. Nonetheless, the White House is circulating an argument that the deal not only meets but exceeds the letter's benchmarks, and it's quite possible, even probable, that the requisite number of lawmakers will buy their assertions. And no matter what happens on Capitol Hill, the United Nations and the European Union will begin unwinding sanctions on Iran in short order; the UN will likely act even before Congress gets around to debating a disapproval resolution. And that makes things a lot trickier for the next president than some of the Republicans who want the job are letting on. Congress can pull the U.S. out of the deal; so can the next president. But at this point, Washington can do little to change the basic picture. "As President," Rick Perry said in a statement, "one of my first official acts will be to fully rescind this accord"—which, under a straightforward interpretation of "fully rescind," is not actually possible. Scott Walker at least said in his official campaign announcement on Monday that "we need to terminate the bad deal with Iran on day one, put in place crippling economic sanctions and convince our allies to do the same," which at least includes a nod toward the fact that the sanctions are an international issue. But with Iran open for business and European corporations eager to cash in, reviving the sanctions regime internationally almost certainly can't be done in year one, much less on day one. If it's possible at all, it would require a multi-year process of documenting Iranian violations of the deal to rebuild the consensus that has until now left Iran

isolated. White House protestations to the contrary, the snapback provisions in the deal do little to change that. To her credit, Carly Fiorina acknowledges this: "Even if Congress does vote this deal down, the rest of the world has moved on," she notes. Fiorina advocates U.S. sanctions on Iran's financial sector; that would have some bite, but without international cooperation it wouldn't undo much of what Iran gets from the deal. Other candidates are less candid: Ted Cruz echoes Walker's "day one" phrasing, and Marco Rubio promises to "re-impose sanctions" but glosses over the limits on Washington's ability to do so unilaterally. Congress can pull the U.S. out of the deal; so can the next president. But at this point, Washington can do little to change the basic picture: Tehran is getting a massive windfall. Newly un-sanctioned Quds Force General Qasem Soleimani will be freer to spread mayhem across the region (if not the world). And, most likely, nothing short of regime change will stop the Islamic Republic from getting the bomb in the long run.

Amendment

Impossible to amend the constitution without political capital

Albert 14 (<http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=1758&context=lsfp>, Constitutional Disuse or Desuetude: The Case of Article V, Richard Albert, studied at Boston College Law School, January 2014)

“Nothing is easy,” writes Henry Paul Monaghan, “about the processes prescribed by Article V.”¹¹² Scholars today describe the requirements of Article V as practically impossible to meet.¹¹³ For instance, Bruce Ackerman views Article V as establishing a “formidable obstacle course.”¹¹⁴ Sanford Levinson argues that “Article V, practically speaking, brings us all too close to the Lockean dream (or nightmare) of changeless stasis,”¹¹⁵ and that it is “the Constitution’s most truly egregious feature.”¹¹⁶ Rosalind Dixon has described the “virtual impossibility of formal amendment to the Constitution under Article V.”¹¹⁷ Jeffrey Goldsworthy observes that “the super majoritarian requirements of Article V are so onerous as to be arguably undemocratic, by making it much too easy for minorities to veto constitutional amendments.”¹¹⁸ Vik Amar explains that Article V establishes “particular and cumbersome processes.”¹¹⁹ And Richard Fallon laments that “[e]ven under the best of circumstances, the requirement that three-fourths of the states must ratify constitutional amendments makes it nearly impossible to achieve significant change in our written Constitution through the Article V process.”¹²⁰ Article V, in short, is seen as a dead end. This is not a new perspective on the difficulty of successfully using Article V. Writing in 1885, Woodrow Wilson decried the “cumbrous machinery of formal amendment erected by Article Five.”¹²¹ Even earlier, at the adoption of the Constitution, John DeWitt doubted whether it would ever be possible to amend the Constitution using Article V: “[W]ho is there to be found among us, who can seriously assert, that this Constitution, after ratification and being practiced upon, will be so easy of alteration?”¹²² DeWitt believed states would have views too different to meet Article V’s required supermajority threshold: Where is the probability that three fourths of the States in that Convention, or three fourths of the Legislatures of the different States, whose interests differ scarcely in nothing short of every thing, will be so very ready or willing materially to change any part of this System, which shall be to the emolument of an individual State only?¹²³ The answer, he predicted, was that formal amendment would be rare.

Animal Disease Traceability

ADT surveillance has bipartisan support – empirics prove. PC required to get Obama to repeal it

Warnick 15 (<http://judywarnick.src.wastateleg.org/senate-adopts-warnick-bill-to-modernize-animal-disease-traceability/>, Senate adopts Warnick bill to modernize animal disease traceability, Judy Warnick, Senator of Congress, March 10, 2015)

Beginning in 2011, the Washington State Department of Agriculture implemented the Animal Disease Traceability to better track animals and locate instances of disease. Senate Bill 5733, **sponsored by** Sen. Judy Warnick, **was approved in a nearly unanimous vote Monday. The measure would implement an electronic livestock transaction system.** “We are using technology to increase safety in our food supply and possibly make the process easier for our farmers,” said Warnick, R-Moses Lake. “The Washington State Department Agriculture is working on final implementation to have timely information regarding the transfer of ownership and traceability in the event of a disease outbreak.” The legislation allows licenses to electronically report cattle transactions as an alternative to mandatory cattle inspection requirements currently in place. This information is already collected through the mandatory program but the electronic system is viewed as a more efficient approach to collecting data related to transactions. “This bill makes information about transactions more accessible, more complete, and producers will have that information available. This does not require producers to submit movements to the Department of Agriculture but helps keep records in the event there are issues with livestock health.” “The Washington Cattlemen’s Association appreciates the efforts and focus that Senator Warnick has made to see that Animal Disease Traceability is able to be implemented in Washington State,” said Jack Field, Executive Vice President of the Washington Cattleman’s Association. ADT is an important tool that will assist the cattle industry and animal health officials in the event of an animal health event. The cattle industry has worked closely with the WSDA to ensure that all necessary information is captured for ADT. Senate Bill 5733 is a component of ADT and will need to capture the same quality of information that a field inspection captures for the WSDA Lid Program.

Ban Prisons

Prison reform is unpopular – rarely brought up in Congress in the first place

Greenwald 09 (http://www.salon.com/2009/03/28/webb_2/, Glenn Greenwald, Jim Webb's courage v. the "pragmatism" excuse for politicians, a former Constitutional and civil rights litigator and is the author of three New York Times Bestselling books: two on the Bush administration's executive power and foreign policy abuses, and his latest book, March 28, 2009)

It's hard to overstate how politically thankless, and risky, is Webb's pursuit of this issue — both in general and particularly for Webb. Though there has been some evolution of public opinion on some drug policy issues, there is virtually no meaningful organized constituency for prison reform. To the contrary, leaving oneself vulnerable to accusations of being "soft on crime" has, for decades, been one of the most toxic vulnerabilities a politician can suffer (ask Michael Dukakis). Moreover, the privatized Prison State is a booming and highly profitable industry, with an army of lobbyists, donations, and other well-funded weapons for targeting candidates who threaten its interests. Most notably, Webb is in the Senate not as an invulnerable, multi-term political institution from a safely blue state (he's not Ted Kennedy), but is the opposite: he's a first-term Senator from Virginia, one of the "toughest" "anti-crime" states in the country (it abolished parole in 1995 and is second only to Texas in the number of prisoners it executes), and Webb won election to the Senate by the narrowest of margins, thanks largely to George Allen's macaca-driven implosion. As Ezra Klein wrote, with understatement: "Lots of politicians make their name being anti-crime, which has come to mean pro-punishment. Few make their name being pro-prison reform." For a Senator like Webb to spend his time trumpeting the evils of excessive prison rates, racial disparities in sentencing, the unjust effects of the Drug War, and disgustingly harsh conditions inside prisons is precisely the opposite of what every single political consultant would recommend that he do. There's just no plausible explanation for Webb's actions other than the fact that he's engaged in the noblest and rarest of conduct: advocating a position and pursuing an outcome because he actually believes in it and believes that, with reasoned argument, he can convince his fellow citizens to see the validity of his cause. And he is doing this despite the fact that it potentially poses substantial risks to his political self-interest and offers almost no prospect for political reward. Webb is far from perfect — he's cast some truly bad votes since being elected — but, in this instance, not only his conduct but also his motives are highly commendable.

Biometrics

Curtailment of biometrics will cause backlash from the private sector – will cause Congress to rethink their decision

Mann 11 (Selena Mann, staff writer for IT World Canada,

<http://www.itworldcanada.com/article/biometrics-growing-in-popularity-analyst-says/43177>, Biometrics growing in popularity, analyst says, February 7, 2011)

Biometrics is growing increasingly popular amongst enterprises as a security measure, according to a report by Global Industry Analysts Inc. The worldwide biometrics market will increase to US\$14 billion by 2015. This increase is because there are growing demands for security against terrorism, sophisticated crimes and financial fraud, according to Global Industry Analysts. The US and European share of biometric technology accounts for 60 per cent of the biometrics market. “In general, there’s a market for it,” said Michelle Warren, an analyst at MW Research and Consulting. Biometrics is technology, used to recognize humans by physical features. It is using technology to identify a person based on their biological traits, like retinal or iris scanning, fingerprinting or facial recognition according to The International Biometric Society. Companies use it to control who has access to information or restricted places within their facilities. It can also be used to monitor where individuals go within the company. “Biometrics are embedded into many laptops and mobile devices now to lock down important databases and to replace passwords; again the ROI (return of investment) is significant here,” said Peter O’Neill, president of Find Biometrics. Toronto-based company, Revolution in Secure Sensor Technology (RISST Ltd.), specializes in the creation of biometric products. This company created Automated Fingerprint Identification Systems (AFIS) and other biometric fingerprint recognition systems for enterprises. This technology is effective because it is accurate and fast, as fingerprints are contained in a database are easily accessible in seconds, according to RISST. AFIS could be used for hotels and for credit cards, according to Arun Malhotra, president of RISST. “It would be a better way of eliminating plastic cards,” Malhotra said. With bank and credit card transaction fraud increasing, there is a need for higher levels of security and better ways of identifying people, personal verification technology is becoming more vital, according to the Biometric Consortium, a part of the United States government. “Biometrics on the enterprise level are currently being used for Physical Access to replace cards and keys,” O’Neill said. There is also a use for this type of technology in the legal field. Biometrics can be used to present evidence in court. It is currently being used for fingerprinting and identifying DNA on objects, like extracting fingerprints from metal fragments, gun cartridges and sensory technology. The biometrics/fingerprinting market had a compound annual growth rate of 12 per cent in 2009, according to a report by Global Industry Analysts Inc. There is enhanced security like retinal scans for users, on notebooks, so unauthorized individuals cannot access your private information on your personal laptop. Another benefit with this is a person does not have to remember passwords anymore. It is costly to implement, though, compared to using traditional security measures like passwords. “It is a niche market security solution depending on the organization,” Warren said. “Health care has an increased need, (as do) legal and accounting.” Enterprises might rule using this technology out because of the high cost associated with biometric security, or the company may use biometrics only for part of their organizations where, leaked information could be detrimental to the company, according to Warren.

“Biometric solution is at the individual level; it’s important because that’s where most of the information is being lost,” Warren said.

Borders

Border surveillance reforms unpopular

Rigney 14 (<http://usfinancepost.com/new-cbs-poll-shows-obama-and-immigration-reform-remain-unpopular-18999.html>, New CBS poll shows Obama and immigration reform remain unpopular, Patrick Rigney, Patrick Rigney is a freelance writer with experience writing political speeches, radio advertisements, research works, and financial analysis pieces. He has a love of all things involving politics and history, May 23, 2014)

According to a new CBS poll, President Obama's approval ratings sit at a dismal 43 percent. The newly released poll also shows that the American public would prefer it if the government enforced its current immigration laws before offering amnesty to illegal immigrants. The May 22 poll questioned 1,009 adults, and it found that 48 percent of respondents disapprove of Obama's record. A mere 42 percent rate Obama's economic record positively, only 43 percent support his healthcare policy, and 39 percent support his foreign policy. These are pretty dismal numbers for a president, even one facing a second-term rut. If the President's ratings remain this low, his own party is likely to face massive losses in this year's midterm elections. Democrats are struggling to hold onto the Senate, and this has to do with the fact that President Obama remains incredibly unpopular. Many Democrats have been attempting to distance themselves from President Obama and his signature healthcare law, the Affordable Care Act. Just 37 percent of adults say that "addressing the status of illegal immigrants" should be a higher priority for the federal government. Respondents also heavily favored increasing border security over providing amnesty for illegal immigrants. Independents choose increasing border security over amnesty by a 55 to 35 percent margin. Republicans favored security by a 64 to 31 percent margin. Even Democrats support border enforcement over amnesty by 6 percentage points. CBS notes that these numbers displaying the relative popularity of border security and amnesty have not changed since July of last year. The Daily Caller reports "That's a problem for Obama, his progressive allies, and for business donors. They're collectively pressuring GOP leaders to back the Senate immigration bill that would effectively double the annual inflow of guest workers and immigrants, long before new border and airport security checks survive lawsuits by pro-immigration groups." Should Democrats continue their push for immigration reform without increased border security, the party may be setting itself up for a public relations nightmare going into the 2014 midterm elections. The Daily Caller notes that the CBS poll most likely is understating the public's opposition to new immigration reform, as a Rasmussen survey conducted last year found that only 10 percent of Americans know the current inflow of illegal immigrants per year (roughly 1 million.) If the public had an accurate understanding of the number of illegal immigrants who enter the country each year, public support for amnesty would be even lower than it already is at this point in time.

Drones

Curtailment of Domestic Drones is unpopular

Antle 13 (<http://www.theamericanconservative.com/articles/the-drone-consensus313/>, Congress Goes Bipartisan—Against Civil Liberties, W. James Antle III, editor of the Daily Caller News Foundation and senior editor at The American Spectator, and the author of *Devouring Freedom: Can Big Government Ever Be Stopped?*, March 4, 2013)

Civil liberties are theoretically a bipartisan concern. Conservative Republicans who don't like Obamacare's "death panels" should be outraged by presidential kill lists. Liberal Democrats who defend due process ought to be offended by secret surveillance law. Protectors of the First and Second Amendments should have a high regard for the Fourth, Fifth, and Sixth. Yet restricting civil liberties is what actually commands bipartisan support in Washington. The same Congress that barely averted the fiscal cliff swiftly passed extensions of warrantless wiretapping and indefinite detention, assuring Americans that only the bad guys will be affected but evincing little interest in establishing whether this is really the case. The same Congress that failed to come up with an agreement to avoid sequestration appears to have bipartisan majorities in favor of profligate drone use at home and abroad. Lawmakers are generally less exercised about the confirmation of likely CIA chief John Brennan than Defense Secretary Chuck Hagel. At the very time it appears Washington is so dysfunctional that the two parties cannot get anything done, Democrats and Republicans cooperate regularly—when it comes to jailing, spying on, and meting out extrajudicial punishments in ways that on their face contradict the Bill of Rights. Senate Majority Leader Harry Reid argued that preserving the Bush administration's national surveillance program—now for the benefit of the Obama administration—was more important than Christmas. Republican Sen. Saxby Chambliss didn't even want any amendments. The Senate overwhelmingly rejected an amendment that would apply the same protections against unlawful search and seizure to emails and text messages that already exist for letters, phone calls, and presumably the carrier pigeon. Despite deep divisions over taxes and domestic spending, members of both parties tend to sing from the same song sheet about the Patriot Act, the National Defense Authorization Act, and the Foreign Intelligence Surveillance Act amendments. So much for the Democrats' bedrock belief in the right to privacy or Republicans' convictions about limited government. Civil libertarians are currently a rump caucus in both parties. But they are at least starting to work together. In fact, a critical mass of legislators seeks to use this week's Brennan vote to extract additional drone memos from the Obama administration. More promisingly, liberal Democrats like Sen. Ron Wyden of Oregon and Sen. Mark Udall of Colorado have been teaming up with such conservative Republicans as Sen. Rand Paul of Kentucky and Sen. Mike Lee of Utah, seeking to impose real checks on powers the federal government acquired to fight the war on terror—a conflict with no real boundaries or identifiable endpoint. The core purpose of the Constitution is to balance the powers necessary for the federal government to protect the United States with the need to erect institutional barriers to protect against the abuse of those powers. But in emergencies, constitutional restraints often go out the window and it is difficult to restore them after the fact. This is especially true when there is no transparency or public accountability. Many details about national surveillance, extraordinary rendition, and even the spending habits of intelligence agencies remain state secrets. Some level of secrecy is undoubtedly necessary to preserve

national security. But giving federal officials sweeping, routinely exercised powers without sunlight or scrutiny is an invitation to abuse. That's why having even a small group of senators pressing for public information is important. Eli Lake noted in *The Daily Beast*, "[A]t a moment when inter-party cooperation is almost nonexistent in Washington, any bipartisan alliance—especially one that includes some of DC's most committed ideological opposites—is both unusual and noteworthy." Lake was referring to the bipartisan alliance between civil libertarian-leaning senators like Paul and Wyden. But until they make legislative inroads, the more usual and less noteworthy bipartisan alliance will be the one that exists between John Yoo and the Obama administration, united by a predilection for virtually unchecked executive power.

Islamaphobia

Curtailment of surveillance on Muslims is unpopular

Obeidallah 14 (<http://www.thedailybeast.com/articles/2014/09/11/13-years-after-9-11-anti-muslim-bigotry-is-worse-than-ever.html>, 13 Years After 9/11, Anti-Muslim Bigotry Is Worse Than Ever, Dean Obeidallah, staff writer for the Daily Beast 9/11/14)

On 9/11, I didn't watch the World Trade Center collapse on television like most people. I witnessed that tragedy a few blocks from where it occurred, standing motionless at 8th Street and 6th Avenue in lower Manhattan. Images from that day are still seared in my mind. The South Tower buckling. A sobbing woman running by. An NYPD police car racing uptown covered in debris. A crystal blue sky. Once we learned that al Qaeda was responsible for the attack, I knew there would be a backlash against Muslim and Middle Eastern Americans. But what I could've never predicted was that, 13 years later, my fellow Americans would view Muslims far worse today than in the months after 9/11. The numbers tell a distressing tale. In October 2001, an ABC poll found that 47 percent of Americans had a favorable view of Islam. By 2010, that number had dropped to 37 percent. And today, alarmingly, only 27 percent of Americans have a favorable view of Muslim Americans. This last poll is the most concerning because it shows how my fellow Americans see my Muslim friends, colleagues and even me—because I'm Muslim. How did we get to this place? That's a question I've been asking myself over and over. There are a few key factors. Undisputedly the horrible acts committed by radical Muslims have had a big impact. In the last year alone we've seen the Boston Marathon bombing, the Boko Haram kidnappings of schoolgirls, and now ISIS rampaging through Iraq and Syria. Another reason is that many Americans tell me they don't see Muslims publicly condemning these terrorists. They want to be convinced that the radicals are truly the exception and not "true Islam." Of course, condemning terrorism and getting media coverage for it are two different things. A grisly beheading results in days of media coverage. Muslim leaders holding a press conference denouncing terrorism, which they have done extensively in response to ISIS, will result in two to three minutes of media coverage on cable news, if they're lucky. Just last week an Oklahoma state representative wrote on his official Facebook page that Christians should be "wary" of Muslim Americans because they are planning to kill Christians. Making our efforts more challenging is that we are a small minority group, comprising only 1 to 2 percent of the nation. Unsurprisingly, a recent Pew poll found that more than 60 percent of Americans don't even personally know a Muslim. If you only see news stories that present Muslims in a negative light, and you have no personal connection to Muslims to offer a counter narrative, I can understand why many hold negative views of us. Compounding this issue is that there are few positive images of Muslims or Muslim Americans in American entertainment media. In fact, the exact opposite is true as Hollywood has made millions furthering the worst image of Muslims. And I can tell you firsthand as someone who has pitched film and TV shows that would depict Muslims in a positive light, there's little appetite in Hollywood for such projects. But there's something else causing this. And it's something truly despicable. There are people who intentionally stoke the flames of hate against our community. Some do it because they simply detest/fear anyone who doesn't pray or look like them. For some, Muslim bashing is their career. They make a living writing books and giving lectures about how Muslims want to destroy America. And then there are the politicians, almost exclusively Republicans, who gin up hate of the "other" for political

gain. The anti-sharia law measures passed in states like Florida and North Carolina are a prime example. The proponents of these laws will demonize Muslims while making the case for these measures. Yet they publicly admit there are zero instances of Muslims trying to impose Islamic law in their respective states. For example, Florida State Senator Alan Hays conceded as much but argued the anti-Shaira law legislation was needed as a “preemptive measure,” similar to when your parents would “have you vaccinated against different diseases.” And worse, we have seen unmitigated hate spewed by some Republicans that could inspire hate crimes. For example, just last week Oklahoma State Representative John Bennett wrote on his official Facebook page that Christians should be “wary” of Muslim Americans because they are planning to kill Christians. Not only did Bennett refuse to apologize for his comments, the Oklahoma state Republican chair defended Bennett. What a difference from the words President George W. Bush offered our nation in the days after 9/11. Bush, with the World Trade Center still literally smoldering, visited the large Islamic Center in Washington, D.C., and denounced those who were demonizing Muslim Americans: “Those who feel like they can intimidate our fellow citizens to take out their anger don’t represent the best of America, they represent the worst of humankind, and they should be ashamed of that kind of behavior.” Bush added: “America counts millions of Muslims amongst our citizens, and Muslims make an incredibly valuable contribution to our country. Muslims are doctors, lawyers, law professors, members of the military, entrepreneurs, shopkeepers, moms and dads. And they need to be treated with respect.” So what’s the future for Muslim Americans? Will we see even more hate crimes against Muslims? And Sikhs, whom many misidentify as Muslims? These numbers have spiked in recent years. And just last week my friend Linda Sarsour, a hijab-wearing civil rights activist, was attacked on the streets of New York City by a man who shouted that he wanted to behead her and then chased her into traffic. Thankfully, Linda was not injured and the assailant, a white male, was arrested. Will we see an even higher number of employment discrimination claims filed by Muslim Americans? Currently over 20 percent of the claims filed with the EEOC are from Muslims, even though we comprise just 2 percent of the country. I want to be optimistic. I want to be able to say in a few years it will be better. But I don’t know if that’s true. What I can say with confidence is that American Muslims are not going anywhere. Yes, we will denounce those who commit horrible acts in the name of our faith to make it clear their actions don’t represent us. However, our focus is pursuing our American dream just like every other American. We will become doctors, deli owners, teachers, parents, and maybe even one day, President of the United States. And what I can also say to the bigots is that we will continue, together with the good people who stand with us, to fight your efforts to demonize and marginalize us simply because of our faith. We won’t do that because it’s demanded of us as Muslims, we will do that because it’s demanded of us as Americans.

Curtailment of surveillance on Muslims unpopular with Republican Congress members and public in general – will create backlash

Shen 12 (<http://thinkprogress.org/politics/2012/08/23/735461/poll-republicans-strongly-dislike-muslims/>, Poll: Republicans Strongly Dislike Muslims, August 23, 2012, Aviva Shen, Senior editor and writer of Thing Progress)

57 percent of Republicans hold strongly negative views of Muslims, according to a poll released today by the Arab American Institute. Just 26 percent hold favorable views of Muslims, while

Arabs are equally unpopular among Republicans — 53 percent negative versus 27 positive. The numbers improved slightly when asked about “Muslim Americans” and “Arab Americans.” Democrats, on the other hand, viewed Muslims and Arab Americans favorably by margins of at least 20 to 35 percent in all four cases, though Democrats and Republicans alike had less positive feelings toward Muslims than any other religious group.

NSA Surveillance/Generic

NSA Surveillance reforms unpopular – no bipartisan support – won't change NSA surveillance anymore after Freedom Act

Gross 15 (<http://www.pcworld.com/article/2932337/dont-expect-major-changes-to-nsa-surveillance-from-congress.html>, Don't expect major changes to NSA surveillance from Congress, Grant Gross, June 5, 2015)

After the U.S. Congress approved what critics have called modest limits on the National Security Agency's collection of domestic telephone records, many lawmakers may be reluctant to further change the government's surveillance programs. The Senate this week passed the USA Freedom Act, which aims to end the NSA's mass collection of domestic phone records, and President Barack Obama signed the bill hours later. After that action, expect Republican leaders in both the Senate and the House of Representatives to resist further calls for surveillance reform. That resistance is at odds with many rank-and-file lawmakers, including many House Republicans, who want to further limit NSA programs brought to light by former agency contractor Edward Snowden. Civil liberties groups and privacy advocates also promise to push for more changes. It may be difficult to get "broad, sweeping reform" through Congress, but many lawmakers seem ready to push for more changes, said Adam Eisgrau, managing director of the office of government relations for the American Library Association. The ALA has charged the NSA surveillance programs violate the Fourth Amendment of the U.S. Constitution, which prohibits unreasonable searches and seizures. "Congress is not allowed to be tired of surveillance reform unless it's prepared to say it's tired of the Fourth Amendment," Eisgrau said. "The American public will not accept that." Other activists are less optimistic about more congressional action. "It will a long slog getting more restraints," J. Kirk Wiebe, a former NSA analyst and whistleblower said by email. "The length of that journey will depend on public outcry—that is the one thing that is hard to gauge." With the USA Freedom Act, "elected officials have opted to reach for low-hanging fruit," said Bill Blunden, a cybersecurity researcher and surveillance critic. "The theater we've just witnessed allows decision makers to boast to their constituents about reforming mass surveillance while spies understand that what's actually transpired is hardly major change." The "actual physical mechanisms" of surveillance programs remain largely intact. Blunden added by email. "Politicians may dither around the periphery but they are unlikely to institute fundamental changes." What's in the USA Freedom Act? Some critics have blasted the USA Freedom Act as fake reform, while supporters have called it the biggest overhaul of U.S. surveillance program in decades. Many civil liberties and privacy groups have come down in the middle of those two views, calling it modest reform of the counterterrorism Patriot Act. The law aims to end the NSA's decade-plus practice of collecting U.S. telephone records in bulk, while allowing the agency to search those records in a more targeted manner. The law also moves the phone records database from the NSA to telecom carriers, and requires the U.S. Foreign Intelligence Surveillance Court (FISC) to consult with tech and privacy experts when ruling on major new data collection requests from the NSA. It also requires all significant FISC orders from the last 12 years to be released to the public. The new law limits bulk collection of U.S. telephone and business records by requiring the FBI, the agency that applies for data collection, to use a "specific selection term" when asking the surveillance court to authorize records searches. The law prohibits the FBI and NSA from using a "broad geographic region,"

including a city, county, state or zip code, as a search term, but it doesn't otherwise define "specific search term." That's a problem, according to critics. The surveillance court could allow, for example, "AT&T" as a specific search term and give the NSA the authority to collect all of the carrier's customer records. Such a ruling from FISC would seem to run counter to congressional intent, but this is the same court that defined all U.S. phone records as "relevant" to a counterterrorism investigation under the old version of the Patriot Act's Section 215. The USA Freedom Act also does nothing to limit the NSA's surveillance of overseas Internet traffic, including the content of emails and IP voice calls. Significantly limiting that NSA program, called Prism in 2013 Snowden leaks, will be a difficult task in Congress, with many lawmakers unconcerned about the privacy rights of people who don't vote in U.S. elections. Still, the section of the Foreign Intelligence Surveillance Act that authorizes those NSA foreign surveillance programs sunsets in 2017, and that deadline will force Congress to look at FISA, although lawmakers may wait until the last minute, as they did with the expiring sections of the Patriot Act covered in the USA Freedom Act. The House Judiciary Committee will continue its oversight of U.S. surveillance programs, and the committee will address FISA before its provisions expire, an aide to the committee said. Republican leaders opposed to more changes Supporters of new reforms will have to bypass congressional leadership, however. Senate Republican leaders attempted to derail even the USA Freedom Act and refused to allow amendments that would require further changes at the NSA. In the House, Republican leaders threatened to kill the USA Freedom Act if the Judiciary Committee amended the bill to address other surveillance programs. Still, many House members, both Republicans and Democrats, have pushed for new surveillance limits, with lawmakers adding an amendment to end so-called backdoor government searches of domestic communications to a large appropriations bill this week. Obama's administration has threatened to veto the appropriations bill for several unrelated reasons, but several House members have pledged to push hard to prohibit the FBI and CIA from searching the content of reportedly tens of thousands of U.S. communications swept up in an NSA surveillance program targeting overseas terrorism suspects. Closing that surveillance backdoor is a top priority for civil liberties groups, said Neema Singh Guliani, a legislative counsel with the American Civil Liberties Union's Washington, D.C., legislative office. "We've had this statute that masquerades as affecting only people abroad, but the reality is that it sweeps up large numbers of U.S. persons," she said. Other changes possible Advocates and lawmakers will also push for a handful of other surveillance reforms in the coming months. The changes most likely to pass make limited changes to surveillance programs, however. While not tied to NSA surveillance, lawmakers will press for changes to the 29-year-old Electronic Communications Privacy Act (ECPA), a wiretap law that gives law enforcement agencies warrantless access to emails and other communications stored in the cloud for more than six months. A House version of ECPA reform counts more than half the body as co-sponsors. Still, tech companies and civil liberties groups have been pushing since 2010 to have those communications protected by warrants, but law enforcement agencies and some Republican lawmakers have successfully opposed the changes. Another bill that may gain traction in coming months is the Judicial Redress Act, a bill that would allow citizens of some countries to file lawsuits under the U.S. Privacy Act if government agencies misuse their records. "The Privacy Act offers limited protections, even to Americans, but passage of this bill would be an important first step to addressing especially European concerns that US privacy reforms won't help them,"

said Berin Szoka, president of free market think tank TechFreedom. Public pressure, along with potentially new leaks, will be the key to driving any more surveillance changes, advocates said. “The public will for mass surveillance laws was made very clear recently, and that’s partly why we saw much of Congress flock to whatever could be called surveillance reform,” said Tiffiny Cheng, a founder of digital rights group Fight for the Future. “No one is fooled by USA Freedom—it’s a weak piece of legislation that uses exceptions in legislative language to codify the NSA’s practice of surveilling most people.” Congress has much work left to do, Cheng said by email. “After the recent showdown and public outcry, USA Freedom is at best, seen as a beginning of surveillance reform, not the end,” she said.

NSA Surveillance popular with both the public and Congress – creates backlash when trying to curtail it

Cohen 13 (http://www.washingtonpost.com/politics/most-americans-support-nsa-tracking-phone-records-prioritize-investigations-over-privacy/2013/06/10/51e721d6-d204-11e2-9f1a-1a7cdee20287_story.html, Most Americans back NSA tracking phone records, prioritize probes over privacy, Jon Cohen, Staff writer for the Washington Post, June 10, 2013)

A large majority of Americans say the federal government should focus on investigating possible terrorist threats even if personal privacy is compromised, and most support the blanket tracking of telephone records in an effort to uncover terrorist activity, according to a new Washington Post-Pew Research Center poll. Fully 45 percent of all Americans say the government should be able to go further than it is, saying that it should be able to monitor everyone’s online activity if doing so would prevent terrorist attacks. A slender majority, 52 percent, say no such broad-based monitoring should occur. The new survey comes amid recent revelations of the National Security Agency’s extensive collection of telecommunications data to facilitate terrorism investigations. Overall, 56 percent of Americans consider the NSA’s accessing of telephone call records of millions of Americans through secret court orders “acceptable,” while 41 percent call the practice “unacceptable.” In 2006, when news broke of the NSA’s monitoring of telephone and e-mail communications without court approval, there was a closer divide on the practice — 51 percent to 47 percent. General priorities also are similar to what they were in 2006: Sixty-two percent of Americans now say it’s more important for the government to investigate terrorist threats, even if those investigations intrude on personal privacy, while 34 percent say privacy should be the focus, regardless of the effect on such investigations. But with a Democratic president at the helm instead of a Republican, partisan views have turned around significantly. Sixty-nine percent of Democrats say terrorism investigations, not privacy, should be the government’s main concern, an 18-percentage-point jump from early January 2006, when the NSA activity under the George W. Bush administration was first reported. Compared with that time, Republicans’ focus on privacy has increased 22 points. The reversal on the NSA’s practices is even more dramatic. In early 2006, 37 percent of Democrats found the agency’s activities acceptable; now nearly twice that number — 64 percent — say the use of telephone records is okay. By contrast, Republicans slumped from 75 percent acceptable to 52 percent today. Compared with a 2002 Pew poll, Democrats are now 12 percentage points more apt to support the government’s monitoring of all e-mails and other online activity if officials say that it might help prevent terrorist attacks. On the flip side, the number of Republicans who say the government should not do this has increased by 13 points. The poll was conducted Thursday

through Sunday among a random national sample of 1,004 adults. Results from the full poll have a margin of sampling error of plus or minus 3.5 percentage points. The question on monitoring everyone's online activity was asked starting Friday; results from that question have a 4.5-point error margin.

Prism

PRISM is popular with Congress and public – curtailing it will create backlash

Logiurato 13 (<http://www.businessinsider.com/prism-surveillance-poll-nsa-obama-approval-2013-6>, The NSA's PRISM Program Is Shockingly Uncontroversial with the American Public, Business Insider, Brett Logiurato, Business Insider's politics editor, June 17, 2013)

President Barack Obama's approval rating is sinking like a stone in a new CNN/ORC poll — but it's not because of Americans' reactions to the National Security Agency surveillance program known as "PRISM." In fact, the public overwhelmingly approves of the program. The poll found that 66 percent of Americans say the Obama administration was right to gather and analyze information from major internet companies to help locate suspected terrorists. Here's the full wording of the question posed in the poll: [F]or the past few years the Obama administration has reportedly been gathering and analyzing information from major internet companies about audio and video chats, photographs, e-mails and documents involving people in other countries in an attempt to locate suspected terrorists. The government reportedly does not target internet usage by U.S. citizens and if such data is collected, it is kept under strict controls. Do you think the Obama administration was right or wrong in gathering and analyzing that internet data? Overall, according to the poll, the public has exhibited a collective shrug to new revelations detailing the scope of the NSA's surveillance efforts. On its collection of phone data, the public is less gung-ho about the program, but still supportive — 51 percent say the Obama administration is right, while 48 percent say it's wrong. Incidentally, partisans on both sides of the aisle are most likely to support the programs. Self-identified Republicans and Democrats approve of both programs, while Independents are much less enthusiastic. They disapprove of the NSA's phone surveillance program by a 40-58 split, and their approval of PRISM (58-41) significantly trails both Republicans (67-31) and Democrats (76-24)

PRISM popular with Congress right now – no chance they will curtail it

Maharrey 15 (<http://blog.tenthamentendmentcenter.com/2015/05/yes-more-proof-congress-wont-stop-mass-surveillance/>, Yet More Proof Congress Won't Stop Mass Surveillance, Mike Maharrey, blogger, May 6, 2015)

A recent House Judiciary Committee markup session for the USA Freedom Act provided an inside look at political jockeying going on behind the scenes as Congress tries to hammer out some kind of surveillance reform. It wasn't encouraging for privacy advocates. In fact, it provides yet more proof that Congress will not ever stop mass surveillance. With section 215 of the Patriot Act set to sunset in June, a sense of urgency has bubbled up around the issue of surveillance reform in Washington D.C. Senate Majority Leader Mitch McConnell wants to extend the Patriot Act provisions that authorize bulk collection of telephone metadata. Some privacy advocates and some members of Congress want to let the provisions expire altogether. Others see the USA Freedom Act fix as the only chance to usher in some reforms – however meager. The bill purports to end bulk collection of business records under foreign intelligence authorities. It remains up for debate as to whether the legislation would actually succeed in this aim. Even if it does, the bill does not address other avenues of spying, including Executive Order 12333 and Section 702 of the FISA Amendments Act. Even with a sunset of the Patriot Act

provisions or passage of the USA Freedom Act, bulk spying on your phone records would almost certainly continue. During the committee markup session, Rep. Ted Poe (R-Texas) proposed an amendment to address the most controversial aspect of Section 702, so-called “back-door searches.” This allows the government to search American’s emails and phone calls collected by the NSA while targeting foreigners without a warrant. Poe’s amendment would have required a warrant for these back-door searches. The vast majority of committee members supported the idea. But it didn’t pass because of politics. JustSecurity.org reported on the hearing and described the scene. It was clear from their comments that a majority of committee members supported the goal of the amendment. Indeed, no member spoke against it on substantive grounds. But Committee Chair Bob Goodlatte (R-Va.) explained that the bill represents a fragile compromise — primarily with members of the House Intelligence Committee (HPSCI) — and that House leadership had made clear the bill would not get a floor vote if the Judiciary Committee amended it. The members were faced with a choice: acknowledge the terms set by House leadership and vote against an amendment designed to restore critical Fourth Amendment protections for Americans, or reject those terms and possibly derail surveillance reform altogether. According to Just Security, many on the committee characterized the Poe amendment as an example of “the perfect being the enemy of the good.” Poe was reportedly frustrated. As Just Security reports, he implored committee members not to allow House leadership to dictate their vote. Poe observed dryly that the Committee was not simply delaying the building of a bridge. It was delaying vital Fourth Amendment protections for Americans. He put the question simply: do politics trump the Constitution, or does the Constitution trump politics? He urged fellow committee members not to let leadership’s threats dictate their vote. He said they should support the amendment and let the political chips fall where they may. Ultimately, the amendment failed. Many advocates of reform reportedly breathed a sigh of relief, knowing that the amendment would have effectively killed the bill. Without it, the USA Freedom Act has a decent shot at moving forward. Poe wasn’t thrilled. “Everyone who’s spoken against it is actually for the amendment. It’s a sad day for America,” he said. The politicking raises a huge question: what good is reform that can’t ultimately stop violations of the Constitution and of your privacy rights? And it proves something I’ve said over and over again – we cannot depend on Congress to end mass spying. Even when there is a way, there is no will. The committee markup session demonstrated this sad fact. Even if the USA Freedom Act passes the House, it remains highly questionable if it can get through the Senate. Sen. McConnell has made it clear he wants to continue spying on you and he runs the show in the upper chamber. And even if by some miracle USA Freedom passes both houses of Congress and Pres. Obama signs it, spying will continue unabated under other authorities. It’s been 40 years since Sen. Frank Church declared that the American surveillance apparatus created the potential for “total tyranny.” Congress hasn’t done anything about it yet, and events on the Hill make it clear it won’t in the future. Congress may tinker around the edges and then declare a grand victory for privacy. In the meantime, the NSA will go right on spying on you and everybody else in America. The time has come to focus on new strategies that bypass the political class on Capitol Hill. OffNow has developed that alternative path forward – utilize the power of state governments to thwart the surveillance state.

SSRA

SSRA is unpopular – there’s a bipartisan coalition opposing passage—2013 proves

Wachtler 2015, Mark Wachtler, 4/11/2015, HR 1466 Surveillance State Repeal Act of 2015, <http://www.whiteoutpress.com/articles/2015/q2/hr-1466-surveillance-state-repeal-act-2015/>

Considering the overwhelming outrage by the American people over the government’s blanket domestic espionage programs, it’s surprising that the 2013 Surveillance State Repeal Act didn’t garner more support. The Bill accumulated ten co-sponsors, was assigned to four Committees and six Sub-Committees. But not a single vote was ever taken to advance them out of Committee and to the full House. Supporters of the effort to stop the universal surveillance of the American people hope this year’s effort will be more successful.¶ HR 1466 - Surveillance State Repeal Act of 2015¶ In 2013, Rep Mark Pocan (D-WI) was one of ten Democrat Congressmen who co-sponsored the Patriot Act repeal Bill. This time, he’s the main sponsor and he has a Republican co-sponsor signed on with him. Introduced on March 19, 2015, the new Bill was proposed by five Congressmen and already has an additional Representative who’s signed on since then. The sponsors include Rep Pocan, Rep Thomas Massie (R-KY), Rep Alan Grayson (D-FL), Rep James McGovern (D-MA), Rep Lloyd Doggett (D-TX), Rep Michael Capuano (D-MA).¶ As detailed by the House website, HR 1466 was immediately referred to a number of House Committees upon its introduction. The summary explains that the Surveillance State Repeal Act of 2015 was, ‘Referred to the Committee on the Judiciary, and in addition to the Committees on Intelligence (Permanent Select), Financial Services, Foreign Affairs, Energy and Commerce, Education and the Workforce, Transportation and Infrastructure, and Armed Services, for a period to be subsequently determined by the Speaker.’¶ What the Bill would repeal and require¶ HR 1466’s official description gives a brief overview of the Bill’s ramifications. The legislation, ‘Repeals the USA PATRIOT Act and the FISA Amendments Act of 2008 (thereby restoring or reviving provisions amended or repealed by such Acts as if such Acts had not been enacted), except with respect to reports to Congress regarding court orders under the Foreign Intelligence Surveillance Act of 1978 (FISA) and the acquisition of intelligence information concerning an entity not substantially composed of US persons that is engaged in the international proliferation of weapons of mass destruction.’¶ As currently written, the Bill would also prohibit the government from collecting information on an American citizen, ‘without a warrant based on probable cause.’ If passed, it would also force the Director of the Office of National Intelligence, and its 16 spy agencies to, ‘destroy any information collected under the repealed Acts, or acquired under Executive Order 12333 without a warrant.’¶ The law would also protect electronics manufacturers from being forced by the government to include encryption-free back doors to their devices and services allowing spy agencies to monitor their customers. Finally, the Bill attempts to protect future whistleblowers that come forward with evidence that the government isn’t abiding by the law.¶ Little chance of passage¶ Illustrating that once you go from Republic to Empire, it’s nearly impossible to go back, experts are already warning that HR 1466 has almost no chance of passing. Much like previous attempts to reign in the government’s massive blanket domestic espionage programs, this latest effort will most likely pit regular Americans from all walks of the political spectrum supporting the Bill against a bipartisan coalition of the most powerful establishment leaders from both Parties opposing it.¶ That uphill fight isn’t deterring the Bill’s main sponsor however. “This isn’t just tinkering around the edges,” Rep Mark Pocan was reported by The Hill explaining during a Capitol Hill briefing after he introduced the legislation, “This is a meaningful overhaul of the system, getting rid of essentially all parameters of the Patriot Act.”¶ Republican co-sponsor Rep Thomas Massie also commented on the Bill with targeted remarks about the whistleblower portion of the newly proposed HR 1466. “Really, what we need are new whistleblower protections so that the next Edward Snowden doesn’t have to go to Russia or Hong Kong or whatever the case may be just for disclosing this,” he said, “We need to repeal all of this junk and just start over.”¶ Illustrating the uphill battle the co-sponsors and their supporters have in front of them, The Hill writes, ‘The bill is likely to be a nonstarter for leaders in Congress, who have been worried that even much milder reforms to the nation’s spying laws would tragically [hurt] handicap the nation’s ability to fight terrorists. A similar bill was introduced in 2013 but failed to gain any movement in the House.’

SSRA is unpopular – link magnitude is huge – major opposition

Macri 2015, Giuseppe Macri, Tech Editor for the Daily Caller, 3/24/2015, House Revives Bill To Completely Repeal The Patriot Act, Dismantle NSA Spying,

Wisconsin Democratic Rep. Mark Pocan and Kentucky Republican Rep. Thomas Massie announced in a press release their intention to reintroduce the Surveillance State Repeal Act — a bill first introduced following the Snowden leaks in 2013 that

would completely repeal the Patriot Act and the 2008 FISA Amendments Act, as well as introduce reforms to the Foreign Intelligence Surveillance Court.¶ The bill **would legally dismantle the National Security Agency's most aggressive surveillance programs**, including the bulk collection and retention of virtually all Americans' landline phone records justified under Section 215 of the Patriot Act. The repeal of the 2008 FISA Amendments Act would also prevent the agency from tapping the physical infrastructure of the Internet, such as undersea fiber cables, to intercept "upstream" data in bulk, which critics including the ACLU claim the NSA uses to collect data on Americans. (RELATED: Wikipedia Tells Reddit Why It Thinks It Can Win A Lawsuit Against NSA)¶ Under the new law the FISA Court, which approves secret surveillance requests by the NSA and other intelligence agencies, would be appointed technology experts to advise judges on the privacy implications of government surveillance requests. The court would also be held to new standards for issuing warrants for all surveillance based on probable cause, as opposed to the current lesser standard of reasonable suspicion.¶ The bill would make it illegal to prosecute whistleblowers like former NSA contractor Edward Snowden and prevent the government from mandating companies build "backdoors" into their privacy encryption products like those currently sought by the FBI. (RELATED: Wyden: Don't Give The FBI Backdoors Into Americans' Cellphones)¶ "Really, what we need are new whistleblower protections so that the next Edward Snowden doesn't have to go to Russia or Hong Kong or whatever the case may be just for disclosing this," Massie said during a Capitol Hill briefing Tuesday, according to The Hill.¶ "The warrantless collection of millions of personal communications from innocent Americans is a direct violation of our constitutional right to privacy," Pocan said in the statement. "Revelations about the NSA's programs reveal the extraordinary extent to which the program has invaded Americans' privacy."¶ "I reject the notion that we must sacrifice liberty for security — we can live in a secure nation which also upholds a strong commitment to civil liberties. This legislation ends the NSA's dragnet surveillance practices, while putting provisions in place to protect the privacy of American citizens through real and lasting change."¶ **After failing the first time in 2013 amid the immediate public backlash from the Snowden leaks, the bill will likely be dead on arrival in Congress, where much weaker reforms failed to pass the Senate as a result of last-minute Republican attacks — all that while the chamber was still in Democratic control.**

Student Visas

Decreasing surveillance on Foreigners with Student Visas unpopular in Congress

Schwab 14 (Thousands roam the U.S. on expired student visas unchecked, <http://tnsjournal.com/national/thousands-roam-u-s-expired-student-visas-unchecked/>, Dwight L. Schwab Jr., staff writer for TNS Journal, ABC News, etc., September 9, 2014)

With thousands of illegal immigrants either sitting at the southern border or being shipped throughout the country to various locations, the Obama administration has yet another scandal on its hands. It seems the administration is unable to locate 6,000 foreign nationals who have entered the United States on student visas, according to ABC News. What makes this more incredible is the growing concern that the government's ability to track potential terror suspects is nothing more than a joke. It is suspected by many experts that thousands may already be in the country. The idea that it is time to grant full or partial amnesty to any illegal is beyond comprehension. Peter Edge, the U.S. Immigration and Customs Enforcement official who oversees investigations into visa violators says, "My greatest concern is that they could be doing anything. Some of them could be here to do us harm." expired student visas imageEdge's comments followed British Prime Minister David Cameron's bold remarks to the House of Commons announcing plans to block all British jihadist passports from re-entering the country. The threat of violence from the Islamic State is apparently being taken as a national threat and not a political football for some encounter group discussion. America's staunchest ally is taking the lead that should be the United State's role. Many within Washington lawmaker circles wonder where the President of the United States is on this topic of this international crisis. The United Kingdom has taken moves to prevent these jihadist-trained nationals from ever returning to provoke deadly violence. The president and his party cannot seriously think these are potential Democratic votes in the future. It would seem only logical that President Obama review the southern border invasion of thousands of unknown illegals and propose a plan of America's own making to stop the tide of unprocessed aliens from putting one foot on U.S. soil. **The vote to do so in Congress would be overwhelming.** Whether or not this is an unpopular move among Obama's political base is negated by the growing threat to America's national security. The shocking facts are that foreign students entering the United States have overstayed their visa limitations to the tune of 58,000 individuals. There are no real numbers available for how many illegal aliens are wandering the American countryside unchecked, unprocessed and free to travel at will. What has been a political folly for years is now a matter of national survival. One stunning fact is since the Sept. 11, 2001, terrorist attacks, 26 student visa holders have been arrested in the United States on terrorism-related charges ABC News reported. Reasonably, the schools should monitor their individual foreign students but they haven't the time or the money to do so with precision. Sen. Tom Coburn (R-OK) says, "We know we have a lot of non-accredited universities that are using this system to bring people in, collect money and not educate them at all. To me, it's a mess." It is a mess that should be priority one to Homeland Security, the FBI and the President of the United States. "Protect and defend" is part of the president's oath of office and it is time to follow through with immediacy on those very words. The American people should demand it.

War on Drugs

War on Drugs has both bipartisan and public support – reforming it requires PC

Vance 15 (<http://fff.org/explore-freedom/article/root-support-drug-war/>, THE ROOT OF SUPPORT FOR THE DRUG WAR, Laurence M. Vance, staff writer for FFF, January 1, 2015)

For some the reason is political. The war on drugs enjoys widespread bipartisan support. Liberals, conservatives, Democrats, Republicans, moderates, populists, progressives, centrists, Tea Partiers — they all generally support government prohibition of certain drugs. The drug war is never an issue in any congressional primary or general election. As long as their party or their political group supports the drug war, most Americans will follow suit. The decision to use drugs should be an ethical, religious, medical, or moral decision, not a political decision.

Opposite - War on Drugs reform is popular and has bipartisan support

Sargent 13 (<http://www.washingtonpost.com/blogs/plum-line/wp/2013/08/12/is-bipartisan-war-on-drugs-reform-possible/>, Is bipartisan 'War on Drugs' reform possible?, Greg Sargent, staff writer for the Washington Post, August 12, 2013)

As expected, Attorney General Eric Holder just delivered a speech in which he proposed long-overdue reforms to ensure that low-level and nonviolent drug offenders without gang ties will no longer face severe mandatory sentences. In the speech, Holder painted the need for reform as morally urgent and a practical imperative. “Too many Americans go to too many prisons for far too long and for no good law enforcement reason,” he said. “We cannot simply prosecute or incarcerate our way to becoming a safer nation.” Holder proposed both executive and legislative action. The executive changes concern instructions to prosecutors on how to write charges without setting in motion the mandatory minimum sentences. As for legislative changes, Holder referenced a bill, sponsored by Dick Durbin, Patrick Leahy, Mike Lee, and Rand Paul, that would allow federal judges more say over whether mandatory minimum sentences are doled out. The administration appears ready to try to work with Congress to build on this proposal. The possibility of legislative change, backed by bipartisan majorities, is not as far fetched as you might imagine. As Ed Kilgore comments: Conservative reaction to Holder’s speech will be extraordinarily interesting. Long before Rand Paul drew national attention to his own support for sentencing reform, there was a quiet movement slowly but surely developing on the Right (which David Dagan and Steven Teles wrote about in the November/December 2012 issue of the Washington Monthly) in favor of calling off the madness of mandatory minimums. Just as importantly, this trend was being fed by various tributaries of the conservative stream, not just libertarians but conservative evangelicals and budget-conscious fiscal hawks. Just last week, in fact, the American Legislative Exchange Council, which probably contributed more to the spread of mandatory minimum legislation in the states than just about any other single source, reversed its position and endorsed sentencing reform. So Holder may be pushing on an unlocked door. Still, a whole generation of pols — mostly Republicans, to be sure, but also many Democrats trying to prove themselves as “tough on crime” — have prospered politically from the “Three Strikes” era. And the high visibility of those people in the ranks of non-violent drug offenders may give emotional pause to conservatives tempted by the massive evidence of the failure of Lock ‘Em Up and Throw Away the Key policies to admit it’s been a tragic mistake. This

could be one of those moments when a rare bipartisan breakthrough happens, or it could get complicated and gridlocked. Along these lines, you should watch for the reaction in particular from Republican Senators on the Judiciary Committee. For instance, Senator Jeff Sessions previously worked with Durbin on a compromise proposal that reduced the disparity between the amounts of crack and powdered cocaine, which had disproportionately impacted blacks. Sessions has yet to comment on today's announcement, but aides to Senators on both sides are looking to the Alabama Senator to get a sense of whether the new push can move out of Judiciary. Another Senator on Judiciary worth watching is Orrin Hatch, who, like Lee (a co-sponsor of the reform) is from Utah. And some Dems believe John Cornyn, who has expressed interest in this area, could be gettable. This is one of those issues where movement once seemed unthinkable. As Kilgore notes, for the longest time, few lawmakers would risk being labeled as "soft on crime." But this is an issue around which Dems concerned about racial justice, and conservative libertarians (such as Senator Paul) who share race-based concerns in their better moments, and conservatives who see the issue more through the prism of their opposition to government overreach and "one size fits all" solutions, should theoretically be able to find common ground. All of this, combined with the sense that the "soft on crime" attacks, for a variety of reasons, no longer have anywhere near the cultural potency or political relevance they once did suggests this may now be an area where compromise is possible.

Welfare

“War on Poverty” bills like the plan has Congress divided – creates backlash

King 14 (<http://www.usatoday.com/story/news/politics/2014/01/08/congress-divided-over-war-on-poverty/4378937/>, Congress divided over war on poverty, January 8, 2014, Ledyard King, staff writer for USA Today)

WASHINGTON — The 50th anniversary of President Lyndon Johnson's "war on poverty" is turning into a pitched battle of agendas in Congress over how to improve prospects for millions of Americans still struggling financially. On Wednesday, exactly five decades after Johnson laid his plans before Congress, Democrats and Republicans voiced disagreement on whether those plans succeeded and, more importantly, whether Johnson's war should continue in its current form as the country emerges from a deep recession. Democrats are pushing for a higher minimum wage, an extension of long-term unemployment benefits and a narrowing of the nation's income gap between rich and poor. "Our economy is still struggling to recover from the Great Recession," said Sen. Tom Harkin, an Iowa Democrat sponsoring a bill to raise the minimum wage from \$7.25 to \$10.10 an hour. "The sluggish recovery has left us with chronic unemployment and a middle class in crisis. For the vast majority of American workers, incomes have stagnated for decades." Republicans say many of the safety-net programs Johnson started have sputtered and need to be scaled back, both to reduce the nation's mounting debt and to avoid fostering an entitlement attitude among the poor. "While this war may have been launched with the best of intentions, it's clear we're now engaged in a battle of attrition that has left more Americans in poverty than at any other point in our nation's history," GOP Rep. Steve Southerland of Florida said. "Clearly, the big-government ideas of the past need to be improved and aren't working to the extent that they should." Those divergent views are fueling congressional debate over key aspects of the government safety net Johnson helped establish. The Democratic-led Senate is preparing to vote on a bill that would extend long-term unemployment benefits for three months. The proposal's fate looks bleak in the Republican-held House because the \$6.5 billion cost of providing those benefits isn't paid for in the Senate measure. Lawmakers are negotiating a farm bill that's expected to cut Supplemental Nutrition Assistance Program benefits, formerly known as food stamps, by as much as \$10 billion. The final bill also could impose new work requirements, authored by Southerland, on able-bodied SNAP recipients. Discussion of ambitious tax reform plans and proposals to raise the federal minimum wage, already long shots, could be derailed before they gain traction. Democrats and Republicans don't even agree on whether Johnson's war on poverty was a success. Democrats resoundingly say it was. Republicans, especially conservatives, are adamant that it wasn't. The official poverty rate in the U.S., defined as lacking resources for life's basic needs, was 19 percent in 1964. It had fallen to 12.1 percent by 1969, the year Johnson left office. Last year, it stood at 15 percent, only a modest decline from the launch of his anti-poverty campaign. Today, about 50 million Americans, including 13 million children, live below the poverty line, which in 2012 was \$23,492 for a family of four. However, poverty experts call the official statistics misleading because they don't take into account non-cash assistance such as rent subsidies, tax credits and food stamps — the tools now favored over a welfare check to ameliorate poverty's effects. Using what's called the Supplemental Poverty Measure, or SPM, researchers at Columbia University calculate that the poverty rate adjusted for inflation has fallen from 26

percent in 1967 to 16 percent today, a more significant decline. "Poverty remains high," says Sharon Parrott, vice president of the Center on Budget and Policy Priorities, a liberal Washington think tank. "It's higher in the United States than in most wealthy nations. We still have very large racial disparities. So you can't look at this record and say we are where we want to be or where we hoped to be when the effort was taken up, but neither is it accurate to say we haven't made significant progress." The government's safety net programs cut the poverty rate last year by nearly half, the Census Bureau reports. Without them, the poverty rate would have been 29 percent in 2012. Government benefits lifted 41 million people, including 9 million children, out of poverty. Some Republicans acknowledge that Johnson's anti-poverty programs initially had a positive impact. But they say the \$15 trillion spent over five decades would have produced better results had it been targeted more specifically than "handing out checks." Republicans want to increase employment by loosening regulations and capitalizing on what they say are job-creating opportunities such as the Keystone XL oil pipeline that's been slowed by the Obama administration's environmental review. "The formula for beating poverty is a job," said Republican Dave Camp of Michigan, chairman of the House Ways and Means Committee, which oversees tax policy. President Obama says government has an obligation to help those who truly need it, and Johnson's legacy should continue. "In the richest nation on Earth, far too many children are still born into poverty, far too few have a fair shot to escape it, and Americans of all races and backgrounds experience wages and incomes that aren't rising, making it harder to share in the opportunities a growing economy provides," Obama said in a written statement Wednesday. "That does not mean, as some suggest, abandoning the War on Poverty... Instead, it means we must redouble our efforts to make sure our economy works for every working American."

XO 12333

Executive Order 12333 has bipartisan support in Congress – recently turned it into an official law – proves that repealing it would be unpopular

Geller 14 (<http://www.dailydot.com/politics/congress-executive-order-12333-surveillance/>, NSA-enabling Executive Order 12333 just passed Congress as a full law, Eric Geller, staff writer for The Daily Dot, December 12, 2014)

Republicans and Democrats can't agree on much these days, but members of Congress recently joined hands to codify a very worrisome national-security executive order into law. The U.S. House of Representatives on Thursday passed a bill authorizing funding for the intelligence community with large bipartisan support. The vote was 325-100. All tallied, 55 Democrats and 45 Republicans voted against it. The same bill passed the Senate by unanimous consent, meaning that the only thing standing in its way is a signature from President Barack Obama. The bill is essentially guaranteed to receive Obama's signature—something privacy advocates have been pushing to prevent. That's because one of the provisions in the bill enshrines Executive Order 12333, a Reagan-era surveillance directive, into law. Executive Order 12333, issued by Reagan on Dec. 4, 1981, is one of the most controversial presidential directives ever issued. If Americans know its name at all, it is only because 12333 is at the heart of the sweeping surveillance apparatus established by the National Security Agency (NSA). To collect contents and metadata from telephone calls and electronic communications, the NSA relies on Executive Order 12333 and Section 215 of the USA Patriot Act, also known as the "business records" provision, respectively. But where Section 215 features relatively serious privacy protections, 12333 is a lawless free-for-all by contrast. Section 215 is subject to the oversight of the Foreign Intelligence Surveillance Court (FISC) and the congressional intelligence committees. It prohibits the collection of audio from phone calls, allowing only metadata collection. It likewise requires the NSA to eliminate the contents of U.S. persons' phone calls if they are "incidentally" collected during an operation aimed at foreign nationals. Executive Order 12333, wrote former State Department Internet-freedom official John Napier Tye, "contains no such protections for U.S. persons if the collection occurs outside U.S. borders." Under 12333, while the NSA still can't individually target U.S. persons and gather content from their phone calls, it is not required to delete such content if it is incidentally acquired. The NSA, relying on 12333 authority, can keep U.S. persons' phone-call recordings even if they are not implicated in any criminal behavior as long as the recordings were obtained accidentally. As if that weren't bad enough, 12333 sits outside the mainstream intelligence apparatus that is subject to congressional oversight. Senator Dianne Feinstein (D-Calif.), the chairwoman of the Senate Intelligence Committee until January, told McClatchy Newspapers in November 2013 that Congress could not "sufficiently" monitor 12333 operations. "Twelve-triple-three programs are under the executive branch entirely," Feinstein said. "I don't think privacy protections are built into it. It's an executive policy. The executive controls intelligence in the country." By codifying Executive Order 12333 as Section 309 of the intelligence community's 2015 budget, Congress has given 12333 operations new legal footing without actually placing them under new oversight. The House was so eager to pass the funding bill and move on that it was prepared to do so by unanimous consent, just like the Senate had done. The only reason there is a recorded vote of the action is because Rep. Justin Amash (R-Mich.) asked the clerk to call the roll. "Sec. 309 provides the first statutory

authority for the acquisition, retention, and dissemination of U.S. persons' private communications obtained without legal process such as a court order or a subpoena," Amash wrote on his Facebook page after the vote. "The administration currently may conduct such surveillance under a claim of executive authority, such as E.O. 12333," he wrote. "However, Congress never has approved of using executive authority in that way to capture and use Americans' private telephone records, electronic communications, or cloud data." In July 2013, Amash worked with with Rep. John Conyers (D-Mich.) to introduce an amendment to the 2014 National Defense Authorization Act that would have ended the NSA's phone-records collection. The House defeated the measure 217-2015. In his Facebook post, Amash called the legislative language giving 12333 increased legal standing "one of the most egregious sections of law I've encountered during my time as a representative."

Iran DA Supplement Northwestern

UQ – Deal will pass

Even though unlikely, fierce pro-Israeli lobbying coupled with congressional bipartisanship will make a veto override majority still very possible

Brett **Logiurato 7-14-15**, Journalist for Business Insider, 7/14/15, "How congress could kill the Iran deal", <http://www.businessinsider.com/how-congress-can-veto-iran-deal-2015-7>

Now that more than a year and a half of nuclear negotiations are in the books, attention on a signature legacy item for President Barack Obama now shifts to Congress. ¶ **Thanks to a bipartisan compromise** that Obama ended up signing in May, **Congress will have a say in the ultimate fate of the deal.** ¶ **While even opponents** of the deal **concede the odds are long, there's at least a small chance that Congress could torpedo it.** ¶ **"The American people are going to repudiate this and I believe Congress will kill the deal,"** said Sen. Tom **Cotton** (R-Arkansas), one of the more hawkish members of the Senate on foreign policy. ¶ Here's a brief overview of what happens next: ¶ Once Congress receives the details of the deal, it will have 60 days to debate and vote on it, according to the terms of the law Obama signed in May. A GOP congressional aide told Business Insider that it has not yet received the details. ¶ If Congress sends a joint resolution of disapproval to Obama (meaning both chambers of Congress disapprove of the deal), it would trigger a new timeline. He would have 12 days to veto the resolution. That's likely, considering his promise Tuesday morning to veto anything that would hamper the deal's implementation. ¶ Following an Obama veto, Congress would have 10 days to vote to override his veto, which would require a two-thirds majority of both chambers of Congress. ¶ If both chambers vote to override, it would prevent Obama from suspending sanctions on Iran related to its nuclear program. ¶ Simple math, then, is in favor of the Iran deal moving along through Congress unscathed. ¶ Nevertheless, the deal has not only become just about universally unpopular among Republican members of Congress. It's also opposed by a chunk of Democrats normally aligned with Obama on both domestic- and foreign-policy matters. ¶ Sen. Chuck Schumer (D-New York), the third-ranking Democrat in the Senate and the incoming Democratic leader after Sen. Harry Reid's retirement next year, said he'd be going through the deal with a "fine-toothed comb" before deciding whether or not to support it. Rep. Eliot Engel (D-New York), the top Democrat on the House Committee on Foreign Affairs, said likewise that he'd have to go through the details – but added that he's been "troubled" by the negotiations. ¶ Many congressional observers consider it likely that Congress will pass an initial resolution of disapproval. Thereafter, it will again become another question of math. ¶ "The rhetoric and behavior from Iran's ayatollahs has been so provocative in recent months that Congress is surprisingly united in its opposition to the nuclear deal that was announced this morning," said Greg Valliere, the chief political strategist at Potomac Research Group. ¶ "Furious lobbying against the deal, from pro-Israeli groups in particular, will begin immediately as a 60-day review period starts. There's little doubt that both houses will pass a resolution of disapproval. ¶ A veto override would require at least 13 Democrats in the Senate and 44 in the House to break with their party and president – if all Republicans are united in their opposition. ¶ There were 20 Democratic cosponsors of the legislation that eventually gave Congress a say in the negotiations. Some congressional GOP aides believe at least 13 of those Democrats and Sen. Angus King (I-Maine), an independent who caucuses with Democrats, are swayable.

The Iran deal will advance – Republicans can't overcome the veto.

Patricia Zengerle 7-14-15, Journalist for Reuters, 7/14/15, "Iran deal faces fight in US congress but will likely survive", <http://www.reuters.com/article/2015/07/14/us-iran-nuclear-congress-process-idUSKCN0PO1HJ20150714>

*edited for ableist language

The nuclear deal between world powers and Iran starts a new phase of intense negotiation - this time between the Obama administration and the U.S. Congress, where some Republicans have long been working to sink an agreement. Any effort in Congress to overturn the deal will face an uphill fight. Republicans have majorities in both the House of Representatives and Senate, but they would need the support of dozens of President Barack Obama's fellow Democrats to sustain a "resolution of disapproval" that could cripple [end] a deal. The odds of that are slim. A resolution of disapproval would need only the Republican majority to pass the House, but would require at least six Democrats to get the 60 votes needed to advance in the Senate. The chances of mustering enough support to then overrule an Obama veto are slimmer still.

PC Key

JCPOA close to passing-but rejection is still possible-PC KEY.

Ryan Costello 14, National Iranian American Council, 11/5/14, "Can Obama and the Republican Congress Seal an Iran Nuclear Deal?",

http://www.huffingtonpost.com/ryan-costello/can-obama-and-the-republi_b_6108300.html

With the Republicans gaining control of both houses of the U.S. Congress, polarization and partisan gridlock are likely to continue to grip Washington. The grim political outlook has already cast a shadow over nuclear negotiations with Iran, where a diplomatic breakthrough remains within reach as the parties near a November 24 deadline for a comprehensive deal. While the parties have a number of difficult choices left to make, the risks of failing to reach an agreement by the November deadline (or shortly thereafter) are significantly higher than they were in July. Given the landscape of domestic politics in both the U.S. and Iran, there may not be a better chance to ink a durable deal than over the next few weeks. Since the U.S. and UN powers secured an interim agreement to freeze Iran's nuclear program last November, President Obama has worked closely with congressional allies to prevent any new sanctions from passing that would violate that agreement. Republicans in the minority clamored to vote on new Iran sanctions, but their motivations could have been due to politics rather than policy. An affirmative vote on Iran sanctions would have killed the agreement, likely fracturing international unity on the sanctions and potentially pushing the U.S. and Iran toward military confrontation. Fortunately, Congress held off, enabling us to test Iran's intentions. As a result, the interim agreement has been an unmitigated success. Iran has capped enrichment at the 5 percent level, eliminated its stockpile of uranium enriched to the 20 percent level, and frozen the number of centrifuges it is operating. Further, Iran has enabled daily access to its enrichment facilities, compared with bimonthly inspections before the deal. However, the future Republican Senate could tip the scales in favor of Congress passing new Iran sanctions. Majority Leader Harry Reid (D-NV) sought to avoid such a vote to allow negotiations to proceed. However, with Mitch McConnell (R-KY) as Majority Leader, a vote on new Iran sanctions becomes far more likely -- regardless of the outcome of talks. McConnell has pursued a policy of obstruction over the past six years, seeking to deny the President any significant policy achievements and then blaming the president for Washington's dysfunction. Despite the obvious benefits of a nuclear deal and the dire consequences of failure, McConnell could continue his policy of denying the president a share of any policy wins.

Obama Lobbying

Obama Lobbying For Iran Deal- The Daily Show and Twitter Campaigning Shows.

Julia **Edwards** 7/21, reporter, 7/21/15, "Obama pitches Iran deal to vets, Daily Show's Stewart", <http://www.reuters.com/article/2015/07/21/us-usa-obama-iran-idUSKCN0PV2GL20150721>

President Barack **Obama's campaign to convince Congress to support the Iran nuclear deal led him** on Tuesday **to a veterans' convention and The Daily Show**, where he took jabs at those **opposing the agreement**. In a back and forth on Comedy Central's nightly political satire show, Obama pushed back against hard questions from host Jon Stewart. **"This [Iran] is an adversary. They are anti-American, anti-Semitic, [and] they sponsor terrorist organizations like Hezbollah," Obama said** of Iran. "Sounds like a good partner for peace," Stewart responded sarcastically. **"Well, as has been said frequently, you don't make peace with your friends."** Obama said. **"The issue here is, do we want them having a nuclear weapon? The answer is no."** **Obama urged Americans to write their representatives in Congress to express their opinion of the deal**. Tuesday's **efforts widened the administration's efforts to gain support** for the deal, from Capitol Hill to the general public. Congress is reviewing the agreement, reached last week, and could vote to reject it. **The process has prompted a lobbying effort on Capitol Hill from both the Obama administration and opponents of the accord. The White House started the Twitter handle @theiranddeal on Tuesday to inform Americans about the contents of the agreement. Speaking to thousands of veterans at the 116th annual Veterans of Foreign Wars conference in Pittsburgh, Obama pushed back against Republicans who oppose him on the issue.** "Some of the same politicians and pundits that are so quick to reject the possibility of a diplomatic solution to Iran's nuclear program are the same folks who were so quick to go to war in Iraq and said it would take a few months," Obama said.

Obama will push for the Iran deal

Gulf News 7-14-15, Middle Eastern News Agency, 7/14/15, "For Obama, another hurdle remains ahead of Iran deal", <http://gulfnews.com/news/mena/iran/for-obama-another-hurdle-remains-ahead-of-iran-deal-1.1550376>

Grumblings from Congress Republicans started soon after Obama's address.¶ US Republican House Speaker John **Boehner criticised the deal, saying Obama had "abandoned his own goals."**¶ The Republican chairman of the US House of Representatives Foreign Affairs Committee said it does not require Tehran to dismantle bomb-making technology and will allow it to develop an industrialised nuclear programme in ten years.¶ **"The deal they have struck is looking like a tough sell."** US Representative Ed Royce, who will convene a hearing on the deal on Tuesday morning, said in a statement.¶ **The deal starts a new phase of intense negotiation — this time between the Obama administration and the US Congress, where some Republicans have long been working to sink an agreement.**

IL

Deal fail in congress = no talks

Failure of the deal to pass congress would collapse the entire deal.

Karen **DeYoung et al.** 4-15-15, Karen DeYoung, Mike DeBonis, Daniela Deane are all journalists for the Washington Post, 4/15/15, "Iran leader: We are in talks with 'the major powers,' not the U.S. Congress", https://www.washingtonpost.com/world/iran-says-it-is-negotiating-with-world-powers-not-the-us-congress/2015/04/15/a828b2f0-e349-11e4-81ea-0649268f729e_story.html

Iranian President Hassan Rouhani said Wednesday that Tehran was negotiating a comprehensive nuclear deal with world powers, not the U.S. Congress, and called a Senate committee's vote to give Congress the power to review any potential deal an American domestic matter.¶ The Iranian leader, in a televised speech in the northern Iranian city of Rasht, also repeated earlier statements that his country will not accept any comprehensive nuclear deal with world powers unless all sanctions imposed against it are lifted.¶ "We are in talks with the major powers and not with the Congress," Rouhani said, Iranian state television reported. Rouhani said the U.S. Congress's power to review a nuclear deal with Iran was a domestic U.S. matter, the Reuters news agency reported.¶ He said Iran wanted to end its isolation by fostering "constructive interaction with the world and not confrontation."

Deal k2 relations

The Iran deal is key to increased relations with Iran – eliminates distrust by integrating Iran into the global economy.

Oren **Dorell** 7-14-15, Journalist for USA Today, 7/14/15, "Nuclear deal spurs prospect for better U.S.-Iran relations", <http://www.usatoday.com/story/news/world/2015/07/14/iran-deal-spurs-hopes--better-us-iran-relations/30084011/>

The nuclear deal between world powers and Iran offers the prospect that the United States and the Islamic Republic may embark on a new, less hostile relationship after 36 years of open enmity. Tuesday's landmark accord [The nuclear deal], which will lift U.S. and international sanctions on Iran in return for its nuclear restraint, will provide Iran with increased trade and the opportunity to integrate its economy and culture more fully with the rest of the world. In Tehran, thousands of people flooded city streets to celebrate the deal amid hopes for more contact with the West, which many crave. The agreement marks the first time the two countries have engaged in direct and open diplomacy in more than a generation. And it puts to rest for now a threat by President Obama to resort to force if necessary to prevent Iran from obtaining a nuclear weapon, something Iran always has denied seeking. The deal could alter a recent history of conflict and lead the two nations toward a more cooperative relationship, both Obama and Iranian President Hassan Rouhani said Tuesday. Obama noted that Iran "has been a sworn adversary of the United States for over 35 years." He urged the Iranian people and their leaders to move away from violence, rigid ideology and threats to eradicate Israel. "A different path, one of tolerance and peaceful resolution of conflict, leads to more integration into the global economy, more engagement with the international community, and the ability of the Iranian people to prosper and thrive," Obama said. "This deal offers an opportunity to move in a new direction. We should seize it." Rouhani said the agreement begins "a new chapter" in Iran's relations with the world community. If the deal is carried out, "we can gradually eliminate distrust," he said in Tehran.

Iran Deal Key To Build U.S-Iran Relations- Rouhani's (Iran President) Statements Show Babak Dehghanpisheh 4/3, Newsweek magazine's Baghdad Bureau Chief, and Ori Lewis 4/3, journalist, 4/3/15, "Iran president views nuclear deal as start of new relationship with world", <http://www.reuters.com/article/2015/04/04/us-iran-nuclear-idUSKBN0MQ0HH20150404>

Iran's president said on Friday that a framework for a nuclear deal was just the first step toward building a new relationship with the world, after Iranians greeted the announcement of the accord with celebrations in the streets. U.S. President Barack Obama also hailed what he called a "historic understanding," although diplomats cautioned that hard work lies ahead to strike a final deal. That work will include efforts by Obama to sell an eventual accord to critics at home, and to close ally Israel, which denounced the interim agreement and pressed for more safeguards in coming negotiations. The tentative agreement, struck on Thursday after eight days

of talks between Iran and six world powers in Lausanne, Switzerland, clears the way for a settlement to allay Western fears that Iran could build an atomic bomb, with economic sanctions on Tehran being lifted in return. It marks the most significant step toward rapprochement between Washington and Tehran since the 1979 Iranian revolution, and could potentially end decades of international isolation, with far-reaching political consequences in the Middle East. In a televised speech on Friday, Iranian President Hassan Rouhani, a relative moderate elected in a landslide two years ago on a promise to reduce Iran's isolation, said the nuclear talks were just the start of a broader policy of opening up. "This is a first step towards productive interactions with the world," he said. "Today is a day that will remain in the historic memory of the Iranian nation," he added. "Some think that we must either fight the world or surrender to world powers. We say it is neither of those, there is a third way. We can have cooperation with the world."

Iran Deal Key

Deal key to prevent nuclear war

Vince Gallo 7/23, Buffalo News Reporter, 7/23/15, “Congress should prevent war and vote in favor of Iran deal”,

<http://www.buffalonews.com/opinion/letters-to-the-editor/letter-congress-should-prevent-war-and-vote-in-favor-of-iran-deal-20150723>

In a **nuclear world**, the planet is too small for any elevated conflicts. The **United States**, our allies and **Iran** recently **reached a deal to stop Iran** from building nuclear weapons. **This historic agreement is an opportunity to resolve one of America’s biggest security concerns through diplomacy, not war.**

I hope my members of Congress will publicly defend and support this deal. **If Congress kills this good deal, Iran could unfreeze its nuclear program, which means either Iran gets a nuclear bomb or we have to fight another war in the Middle East.**

After **over a decade of war** in Iraq, Afghanistan and now Syria, Americans like me are tired of war. **Congress should seize this opportunity to vote for a deal – not war – with Iran.**

Rejection Of The Iran Deal Is Critical To Prevent Another War- Current Events Show This Is True.

Richard Kirsch 7/24, contributor, 7/24/15, “Rejecting Iran deal is what really pours gasoline on fire of war”, <http://thehill.com/blogs/pundits-blog/international/249051-rejecting-iran-deal-is-what-really-pours-gasoline-on-fire-of>

Presidential candidate and U.S. Sen. **Lindsey Graham (R-S.C.)** got a lot of **attention** recently for **saying that the agreement with Iran was like taking a "can of gasoline and [throwing] it on a fire."** But **Graham and other opponents** of the negotiations **have it backwards: It is resorting to the use of force and rejecting diplomacy that pours gasoline on the fire of war.**

Graham and the rest of the hawks should know better. After all, they pushed us into the disastrous war in Iraq, proclaiming that it was the only way to get rid of weapons of mass destruction that did not exist. Their actions cost us the death of thousands of our service men and women, grievance injury to tens of thousands more, and much greater casualties among Iraqis. They also created the unending cycle of unrest in Iraq that has led to the rise of the Islamic State in Iraq and Syria (ISIS). In fact, if we had not invaded Iraq, there would be no ISIS today. **Unfortunately, there are a host of other current examples** where the use of force pours gasoline on the fire. **In Libya, our military support for the rebellion led to continued civil war,** Benghazi and ISIS activity in Libya. **Drone attacks in Yemen helped to destabilize the government, plunging that country into civil war** and an air invasion from Saudi Arabia. The civilian toll in drone attacks in Pakistan, **more than 900** in the first five years, has only won more animosity toward the United States while terrorists have

continued to make gains. **For once**, instead of pouring more gasoline on conflicts, **the agreement with Iran to derail their nuclear weapons program is a stellar example of fire prevention.** The agreement blocks Iran's pathways to nuclear weapons. The breakout time to develop enough material for one bomb will be four times longer with a deal than without one. Rigorous **inspections will guard against cheating**, subject to the most intrusive inspections regime ever negotiated. Uranium will be subject to cradle-to-grave monitoring, which will deter and detect any diversion. **Inspectors will have access to all of Iran's nuclear sites and** will be granted access to **military sites if there are concerns** about illicit nuclear activities. U.S. sanctions will be suspended only after the International Atomic Energy Agency (IAEA) verifies that Iran has taken the key steps it agreed to as part of the nuclear deal. Because the U.S. sanctions architecture is only suspended, not terminated, sanctions can snap back into force if Iran reneges on its commitments. Remarkably and vitally, the agreement was negotiated with two world powers with whom the U.S. has shaky and sometime adversarial relationships: Russia and China. Their participation makes it much harder for Iran to violate the agreement. It also underscores why, if the U.S. rejected the agreement, Russia and China would likely support Iran's conclusion that the U.S. will reject any diplomatic solution and only seek to subjugate Iran. Unfortunately, Iran would be right in making that assertion. **Those who advocate for rejecting the agreement offer no alternative other than igniting a conflagration in Iran, which would put America and Americans in harms way, spread more hatred of the United States, create more terrorists and leave us diplomatically isolated.** There would be no option for tougher sanctions and our allies would not keep the ones we've had in place. **The only option if Iran moved toward nuclear weapons would be war. In today's global world, we have no choice but to work with others to solve the big problems.** It's the only way we can be effectively tough, not just rhetorically tough, as we have been both with the sanctions on Iran and with the agreement to derail their nuclear weapons program. **It's time we switched from being the world's policeman to organizing the world to prevent fires. Sen. Dianne Feinstein (D-Calif.) said on Sunday that the historic deal with Iran is the best chance for peacefully preventing Tehran's acquisition of nuclear weapons.**

Iran Deal Key To Prevent Iran's Acquisition Of Nukes- Iran Wants Deal.

Mark Hensch 7/19, staff writer, 7/19/15, "Iran deal 'our one opportunity,' Feinstein says", <http://thehill.com/policy/international/248453-iran-deal-our-one-opportunity-feinstein-says>

Sen. Dianne Feinstein (D-Calif.) said on Sunday that the historic deal with Iran is the best chance for peacefully preventing Tehran's acquisition of nuclear weapons. "This is our one opportunity," Feinstein, the ranking Democrat on the Senate Intelligence Committee, told host John Dickerson on CBS's "Face the Nation." "It is very likely that regardless of what we do, these nations will drop their sanctions," she said of the U.S. allies involved

in the deal. The Obama administration revealed its major diplomatic pact with Iran on July 14 from Vienna. It reduces economic sanctions on the Islamic nation in exchange for greater restrictions on its nuclear arms research. Feinstein argued on Sunday that the deal was made possible by drastic changes in Iranian leadership. "We have a moderate, elected government that wants to make a change," she said of Iranian President Hassan Rouhani. "We'll see if it is enough to make that change," she added. Ayatollah Ali Khamenei, Iran's supreme leader, has long antagonized the U.S., Israel and America's other allies. Rouhani, in contrast, has struck a more conciliatory tone with Washington since his election in 2013.

Key + AT: Circumvention

Iran Nuclear Deal Vital To Prevent Middle Eastern War And Has Provisions That Will Prevent Circumvention

ABC News 7/15, News, 7/15/15, "Iran nuclear deal needed to avoid 'more war in Middle East', US president Barack Obama says",

<http://www.abc.net.au/news/2015-07-16/iran-nuclear-deal-needed-to-avoid-more-war-in-the-middle-east/6623314>

US president Barack Obama has insisted the landmark Iran nuclear agreement is the best way to avoid a nuclear arms race and more war in the Middle East. Mr Obama made his case in a nationally televised news conference responding to critics at home and abroad after Iran and six world powers sealed an accord in Vienna to restrict Tehran's nuclear program in exchange for sanctions relief. "Without a deal there would be no limits to Iran's nuclear program and Iran could move closer to a nuclear bomb," he said. "Without a deal we risk even more war in the Middle East." Mr Obama said if the US did not seize the opportunity for a deal "future generations will judge us harshly". The agreement is a political triumph for Mr Obama — who has made outreach to America's enemies a hallmark of his presidency — but it is also seen as his biggest foreign policy gamble since taking office in 2009. He is now spearheading an intense White House push to counter Republican critics in Congress and reassure nervous US allies such as Israel and Saudi Arabia. Critics say the deal contains loopholes, especially in regards to the inspection of Iran's procedures and facilities, and will provide Tehran with an infusion of unfrozen assets to fund its proxies in sectarian conflicts ranging from Syria to Iraq to Yemen. Mr Obama argued a "snap-back" mechanism contained in the agreement to restore sanctions if Iran cheated would ensure it faced real consequences for not keeping its nuclear commitments. But he acknowledged that although he hoped the international deal would encourage Iran to rein in its aggressive conduct in the region, he was not betting on a change. "Without a deal, the international sanctions regime will unravel, with little ability to reimpose it," Mr Obama said. "With this deal, we have the possibility to peacefully resolve a major threat to regional and international security." Mr Obama said there would have been a risk of more fighting in the Middle East without a deal and other countries in the region would feel compelled to pursue their own nuclear programs "in the most volatile region in the world". He said the deal would cut off all of Iran's pathways to a nuclear weapons program, but he expected a robust debate in Congress over it.

AT: Circumvention

The JCPOA will work and prevent circumvention- provision text shows.

Paul Heroux 7/21, state representative of Massachusetts, 7/21/15, “Nuclear Iran: How and Why The JCPOA Will Work”,

http://www.huffingtonpost.com/paul-heroux/nuclear-iran_b_7832554.html

If any of these or other provisions of the JCPOA are violated, there is an agreed upon **Dispute Resolution Mechanism** that beings in section 36 of the plan. Section 36 talks about the process for submitting a concern over a breach in the agreement. It continues: 36 -- If the issue still has not been resolved to the satisfaction of the complaining participant, and if the complaining participant deems the issue to constitute significant nonperformance, then that participant could treat the unresolved issue as grounds to cease performing its commitments under this JCPOA in whole or in part and/or notify the UN Security Council that it believes the issue constitutes significant non-performance. This section is saying that there is a way for the U.S. to file for a complaint that Iran is in **breach of its obligations**. Section 37 states that: 37 -- If the resolution described above has not been adopted within 30 days of the notification, then the provisions of the old UN Security Council resolutions would be re-imposed, unless the UN Security Council decides otherwise One reassuring thing about this provision is that U.S. could veto if the four other members of the UNSC decided otherwise. What this section is doing is **effectively snapping back into place the sanctions that were in place before this plan** would take effect **if the US or any party decides that Iran is in non-compliance** of its obligations agreed to under the plan. 24 Days?

The JCPOA “24 Day Provision” Is Not An Issue- They Can’t Clean Up On Time

Paul Heroux 7/21, state representative of Massachusetts, 7/21/15, “Nuclear Iran: How and Why The JCPOA Will Work”,

http://www.huffingtonpost.com/paul-heroux/nuclear-iran_b_7832554.html

There is a lot of **concern about the 24-day provision but there need not be**. First of all, **24 days is not specified** in the JCPOA. There is a **multiple step** process that arrives at 24 days. Second, if **Iran would to cheat** and try to produce nuclear materials for a weapon at an undisclosed location, **nuclear experts are in agreement that it could not be cleaned up in 24 days**. Nuclear materials leave trace particles that **can be detected** by IAEA inspectors. Fourth, Iran agreed that access "will be exclusively for resolving concerns regarding fulfilment of the JCPOA commitments and Iran's other non-proliferation and safeguards obligations." And finally, the **JCPOA states** that if Iran is unable to: Q.78 -- **verify the absence of undeclared nuclear materials and activities** or activities inconsistent with the JCPOA at the specified locations within 14 days of the IAEA's original request for access, **Iran**, in consultation with the members of the Joint Commission, **would resolve the IAEA's concerns** through necessary means agreed between Iran and the IAEA. In the absence of an agreement, the members of the Joint Commission, by consensus or by a vote of 5 or more of its 8 members, would advise on the necessary means to

resolve the IAEA's concerns. The process of consultation with, and any action by, the members of the Joint Commission would not exceed seven days, and Iran would implement the necessary means within 3 additional days. What this means is that the dispute resolution mechanism kicks in and the snapback provision takes effect putting the crippling sanctions back on Iran.

Iran Is Forced To Comply With Agreement- Circumventing Means Economic Collapse.

Paul Heroux 7/21, state representative of Massachusetts, 7/21/15, “Nuclear Iran: How and Why The JCPOA Will Work”,
http://www.huffingtonpost.com/paul-heroux/nuclear-iran_b_7832554.html

Conclusion The contrast between the way President Bush addressed Iraq's suspected WMD program and the way that Obama addressed Iran's nuclear program could not be starker. The sanctions that were placed on Iran under President Obama were effective in getting Iran to negotiate. Sanctions hurt Iran: Iran's unemployment rate is well over 10 percent. Inflation has been up to nearly 40 percent in recent years and is down to about 15 percent right now. Their economy was suffering from a recession and negative growth in recent years. The sanctions were working. Iran agreed to this plan and has everything to gain by adhering to it. Without the sanctions Iran would not have negotiated. Without the JCPOA, there would be no inspection process. With no inspection process, Iran may or may not pursue a nuclear weapon, something it has said many times that it is not and will not pursue. The alternatives that have been proposed by several candidates running for President in the U.S. have no chance of any support in the international community. It was only because the U.S. led international effort to sanction Iran that the sanctions were effective. The U.S. cannot and should not do it alone, as several of the presidential candidates have suggested. Centrifuge enrichment is how Iran probably could first produce enough fissile material for a weapon. The JCPOA blocks this. Covert action is a concern for many. The JCPOA blocks this and has several mechanisms to address this or cheating. If Iran cheats under this plan, the plan still ensures success by snapping back the sanctions. All of this scrutiny comes on the heels that the West and the EU don't trust Iran. But let us not forget that there is no evidence of a nuclear weapons program, and there is no evidence that Iran has been pursuing a nuclear weapon capability. The 2007 NIE stated: **We judge with high confidence that in fall 2003, Tehran halted its nuclear weapons program; we also assess with moderate-to-high confidence that Tehran at a minimum is keeping open the option to develop nuclear weapons.** Any belief to the contrary is in error, or at the very minimum, the critics need to prove there is a nuclear program designed to cause harm.

**Iran Cant Hide Their Nuclear Activity- Inspectors Can Still Uncover The Truth.
Tim Deveaney 7/19, author, 7/19/15, "Obama aide: 'Virtually impossible' for
Iran to hide nuclear activity", [http://thehill.com/policy/international/248444-
energy-secretary-virtually-impossible-for-iran-to-hide-nuclear-activity](http://thehill.com/policy/international/248444-energy-secretary-virtually-impossible-for-iran-to-hide-nuclear-activity)**

One of the Obama administration's top negotiators is defending the controversial Iranian nuclear agreement from critics who say it does not go far enough to protect the West. **Under the agreement, it will be "virtually impossible" for Iran to cover up nuclear activity**, Energy Secretary **Ernest Moniz says**. "We are better off forever in terms of Iranian nuclear activity under this agreement than we would be without it," Moniz told "Fox News Sunday." Moniz made the rounds on the Sunday morning political talk shows. Critics have suggested the nuclear agreement gives Iran too much leeway to secretly build a weapon. One of the chief concerns is that investigators could be forced to wait 24 days before inspecting covert sites suspected of nuclear activity. Some fear this will give Iran enough time to hide any traces of such activity. "You wouldn't tell a drug dealers, give them a 24-day notice," Israeli Prime Minister Benjamin Netanyahu, one of the deal's biggest critics, said. "They'd just flush the drugs down the toilet." **But Moniz said three weeks is a "reasonable" amount of time to inspect for nuclear activity.** Flushing things down the toilet "is not so simple with nuclear materials," he told ABC's "This Week." **"We are very confident in our ability to detect the vestiges of any nuclear work beyond 24 days."** Eventually, inspectors would collect environmental samples. **"When environmental samples are taken and nuclear activity has taken place, it is virtually impossible to clean up that place,"** Moniz said on "Fox News Sunday." **You can paint the floors, you can do what you want. We feel very confident that we would find evidence of nuclear activity."** The key for western negotiators was "getting a defined timeframe" so Iran couldn't hold inspectors out for more than 24 days, Moniz said on CBS's "Face the Nation." "The part of the agreement that is absolutely critical is the one that prevents them from having a weapon," Moniz told CNN's "State of the Union." "There's a lot more you need for a nuclear explosive and if you look at the agreement you will see an indefinite commitment to not pursuing four major activities needed for a weapon," he added on Fox. Moniz said the Obama administration is simply trying to clean up a mess left by the Bush administration. "The issue of Iran having a nuclear program was already established in the previous administration," Moniz said. "Clearly, what we have done is we have dramatically limited and constrained the program."

AT: Disapproval

General + Key

There Is a HUGE amount of support for the Iran Deal- Statement by 60 National Security Leaders Show- Understands Deal Key.

Win Without War 7/20, a national leader in the fight to promote a more progressive national security strategy, 7/20/15, “60 National Security Leaders Support the Iran Deal”, <http://nowarwithiran.org/60-national-security-leaders-support-the-iran-deal/>

applaud the announcement that a Joint Comprehensive Plan of Action (JCPOA) has been reached with Iran to limit its nuclear program. We congratulate President Obama and all the negotiators for a landmark agreement unprecedented in its importance for preventing the acquisition of nuclear weapons by Iran.

Though primarily a nonproliferation agreement, the JCPOA has significant implications for some of America’s most important national objectives: regional stability in the Middle East, Israel’s security, dealing with an untrustworthy and hostile nation, and U.S. leadership on major global challenges.

This JCPOA will put in place a set of constraints and monitoring measures that will help to assure that Iran’s nuclear program will be for peaceful purposes only. Major U.S. objectives have been achieved: uranium enrichment limited to 3.67% and only at the Natanz plant; the Arak reactor will be re-designed to minimize the amount of plutonium produced and Iran is barred from separating plutonium and all spent fuel will be removed from Iran; a 98% reduction in Iran’s stockpile of low enriched uranium for 15 years; unprecedented surveillance of nuclear activities and control of nuclear related imports; a two-thirds reduction in the installed centrifuges for ten years; constraints on research and development of advanced centrifuges. The agreement will set up a highly effective multilayered program to monitor and inspect every aspect of Iran’s nuclear supply chain and fuel cycle, including continuous monitoring at some sites for 20-25 years, and permit inspections on short notice. We have followed carefully the negotiations as they have progressed and conclude that the JCPOA represents the achievement of greater security for us and our partners in the region.

We acknowledge that the JCPOA does not achieve all of the goals its current detractors have set for it. But it does meet all of the key objectives. Most importantly, should Iran violate the agreement and move toward building nuclear weapons, it will be discovered early and in sufficient time for strong countermeasures to be taken to stop Iran. No agreement between multiple parties can be a perfect agreement without risks. We believe without this agreement, the risks to the security of the U.S. and its friends would be far greater. We have also not heard any viable alternatives from those who oppose the implementation of the JCPOA.

We, the undersigned, have devoted our careers to the peace and security of the United States in both Republican and Democratic Administrations. U.S. presidents and Congresses over the past 20 years have joined in a bipartisan policy of sanctioning and isolating Iran to prevent a nuclear weapon. There was bipartisan understanding that when the Iranians indicated a readiness to talk the U.S. would lead the negotiations to test Iran’s seriousness. Indeed the Corker-Cardin

legislation, which was approved this past spring by an overwhelming bipartisan vote in both the House and Senate was signed into law by the President, defines the review process that the Congress will use over the coming months. Members of both political parties can deservedly take credit for bringing us to this moment.

We welcome the discussion that will unfold over the merits of this agreement. We urge members of Congress to be closely involved in the oversight, monitoring and enforcement of this agreement. As Congress was so diligent and constructive in pressing forward the highly effective sanctions regime that helped get Iran to the table, it must now play a key role in the implementation of the agreement which they helped bring about. Congressional approval will eventually be required to lift sanctions under the agreement. Arrangements now need to be made to assure that Congress is a full partner in its implementation.

Those who advocate rejection of the JCPOA should evaluate whether there is a feasible alternative for better protecting U.S. security and more effectively preventing Iran from acquiring a nuclear weapon. The consequences of rejection [of JCPOA] are grave: [1] the unraveling of international sanctions; [2] U.S. responsibility for the collapse of the agreement; and [3] the possible development of an Iranian nuclear weapon under significantly reduced or no inspections. A rejection of the agreement could leave the U.S. with the only alternative of having to use military force unilaterally in the future.

We call on the Administration to place the Joint Comprehensive Plan of Action in a strategic context: assuring our partners in the region that the United States remains fully committed to their defense and to countering any destabilizing Iranian actions in the region. We also call on the Administration, with the express support of the Congress, to make clear that it will remain the arm policy of the United States, during the agreement's initial 10 to 15 years as well as after key restrictions expire, to prevent Iran from acquiring a nuclear weapon by all available means.

[LIST OF SUPPORTERS] → You can list a couple if you want to show the significance of the approval

Amb. (ret.) Morton Abramowitz, Assistant Secretary of State for Intelligence and Research and Ambassador to Thailand and Turkey

Madeleine Albright, U.S. Secretary of State

Samuel Berger, U.S. National Security Advisor

Zbigniew Brzezinski, U.S. National Security Advisor

Amb. (ret.) Nicholas Burns, Under Secretary of State for Political Affairs and Ambassador to Greece

BGen. (ret.) Stephen A. Cheney, U.S. Marine Corps

Joseph Cirincione, President of the Ploughshares Fund

Amb. (ret.) Chester A Crocker, Assistant Secretary of State for African Affairs

Amb. (ret.) Ryan Crocker, Ambassador to Afghanistan, Iraq, Pakistan, Syria, Kuwait, and Lebanon

Tom Daschle, U.S. Senator and Senate Majority Leader

Suzanne DiMaggio, Director of the 21st Century Diplomacy Project at New America
Amb. (ret.) James Dobbins, Special Representative for Afghanistan and Pakistan
Robert Einhorn, Assistant Secretary for Nonproliferation and Secretary of State's Special Advisor for Nonproliferation and Arms Control
Amb. (ret.) Stuart E. Eizenstat, Deputy Treasury Secretary and Department of State's Special Envoy for Holocaust Issues in the Bureau of European and Eurasian Affairs
Michele Flournoy, Under Secretary of Defense for Policy
Leslie Gelb, Assistant Secretary of State for Political-Military Affairs and Director of Policy Planning and Arms Control at the Department of Defense
Morton H. Halperin, Director of Policy Planning, Department of State
Lee H. Hamilton, U.S. House of Representatives and Chairman of the House Foreign Affairs Committee
Amb. (ret.) William C. Harrop, Ambassador to Israel and Inspector General of the State Department
Gary Hart, U.S. Senator and Special Envoy to Northern Ireland
Stephen B. Heintz, President, Rockefeller Brothers Fund
Amb. (ret.) Christopher Hill, Assistant Secretary of State for East Asian and Pacific Affairs and Ambassador to Iraq, Korea, Poland, and Macedonia
Amb. (ret.) Carla A. Hills, U.S. Trade Representative
James Hoge, former Editor, Foreign Affairs Magazine
J. Bennett Johnston, U.S. Senator
Nancy Landon Kassebaum, U.S. Senator
LTG (ret.) Frank Kearney, U.S. Army
Carl Levin, U.S. Senator and Chairman of the Senate Committee on Armed Services
Amb. (ret.) Winston Lord, Assistant Secretary of State for East Asia and the Pacific, Ambassador to China and Director of State Department Policy Planning
Amb. (ret.) William H. Luers, Ambassador to Czechoslovakia and Venezuela
Jessica T. Mathews, Director of the Office of Global Issues of the National Security Council
George J. Mitchell, U.S. Senator and Senate Majority Leader
Amb. (ret.) William G. Miller, Ambassador to Ukraine
Amb. (ret.) Richard W. Murphy, Ambassador to Saudi Arabia and Assistant Secretary of State for Near Eastern and South Asian Affairs
Vali Nasr, Special Representative for Afghanistan and Pakistan and Dean of Johns Hopkins University SAIS
Richard Nephew, Director for Iran, National Security Council and Deputy Coordinator for Sanctions Policy at the Department of State
Joseph Nye, Assistant Secretary of Defense and Chairman National Intelligence Council
Paul O'Neill, U.S. Secretary of the Treasury
Admiral (ret.) Eric Olson, U.S. Navy and Commander of U.S. Special Operations Command
William Perry, U.S. Secretary of Defense
Amb. (ret.) Thomas Pickering, Permanent Representative to the United Nations, Under Secretary of State for Political Affairs, and Ambassador to Israel, Russia, India, United Nations, El Salvador, Nigeria, and Jordan
Paul R. Pillar, National Intelligence Officer for the Near East and South Asia

Amb. (ret.) Nicholas Platt, Ambassador to Pakistan, Philippines, and Zambia
Joe R. Reeder, Deputy Secretary of the Army and Chairman of the Panama Canal Commission

A2 Oil DA

Iran won't flood the market – infrastructural and investment issues will keep output consistent and safe.

Jordan **Golson 7-5-15**, Journalist for Wired, 7/15/15, "LOOK, DON'T FREAK OUT ABOUT IRANIAN OIL FLOODING THE MARKET", <http://www.wired.com/2015/07/look-dont-freak-iranian-oil-flooding-market/>

IRANIAN OIL WILL soon hit the global market, thanks to sanctions being lifted as part of the historic deal reached yesterday to regulate the country's nuclear program.¶ **Some are suggesting that this will flood global markets with oil** at a time when prices are already incredibly low (thanks, in part, to high production from the US and Saudi Arabia). So, should you go out and buy a gas-guzzler and scrap your plans to save up for an electric car?¶ Uh, **no. To the extent that an increase in Iranian oil production will have an effect on the global price of gas, it will be slight and delayed.**¶ "Most of what is assumed can be delivered [from Iran] **has already been priced into the market.**" says Sarah Ladislaw, director of the Energy and National Security Program at the Center for Strategic & International Studies. "We really **don't know how quickly they can ramp up investment and what the state of their fields looks like.**"¶ **According to projections from three energy monitoring agencies, the global demand for crude oil amounts to 30 million barrels a day. Iran wants to double exports up to 2.3 million barrels per day, a far cry from the 6 million barrels per day it was making in the '70s,** before the 1979 revolution. The country's oil minister says it can increase exports by 500,000 barrels per day as soon as sanctions are officially lifted (expected late this year), with another 500,000 per day added over the next six months.¶ But **it's questionable how much oil the country's export infrastructure can handle without significant investment—everything from tankers, pipelines and the wells themselves can affect total production.** And **most of that investment will need to come from western oil companies. The question remains of how much they will want to invest in Iranian production, and when they'll be able to.**¶ "Investors are very **cautious.**" says Ladislaw. "They'll look at how the agreement is being implemented and if things are going well. They need some sense of whether or not their investment could be put at risk."¶ **Even members of OPEC appear to disagree about what the impact of Iranian oil will be.** An emergency meeting may be held to discuss the fallout from increased Iranian production.¶ **The global oil market is incredibly complicated,** with enough moving parts to fill a supertanker. **The potential for increased production from Iran isn't enough to spike or crash gas prices.** It's just all way too complicated for that.

Iran doesn't have the capabilities to flood the market and doesn't have the incentive to do it anyways.

Felicity **Capon 3-26-15**, Journalist for Newsweek-Europe, 3/26/15, "Fears That Iran Will 'Flood' the Oil Market Exaggerated", <http://europe.newsweek.com/fears-iran-will-flood-oil-market-exaggerated-317001>

Oil industry experts say it is unlikely that Iran will flood the market with oil **if sanctions are lifted** as a result of Iranian nuclear talks, quelling fears that the talks would spook the markets.¶ Negotiations between Iran and the U.S., UK, France, Russia, China and Germany - the so-called P5+1 group - reconvene this week, with the aim of curtailing Iran's controversial nuclear programme, in exchange for the lifting of crippling international sanctions.¶ Iran already has large amounts of oil in storage which have been extracted, say experts. **Although it is a state secret exactly how much oil Iran has stored,**

analysts predict it could be as much as 37 million barrels. There have been reports that an injection of hundreds of thousands of barrels a day into the oil market, which is already struggling with oversupply, could depress prices further.¶ The International Energy Agency, an intergovernmental organisation, has warned that Iran "may be in a position to increase production and exports rapidly" if an agreement is reached, stating that "much of last year was spent making sure wells and processing units were up to scratch and pipeline systems were tested".¶ Western sanctions aimed at curtailing Iran's nuclear activities have reduced the country's crude output to about 2.8 million barrels per day, from 3.6 million barrels per day at the end of 2011. While Iran holds almost 10% of the world's proven reserves, financial sanctions have made it extremely difficult for Iran to attract foreign investment needed in order to pump the oil out of the ground.¶ However, energy analysts say concerns that Iran could quickly reboot production in the event of successful negotiations have been exaggerated.¶ "A lot of reports misunderstand how quickly Iranian oil could recover," says Richard Mallinson, geopolitical analyst at consultancy Energy Aspects. "It's a big challenge for Iran - can it increase its production?" Iranian ministers say they are very confident and they have ambitious targets but at the moment they are producing less than three million barrels per day, and because western sanctions on Iran's oil sector back to the 1990s, that has taken its toll on Iran's production capabilities.¶ Mallinson estimates that towards the end of this year and into 2016, Iran would only be likely to lift production to 3.1 million barrels per day, from 2.8 million barrels per day now. "Even if 30 million barrels held in floating storage are released over April, May and June, that will amount to just over 300,000 extra barrels a day," he says. "That's a noticeable amount, but it's not a flood."¶ Demand has also begun to grow since the fall in global oil prices at the beginning of the year. "Demand for oil is coming in much stronger than expected because of the lower prices," says Mallinson, "so the size of the global oversupply is not as big as many had predicted. I don't think we'll see prices drop down to the lows we saw in January, because of this better demand."¶ Valerie Marcel, an associate fellow at Chatham House, agrees. "It's been a bit exaggerated that there will be a flood," she says. "To get to that stage would take some time; it's not like just turning on a tap to get the oil pumping again."¶ Marcel also says it would not be in Iran's interests to flood the market. "It's a tricky situation," she says. "On the one hand Iran will be desperate for cash and will want to maximise the revenues for what they have. But if they flood the market the price will really fall and they won't be making the best of what they have, so there's no incentive."¶ Yet there is a concern that Iran will try to recover its market share by offering low prices. "Iran has lost a lot of market share in critical Asian markets," she continues, "which has been taken back by Saudi Arabia, so Iran might start offering a good deal to get their market share back. I expect there will be a big competition between Saudi Arabia and Iran. They'll be fighting for market share, which will drive down price."

ECON Turn

Iran Deal Key To Prevent War With Iran And As A Result Prevent U.S Economic Collapse-5 things.

Michael Snyder 10, American Author, 6/29/10, "7 Potential Economic Effects Of A War With Iran", <http://theeconomiccollapseblog.com/archives/7-potential-economic-effects-of-a-war-with-iran>

So just **what would a war** between Israel and Iran [U.S would get involved too because they're allies with Israel] **mean for the world economy?** The following are 7 potential economic effects of a conflict between Israel and Iran.... **#1) The Price Of Oil Would Skyrocket** – One of the very first things **a war with Iran would** do is that it would severely constrict or even **shut down oil shipments** through the Strait of Hormuz. Considering the fact that approximately **20% of the world's oil flows through the Strait of Hormuz**, world oil markets would instantly be **plunged into a frenzy**. In fact, some **analysts believe** that oil **prices would rise to \$250 per barrel**. So are you ready to pay 8 or 10 dollars for a gallon of gasoline? What do you think that would do to the U.S. economy? The truth is that **every single transaction that we make every single day is influenced by the price of oil**. If the price of oil **suddenly doubles or triples** that would absolutely **devastate the** already very **fragile U.S. economic system**. **#2) Fear Would Explode In World Financial Markets** – Even without a war, the **dominant force in world financial markets in 2010 is fear**. We are already seeing **unprecedented volatility in financial markets around the globe**, and there is nothing like a war to **turn fear into** a full-fledged **panic**. And **what happens when panic grips financial markets?** What happens is that **they crash**. **#3) World Trade Would Instantly Seize Up** – Once upon a time the economies of the world were relatively self-contained, so a war in one area would not necessarily wreck economies all over the globe. But all of that has changed now. Today, **the economies of virtually every nation are highly interdependent**. That has some advantages, but it also has a lot of disadvantages. **If a war with Iran did break out, nations all over the globe would start taking sides** and world trade would **seize up**. The **global flow of goods and services would be severely interrupted**. That would be enough to push many **nations around the world into a full-blown depression**. **#4) Military Spending Would Escalate** – Even if the **United States was not pulled directly into a conflict between [such as] Israel and Iran**, there is little doubt that **the U.S. would be spending a lot of money and resources to support Israel [or an ally] and to build up military assets in the region in case a wider war broke out**. The U.S. has already spent somewhere in the neighborhood of **a trillion dollars** on the wars in Iraq and Afghanistan. If war does break out with Iran **the amount of money the U.S. government could be forced to spend could be absolutely staggering**. The truth is that **the U.S. is already drowning in debt**. At this point **the U.S. government is over 13 trillion dollars in debt, and another Middle East war is certainly not going to help** things. **#5) Russia Would Greatly Benefit** – Russia and other major oil producers outside of the Middle East would greatly benefit if a war with Iran erupts. Russia is already the number one oil producer in the world, and if supplies out of the Middle East were disrupted for any period of time it would

mean an unprecedented windfall for the Russian Bear. #6) **[5] Massive Inflation** – A huge jump in the price of oil and dramatically increased military spending by the U.S. government would most definitely lead to price inflation. We would probably see a dramatic rise in interest rates as well. In fact, it is quite likely that if a war with Iran does break out we would see a return of “stagflation” – a situation where prices are rapidly escalating but economic growth as a whole is either flat or declining. #7) The Price Of Gold Would Go Through The Roof – When there is a high degree of uncertainty in world financial markets, where do investors turn? As we have seen very clearly recently, they turn to gold. As high as the price of gold is now, the truth is that it is nothing compared to what would happen if a war with Iran breaks out. When times get tough, we almost always see a flight to safety. Right now none of the major currencies around the globe provide much safety, so investors are increasingly viewing precious metals such as gold and silver as a wealth preservation tool. War is never pleasant. If war with Iran does break out it could potentially set off a chain of cascading events that would permanently alter the world economy for the rest of our lifetimes. So let us hope that war does not erupt. It wouldn't be good for anyone. But the reality is that at this point it almost seems like a foregone conclusion. Tensions in the Middle East are rising by the day, and all sides are certainly preparing as if they fully expect a war to happen. Even without a war with Iran, incredibly hard economic times are on the way, so if a war does happen it could mean a complete and total economic disaster.

HEG Turn

Rejecting The Iran Deal Will Only Hurt U.S. Hegemony- The U.S Will Take The Blame If Iran Doesn't Violate And No Deal Was Made.

Michael Krepon 7/15, the co-founder of the nonpartisan Stimson Center.

7/15/15, "The danger of a 'no' vote on the Iran deal",

<http://www.latimes.com/opinion/op-ed/la-oe-krepon-iran-deal-republican-resistance-20150715-story.html>

Congress voted to rid Saddam Hussein of weapons of mass destruction that did not exist. **Will it [congress] now act to block an agreement that verifiably limits Iran's all-too-real nuclear capabilities for a decade or more?** Nothing would **diminish U.S. global leadership, destabilize the Middle East, further exhaust American military forces and weaken the U.S. Treasury more than this one-two punch**. A "nay" vote by Republicans against the Iran deal **can have grave consequences even if they cannot override a presidential veto**. Division, mostly along party lines, **is never cost-free on national security issues**. Countries hedge against American leadership **even when U.S. foreign policies have a broad base of domestic support**. They hedge more when domestic divisions convey that U.S. policies are not sustainable. **Nuclear proliferation can be managed with this agreement; that becomes much harder if it unravels**. Capitol Hill has become a theatrical, **partisan battleground where lawmakers can cast votes in the confident expectation of coming up short**. Republicans can vote repeatedly against Obamacare without having to deal with the consequences of leaving millions of Americans without coverage because they can't override a presidential veto or the Supreme Court. Democrats can vote in large numbers against fast-tracking the Trans-Pacific Partnership because they know the White House will still be able to cobble together a majority. **Voting against the Iran agreement is different**. A deep partisan divide would send all the **wrong messages to U.S. friends, allies and adversaries**. What we need is **a bipartisan strategy to cope with the deal's downside risks and shore up our partners in the Middle East that will be affected** by the lifting of sanctions on Iran. This agreement reflects compromises that can be labeled as defects. They pale in comparison to the defects of a strategy to undo it.- Instead, Republicans are gearing up to oppose this deal, and to carry out a long campaign to block its implementation. Some sanctions covered by the deal can be lifted by executive order, others will need congressional approval. (Sanctions relating to human rights abuses and terrorist activities aren't part of the deal.) In Senate Majority Leader Mitch McConnell's words, **Republicans will continue to send an "unmistakable signal about congressional opposition to lifting sanctions."** **If Tehran violates the provisions of this agreement, it will be responsible for its demise and any consequences that follow. If, however, Tehran abides by its obligations, critics will still accuse Iran of violating provisions that the United States and its negotiating partners wanted but failed to get**. Right-wing opponents may also spin ambiguous Iranian behavior as a **kind of cheating to justify repeated votes to retain sanctions**. Such a strategy could unravel the deal in the future, and then **Washington, not Tehran, would bear primary responsibility** for its failure. **When one party lines up against an**

agreement of this importance, U.S. global leadership takes a **major hit**. America's allies in this deal — Britain, Germany and France — and all our allies in Europe and the Pacific **will be** badly shaken if congressional action indicates that **they cannot place trust in executive agreements reached with the United States**. Beijing and Moscow will be the greatest beneficiaries of weakened confidence in U.S. leadership. Only the governments of Israel and Saudi Arabia vociferously oppose this agreement. By seeking to undermine it, they are not acting as friends or allies. **They will lose more than they will gain if this agreement unravels**. The point of sanctions has been to isolate Tehran and to set the table for an effective and verifiable nuclear limitation agreement. **If Republicans block** implementation of **this agreement**, or if they sabotage it by repeatedly voting to retain sanctions once the deal is done, **Washington** rather than Tehran **will be isolated**, tougher sanctions if they are needed in the future will be a pipe-dream, **and Tehran will be off the hook**. The United States and its friends and allies will then face the worst of both worlds: an Iran that is under no obligations to limit its nuclear capabilities and that welcomes foreign investment. This agreement reflects compromises that can be labeled as defects. They pale in comparison to the defects of a strategy to undo it. The need of the hour is to avoid a partisan divide and instead to work up a bipartisan strategy to support friends in the region.

Iran DA Reverse Politics Northwestern

1NC – Reverse Politics

Iran deal will survive but veto override is possible—Obama’s sales pitch is key
Liptak, White House producer for CNN, **7/14/2015**

(Kevin, “Now that he has a deal with Iran, Obama must face Congress,”

<http://www.cnn.com/2015/07/14/politics/iran-nuclear-deal-congress-obama-block/>)

With a historic deal meant to curb Iran's nuclear ambitions in place, President Barack Obama has ticked off another legacy-making item on his checklist -- as long as Congress doesn't get in his way.¶ Early Tuesday, Obama launched a sales pitch to lawmakers who remain deeply skeptical of the nuclear deal. But while Congress retains the ability to nullify Obama's accord with Tehran, the high bar for action on Capitol Hill -- including building veto-proof majorities in just over two months -- will make it difficult for opponents to block the President.¶ In its most simplistic form, the deal means that in exchange for limits on its nuclear activities, Iran would get relief from sanctions while being allowed to continue its atomic program for peaceful purposes. Many of the more technical points of the deal weren't available Tuesday morning, and specifics could prove to be red flags for skeptical members of Congress, many of whom said they were still reviewing the specifics of the plan.¶ Congress has 60 days to review the deal, and if it opposes it can pass a resolution of disapproval to block its implementation. The administration now has five days to certify the agreement and formally present the deal to Capitol Hill. The clock on that 60 day period will not start until the official document is delivered to Capitol Hill.¶ The Republican controlled House has the votes to pass a resolution, but in the Senate Republicans would need to attract support from a half a dozen Democrats.¶ Because President Obama has already pledged to veto any bill to block the deal GOP leaders would need to convince enough Democrats to join with them to override his veto -- a heavy lift. How the public views the deal will be critical, as Members of Congress will be back home for several weeks this summer before any vote.¶ While Obama on Tuesday said he welcomed a "robust" debate over the deal's merits, he issued a warning to lawmakers considering blocking the agreement, bluntly threatening to veto any measure that would prevent the deal from going into effect.¶ "Precisely because the stakes are so high, this is not the time for politics," he said in an address from the White House. "Tough talk from Washington does not solve problems. Hard nosed diplomacy, leadership that has united the world's major powers, offers a more effective way of verifying Iran is not pursuing a nuclear weapon."¶ Like the completion earlier this month of a diplomatic renewal with Cuba, the deal with Iran provides Obama a tentative foreign policy achievement in the final year-and-a-half of his presidency. Both are built on the premise of engaging traditional U.S. foes, a vow Obama made at the very beginning of his presidency when he declared to hostile nations the United States would "extend a hand if you are willing to unclench your fist."¶ The deal -- which was finalized after almost two years of talks -- provides vindication for an administration that's sought to emphasize diplomacy over military force.¶ "This deal demonstrates that American diplomacy can bring about real and meaningful change," Obama said Tuesday, adding later that the deal "offers an opportunity to move in a new direction."¶ But even Obama himself has admitted there are risks inherent in striking an accord with a sworn U.S. enemy. Lawmakers, many deeply wary of those risks, now have 60 days to digest the provisions included in the deal with Iran, a two-month review period Congress insisted upon as the negotiations unfolded.¶ Obama was initially resistant to any congressional review of the Iran pact. But faced with overwhelming support among lawmakers for some kind of evaluation period, the White House ultimately conceded that Congress could be able to review the final deal before it takes full effect.¶ It won't be easy for Congress to inflict damage on the agreement. They must act quickly -- and the two-month period in which they can scuttle the plan includes a month-long August recess, and only a handful of working days.¶ Foreign Relations Committee Chairman Bob Corker told reporters Monday he expects to start hearings sometime shortly after the 60-day clock begins -- which will come sometime in the next five days, after the Director of National Intelligence completes a number of certifications to Congress about the deal, including that it meets U.S. non-proliferation objectives and does not jeopardize U.S. national security.¶ Corker said he

wants first to ensure senators have ample time to read the agreement and its classified annexes so they are "well versed" before hearing from the administration and any outside experts he plans to call to testify.¶ **Corker said he would like to complete hearings before the August recess -- which begins Aug. 7 -- so lawmakers have the recess to consider their positions.** Under this scenario, up or down votes on the deal itself would not happen until mid-September, he said.¶ In the House, a similar process and timeframe is also expected.¶ **Within the 60-day span, opponents of the measure must rally votes to either enact new sanctions against Iran, or to disallow Obama from easing sanctions as part of the deal, measures the President would veto.**¶ **Overriding the veto in Congress would require a two-thirds majority -- meaning in the Senate, Obama must only secure a minimum of 34 votes** in order for his deal to take effect. Additional time beyond the 60-day review period is included for Obama to veto any legislation, and for Congress to muster support for an override.¶ If lawmakers fail to pass any new restrictions during the review period -- which ends in mid-September -- the deal will go into place, and sanctions will be lifted in Iran.¶ **But among deeply skeptical senators, who worry about Iran's support for terror groups and incarceration of Americans, even 34 Democratic votes in support of Obama aren't necessarily assured.**¶ "Over this August recess there's going to be **fast-and-furious lobbying, and we don't know whether there will be 34 votes,**" said former Democratic Rep. Jane Harman, who now heads the Woodrow Wilson International Center for Scholars.

CP is unpopular -- Curtailing drone surveillance has bipartisan opposition backed by drone campaign contributors

Aaron **Mehta 12**, journalist, June 14, 2012, "Drones not used effectively on U.S. borders," <http://www.publicintegrity.org/2012/06/14/9141/drones-not-used-effectively-us-borders>

In the House, **a 55-member, bi-partisan Unmanned Systems Caucus is dedicated to expanding the use of drone technology.** Part of **the caucus' mission statement is "the urgent need to rapidly develop and deploy more Unmanned Systems in support of ongoing civil, military, and law enforcement operations."** The caucus is **headed up by Defense committee chair Buck McKeon (R-Calif.), a noted friend of the defense industry who has received campaign contributions from multiple drone manufacturers.**

Courts shield

Whittington 5 Keith E., Cromwell Professor of Politics – Princeton University, "'Interpose Your Friendly Hand': Political Supports for the Exercise of Judicial Review by the United States Supreme Court", American Political Science Review, 99(4), November, p. 585, 591-592

There are some issues that politicians cannot easily handle. For individual legislators, their constituents may be sharply divided on a given issue or overwhelmingly hostile to a policy that the legislator would nonetheless like to see adopted. Party leaders, including **presidents** and legislative leaders, must similarly sometimes manage deeply divided or cross-pressured coalitions. When faced with such issues, elected **officials may actively seek to turn over controversial political questions to the courts so as to circumvent a paralyzed legislature and avoid the political fallout that would come with taking direct action themselves.** As Mark Graber (1993) has detailed **in cases such as slavery and abortion, elected officials may prefer judicial resolution of disruptive political issues** to direct legislative action, especially when the courts are believed to be sympathetic to the politician's own substantive preferences but even when the attitude of the courts is uncertain or unfavorable (see also, Lovell 2003). Even when politicians do not invite judicial intervention, strategically minded courts will take into account not only the policy preferences of well-positioned policymakers but also the willingness of those potential policymakers to act if doing so means that they must assume responsibility for policy outcomes. **For** cross-pressured **politicians** and coalition leaders,

shifting blame for controversial decisions to the Court and obscuring their own relationship to those decisions may preserve electoral support and coalition unity

without threatening active judicial review (Arnold 1990; Fiorina 1986; Weaver 1986). The conditions for the exercise of judicial review may be relatively favorable when judicial invalidations of legislative policy can be managed to the electoral benefit of most legislators. In the cases considered previously, fractious coalitions produced legislation that presidents and party leaders deplored but were unwilling to block. Divisions within the governing coalition can also prevent legislative action that political leaders want taken, as illustrated in the following case.

Iran deal leads to nuclear proliferation

Rogin 6/24/14 (Josh, writer for Bloomberg, "Clinton Defense Chief: Iran Deal Could Spark Proliferation", [//BW](http://www.bloombergview.com/articles/2015-06-24/clinton-defense-chief-iran-deal-could-spark-proliferation))

Gulf Arab powers are likely to respond to President Barack Obama's pending nuclear deal with Iran by developing their own nuclear programs, former Defense Secretary William Cohen said Wednesday. He said they don't trust either the Iranians or the United States to protect their interests. "The administration's intent was to have a counter-proliferation program. And the irony is, it may be just the opposite," he told a meeting of Bloomberg reporters Wednesday morning. As Secretary of State John Kerry prepares to meet Iranian leaders for the final push toward a comprehensive nuclear deal with Iran, there's growing angst in countries like Saudi Arabia, the United Arab Emirates, Qatar and Israel about the deal, which will leave Iran with significant uranium enrichment capabilities and may not give the international community the right to inspect all of Iran's nuclear facilities. The administration argues that a deal with Iran will remove the need for other regional powers to pursue their own nuclear enrichment and weapons programs. Cohen said the region doesn't see it that way. "Once you say they are allowed to enrich, the game is pretty much up in terms of how do you sustain an inspection regime in a country that has carried on secret programs for 17 years and is still determined to maintain as much of that secrecy as possible," said Cohen, who was a Republican lawmaker from Maine before serving under President Clinton from 1997 to 2001. Other regional powers are further skeptical of the international community's ability to enforce any deal with Iran because the Obama administration has lost credibility in the region, according to Cohen. He said America's relationships in the region were damaged in 2013, when President Obama backed away from striking Syria after telling Gulf allies he would do so, even though the Assad regime had crossed his "red line" on chemical weapons. "It was mishandled and everybody in the region saw how it was handled. And I think it shook their confidence in the administration. ... The Saudis, the UAE and the Israelis were all concerned about that," Cohen said. "They are looking at what we say, what we do, and what we fail to do, and they make their judgments. In the Middle East now, they are making different calculations." Cohen acknowledged that without a nuclear deal, Iran could have the ability to expand its nuclear activities with no restrictions, leading to an even more dangerous situation for the U.S. and the region. He doesn't agree with some lawmakers, such as Senator Tom Cotton, who argue that a military strike on Iran's nuclear facilities could be a solution. Cohen said that if a deal is reached, there will be significant international momentum for implementing the deal and lifting sanctions against Iran. The drive to do business in Iran will be alluring, especially to European countries, who have been eager to return to Iran but have been held back by the U.S.-led sanctions. Iranian officials have said that if the U.S. is the only country left with sanctions on Iran, that would amount to America sanctioning itself. "I anticipate this deal will be done. I think Congress is going to be hard-pressed to reject it," said Cohen. "Congress, the only chance it has to influence it is now, before it's signed." Cohen disagrees with those who believe that a nuclear deal will mollify Iran. He is skeptical that giving Iran large economic benefits will lead to significant reform in the Islamic Republic. "Most people that I know believe that Iran will continue to be a revolutionary country, and that's what bothers all of the others in the region, that this is going to continue the expansion of power, that they will be at a disadvantage, and they can't count on the United States," he said. Overall, countries in the Middle East have lost confidence in the Obama administration, Cohen said, in part because the U.S. has failed to articulate a clear vision for America's role in the world in the 21st century. That may not be resolved in the remainder of this administration. "There's a lot of worry about U.S. leadership and what we'll do next. You couple that with the Iran situation, and you could see there's a lot of nervousness now about where we are," he said. "That's something the next president will have to deal with."

Nuclear proliferation risks extinction – deterrence theory is flawed

Krieger, Councillor of the World Future Council, 2009

(David, "Still Loving the Bomb After All These Years", 9-4,
https://www.wagingpeace.org/articles/2009/09/04_krieger_newsweek_response.php?krieger)

Jonathan Tepperman's article in the September 7, 2009 issue of Newsweek, "Why Obama Should Learn to Love the Bomb," provides a novel but frivolous argument that nuclear weapons "may not, in fact, make the world more dangerous..." Rather, in Tepperman's world, "The bomb may actually make us safer." Tepperman shares this world with Kenneth Waltz, a University of California professor emeritus of political science, who Tepperman describes as "the leading 'nuclear optimist.'" Waltz expresses his optimism in this way: "We've now had 64 years of experience since Hiroshima. It's striking and against all historical precedent that for that substantial period, there has not been any war among nuclear states." Actually, there were a number of proxy wars between nuclear weapons states, such as those in Korea, Vietnam and Afghanistan, and some near disasters, the most notable being the 1962 Cuban Missile Crisis. Waltz's logic is akin to observing a man falling from a high rise building, and noting that he had already fallen for 64 floors without anything bad happening to him, and concluding that so far it looked so good that others should try it. Dangerous logic! Tepperman builds upon Waltz's logic, and concludes "that all states are rational," even though their leaders may have a lot of bad qualities, including being "stupid, petty, venal, even evil..." He asks us to trust that rationality will always prevail when there is a risk of nuclear retaliation, because these weapons make "the costs of war obvious, inevitable, and unacceptable." Actually, he is asking us to do more than trust in the rationality of leaders; he is asking us to gamble the future on this proposition. "The iron logic of deterrence and mutually assured destruction is so compelling," Tepperman argues, "it's led to what's known as the nuclear peace..." But if this is a peace worthy of the name, which it isn't, it certainly is not one on which to risk the future of civilization. One irrational leader with control over a nuclear arsenal could start a nuclear conflagration, resulting in a global Hiroshima. Tepperman celebrates "the iron logic of deterrence," but deterrence is a theory that is far from rooted in "iron logic." It is a theory based upon threats that must be effectively communicated and believed. Leaders of Country A with nuclear weapons must communicate to other countries (B, C, etc.) the conditions under which A will retaliate with nuclear weapons. The leaders of the other countries must understand and believe the threat from Country A will, in fact, be carried out. The longer that nuclear weapons are not used, the more other countries may come to believe that they can challenge Country A with impunity from nuclear retaliation. The more that Country A bullies other countries, the greater the incentive for these countries to develop their own nuclear arsenals. Deterrence is unstable and therefore precarious. Most of the countries in the world reject the argument, made most prominently by Kenneth Waltz, that the spread of nuclear weapons makes the world safer. These countries joined together in the Nuclear Non-Proliferation Treaty (NPT) to prevent the spread of nuclear weapons, but they never agreed to maintain indefinitely a system of nuclear apartheid in which some states possess nuclear weapons and others are prohibited from doing so. The principal bargain of the NPT requires the five NPT nuclear weapons states (US, Russia, UK, France and China) to engage in good faith negotiations for nuclear disarmament, and the International Court of Justice interpreted this to mean complete nuclear disarmament in all its aspects. Tepperman seems to be arguing that seeking to prevent the proliferation of nuclear weapons is bad policy, and that nuclear weapons, because of their threat, make efforts at non-proliferation unnecessary and even unwise. If some additional states, including Iran, developed nuclear arsenals, he concludes that wouldn't be so bad "given the way that bombs tend to mellow behavior." Those who oppose Tepperman's favorable disposition toward the bomb, he refers to as "nuclear pessimists." These would be the people, and I would certainly be one of them, who see nuclear weapons as presenting an urgent danger to our security, our species and our future. Tepperman finds that when viewed from his "nuclear optimist" perspective, "nuclear weapons start to seem a lot less frightening." "Nuclear peace," he tells us, "rests on a scary bargain: you accept a small chance that something extremely bad will happen in exchange for a much bigger chance that something very bad – conventional war – won't happen." But the "extremely bad thing" he asks us to accept: is the end of the human species. Yes, that would be serious. He also doesn't make the case that in a world without nuclear weapons, the prospects of conventional war would increase dramatically. After all, it is only an unproven supposition that nuclear weapons have prevented wars, or would do so in the future. We have certainly come far too close to the precipice of catastrophic nuclear war. As an ultimate celebration of the faulty logic of deterrence, Tepperman calls for providing any nuclear weapons state with a "survivable second strike option." Thus, he not only favors nuclear weapons, but finds the security of these weapons to trump human security. Presumably he would have President Obama providing new and secure nuclear weapons to North Korea, Pakistan and any other nuclear weapons states that come along so that they will feel secure enough not to use their weapons in a first-strike attack. Do we really want to bet the human future that Kim Jong-il and his successors are more rational than Mr. Tepperman?

Will Pass

Extend Liptak—Deal will pass now but August recess means that Obama has to counter intense lobbying

Iran deal will pass, although Congress can still kill it – PC needed to make sure it won't get overridden.

Prokop 7/14 (How Congress could kill the Iran deal, and why it probably won't, <http://www.vox.com/2015/7/14/8959807/iran-deal-congress>, Andrew Prokop, politics Staff Writer for Vox)

Republicans in Congress will get a chance to kill President Obama's new nuclear deal with Iran. But they'd have to win over a sizable chunk of Democrats to do it. The deal doesn't need to be affirmatively approved by Congress. But a law passed earlier this year allows Congress to vote to disapprove it and therefore block the relief of sanctions on Iran that's crucial to it. However, this resolution of disapproval would need to be passed by both the House and Senate over President Obama's veto. Assuming every Republican in the House and Senate votes to disapprove the deal, 13 Senate Democrats and 44 House Democrats would have to join them to kill Obama's veto. (If a vacant House seat is filled by a Republican by the time of the vote, only 43 House Democrats would be needed.) That would be over a fifth of the Democratic delegation in each chamber. Given that Obama made the deal and Hillary Clinton is praising it, defections like these seem unlikely unless key party leaders, like Sen. Chuck Schumer and House Minority Whip Steny Hoyer, come out against it. How the congressional review process works At the start of this year, Congress had no clear way to review the deal with Iran that Obama's team was hoping to strike. Both Democrats and Republicans were unhappy about this, and so after some debate, the bipartisan Iran Nuclear Agreement Review Act of 2015 was passed and signed by Obama. The new law says that once the administration submits this deal to Congress, Obama can't waive sanctions on Iran for 60 days so Congress can have time to review the agreement. However, the burden is then on Congress to disapprove the deal. If Congress takes no action, the lifting of sanctions will go into effect. Furthermore, a mere majority vote to kill the deal isn't enough. To go into effect and block Obama from lifting the sanctions permanently, Congress's resolution of disapproval would have to overcome Obama's promised veto. For that, the GOP would need two-thirds of both the House and Senate — 290 votes in the lower chamber, plus 67 in the upper one. In the House, there are currently 246 sitting Republicans — so if every one of them opposed the deal, the remaining 44 votes would have to come from Democrats. The vacant seat of former Rep. Aaron Schock (R-IL) will be filled in a September 10 special election, and Republican Darin LaHood is expected to win it. So if he's seated in time for the vote, only 43 Democrats would need to disapprove the deal. In addition to that, the Senate would have to vote to override a veto too. In the Senate, there are 54 sitting Republicans, meaning that 13 Democrats would have to join them. The politics of the Iran deal on the Hill What this means in practice, though, is that a vote will take place. And that will be an uncomfortable vote for many Democrats. Some may be genuinely skeptical of the deal, and others may be caught between their desire to support the president and their desire to have good relations with hawkish pro-Israel groups like AIPAC (which released a "deeply concerned" statement about the deal Tuesday morning). But AIPAC has had less clout among Democrats recently. Last year, the Daily

Beast's Eli Lake reported on how, in somewhat of a precursor to this fight, AIPAC "helped turn what was a bipartisan effort to keep Iran in check into just another political squabble," when its effort to get Congress to further toughen sanctions on the country failed. Plus, in addition to President Obama, Hillary Clinton — one of the more hawkish leaders in the party — is praising the deal. That means that Democrats who defect would be going against both the current president and his potential successor. So, barring a true outpouring of anti-deal opinion and pressure from constituents over the summer, not too many Democrats are likely to defect unless they have cover from some respected figures in the party. Those could include Sen. Chuck Schumer (D-NY) and House Minority Leader Steny Hoyer, who have hawkish foreign policy leanings and have tended to be strong allies of pro-Israel groups. Indeed, earlier this year, it was Schumer whose intervention was key in passing the law that gave Congress this review power in the first place, and he is Senate Democrats' choice to replace Harry Reid as their leader after he retires. So for signs of whether Congress will kill the deal, look to Schumer and Hoyer.

Iran deal will pass – but Obama needs his PC to keep Schumer and Dems on his side

Feehery 7/14 (<http://blogs.wsj.com/washwire/2015/07/14/republicans-oppose-the-iran-deal-but-can-they-override-a-veto/>, Republicans Oppose the Iran Deal—but Can They Override a Veto?, John Feehery, policy analyst for Christian Science Monitor and writer for Wall Street Journal, 7/14/2015)

It's easy for Republicans to oppose this nuclear deal with Iran. They don't trust President Barack Obama, they don't like John Kerry, and they love Benjamin Netanyahu. The question is: Can they override a presidential veto of a resolution of disapproval? Congress can pass either a resolution of approval or disapproval regarding the agreement. A two-thirds vote in both chambers is needed to assert congressional dominance over the president, and to reach that threshold, Republicans will most likely need the support of the incoming Democratic leader of the Senate, Chuck Schumer. Senate Majority Leader Mitch McConnell will need Mr. Schumer, all of the other Jewish Democrats in the Senate, and three other Democrats to join him in overcoming the veto that President Obama promised Tuesday in the face of congressional opposition. Sen. Robert Menendez is a likely suspect; Bill Nelson and Kirsten Gillibrand are also strong possibilities. In the House, getting enough votes would be an even tougher slog. Iran is the one issue that unifies House Republicans. Indeed, when Speaker John Boehner invited the Israeli prime minister to address a joint session of Congress, it sent his stock sky-high among his most recalcitrant conservative colleagues. But the odds of getting enough bipartisan support for an override are dicey at best. There are 247 Republicans in the House. They need 290 members to override a veto, which means they would need 43 Democrats to abandon Mr. Obama. It's hard to see where they get that many votes. There are 18 Jewish Democrats in the House, and many of them will probably stick with the president. Neither the black caucus nor the Hispanic caucus is likely to abandon Mr. Obama, and it is highly unlikely that House Democratic leader Nancy Pelosi will either. If Congress can't disapprove of the deal, it becomes fodder for the 2016 presidential campaign. Hillary Clinton has already signaled her support. Sen. Bernie Sanders applauded this "victory for diplomacy." Joe Biden obviously has to support it. Among Republican presidential candidates, the general consensus is that the deal stinks. The question is how colorful their rhetoric will be to capture the support of big donors who also oppose the

agreement. (Expect rhetoric along the lines of: Is this merely the worst deal in history or will it likely bring on the apocalypse?) The president and his secretary of state finally have the deal they have worked so hard to make. Can they keep it? Time will tell.

Iran deal has controversy in Congress but will likely pass as long as Obama has PC

Zengerle 7/14 (Iran deal faces fight in U.S. Congress but will likely survive, <http://www.reuters.com/article/2015/07/14/us-iran-nuclear-congress-process-idUSKCN0PO1HJ20150714>, Patricia Zengerle, Congressional Correspondent and Staff Writer for Reuters, July 14, 2015)

The nuclear deal between world powers and Iran starts a new phase of intense negotiation - this time between the Obama administration and the U.S. Congress, where some Republicans have long been working to sink an agreement. Any effort in Congress to overturn the deal will face an uphill fight. Republicans have majorities in both the House of Representatives and Senate, but they would need the support of dozens of President Barack Obama's fellow Democrats to sustain a "resolution of disapproval" that could cripple a deal. The odds of that are slim. A resolution of disapproval would need only the Republican majority to pass the House, but would require at least six Democrats to get the 60 votes needed to advance in the Senate. The chances of mustering enough support to then overrule an Obama veto are slimmer still. Obama vowed on Tuesday that he would veto any bill Congress passed that would prevent implementation of the Iran agreement. Nancy Pelosi, who leads the Democrats in the House, praised Obama in a statement. "I commend the president for his strength throughout the historic negotiations that have led to this point," she said, promising Congress would "closely review" the agreement. Senate Democrats have stood firm so far against Republican-led efforts to interfere with the talks between Iran, the United States and five other world powers. Some expressed skepticism about the deal, but others said they expected to vote for it. Senator Dianne Feinstein, a veteran Democrat who is the ranking member of the Senate Intelligence Committee, said she would support the deal. "This is a strong agreement that meets our national security needs and I believe will stand the test of time," she said in a statement. In the House, more than 150 Democrats, including Pelosi, signed a letter in May that strongly supported the negotiations. "I understand the heavy lift that's involved," Tennessee Republican Senator Bob Corker, chairman of the Senate Foreign Relations Committee, told reporters when asked about the chances of passing a "resolution of disapproval". Corker said the Foreign Relations committee would review the deal closely but added he would begin "from a place of deep skepticism" about whether the agreement meets the goal of preventing Iran from obtaining a nuclear weapon. RELATED COVERAGE › White House says it will take a couple of days to get Iran deal to Congress Other leading Republicans went much further in their criticism. House Speaker John Boehner promised a fight. "Instead of stopping the spread of nuclear weapons in the Middle East, this deal is likely to fuel a nuclear arms race around the world," Boehner said in a statement. Obama in May signed a law, authored by Corker, giving Congress the right to review the agreement and potentially sink it by passing a disapproval resolution that would eliminate the president's ability to waive sanctions passed by Congress. Easing sanctions is an integral part of the deal, under which Iran will curtail its nuclear program. 60 DAYS Under the Iran Review Act, lawmakers have 60 days to review the agreement and decide how to respond, once they receive the agreement

and supporting documentation. During that period, plus 22 more days in which Obama could veto a resolution and Congress could try to override it, Obama cannot waive the congressional sanctions. A veto override would require a two-thirds majority in both houses, or 13 Democrats along with all 54 Republicans in the Senate, and 43 Democrats plus all 236 House Republicans. Sanctions passed by Congress account for the overwhelming majority of those imposed by the United States. U.S. sanctions are central to the international regime because of the country's influence on global trade and banking. Congressional briefings on the Iran deal have already begun. Vice President Joe Biden was to meet with House Democrats on Wednesday morning to discuss Iran, and Obama and other administration officials called several lawmakers on Tuesday. RELATED COVERAGE › U.S. Senate leader: If Iran deal rejected, would be 'hard' to override veto Acknowledging the difficulty of passing a disapproval resolution, some lawmakers suggested Congress should consider, and then reject, a "resolution of approval." Defeating such a resolution by a large margin would not affect the sanctions regime, but it would send a strong message that the United States is not united behind a "bad" pact and was prepared to act if Iran moved toward building a bomb, they said. Corker told Reuters in an interview that congressional leaders would decide whether to pursue a resolution of approval or disapproval in the coming weeks. But neither the full House nor Senate is expected to vote on any measure before September, after lawmakers' August recess. Steny Hoyer, the number-two Democrat in the House, dismissed concerns that the delay would leave Democrats vulnerable to a summer of attacks from Republicans that they will be voting "for Iran" if they back Obama. "I'm not sure that it's politically disadvantageous to members," he told reporters. "I think the American public may well agree with the president on this." Both parties acknowledged that the debate will not end this year. Some lawmakers have discussed imposing more sanctions over Iran's human rights record or for supporting terrorism. The Iran Review Act requires the president to regularly certify that Tehran is adhering to terms of a deal. There is no guarantee the next president would do so. Most Republican 2016 White House hopefuls said they do not support the deal.

Will pass – can't override veto

Davis 7/14/15 (Susan, writer at USA Today, "Congress Unlikely to block Iran deal", <http://www.usatoday.com/story/news/politics/2015/07/14/congress-iran-deal/30125885/>)/BW

Congressional skeptics of the Iran nuclear deal said lawmakers would thoroughly vet the agreement, but Congress is unlikely to find a veto-proof majority necessary to block the deal. "I want to read the agreement in detail and fully understand it, but I begin from a place of deep skepticism that the deal actually meets the goal of preventing Iran from obtaining a nuclear weapon," said Senate Foreign Relations Chairman Bob Corker, R-Tenn. Iran, world powers reach landmark nuclear agreement "In the coming days, Congress will need to scrutinize this deal and answer whether implementing the agreement is worth dismantling our painstakingly-constructed sanctions regime that took more than a decade to establish," Corker added. The Tennessee senator led the effort to pass a law earlier this year that gave Congress an enhanced oversight role in the event a deal was reached. The law provides a 60-day review period after lawmakers receive the terms of the agreement to hold hearings and examine the fine print. Congress can then vote on a resolution that approves or disapproves of the deal, or they can do nothing at all. Corker told reporters Tuesday that hearings will take place prior to the August recess and a vote would happen in September. If Congress were to pass a resolution seeking to block the deal, President Obama said Tuesday he would veto it. Opponents would then need a veto-proof, two-thirds majority in both chambers to override — a scenario that seems unlikely today as top Democrats issued early statements of support.

CP Unpopular

Curtailment of Domestic Drones is unpopular

Antle 13 (<http://www.theamericanconservative.com/articles/the-drone-consensus313/>, Congress Goes Bipartisan—Against Civil Liberties, W. James Antle III, editor of the Daily Caller News Foundation and senior editor at The American Spectator, and the author of *Devouring Freedom: Can Big Government Ever Be Stopped?*, March 4, 2013)

Civil liberties are theoretically a bipartisan concern. Conservative Republicans who don't like Obamacare's "death panels" should be outraged by presidential kill lists. Liberal Democrats who defend due process ought to be offended by secret surveillance law. Protectors of the First and Second Amendments should have a high regard for the Fourth, Fifth, and Sixth. Yet restricting civil liberties is what actually commands bipartisan support in Washington. The same Congress that barely averted the fiscal cliff swiftly passed extensions of warrantless wiretapping and indefinite detention, assuring Americans that only the bad guys will be affected but evincing little interest in establishing whether this is really the case. The same Congress that failed to come up with an agreement to avoid sequestration appears to have bipartisan majorities in favor of profligate drone use at home and abroad. Lawmakers are generally less exercised about the confirmation of likely CIA chief John Brennan than Defense Secretary Chuck Hagel. At the very time it appears Washington is so dysfunctional that the two parties cannot get anything done, Democrats and Republicans cooperate regularly—when it comes to jailing, spying on, and meting out extrajudicial punishments in ways that on their face contradict the Bill of Rights. Senate Majority Leader Harry Reid argued that preserving the Bush administration's national surveillance program—now for the benefit of the Obama administration—was more important than Christmas. Republican Sen. Saxby Chambliss didn't even want any amendments. The Senate overwhelmingly rejected an amendment that would apply the same protections against unlawful search and seizure to emails and text messages that already exist for letters, phone calls, and presumably the carrier pigeon. Despite deep divisions over taxes and domestic spending, members of both parties tend to sing from the same song sheet about the Patriot Act, the National Defense Authorization Act, and the Foreign Intelligence Surveillance Act amendments. So much for the Democrats' bedrock belief in the right to privacy or Republicans' convictions about limited government. Civil libertarians are currently a rump caucus in both parties. But they are at least starting to work together. In fact, a critical mass of legislators seeks to use this week's Brennan vote to extract additional drone memos from the Obama administration. More promisingly, liberal Democrats like Sen. Ron Wyden of Oregon and Sen. Mark Udall of Colorado have been teaming up with such conservative Republicans as Sen. Rand Paul of Kentucky and Sen. Mike Lee of Utah, seeking to impose real checks on powers the federal government acquired to fight the war on terror—a conflict with no real boundaries or identifiable endpoint. The core purpose of the Constitution is to balance the powers necessary for the federal government to protect the United States with the need to erect institutional barriers to protect against the abuse of those powers. But in emergencies, constitutional restraints often go out the window and it is difficult to restore them after the fact. This is especially true when there is no transparency or public accountability. Many details about national surveillance, extraordinary rendition, and even the spending habits of intelligence agencies remain state secrets. Some level of secrecy is undoubtedly necessary to preserve

national security. But giving federal officials sweeping, routinely exercised powers without sunlight or scrutiny is an invitation to abuse. That's why having even a small group of senators pressing for public information is important. Eli Lake noted in The Daily Beast, "[A]t a moment when inter-party cooperation is almost nonexistent in Washington, any bipartisan alliance—especially one that includes some of DC's most committed ideological opposites—is both unusual and noteworthy." Lake was referring to the bipartisan alliance between civil libertarian-leaning senators like Paul and Wyden. But until they make legislative inroads, the more usual and less noteworthy bipartisan alliance will be the one that exists between John Yoo and the Obama administration, united by a predilection for virtually unchecked executive power.

Plan's controversial—differing regulatory stances, strong lobbies

Clay **Dillow 6/23**, June 23, 2015, "Is Congress' new drone safety act an innovation killer?," <http://fortune.com/2015/06/23/congress-drone-safety/>

This type of disconnect between government officials and the industry, perhaps, best embodies the ongoing regulatory conflict that's taking place in the drone industry these days. The drone industry has formed its own lobbying group, the Small UAV Coalition, which includes such deep-pocketed backers as Amazon and Google (Airware, Airmap, DJI, and 3DR are all also members) to represent its side of the argument on Capitol Hill. How effective the industry is at pushing pro-regulation legislators like Sen. Feinstein toward a middle ground will have a lot of impact on what the future U.S. drone industry looks like.

Plan controversial in congress – Drone industry lobbying

James **Rogers 6/17**, Bachelor of Arts from University of Leeds, "Industry group urges Congress to support expanded drone use", 6/17/15, *Fox News*, <http://www.foxnews.com/tech/2015/06/17/industry-group-urges-congress-to-support-expanded-drone-use/>

A key drone industry group called on Congress to support expanded use of the controversial technology during testimony to the House Oversight and Government Reform Committee Wednesday. The Association for Unmanned Vehicle Systems International (AUVSI) noted that the Federal Aviation Administration is working on finalizing rules for commercial and public drone use and is also granting permission for limited commercial use on a case-by-case basis. "But more can and should be done," said AUVSI President Brian Wynne, in prepared testimony. Wynne said that the upcoming FAA reauthorization bill should focus on two key areas – accelerating the safe commercial use of drones, also known as Unmanned Aerial Systems (UAS), and expanding research efforts. The FAA's current authorization bill expires Sept. 30, 2015. The FAA proposed rules in February that would severely restrict the use of commercial drones. The proposed rules would require operators to keep commercial drones within eyesight at all times, which significantly limits the distance they can fly. Last month the FAA also unveiled its Pathfinder program, which will study how drones are used for newsgathering, as well as in the agriculture and transport industries. "We need to permit

expanded uses that pose no additional risk to the airspace system,” said Wynne, in his testimony. “Whether within the context of the rule, through the reauthorization or by other means, we need to allow for beyond-visual-line-of-sight, nighttime operations and operations over congested areas. Otherwise we risk stunting a still-nascent industry.”

Plan extremely controversial ---- fear of terrorist attack by drone use --- held press conference to try discourage use --- I can't believe this is actually true

Kevin **Poulsen 15**, contributing editor at WIRED and author of *Kingpin: How One Hacker Took Over the Billion-Dollar Cybercrime Underground*, “Why the US Government Is Terrified of Hobbyist Drones”, 2/5/15, *Wired*, <http://www.wired.com/2015/02/white-house-drone/>
